{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Next,\ we\ write\ the\ function\ {\char92}userfun{\char123}displayRow{\char125}\nwnewline
to\ display\ the\ row,\ separating\ entries\ by\ blanks\ and\ centering.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}displayRow(n)\ ==\ output\ center\ blankSeparate\ pascalRow(n)\ \nwnewline
{\char92}free{\char123}pascalRow{\char125}{\char92}bound{\char123}displayRow{\char125}{\char92}free{\cha
{\char125}\nwnewline
{\char37}\nwnewline
Here\ we\ have\ used\ three\ output\ operations.\nwnewline
Operation\ {\char92}axiomFunFrom{\char123}output{\char125}{\char123}OutputForm{\char125}\nwnewline
displays\ the\ printable\ form\ of\ objects\ on\ the\ screen,\nwnewline
{\char92}axiomFunFrom{\char123}center{\char125}{\char123}OutputForm{\char125}\ centers\ a\ printable\ fo
width\ of\ the\ screen,\ and\ {\char92}axiomFunFrom{\char123}blankSeparate{\char125}{\char123}OutputForm
takes\ a\ list\ of\ printable\ forms\ and\ inserts\ a\ blank\ between\ \nwnewline
successive\ elements.\nwnewline
{\char92}xtc{\char123}\nwnewline
Look\ at\ the\ result.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}for\ i\ in\ 1..7\ repeat\ displayRow\ i\ {\char92}free{\char123}d
{\char125}\nwnewline
Being\ purists,\ we\ find\ this\ less\ than\ satisfactory.\nwnewline
Traditionally,\ elements\ of\ Pascal's\ triangle\ are\ centered\ between\nwnewline
the\ left\ and\ right\ elements\ on\ the\ line\ above.\nwnewline
{\char37}\nwnewline
{\char92}xtc{\char123}\nwnewline
To\ fix\ this\ misalignment,\ we\ go\ back\ and\nwnewline
redefine\ {\char92}userfun{\char123}pascalRow{\char125}\ to\ right\ adjust\ the\ entries\ wit
triangle\ within\ a\ width\ of\ four\ characters.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}pascalRow(n)\ ==\ [right(pascal(i,n),4)\ for\ i\ in\ 1..n]\ \nwne
{\char92}bound{\char123}pascalRow2{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char37}\nwnewline
{\char92}xtc{\char123}\nwnewline
Finally\ let's\ look\ at\ our\ purely\ reformatted\ triangle.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}for\ i\ in\ 1..7\ repeat\ displayRow\ i\ {\char92}free{\char123}p
{\char92}free{\char123}displayRow{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Unexpose\ {\char92}axiomType{\char123}OutputForm{\char125}\ so\ we\ don't\ get\ unexpected\nw
results\ later.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123})set\ expose\ drop\ constructor\ OutputForm{\char125}\nwnewline

\nwnewline
A\ common\ mathematical\ formula\ is\nwnewline
{\char92}texht{\char123}{\char92}narrowDisplay{\char123}{\char37}\nwnewline
{\char92}log(x)\ +\ {\char92}log(y)\ =\ {\char92}log(x\ y)\ {\char92}quad{\char92}forall\ {\c
{\char92}axiom{\char123}log(x)\ +\ log(y)\ ==\ log(x\ *\ y){\char125}\ for\ any\ {\char92}axi
```

```
The\ presence\ of\nwnewline
{\char92}texht{\char123}‘‘{\char36}{\char92}forall{\char36}’’{\char125}{\char123}the\ word\ ‘‘any’’{\cha
indicates\ that\ {\char92}axiom{\char123}x{\char125}\ and\ {\char92}axiom{\char123}y{\char125}\ can\ sta
expressions\ in\ the\ above\ formula.\nwnewline
You\ can\ use\ such\ mathematical\ formulas\ in\ Axiom\ to\ specify\ ‘‘rewrite\nwnewline
rules’’.\nwnewline
Rewrite\ rules\ are\ objects\ in\ Axiom\ that\ can\ be\ assigned\ to\ variables\ for\nwnewline
later\ use,\ often\ for\ the\ purpose\ of\ simplification.\nwnewline
Rewrite\ rules\ look\ like\ ordinary\ function\ definitions\ except\ that\ they\ are\nwnewline
preceded\ by\ the\ reserved\ word\ {\char92}axiom{\char123}rule{\char125}.\nwnewline
{\char92}spadkey{\char123}rule{\char125}\nwnewline
For\ example,\ a\ rewrite\ rule\ for\ the\ above\ formula\ is:\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
rule\ log(x)\ +\ log(y)\ ==\ log(x\ *\ y)\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
Like\ function\ definitions,\ no\ action\ is\ taken\ when\ a\ rewrite\ rule\ is\ issued.\nwnewline
Think\ of\ rewrite\ rules\ as\ functions\ that\ take\ one\ argument.\nwnewline
When\ a\ rewrite\ rule\ {\char92}axiom{\char123}A\ =\ B{\char125}\ is\ applied\ to\ an\ argument\ {\char
meaning\ is:\ ‘‘rewrite\ every\ subexpression\ of\ {\char92}axiom{\char123}f{\char125}\ that\ {\char123}
{\char92}axiom{\char123}A{\char125}\ by\ {\char92}axiom{\char123}B.{\char125}’’\nwnewline
The\ left-hand\ side\ of\ a\ rewrite\ rule\ is\ called\ a\ {\char92}spadgloss{\char123}pattern{\char125}
right-side\ side\ is\ called\ its\ {\char92}spadgloss{\char123}substitution{\char125}.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
Create\ a\ rewrite\ rule\ named\ {\char92}userfun{\char123}logrule{\char125}.\nwnewline
The\ generated\ symbol\ beginning\ with\ a\ {\char92}axiomSyntax{\char123}{\char92}{\char37}{\char125}\
for\ any\ other\ terms\ that\ might\ occur\ in\ the\ sum.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}logrule\ :=\ rule\ log(x)\ +\ log(y)\ ==\ log(x\ *\ y)\ {\char92}bound{\char
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Create\ an\ expression\ with\ logarithms.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}f\ :=\ log\ sin\ x\ +\ log\ x\ {\char92}bound{\char123}f{\char125}{\char125}
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Apply\ {\char92}userfun{\char123}logrule{\char125}\ to\ {\char92}axiom{\char123}f{\char125}.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}logrule\ f\ {\char92}free{\char123}f{\char125}{\char92}free{\char123}logrule
{\char125}\nwnewline
\nwnewline
The\ meaning\ of\ our\ example\ rewrite\ rule\ is:\nwnewline
‘‘for\ all\ expressions\ {\char92}axiom{\char123}x{\char125}\ and\ {\char92}axiom{\char123}y{\char125},\
{\char92}axiom{\char123}log(x)\ +\ log(y){\char125}\ by\ {\char92}axiom{\char123}log(x\ *\ y){\char125}.
Patterns\ generally\ have\ both\ operation\ names\nwnewline
(here,\ {\char92}axiomFun{\char123}log{\char125}\ and\ {\char92}axiomOp{\char123}+{\char125})\nwnewline
and\ variables\ (here,\ {\char92}axiom{\char123}x{\char125}\ and\ {\char92}axiom{\char123}y{\char125}).\
By\ default,\ every\ operation\ name\ stands\ for\ itself.\nwnewline
Thus\ {\char92}axiomFun{\char123}log{\char125}\ \ matches\ only\ ‘‘{\char92}axiom{\char123}log{\char125}
other\ operation\ such\ as\ {\char92}axiomFun{\char123}sin{\char125}.\nwnewline
```

```
On\ the\ other\ hand,\ variables\ do\ not\ stand\ for\ themselves.\nwnewline
Rather,\ a\ variable\ denotes\ a\nwnewline
{\char123}{\char92}it\ pattern\ variable{\char125}\ that\ is\ free\ to\ match\ any\ expressio
\nwnewline
When\ a\ rewrite\ rule\ is\ applied,\ a\ process\ called\ {\char92}spadgloss{\char123}pattern
matching{\char125}\ goes\ to\ work\ by\ systematically\ scanning\ the\ subexpressions\nwnewli
of\ the\ argument.\ \ When\ a\ subexpression\ is\ found\ that\ ‘‘matches’’\ the\nwnewline
pattern,\ the\ subexpression\ is\ replaced\ by\ the\ right-hand\ side\ of\ the\nwnewline
rule.\ \ The\ details\ of\ what\ happens\ will\ be\ covered\ later.\nwnewline
\nwnewline
The\ customary\ Axiom\ notation\ for\ patterns\ is\ actually\ a\ shorthand\ for\nwnewline
a\ longer,\ more\ general\ notation.\ \ Pattern\ variables\ can\ be\ made\nwnewline
explicit\ by\ using\ a\ percent\ ({\char92}axiomSyntax{\char123}{\char92}{\char37}{\char125})
of\ the\ variable\ name.\ \ To\ say\ that\ a\ name\ stands\ for\ itself,\ you\ can\nwnewline
prefix\ that\ name\ with\ a\ quote\ operator\ ({\char92}axiomSyntax{\char123}’{\char125}).\ \
the\ current\ Axiom\ parser\ does\ not\ let\ you\ quote\ an\ operation\ name,\nwnewline
this\ more\ general\ notation\ gives\ you\ an\ alternate\ way\ of\ giving\ the\nwnewline
same\ rewrite\ rule:\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
rule\ log({\char37}x)\ +\ log({\char37}y)\ ==\ log(x\ *\ y)\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
This\ longer\ notation\ gives\ you\ patterns\ that\ the\nwnewline
standard\ notation\ won’t\ handle.\nwnewline
For\ example,\ the\ rule\nwnewline
{\char92}texht{\char123}{\char92}typeout{\char123}check\ this\ example{\char125}{\char125}{\c
{\char92}begin{\char123}verbatim{\char125}\nwnewline
rule\ {\char37}f(c\ *\ ’x)\ ==\ \ c*{\char37}f(x)\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
means\ ‘‘for\ all\ {\char92}axiom{\char123}f{\char125}\ and\ {\char92}axiom{\char123}c{\char1
{\char92}axiom{\char123}c\ *\ f(x){\char125}\ when\ {\char92}axiom{\char123}y{\char125}\ is\
and\ the\ explicit\ variable\ {\char92}axiom{\char123}x{\char125}.’’\nwnewline
\nwnewline
Thus\ the\ pattern\ can\ have\ several\ adornments\ on\ the\ names\ that\ appear\ there.\nwne
Normally,\ all\ these\ adornments\ are\ dropped\ in\ the\ substitution\ on\ the\nwnewline
right-hand\ side.\nwnewline
\nwnewline
To\ summarize:\nwnewline
\nwnewline
{\char92}beginImportant\nwnewline
To\ enter\ a\ single\ rule\ in\ Axiom,\ use\ the\ following\ syntax:\nwnewline
{\char92}spadkey{\char123}rule{\char125}\nwnewline
{\char92}centerline{\char123}{\char123}{\char123}{\char92}tt\ rule\ {\char123}{\char92}it\ le
The\ {\char123}{\char92}it\ leftHandSide{\char125}\ is\ a\ pattern\ to\ be\ matched\ and\nwne
the\ {\char123}{\char92}it\ rightHandSide{\char125}\ is\ its\ substitution.\nwnewline
The\ rule\ is\ an\ object\ of\ type\ {\char92}axiomType{\char123}RewriteRule{\char125}\ that\
assigned\ to\ a\ variable\ and\ applied\ to\ expressions\ to\ transform\ them.\nwnewline
{\char92}endImportant\nwnewline
\nwnewline
Rewrite\ rules\ can\ be\ collected\ into\ rulesets\ so\ that\ a\ set\ of\ rules\nwnewline
can\ be\ applied\ at\ once.\ \ Here\ is\ another\ simplification\ rule\ for\nwnewline
```

```
logarithms.\ \ {\char92}texht{\char123}{\char92}narrowDisplay{\char123}y\ {\char92}log(x)\ =\ {\char92}l
{\char92},\ x\ {\char92}hbox{\char123}{\char92}\ and{\char92}\ {\char125}\ y.{\char125}{\char125}{\char1
{\char92}axiom{\char123}x{\char125}\ and\ {\char92}axiom{\char123}y{\char125}.{\char125}\ \ If\ instead\
following\ the\ reserved\ word\ {\char92}axiom{\char123}rule{\char125}\ you\ give\ a\ ‘‘pile’’\ of\ rule
you\ create\ what\ is\ called\ a\ {\char123}{\char92}it\ ruleset.{\char125}\ \ Like\ rules,\ rulesets\ a
objects\ in\ Axiom\ and\ can\ be\ assigned\ to\ variables.\ \ You\ will\ find\ it\nwnewline
useful\ to\ group\ commonly\ used\ rules\ into\ input\ files,\ and\ read\ them\ in\nwnewline
as\ needed.\nwnewline
{\char92}xtc{\char123}\nwnewline
Create\ a\ ruleset\ named\ {\char92}axiom{\char123}logrules{\char125}.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}begin{\char123}spadsrc{\char125}[{\char92}bound{\char123}logrules{\char125}]\nwnewline
logrules\ :=\ rule\nwnewline
\ \ log(x)\ +\ log(y)\ ==\ log(x\ *\ y)\nwnewline
\ \ y\ *\ log\ x\ \ \ \ \ \ \ ==\ log(x\ **\ y)\nwnewline
{\char92}end{\char123}spadsrc{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Again,\ create\ an\ expression\ {\char92}axiom{\char123}f{\char125}\ containing\ logarithms.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}f\ :=\ a\ *\ log(sin\ x)\ -\ 2\ *\ log\ x\ {\char92}bound{\char123}f1{\char1
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Apply\ the\ ruleset\ {\char92}userfun{\char123}logrules{\char125}\ to\ {\char92}axiom{\char123}f{\char12
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}logrules\ f\ {\char92}free{\char123}f1{\char125}{\char92}free{\char123}logru
{\char125}\nwnewline
\nwnewline
We\ have\ allowed\ pattern\ variables\ to\ match\ arbitrary\ expressions\ in\nwnewline
the\ above\ examples.\ \ Often\ you\ want\ a\ variable\ only\ to\ match\nwnewline
expressions\ satisfying\ some\ predicate.\ \ For\ example,\ we\ may\ want\ to\nwnewline
apply\ the\ transformation\ {\char92}texht{\char123}{\char92}narrowDisplay{\char123}y\ {\char92}log(x)\
{\char92}log(x{\char94}y){\char125}{\char125}{\char123}{\char92}axiom{\char123}y\ *\ log(x)\ ==\ log(x\
an\ integer.\nwnewline
{\char37}\nwnewline
The\ way\ to\ restrict\ a\ pattern\ variable\ {\char92}axiom{\char123}y{\char125}\ by\ a\ predicate\nwne
{\char92}axiom{\char123}f(y){\char125}\ is\ by\ using\ a\ vertical\ bar\ {\char92}axiomSyntax{\char123}|
‘‘such\ that,’’\ in\ much\ the\ same\ way\ it\ is\ used\ in\ function\nwnewline
definitions.\ \ You\ do\ this\ only\ once,\ but\ at\ the\ earliest\ (meaning\nwnewline
deepest\ and\ leftmost)\ part\ of\ the\ pattern.\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ restricts\ the\ logarithmic\ rule\ to\ create\ integer\ exponents\ only.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}begin{\char123}spadsrc{\char125}[{\char92}bound{\char123}logrules2{\char125}]\nwnewline
logrules2\ :=\ rule\nwnewline
\ \ log(x)\ +\ log(y)\ \ \ \ \ \ \ \ \ \ ==\ log(x\ *\ y)\nwnewline
\ \ (y\ |\ integer?\ y)\ *\ log\ x\ ==\ log(x\ **\ y)\nwnewline
{\char92}end{\char123}spadsrc{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
```

```
Compare\ this\ with\ the\ result\ of\ applying\ the\ previous\ set\ of\ rules.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}f\ {\char92}free{\char123}f1{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}logrules2\ f\ {\char92}free{\char123}f1{\char125}{\char92}free{\c
{\char125}\nwnewline
You\ should\ be\ aware\ that\ you\ might\ need\ to\ apply\ a\ function\ like\nwnewline
{\char92}spadfun{\char123}integer{\char125}\ within\ your\ predicate\ expression\ to\ actual
the\ test\ function.\nwnewline
{\char92}xtc{\char123}\nwnewline
Here\ we\ use\ {\char92}spadfun{\char123}integer{\char125}\ because\ {\char92}spad{\char123}
type\ {\char92}spadtype{\char123}Expression\ Integer{\char125}\ but\ {\char92}spadfun{\char1
defined\ on\ integers.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}\nwnewline
evenRule\ :=\ rule\ cos(x)**(n\ |\ integer?\ n\ and\ even?\ integer\ n)==\nwnewline
(1-sin(x)**2)**(n/2)\ {\char92}bound{\char123}evenRule{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Here\ is\ the\ application\ of\ the\ rule.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}evenRule(\ cos(x)**2\ )\ {\char92}free{\char123}evenRule{\char12
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ is\ an\ example\ of\ some\ of\ the\ usual\ identities\ involving\ products\ of\nwnewli
sines\ and\ cosines.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}begin{\char123}spadsrc{\char125}[{\char92}bound{\char123}sinCosProducts{\char125}]\
sinCosProducts\ ==\ rule\nwnewline
\ \ sin(x)\ *\ sin(y)\ ==\ (cos(x-y)\ -\ cos(x\ +\ y))/2\nwnewline
\ \ cos(x)\ *\ cos(y)\ ==\ (cos(x-y)\ +\ cos(x+y))/2\nwnewline
\ \ sin(x)\ *\ cos(y)\ ==\ (sin(x-y)\ +\ sin(x\ +\ y))/2\nwnewline
{\char92}end{\char123}spadsrc{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}g\ :=\ sin(a)*sin(b)\ +\ cos(b)*cos(a)\ +\ sin(2*a)*cos(2*a)\ \n
{\char92}bound{\char123}g{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}sinCosProducts\ g\ {\char92}free{\char123}sinCosProducts\ g{\cha
{\char125}\nwnewline
\nwnewline
Another\ qualification\ you\ will\ often\ want\ to\ use\ is\ to\ allow\ a\ pattern\nwnewline
to\ match\ an\ identity\ element.\ \ Using\ the\ pattern\ {\char92}axiom{\char123}x\ +\ y{\c
example,\ neither\ {\char92}axiom{\char123}x{\char125}\ nor\ {\char92}axiom{\char123}y{\char
{\char92}axiom{\char123}0{\char125}.\ \ Similarly,\ if\ a\ pattern\ contains\ a\ product\ {\
an\ exponentiation\ {\char92}axiom{\char123}x**y{\char125},\ then\ neither\ {\char92}axiom{\char123}x{\c
matches\ {\char92}axiom{\char123}1{\char125}.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
If\ identical\ elements\ were\ matched,\ pattern\ matching\ would\ generally\ loop.\nwnewline
Here\ is\ an\ expansion\ rule\ for\ exponentials.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}exprule\ :=\ rule\ exp(a\ +\ b)\ ==\ exp(a)\ *\ exp(b){\char92}bound{\char12
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ rule\ would\ cause\ infinite\ rewriting\ on\ this\ if\ either\ {\char92}axiom{\char123}a{\char125}
{\char92}axiom{\char123}b{\char125}\ were\ allowed\ to\ match\ {\char92}axiom{\char123}0{\char125}.\nwne
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}exprule\ exp\ x\ {\char92}free{\char123}exprule{\char125}{\char125}\nwnewlin
{\char125}\nwnewline
\nwnewline
There\ are\ occasions\ when\ you\ do\ want\ a\ pattern\ variable\ in\ a\ sum\ or\nwnewline
product\ to\ match\ {\char92}axiom{\char123}0{\char125}\ or\ {\char92}axiom{\char123}1{\char125}.\ \ If\
a\ {\char92}axiomSyntax{\char123}?{\char125}\ whenever\ it\ appears\ in\ a\ left-hand\ side\ of\ a\ rule
For\ example,\ consider\ the\ following\ rule\ for\ the\ exponential\ integral:\nwnewline
{\char92}texht{\char123}{\char92}narrowDisplay{\char123}{\char92}int\ {\char92}left({\char92}frac{\char1
{\char92}frac{\char123}y{\char125}{\char123}x{\char125}{\char92}:\ dx\ +\ {\char92}hbox{\char123}{\char9
y.{\char125}{\char125}{\char123}\ {\char92}axiom{\char123}integral((y\ +\ exp\ x)/x,\ x)\ ==\ integral(y
for\ any\ {\char92}axiom{\char123}x{\char125}\ and\ {\char92}axiom{\char123}y{\char125}.{\char125}\ \ Th
0{\char125}.\ \ One\ solution\ is\ to\ create\ a\ {\char92}axiomType{\char123}Ruleset{\char125}\ with\ t
one\ with\ and\ one\ without\ {\char92}axiom{\char123}y{\char125}.\ \ A\ better\ solution\ is\ to\ use\
``optional''\ pattern\ variable.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
Define\ rule\ {\char92}axiom{\char123}eirule{\char125}\ with\nwnewline
a\ pattern\ variable\ {\char92}axiom{\char123}?y{\char125}\ to\ indicate\nwnewline
that\ an\ expression\ may\ or\ may\ not\ occur.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}eirule\ :=\ rule\ integral((?y\ +\ exp\ x)/x,x)\ ==\ \nwnewline
integral(y/x,x)\ +\ Ei\ x\ {\char92}bound{\char123}eirule{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Apply\ rule\ {\char92}axiom{\char123}eirule{\char125}\ to\ an\ integral\ without\ this\ term.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}eirule\ integral(exp\ u/u,\ u)\ {\char92}free{\char123}eirule{\char125}{\cha
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Apply\ rule\ {\char92}axiom{\char123}eirule{\char125}\ to\ an\ integral\ with\ this\ term.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}eirule\ integral(sin\ u\ +\ exp\ u/u,\ u)\ {\char92}free{\char123}eirule{\ch
{\char125}\nwnewline
\nwnewline
Here\ is\ one\ final\ adornment\ you\ will\ find\ useful.\ \ When\ matching\ a\nwnewline
pattern\ of\ the\ form\ {\char92}axiom{\char123}x\ +\ y{\char125}\ to\ an\ expression\ containing\ a\ lo
sum\ of\ the\ form\ {\char92}axiom{\char123}a\ +{\char92}ldots+\ b{\char125},\ there\ is\ no\ way\ to\ p
```

```
advance\ which\ subset\ of\ the\ sum\ matches\ {\char92}axiom{\char123}x{\char125}\ and\ whi
{\char92}axiom{\char123}y{\char125}.\ \ Aside\ from\ efficiency,\ this\ is\ generally\ unimp
the\ rule\ holds\ for\ any\ possible\ combination\ of\ matches\ for\ {\char92}axiom{\char123
and\ {\char92}axiom{\char123}y{\char125}.\ \ In\ some\ situations,\ however,\ you\ may\ want
pattern\ variable\ is\ a\ sum\ (or\ product)\ of\ several\ terms,\ and\ which\nwnewline
should\ match\ only\ a\ single\ term.\ \ To\ do\ this,\ put\ a\ prefix\ colon\nwnewline
{\char92}axiomSyntax{\char123}:{\char125}\ before\ the\ pattern\ variable\ that\ you\ want\
multiple\ terms.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ remaining\ rules\ involve\ operators\ {\char92}axiom{\char123}u{\char125}\ and\ {\char9
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}u\ :=\ operator\ 'u\ {\char92}bound{\char123}u{\char125}{\char12
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
These\ definitions\ tell\ Axiom\ that\nwnewline
{\char92}axiom{\char123}u{\char125}\ and\ {\char92}axiom{\char123}v{\char125}\ are\ formal\
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}v\ :=\ operator\ 'v\ {\char92}bound{\char123}v{\char125}{\char12

{\char125}\nwnewline
\nwnewline
\nwnewline
Here\ are\ some\ final\ remarks\ on\ pattern\ matching.\nwnewline
Pattern\ matching\ provides\ a\ very\ useful\ paradigm\ for\ solving\nwnewline
certain\ classes\ of\ problems,\ namely,\ those\ that\ involve\nwnewline
transformations\ of\ one\ form\ to\ another\ and\ back.\nwnewline
However,\ it\ is\ important\ to\ recognize\ its\ limitations.\nwnewline
```

```
\nwnewline
First,\ pattern\ matching\ slows\ down\ as\ the\ number\ of\ rules\ you\ have\ to\nwnewline
apply\ increases.\ \ Thus\ it\ is\ good\ practice\ to\ organize\ the\ sets\ of\nwnewline
rules\ you\ use\ optimally\ so\ that\ irrelevant\ rules\ are\ never\ included.\nwnewline
\nwnewline
Second,\ careless\ use\ of\ pattern\ matching\ can\ lead\ to\ wrong\ answers.\nwnewline
You\ should\ avoid\ using\ pattern\ matching\ to\ handle\ hidden\ algebraic\nwnewline
relationships\ that\ can\ go\ undetected\ by\ other\ programs.\ \ As\ a\ simple\nwnewline
example,\ a\ symbol\ such\ as\ ``J''\ can\ easily\ be\ used\ to\ represent\ the\nwnewline
square\ root\ of\ {\char92}axiom{\char123}-1{\char125}\ or\ some\ other\ important\ algebraic\ quantity.
Many\ algorithms\ branch\ on\ whether\ an\ expression\ is\ zero\ or\ not,\ then\nwnewline
divide\ by\ that\ expression\ if\ it\ is\ not.\ \ If\ you\ fail\ to\ simplify\ an\nwnewline
expression\ involving\ powers\ of\ {\char92}axiom{\char123}J{\char125}\ to\ {\char92}axiom{\char123}-1,{
incorrectly\ assume\ an\ expression\ is\ non-zero,\ take\ a\ wrong\ branch,\ and\nwnewline
produce\ a\ meaningless\ result.\nwnewline
\nwnewline
Pattern\ matching\ should\ also\ not\ be\ used\ as\ a\ substitute\ for\ a\ domain.\nwnewline
In\ Axiom,\ objects\ of\ one\ domain\ are\ transformed\ to\ objects\ of\ other\nwnewline
domains\ using\ well-defined\ {\char92}axiomFun{\char123}coerce{\char125}\ operations.\nwnewline
Pattern\ matching\ should\ be\ used\ on\ objects\ that\ are\ all\ the\ same\ type.\nwnewline
Thus\ if\ your\ application\ can\ be\ handled\ by\ type\ {\char92}axiomType{\char123}Expression{\char125
Axiom\ and\ you\ think\ you\ need\ pattern\ matching,\ consider\ this\ choice\nwnewline
carefully.\nwnewline
You\ may\ well\ be\ better\ served\ by\ extending\ an\ existing\ domain\nwnewline
or\ by\ building\ a\ new\ domain\ of\ objects\ for\ your\ application.\nwnewline
{\char92}endscroll\nwnewline
{\char92}autobuttons\nwnewline

\nwnewline
This\ chapter\ shows\ how\ to\ use\ the\ Axiom\ graphics\ facilities\ under\ the\nwnewline
X\ Window\ System.\ \ Axiom\ has\ {\char92}twodim{\char123}{\char125}\ and\ {\char92}threedim
rendering\ packages\ that\ allow\ the\ drawing,\ coloring,\ transforming,\nwnewline
mapping,\ clipping,\ and\ combining\ of\ graphic\ output\ from\ Axiom\nwnewline
computations.\ \ This\ facility\ is\ particularly\ useful\ for\ investigating\nwnewline
problems\ in\ areas\ such\ as\ topology.\ \ The\ graphics\ package\ is\ capable\nwnewline
of\ plotting\ functions\ of\ one\ or\ more\ variables\ or\ plotting\ parametric\nwnewline
```

```
surfaces\ and\ curves.\ \ Various\ coordinate\ systems\ are\ also\ available,\nwnewline
such\ as\ polar\ and\ spherical.\nwnewline
\nwnewline
A\ graph\ is\ displayed\ in\ a\ viewport\ window\ and\ it\ has\ a\ control-panel\nwnewline
that\ uses\ interactive\ mouse\ commands.\ \ PostScript\ and\ other\ output\nwnewline
forms\ are\ available\ so\ that\ Axiom\ images\ can\ be\ printed\ or\ used\ by\nwnewline
other\ programs.{\char92}footnote{\char123}PostScript\ is\ a\ trademark\ of\ Adobe\ Systems\nwnewline
Incorporated,\ registered\ in\ the\ United\ States.{\char125}\nwnewline

in\ Section\ 7.1.4{\char92}ignore{\char123}ugGraphTwoDOptions{\char125}.\nwnewline
```

```
An\ example\ of\ an\ option\ is\ {\char92}axiom{\char123}curveColor\ ==\ bright\ red().{\char125}\nwnewl
An\ alternative\ format\ involving\ functions\ {\char92}axiom{\char123}f{\char125}\ and\ {\char92}axiom{
is\ also\ available.\nwnewline
{\char92}endImportant\nwnewline
\nwnewline
A\ simple\ way\ to\ plot\ a\ function\ is\ to\ use\ a\ formula.\ \ The\ first\nwnewline
argument\ is\ the\ formula.\ \ For\ the\ second\ argument,\ write\ the\ name\ of\nwnewline
the\ independent\ variable\ (here,\ {\char92}axiom{\char123}x{\char125}),\ followed\ by\ an\nwnewline
{\char92}spadSyntax{\char123}={\char125},\ and\ the\ range\ of\ values.\nwnewline
\nwnewline
{\char92}psXtc{\char123}\nwnewline
Display\ this\ formula\ over\ the\ range\nwnewline
{\char92}texht{\char123}{\char36}0\ {\char92}leq\ x\ {\char92}leq\ 6{\char36}{\char125}{\char123}0\ <=\
Axiom\ converts\ your\ formula\ to\ a\ compiled\nwnewline
function\ so\ that\ the\ results\ can\ be\ computed\nwnewline
quickly\ and\ efficiently.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}graphpaste{\char123}draw(sin(tan(x))\ -\ tan(sin(x)),x\ =\ 0..6){\char125}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}epsffile[0\ 0\ 295\ 295]{\char123}../ps/2d1vara.ps{\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
Notice\ that\ Axiom\ compiled\ the\ function\ before\ the\ graph\ was\ put\nwnewline
on\ the\ screen.\nwnewline
\nwnewline
{\char92}psXtc{\char123}\nwnewline
Here\ is\ the\ same\ graph\ on\ a\ different\ interval.\nwnewline
This\ time\ we\ give\ the\ graph\ a\ title.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}graphpaste{\char123}draw(sin(tan(x))\ -\ tan(sin(x)),x\ =\ 10..16){\char125}\nwnewline

If\ you\ plan\ on\ plotting\ {\char92}axiom{\char123}x\ =\ f(t){\char125},\ {\char92}axiom{\c
ranges\ over\ several\ intervals,\ you\ may\ want\ to\ define\ functions\ \nwnewline
{\char92}axiom{\char123}f{\char125}\ and\ {\char92}axiom{\char123}g{\char125}\ first,\ so\nwn
that\ they\ need\ not\ be\ recompiled\ every\ time\ you\ create\ a\ new\ graph.\nwnewline
Here's\ an\ example:\nwnewline
{\char92}xtc{\char123}\nwnewline
As\ before,\ you\ can\ first\ define\ the\ functions\ you\ wish\ to\ draw.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}f(t:DFLOAT):DFLOAT\ ==\ sin(3*t/4)\ {\char92}bound{\char123}f{\ch
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Axiom\ compiles\ them\ to\ map\ {\char92}axiomType{\char123}DoubleFloat{\char125}\nwnewline
values\ to\ {\char92}axiomType{\char123}DoubleFloat{\char125}\ values.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}g(t:DFLOAT):DFLOAT\ ==\ sin(t)\ {\char92}bound{\char123}g{\char12
{\char125}\nwnewline
\nwnewline
{\char92}psXtc{\char123}\nwnewline
Give\ to\ {\char123}{\char92}tt\ curve{\char125}\ the\ names\ of\ the\ functions,\nwnewline
then\ write\ the\ range\ without\ the\ name\ of\ the\nwnewline
independent\ variable.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}graphpaste{\char123}draw(curve(f,g),0..{\char92}{\char37}pi)\ {\char92}free{\char123

}{
%
}

%See Figure #.#.
```

```
\subsubsection{Creating a Two-Dimensional Viewport of a
List of Points from a File}

The following three functions read a list of points from a file and
then draw the points and the connecting lines. The points are stored
in the file in readable form as floating point numbers (specifically,
\axiomType{DoubleFloat} values) as an alternating stream of \axiom{x}-
and \axiom{y}-values. For example,
\begin{verbatim}
0.0 0.0     1.0 1.0     2.0 4.0
3.0 9.0     4.0 16.0    5.0 25.0
\end{verbatim}

\beginImportant

\noindent
{\tt 1.\ \ \ drawPoints(lp:List\ Point\ DoubleFloat):VIEW2D\ ==}\newline
{\tt 2.\ \ \ \ \ g\ :=\ graphImage()\$GRIMAGE}\newline
{\tt 3.\ \ \ \ \ for\ p\ in\ lp\ repeat}\newline
{\tt 4.\ \ \ \ \ \ \
component(g,p,pointColorDefault(),lineColorDefault(),}\newline
{\tt 5.\ \ \ \ \ \ \ \ \ pointSizeDefault())}\newline
{\tt 6.\ \ \ \ \ gi\ :=\ makeGraphImage(g)\$GRIMAGE}\newline
{\tt 7.\ \ \ \ \ makeViewport2D(gi,[title("Points")])\$VIEW2D}\newline
{\tt 8.\ \ \ }\newline
{\tt 9.\ \ \ drawLines(lp:List\ Point\ DoubleFloat):VIEW2D\ ==}\newline
{\tt 10.\ \ \ \ g\ :=\ graphImage()\$GRIMAGE}\newline
{\tt 11.\ \ \ \
component(g,\ lp,\ pointColorDefault(),\ lineColorDefault(),}\newline
{\tt 12.\ \ \ \ \ \ pointSizeDefault())\$GRIMAGE}\newline
{\tt 13.\ \ \ \ gi\ :=\ makeGraphImage(g)\$GRIMAGE}\newline
{\tt 14.\ \ \ \ makeViewport2D(gi,[title("Points")])\$VIEW2D}\newline
{\tt 15.\ \ }\newline
{\tt 16.\ \ plotData2D(name,\ title)\ ==}\newline
{\tt 17.\ \ \ \ f:File(DFLOAT)\ :=\ open(name,"input")}\newline
{\tt 18.\ \ \ \ lp:LIST(Point\ DFLOAT)\ :=\ empty()}\newline
{\tt 19.\ \ \ \
while\ ((x\ :=\ readIfCan!(f))\ case\ DFLOAT)\ repeat}\newline
{\tt 20.\ \ \ \ \ \ y\ :\ DFLOAT\ :=\ read!(f)}\newline
{\tt 21.\ \ \ \ \ \
lp\ :=\ cons(point\ [x,y]\$(Point\ DFLOAT),\ lp)}\newline
{\tt 22.\ \ \ \ \ \ lp}\newline
{\tt 23.\ \ \ \ close!(f)}\newline
{\tt 24.\ \ \ \ drawPoints(lp)}\newline
{\tt 25.\ \ \ \ drawLines(lp)}\newline
\endImportant
%
This command will actually create the viewport and the graph if
the point data is in the file \axiom{"file.data"}.
```

```
\beginImportant

8.0.69 Addendum: Appending a Graph to a Viewport Window Containing a Graph

— **ug07.ht** —

```
\begin{page}{ugGraphTwoDappendPage}
{7.1.10. Addendum: Appending a Graph to a Viewport
Window Containing a Graph}
\beginscroll

This section demonstrates how to append a \twodim{} graph to a
viewport already containing other graphs.  The default \axiomFun{draw}
command places a graph into the first \axiomType{GraphImage} slot
position of the \axiomType{TwoDimensionalViewport}.

\xtc{
This graph is in the first slot in its viewport.
}{
\spadpaste{v1 := draw(sin(x),x=0..2*\%pi) \bound{v1}}
}
\xtc{
So is this graph.
}{
\spadpaste{v2 := draw(cos(x),x=0..2*\%pi, curveColor==light red())
\bound{v2}}
}
\xtc{
The operation \axiomFunFrom{getGraph}{TwoDimensionalViewport}
retrieves the \axiomType{GraphImage} \axiom{g1} from the first slot
position in the viewport \axiom{v1}.
}{
```

```
\spadpaste{g1 := getGraph(v1,1) \bound{g1}\free{v1}}
}
\xtc{
Now \axiomFunFrom{putGraph}{TwoDimensionalViewport}
places \axiom{g1} into the the second slot position of \axiom{v2}.
}{
\spadpaste{putGraph(v2,g1,2) \bound{v22}\free{g1 v2}}
}
\psXtc{
Display the new \axiomType{TwoDimensionalViewport} containing both graphs.
}{
\graphpaste{makeViewport2D(v2) \free{v22}}
}{
%
}
%
%See Figure #.#.

\begin{page}{ugGraphThreeDPage}{7.2. Three-Dimensional Graphics}
\beginscroll
%
The Axiom \threedim{} graphics package provides the ability to
%
\indent{4}
\beginitems
%
\item[-] generate surfaces defined by a function of two real variables
%
\item[-] generate space curves and tubes defined by parametric equations
%
\item[-] generate surfaces defined by parametric equations
\enditems
\indent{0}
These graphs can be modified by using various options, such as calculating
points in the spherical coordinate system or changing the polygon grid size
of a surface.

8.0.71 Plotting Three-Dimensional Functions of Two Variables

⇒ "notitle" (ugGraphThreeDOptionsPage) 8.0.74 on page 1996

— **ug07.ht** —

```
\begin{page}{ugGraphThreeDPlotPage}
{7.2.1. Plotting Three-Dimensional Functions of Two Variables}
\beginscroll

The simplest \threedim{} graph is that of a surface defined by a function
of two variables, \axiom{z = f(x,y)}.

\beginImportant

The general format for drawing a surface defined by a formula
\axiom{f(x,y)} of two variables \axiom{x} and \axiom{y} is:

\centerline{{{\tt draw(f(x,y), x = a..b, y = c..d, {\it options})}}}
where \axiom{a..b} and \axiom{c..d} define the range of \axiom{x}
and \axiom{y}, and where {\it options} prescribes zero or more
options as described in
```

```
\downlink{``Three-Dimensional Options''}{ugGraphThreeDOptionsPage}
in Section 7.2.4\ignore{ugGraphThreeDOptions}.
An example of an option is \axiom{title == "Title of Graph".}
An alternative format involving a function \axiom{f} is also
available.
\endImportant

%
\psXtc{
The simplest way to plot a function of two variables is to use a formula.
With formulas you always precede the range specifications with
the variable name and an \spadSyntax{=} sign.
}{
\graphpaste{draw(cos(x*y),x=-3..3,y=-3..3)}

```
\begin{page}{ugGraphThreeDParPage}
{7.2.3. Plotting 3D Parametric Surfaces}
\beginscroll

A third kind of \threedim{} graph is a surface defined by
```

```
parametric equations for \axiom{x(u,v)}, \axiom{y(u,v)}, and
\axiom{z(u,v)} of two independent variables \axiom{u} and \axiom{v}.

%
\beginImportant
The general format for drawing a \threedim{} graph defined by
parametric formulas \axiom{x = f(u,v)}, \axiom{y = g(u,v)},
and \axiom{z = h(u,v)} is:
%
\centerline{{{\tt draw(surface(f(u,v),g(u,v),h(u,v)),
u = a..b, v = c..d, {\it options})}}}
where \axiom{a..b} and \axiom{c..d} define the range of the
independent variables \axiom{u} and \axiom{v}, and where
{\it options} prescribes zero or more options as described in
\downlink{``Three-Dimensional Options''}{ugGraphThreeDOptionsPage}
in Section 7.2.4\ignore{ugGraphThreeDOptions}.
An example of an option is \axiom{title == "Title of Graph".}
An alternative format involving functions \axiom{f}, \axiom{g} and
\axiom{h} is also available.
\endImportant

%
\psXtc{
This example draws a graph of a surface plotted using the
parabolic cylindrical coordinate system option.
The values of the functions supplied to \axiomFun{surface} are
interpreted in coordinates as given by a {\tt coordinates} option,
here as parabolic cylindrical coordinates (see
\downlink{``Coordinate System Transformations''}{ugGraphCoordPage}
in Section 7.2.7\ignore{ugGraphCoord}).
}{
\graphpaste{draw(surface(u*cos(v), u*sin(v), v*cos(u)),
u=-4..4, v=0..\%pi, coordinates== parabolicCylindrical)}
}{
\epsffile[0 0 295 295]{../ps/3dpsa.ps}
}
%
Again, you can graph these parametric surfaces using functions,
if the functions are long and complex.
\xtc{
Here we declare the types of arguments and values to be of type
\axiomType{DoubleFloat}.
}{
\spadpaste{n1(u:DFLOAT,v:DFLOAT):DFLOAT == u*cos(v) \bound{n1}}
}
\xtc{
As shown by previous examples, these declarations are necessary.
}{
\spadpaste{n2(u:DFLOAT,v:DFLOAT):DFLOAT == u*sin(v) \bound{n2}}
}
```

```
\xtc{
In either case, Axiom compiles the functions
when needed to graph a result.
}{
\spadpaste{n3(u:DFLOAT,v:DFLOAT):DFLOAT == u \bound{n3}}
}
\xtc{
Without these declarations, you have to suffix floats
with \axiom{@DFLOAT} to get a \axiomType{DoubleFloat} result.
However, a call here with an unadorned float
produces a \axiomType{DoubleFloat}.
}{
\spadpaste{n3(0.5,1.0)\free{n3}}
}
%
%
\psXtc{
Draw the surface by referencing the function names, this time
choosing the toroidal coordinate system.
}{
\graphpaste{draw(surface(n1,n2,n3), 1..4, 1..2*\%pi,
coordinates == toroidal(1\$DFLOAT)) \free{n1 n2 n3}}

8.0.74 Three-Dimensional Options

⇒ "notitle" (ugGraphCoordPage) 8.0.77 on page 2021
— **ug07.ht** —

```
\begin{page}{ugGraphThreeDOptionsPage}{7.2.4. Three-Dimensional Options}
\beginscroll

The \axiomFun{draw} commands optionally take an optional list of
options such as {\tt coordinates} as shown in the last example.  Each
option is given by the syntax: \axiom{name} {\tt ==} \axiom{value}.
Here is a list of the available options in the order that they are
described below:

\table{ {title} {coordinates} {var1Steps} {style} {tubeRadius} {var2Steps}
{colorFunction} {tubePoints} {space}}

\psXtc{
The option \axiom{title} gives your graph a title.
}{
\graphpaste{draw(cos(x*y),x=0..2*\%pi,y=0..\%pi,title == "Title of Graph") }
}{
\epsffile[0 0 295 295]{../ps/3doptttl.ps}
}
%
\psXtc{
The \axiom{style} determines which of four rendering algorithms is used for
the graph.
```

```
The choices are
{\tt "wireMesh"}, {\tt "solid"}, {\tt "shade"}, and {\tt "smooth"}.
}{
\graphpaste{draw(cos(x*y),x=-3..3,y=-3..3, style=="smooth",
title=="Smooth Option")}
}{
\epsffile[0 0 295 295]{../ps/3doptsty.ps}
}
%

In all but the wire-mesh style, polygons in a surface or tube plot
are normally colored in a graph according to their
\axiom{z}-coordinate value.  Space curves are colored according to their
parametric variable value.
To change this, you can give a coloring function.
The coloring function is sampled across the range of its arguments, then
normalized onto the standard Axiom colormap.

\xtc{
A function of one variable  makes the color depend on the
value of the parametric variable specified for a tube plot.
}{
\spadpaste{color1(t) == t \bound{colorFxn1}}
}
\psXtc{
}{
\graphpaste{draw(curve(sin(t), cos(t),0), t=0..2*\%pi,
tubeRadius == .3, colorFunction == color1) \free{colorFxn1}}
}{
\epsffile[0 0 295 295]{../ps/3doptcf1.ps}
}
%
\xtc{
A function of two variables makes the color depend on the
values of the independent variables.
}{
\spadpaste{color2(u,v) == u**2 - v**2 \bound{colorFxn2}}
}
\psXtc{
Use the option {\tt colorFunction} for special coloring.
}{
\graphpaste{draw(cos(u*v), u=-3..3, v=-3..3,
colorFunction == color2) \free{colorFxn2}}
}{
\epsffile[0 0 295 295]{../ps/3doptcf2.ps}
}
%
\xtc{
With a three variable function, the
color also depends on the value of the function.
```

```
}{
\spadpaste{color3(x,y,fxy) == sin(x*fxy) + cos(y*fxy) \bound{colorFxn3}}
}
\psXtc{
}{

———-

8.0.75 The makeObject Command

— ug07.ht —

```
\begin{page}{ugGraphMakeObjectPage}{7.2.5. The makeObject Command}
\beginscroll

An alternate way to create multiple graphs is to use
\axiomFun{makeObject}.
The \axiomFun{makeObject} command is similar to the \axiomFun{draw}
command, except that it returns a three-space object rather than a
\axiomType{ThreeDimensionalViewport}.
In fact, \axiomFun{makeObject} is called by the \axiomFun{draw}
command to create the \axiomType{ThreeSpace} then
\axiomFunFrom{makeViewport3D}{ThreeDimensionalViewport} to create a
viewport window.

\xtc{
}{
\spadpaste{m(u:DFLOAT,v:DFLOAT):DFLOAT == 1 \bound{m}}
}
\noOutputXtc{
Do the last example a new way.
First use \axiomFun{makeObject} to
create a three-space object \axiom{sph}.
}{
\spadpaste{sph := makeObject(m, 0..\%pi, 0..2*\%pi,
coordinates==spherical)\bound{sph}\free{m}}
}
\noOutputXtc{
```

```
Add a second object to \axiom{sph}.
}{
\spadpaste{makeObject(curve(1.5*sin(t), 1.5*cos(t), 0),
t=0..2*\%pi, space == sph, tubeRadius == .25) \free{sph}\bound{v1}}
}
\noOutputXtc{
Create and display a viewport
containing \axiom{sph}.
}{
\graphpaste{makeViewport3D(sph,"Multiple Objects") \free{v1}}
}

Note that an undefined \axiomType{ThreeSpace} parameter declared in a
\axiomFun{makeObject} or \axiomFun{draw} command results in an error.
Use the \axiomFunFrom{create3Space}{ThreeSpace} function to define a
\axiomType{ThreeSpace}, or obtain a \axiomType{ThreeSpace} that has been
previously generated before including it in a command line.

— ug07.ht —

```
\begin{page}{ugGraphThreeDBuildPage}
{7.2.6. Building 3D Objects From Primitives}
\beginscroll

Rather than using the \axiomFun{draw} and \axiomFun{makeObject} commands,
you can create \threedim{} graphs from primitives.
Operation \axiomFunFrom{create3Space}{ThreeSpace} creates a
three-space object to which points, curves and polygons
can be added using the operations from the \axiomType{ThreeSpace}
```

```
domain.
The resulting object can then be displayed in a viewport using
\axiomFunFrom{makeViewport3D}{ThreeDimensionalViewport}.

\xtc{
Create the empty three-space object \axiom{space}.
}{
\spadpaste{space := create3Space()\$(ThreeSpace DFLOAT) \bound{space}}
}

Objects can be sent to this \axiom{space} using the operations
exported by the \axiomType{ThreeSpace} domain.
The following examples place curves into \axiom{space}.

\xtc{
Add these eight curves to the space.
}{
\spadpaste{closedCurve(space,{\tt{}0,30,20],\ [0,30,30],\ [0,40,30],\ \nwnewline
[0,40,100],\ [0,30,100],[0,30,110],\ [0,60,110],\ [0,60,100],\ \nwnewline
[0,50,100],\ [0,50,30],\ [0,60,30],\ [0,60,20}) \bound{curve1}
\free{space}}
}
\xtc{
}{
\spadpaste{closedCurve(space,{\tt{}80,0,30],\ [80,0,100],\ [70,0,110],\ \nwnewline

}

\subsubsection{Cube Example}

As a second example of the use of primitives, we generate a cube using a
polygon mesh.
It is important to use a consistent orientation of the polygons for
correct generation of \threedim{} objects.

\xtc{
Again start with an empty three-space object.
}{
\spadpaste{spaceC := create3Space()\$(ThreeSpace DFLOAT) \bound{spaceC}}
}
\xtc{
For convenience,
give \axiomType{DoubleFloat} values \axiom{+1} and \axiom{-1} names.
}{
\spadpaste{x: DFLOAT := 1 \bound{x}}
}
\xtc{
}{
\spadpaste{y: DFLOAT := -1 \bound{y}}
}
```

```
\xtc{
Define the vertices of the cube.
}{
\spadpaste{a := point [x,x,y,1::DFLOAT]\$(Point DFLOAT) \bound{a}
\free{x y}}
}
\xtc{
}{
\spadpaste{b := point [y,x,y,4::DFLOAT]\$(Point DFLOAT) \bound{b}
\free{x y}}
}
\xtc{
}{
\spadpaste{c := point [y,x,x,8::DFLOAT]\$(Point DFLOAT) \bound{c}
\free{x y}}
}
\xtc{
}{
\spadpaste{d := point [x,x,x,12::DFLOAT]\$(Point DFLOAT) \bound{d}
\free{x y}}
}
\xtc{
}{
\spadpaste{e := point [x,y,y,16::DFLOAT]\$(Point DFLOAT) \bound{e}
\free{x y}}
}
\xtc{
}{
\spadpaste{f := point [y,y,y,20::DFLOAT]\$(Point DFLOAT) \bound{f}
\free{x y}}
}
\xtc{
}{
\spadpaste{g := point [y,y,x,24::DFLOAT]\$(Point DFLOAT) \bound{g}
\free{x y}}
}
\xtc{
}{
\spadpaste{h := point [x,y,x,27::DFLOAT]\$(Point DFLOAT) \bound{h}
\free{x y}}
}
\xtc{
Add the faces of the cube as polygons to the space using a
consistent orientation.
}{
\spadpaste{polygon(spaceC,[d,c,g,h]) \free{d c g h spaceC} \bound{pol1}}
}
\xtc{
}{
\spadpaste{polygon(spaceC,[d,h,e,a]) \free{d h e a spaceC} \bound{pol2}}
```

```
}
\xtc{
}{
\spadpaste{polygon(spaceC,[c,d,a,b]) \free{c d a b spaceC} \bound{pol3}}
}
\xtc{
}{
\spadpaste{polygon(spaceC,[g,c,b,f]) \free{g c b f spaceC} \bound{pol4}}
}
\xtc{
}{

8.0.77 Coordinate System Transformations

— ug07.ht —

```
\begin{page}{ugGraphCoordPage}{7.2.7. Coordinate System Transformations}
\beginscroll

The \axiomType{CoordinateSystems} package provides coordinate
transformation functions that map a given data point from the
coordinate system specified into the Cartesian coordinate system.  The
default coordinate system, given a triplet \axiom{(f(u,v), u, v)},
assumes that \axiom{z = f(u, v)}, \axiom{x = u} and \axiom{y = v},
that is, reads the coordinates in \axiom{(z, x, y)} order.

\xtc{
}{
\spadpaste{m(u:DFLOAT,v:DFLOAT):DFLOAT == u**2 \bound{m}}
}
%
\psXtc{
Graph plotted in default coordinate system.
}{
\graphpaste{draw(m,0..3,0..5) \free{m}}
}{
\epsffile[0 0 295 295]{../ps/defcoord.ps}
}

The \axiom{z} coordinate comes first since the first argument of the
\axiomFun{draw} command gives its values.  In general, the coordinate
systems Axiom provides, or any that you make up, must provide a map to
an \axiom{(x, y, z)} triplet in order to be compatible with the
\axiomFunFrom{coordinates}{DrawOption} \axiomType{DrawOption}.  Here
is an example.

\xtc{
Define the identity function.
}{
\spadpaste{cartesian(point:Point DFLOAT):Point DFLOAT == point
\bound{cart}}
}
\psXtc{
Pass \axiom{cartesian} as the \axiomFunFrom{coordinates}{DrawOption}
parameter to the \axiomFun{draw} command.
}{
\graphpaste{draw(m,0..3,0..5,coordinates==cartesian) \free{m cart}}
}{
\epsffile[0 0 295 295]{../ps/cartcoord.ps}
}
%

What happened?  The option {\tt coordinates == cartesian} directs
Axiom to treat the dependent variable \axiom{m} defined by
\texht{$m=u^2$}{m=u**2} as the \axiom{x} coordinate.  Thus the triplet
of values \axiom{(m, u, v)} is transformed to coordinates
\axiom{(x, y, z)} and so we get the graph of \texht{$x=y^2$}{x=y**2}.

Here is another example.
The \axiomFunFrom{cylindrical}{CoordinateSystems} transform takes
input of the form \axiom{(w,u,v)}, interprets it in the order
\texht{($r$,$\theta$,$z$)}{(\axiom{r}, \axiom{theta}, \axiom{z})}
and maps it to the Cartesian coordinates
\texht{$x=r\cos(\theta)$, $y=r\sin(\theta)$, $z=z$}
{\axiom{x = r * cos(theta)}, \axiom{y = r * sin(theta)}, \axiom{z = z}}
in which
\texht{$r$}{\axiom{r}} is the radius,
\texht{$\theta$}{\axiom{theta}} is the angle and
\texht{$z$}{\axiom{z}} is the z-coordinate.
\xtc{
An example using the \axiomFunFrom{cylindrical}{CoordinateSystems}
coordinates for the constant \axiom{r = 3}.
}{
\spadpaste{f(u:DFLOAT,v:DFLOAT):DFLOAT == 3 \bound{f}}
}
```

```
\psXtc{
Graph plotted in cylindrical coordinates.
}{
\graphpaste{draw(f,0..\%pi,0..6,coordinates==cylindrical) \free{f}}
}{
\epsffile[0 0 295 295]{../ps/cylcoord.ps}
}

Suppose you would like to specify \smath{z} as a function of \smath{r}
and \texht{$\theta$}{\axiom{theta}} instead of just \smath{r}?  Well,
you still can use the \axiomFun{cylindrical} Axiom transformation but
we have to reorder the triplet before passing it to the
transformation.

\xtc{
First, let's create a point to
work with and call it \axiom{pt} with some color \axiom{col}.
}{
\spadpaste{col := 5 \bound{c}}
}
\xtc{
}{
\spadpaste{pt := point[1,2,3,col]\$(Point DFLOAT) \free{c} \bound{pt}}
}
The reordering you want is
\texht{$(z,r, \theta)$}{\axiom{(z,r,theta)}} to
\texht{$(r, \theta,z)$}{\axiom{(r,theta,z)}}
so that the first element is moved to the third element, while the second
and third elements move forward and the color element does not change.
\xtc{
Define a function \userfun{reorder} to reorder the point elements.
}{
\spadpaste{
reorder(p:Point DFLOAT):Point DFLOAT == point[p.2, p.3, p.1, p.4]
\bound{freo}}
}
\xtc{
The function moves the second and third elements
forward but the color does not change.
}{
\spadpaste{reorder pt \free{pt freo}}
}
\xtc{
The function \userfun{newmap} converts our reordered version of
the cylindrical coordinate system to the standard
\texht{$(x,y,z)$}{\axiom{(x,y,z)}} Cartesian system.
}{
\spadpaste{
newmap(pt:Point DFLOAT):Point DFLOAT == cylindrical(reorder pt)
\free{freo} \bound{fnewmap}}
}
\xtc{
}{
\spadpaste{newmap pt \free{fnewmap pt} \bound{new}}
}
%
\psXtc{
Graph the same function \axiom{f} using the coordinate mapping
of the function \axiom{newmap}, so it is now interpreted as
\texht{$z=3$}{\axiom{z = 3}}:
}{
\graphpaste{draw(f,0..3,0..2*\%pi,coordinates==newmap) \free{f new}}
}{
\epsffile[0 0 295 295]{../ps/newmap.ps}
}

{\texht{\sloppy}{}
The \axiomType{CoordinateSystems} package exports the following
operations:
\axiomFun{bipolar},
\axiomFun{bipolarCylindrical},
\axiomFun{cartesian},
\axiomFun{conical},
\axiomFun{cylindrical},
\axiomFun{elliptic},
\axiomFun{ellipticCylindrical},
\axiomFun{oblateSpheroidal},
\axiomFun{parabolic},
\axiomFun{parabolicCylindrical},
\axiomFun{paraboloidal},
\axiomFun{polar},
\axiomFun{prolateSpheroidal},
\axiomFun{spherical}, and
\axiomFun{toroidal}.
Use \Browse{} or the \spadcmd{)show} system command
to get more information.

8.0.79 Three-Dimensional Control-Panel

— ug07.ht —

```
\begin{page}{ugGraphThreeDControlPage}
{7.2.9. Three-Dimensional Control-Panel}
\beginscroll
Once you have created a viewport, move your mouse to the viewport and
click with your left mouse button.  This displays a control-panel on
the side of the viewport that is closest to where you clicked.

\subsubsection{Transformations}

We recommend you first select the {\bf Bounds} button while
executing transformations since the bounding box displayed
indicates the object’s position as it changes.
%
\indent{0}
\beginitems
%
\item[Rotate:]  A rotation transformation occurs by clicking the mouse
within the {\bf Rotate} window in the upper left corner of the
control-panel.
The rotation is computed in spherical coordinates, using the
horizontal mouse position to increment or decrement the value of
the longitudinal angle \texht{$\theta$}{\axiom{theta}} within the
range of 0 to \texht{2$\pi$}{2*pi} and the vertical mouse position
to increment or decrement the value of the latitudinal angle
\texht{$\phi$}{\axiom{phi}} within the range of \texht{-$\pi$}{pi}
to \texht{$\pi$}{pi}.
The active mode of rotation is displayed in green on a color
monitor or in clear text on a black and white monitor, while the
inactive mode is displayed in red for color display or a mottled
pattern for black and white.
%
\indent{0}
\beginitems
```

```
\item[origin:] The {\bf origin} button indicates that the rotation is
to occur with respect to the origin of the viewing space, that is
indicated by the axes.

\item[object:]  The {\bf object} button indicates that the
rotation is to occur with respect to the center of volume of the object,
independent of the axes' origin position.
\enditems
\indent{0}
%
\item[Scale:]  A scaling transformation occurs by clicking the mouse
within the {\bf Scale} window in the upper center of the
control-panel, containing a zoom arrow.
The axes along which the scaling is to occur are indicated by
selecting the appropriate button above the zoom arrow window.
The selected axes are displayed in green on a color monitor or in
clear text on a black and white monitor, while the unselected axes
are displayed in red for a color display or a mottled pattern for
black and white.
%
\indent{0}
\beginitems
%
\item[uniform:]  Uniform scaling along the {\tt x}, {\tt y}
and {\tt z} axes occurs when all the axes buttons are selected.

\item[non-uniform:] If any of the axes buttons are not selected,
non-uniform scaling occurs, that is, scaling occurs only in the
direction of the axes that are selected.
\enditems
\indent{0}

\item[Translate:] Translation occurs by indicating with the mouse in
the {\bf Translate} window the direction you want the graph to move.
This window is located in the upper right corner of the control-panel
and contains a potentiometer with crossed arrows pointing up, down,
left and right.  Along the top of the {\bf Translate} window are three
buttons ({\bf XY}, {\bf XZ}, and {\bf YZ}) indicating the three
orthographic projection planes.  Each orientates the group as a view
into that plane.  Any translation of the graph occurs only along this
plane.
\enditems
\indent{0}

\subsubsection{Messages}

The window directly below the potentiometer windows for
transformations is used to display system messages relating to the
viewport, the control-panel and the current graph displaying status.
```

```
\subsubsection{Colormap}

Directly below the message window is the colormap range indicator
window.  The Axiom Colormap shows a sampling of the spectrum from
which hues can be drawn to represent the colors of a surface.  The
Colormap is composed of five shades for each of the hues along this
spectrum.  By moving the markers above and below the Colormap, the
range of hues that are used to color the existing surface are set.
The bottom marker shows the hue for the low end of the color range and
the top marker shows the hue for the upper end of the range.  Setting
the bottom and top markers at the same hue results in monochromatic
smooth shading of the graph when {\bf Smooth} mode is selected.  At
each end of the Colormap are {\bf +} and {\bf -} buttons.  When
clicked on, these increment or decrement the top or bottom marker.

\subsubsection{Buttons}

Below the Colormap window and to the left are located various
buttons that determine the characteristics of a graph.
The buttons along the bottom and right hand side all have special
meanings; the remaining buttons in the first row indicate the mode
or style used to display the graph.
The second row are toggles that turn on or off a property of the
graph.
On a color monitor, the property is on if green (clear text, on a
monochrome monitor) and off if red (mottled pattern, on a
monochrome monitor).
Here is a list of their functions.
%
\indent{0}
\beginitems

\item[Wire] displays surface and tube plots as a wireframe image in a
single color (blue) with no hidden surfaces removed, or displays space
curve plots in colors based upon their parametric variables.  This is
the fastest mode for displaying a graph.  This is very useful when you
want to find a good orientation of your graph.

\item[Solid] displays the graph with hidden
surfaces removed, drawing each polygon beginning with the furthest
from the viewer.
The edges of the polygons are displayed in the hues specified by
the range in the Colormap window.
%
\item[Shade] displays the graph with hidden
surfaces removed and with the polygons shaded, drawing each
polygon beginning with the furthest from the viewer.
Polygons are shaded in the hues specified by the range in the
Colormap window using the Phong illumination model.
```

```
%
\item[Smooth] displays the graph using a
renderer that computes the graph one line at a time.
The location and color of the graph at each visible point on the
screen are determined and displayed using the Phong illumination
model.
Smooth shading is done in one of two ways, depending on the range
selected in the colormap window and the number of colors available
from the hardware and/or window manager.
When the top and bottom markers of the colormap range are set to
different hues, the graph is rendered by dithering between the
transitions in color hue.
When the top and bottom markers of the colormap range are set to
the same hue, the graph is rendered using the Phong smooth shading
model.
However, if enough colors cannot be allocated for this purpose,
the renderer reverts to the color dithering method until a
sufficient color supply is available.
For this reason, it may not be possible to render multiple Phong
smooth shaded graphs at the same time on some systems.

\item[Bounds] encloses the entire volume of the viewgraph within a
bounding box, or removes the box if previously selected.  The region
that encloses the entire volume of the viewport graph is displayed.

\item[Axes] displays Cartesian
coordinate axes of the space, or turns them off if previously selected.

\item[Outline] causes quadrilateral polygons forming the graph surface
to be outlined in black when the graph is displayed in {\bf Shade}
mode.

\item[BW] converts a color viewport to black and white, or vice-versa.
When this button is selected the control-panel and viewport switch to
an immutable colormap composed of a range of grey scale patterns or
tiles that are used wherever shading is necessary.

\item[Light] takes you to a control-panel described below.
%
\item[ViewVolume] takes you to another control-panel as described below.

\item[Save] creates a menu of the possible file types that can be
written using the control-panel.  The {\bf Exit} button leaves the
save menu.  The {\bf Pixmap} button writes an Axiom pixmap of the
current viewport contents.  The file is called {\bf axiom3D.pixmap}
and is located in the directory from which Axiom or {\bf viewalone}
was started.  The {\bf PS} button writes the current viewport contents
to PostScript output rather than to the viewport window.  By default
the file is called {\bf axiom3D.ps}; however, if a file name is
specified in the user's {\bf .Xdefaults} file it is used.  The file is
```

```
placed in the directory from which the Axiom or {\bf viewalone}
session was begun.  See also the
\axiomFunFrom{write}{ThreeDimensionalViewport} function.

\item[Reset] returns the object transformation
characteristics back to their initial states.
%
\item[Hide] causes the control-panel for the
corresponding viewport to disappear from the screen.
%
\item[Quit]  queries whether the current viewport
session should be terminated.
\enditems
\indent{0}

\subsubsection{Light}

The {\bf Light} button changes the control-panel into the
{\bf Lighting Control-Panel}.  At the top of this panel, the three axes
are shown with the same orientation as the object.  A light vector from
the origin of the axes shows the current position of the light source
relative to the object.  At the bottom of the panel is an {\bf Abort}
button that cancels any changes to the lighting that were made, and a
{\bf Return} button that carries out the current set of lighting changes
on the graph.
%
\indent{0}
\beginitems
%
\item[XY:]  The {\bf XY} lighting axes window is below the
{\bf Lighting Control-Panel} title and to the left.
This changes the light vector within the {\bf XY} view plane.
%
\item[Z:]  The {\bf Z} lighting axis window is below the
{\bf Lighting Control-Panel} title and in the center.  This
changes the {\bf Z}
location of the light vector.
%
\item[Intensity:]
Below the {\bf Lighting Control-Panel} title
and to the right is the light intensity meter.
Moving the intensity indicator down decreases the amount of
light emitted from the light source.
When the indicator is at the top of the meter the light source is
emitting at 100\% intensity.
At the bottom of the meter the light source is emitting at a level
slightly above ambient lighting.
\enditems
\indent{0}
```

```
\subsubsection{View Volume}

The {\bf View Volume} button changes the control-panel into
the {\bf Viewing Volume Panel}.
At the bottom of the viewing panel is an {\bf Abort} button that
cancels any changes to the viewing volume that were made and a
{\it Return} button that carries out the current set of
viewing changes to the graph.

\indent{0}
\beginitems

\item[Eye Reference:] At the top of this panel is the {\bf Eye
Reference} window.  It shows a planar projection of the viewing
pyramid from the eye of the viewer relative to the location of the
object.  This has a bounding region represented by the rectangle on
the left.  Below the object rectangle is the {\bf Hither} window.  By
moving the slider in this window the hither clipping plane sets the
front of the view volume.  As a result of this depth clipping all
points of the object closer to the eye than this hither plane are not
shown.  The {\bf Eye Distance} slider to the right of the {\bf Hither}
slider is used to change the degree of perspective in the image.

\item[Clip Volume:] The {\bf Clip Volume} window is at the bottom of
the {\bf Viewing Volume Panel}.  On the right is a {\bf Settings}
menu.  In this menu are buttons to select viewing attributes.
Selecting the {\bf Perspective} button computes the image using
perspective projection.  The {\bf Show Region} button indicates
whether the clipping region of the volume is to be drawn in the
viewport and the {\bf Clipping On} button shows whether the view
volume clipping is to be in effect when the image is drawn.  The left
side of the {\bf Clip Volume} window shows the clipping boundary of
the graph.  Moving the knobs along the {\bf X}, {\bf Y}, and {\bf Z}
sliders adjusts the volume of the clipping region accordingly.

8.0.80 Operations for Three-Dimensional Graphics

— ug07.ht —

```
\begin{page}{ugGraphThreeDopsPage}
{7.2.10. Operations for Three-Dimensional Graphics}
\beginscroll

Here is a summary of useful Axiom operations for \threedim{} graphics.
Each operation name is followed by a list of arguments.  Each argument
is written as a variable informally named according to the type of the
argument (for example, {\it integer}).  If appropriate, a default
value for an argument is given in parentheses immediately following
the name.

%
\texht{\bgroup\hbadness = 10001\sloppy}{}
\indent{0}
\beginitems
%
\item[\axiomFun{adaptive3D?}]\funArgs{}
tests whether space curves are to be plotted
according to the
adaptive refinement algorithm.

%
\item[\axiomFun{axes}]\funArgs{viewport, string\argDef{"on"}}
turns the axes on and off.

%
\item[\axiomFun{close}]\funArgs{viewport}
closes the viewport.

%
\item[\axiomFun{colorDef}]\funArgs{viewport,
\subscriptIt{color}{1}\argDef{1}, \subscriptIt{color}{2}\argDef{27}}
sets the colormap
range to be from
\subscriptIt{color}{1} to \subscriptIt{color}{2}.

%
\item[\axiomFun{controlPanel}]\funArgs{viewport, string\argDef{"off"}}
declares whether the
control-panel for the viewport is to be displayed or not.

%
\item[\axiomFun{diagonals}]\funArgs{viewport, string\argDef{"off"}}
declares whether the
polygon outline includes the diagonals or not.

%
\item[\axiomFun{drawStyle}]\funArgs{viewport, style}
selects which of four drawing styles
are used: {\tt "wireMesh", "solid", "shade",} or {\tt "smooth".}
```

```
%
\item[\axiomFun{eyeDistance}]\funArgs{viewport,float\argDef{500}}
sets the distance of the eye from the origin of the object
for use in the \axiomFunFrom{perspective}{ThreeDimensionalViewport}.

%
\item[\axiomFun{key}]\funArgs{viewport}
returns the operating
system process ID number for the viewport.

%
\item[\axiomFun{lighting}]\funArgs{viewport,
\subscriptText{float}{x}\argDef{-0.5},
\subscriptText{float}{y}\argDef{0.5}, \subscriptText{float}{z}\argDef{0.5}}
sets the Cartesian
coordinates of the light source.

%
\item[\axiomFun{modifyPointData}]\funArgs{viewport,integer,point}
replaces the coordinates of the point with
the index {\it integer} with {\it point}.

%
\item[\axiomFun{move}]\funArgs{viewport,
\subscriptText{integer}{x}\argDef{viewPosDefault},
\subscriptText{integer}{y}\argDef{viewPosDefault}}
moves the upper
left-hand corner of the viewport to screen position
\allowbreak
({\small \subscriptText{integer}{x}, \subscriptText{integer}{y}}).

%
\item[\axiomFun{options}]\funArgs{viewport}
returns a list of all current draw options.

%
\item[\axiomFun{outlineRender}]\funArgs{viewport, string\argDef{"off"}}
turns polygon outlining
off or on when drawing in {\tt "shade"} mode.

%
\item[\axiomFun{perspective}]\funArgs{viewport, string\argDef{"on"}}
turns perspective
viewing on and off.

%
\item[\axiomFun{reset}]\funArgs{viewport}
resets the attributes of a viewport to their
initial settings.
```

```
%
\item[\axiomFun{resize}]\funArgs{viewport,
\subscriptText{integer}{width} \argDef{viewSizeDefault},
\subscriptText{integer}{height} \argDef{viewSizeDefault}}
resets the width and height
values for a viewport.

%
\item[\axiomFun{rotate}]\funArgs{viewport,
\subscriptText{number}{\texht{$\theta$}{\axiom{theta}}}
\argDef{viewThetaDefault},
\subscriptText{number}{\texht{$\phi$}{\axiom{phi}}}
\argDef{viewPhiDefault}}
rotates the viewport by rotation angles for longitude
({\it \texht{$\theta$}{\axiom{theta}}}) and
latitude ({\it \texht{$\phi$}{\axiom{phi}}}).
Angles designate radians if given as floats, or degrees if given
as integers.

%
\item[\axiomFun{setAdaptive3D}]\funArgs{boolean\argDef{true}}
sets whether space curves are to be plotted
according to the adaptive
refinement algorithm.

%
\item[\axiomFun{setMaxPoints3D}]\funArgs{integer\argDef{1000}}
 sets the default maximum number of possible
points to be used when constructing a \threedim{} space curve.

%
\item[\axiomFun{setMinPoints3D}]\funArgs{integer\argDef{49}}
sets the default minimum number of possible
points to be used when constructing a \threedim{} space curve.

%
\item[\axiomFun{setScreenResolution3D}]\funArgs{integer\argDef{500}}
sets the default screen resolution constant
used in setting the computation limit of adaptively
generated \threedim{} space curve plots.

%
\item[\axiomFun{showRegion}]\funArgs{viewport, string\argDef{"off"}}
declares whether the bounding
box of a graph is shown or not.
%
\item[\axiomFun{subspace}]\funArgs{viewport}
returns the space component.
%
```

```
\item[\axiomFun{subspace}]\funArgs{viewport, subspace}
resets the space component
to {\it subspace}.

%
\item[\axiomFun{title}]\funArgs{viewport, string}
gives the viewport the
title {\it string}.

%
\item[\axiomFun{translate}]\funArgs{viewport,
\subscriptText{float}{x}\argDef{viewDeltaXDefault},
\subscriptText{float}{y}\argDef{viewDeltaYDefault}}
translates the object horizontally and vertically
relative to the center of the viewport.

%
\item[\axiomFun{intensity}]\funArgs{viewport,float\argDef{1.0}}
resets the intensity {\it I} of the light source,
\texht{$0 \le I \le 1.$}{{\it 0 \le I \le 1}.}

%
\item[\axiomFun{tubePointsDefault}]\funArgs{\optArg{integer\argDef{6}}}
sets or indicates the default number of
vertices defining the polygon that is used to create a tube around
a space curve.

%
\item[\axiomFun{tubeRadiusDefault}]\funArgs{\optArg{float\argDef{0.5}}}
sets or indicates the default radius of
the tube that encircles a space curve.

%
\item[\axiomFun{var1StepsDefault}]\funArgs{\optArg{integer\argDef{27}}}
sets or indicates the default number of
increments into which the grid defining a surface plot is subdivided with
respect to the first parameter declared in the surface function.

%
\item[\axiomFun{var2StepsDefault}]\funArgs{\optArg{integer\argDef{27}}}
sets or indicates the default number of
increments into which the grid defining a surface plot is subdivided with
respect to the second parameter declared in the surface function.

%
\item[\axiomFun{viewDefaults}]\funArgs{{\tt [}\subscriptText{integer}{%
point}, \subscriptText{integer}{line}, \subscriptText{integer}{axes},
\subscriptText{integer}{units}, \subscriptText{float}{point},
\allowbreak\subscriptText{list}{position},
\subscriptText{list}{size}{\tt ]}}
```

```
resets the default settings for the
point color, line color, axes color, units color, point size,
viewport upper left-hand corner position, and the viewport size.

%
\item[\axiomFun{viewDeltaXDefault}]\funArgs{\optArg{float\argDef{0}}}
resets the default horizontal offset
from the center of the viewport, or returns the
current default offset if no argument is given.

%
\item[\axiomFun{viewDeltaYDefault}]\funArgs{\optArg{float\argDef{0}}}
resets the default vertical offset
from the center of the viewport, or returns the
current default offset if no argument is given.

%
\item[\axiomFun{viewPhiDefault}]\funArgs{\optArg{float
\argDef{-\texht{$\pi$}{{\it pi}}/4}}}
resets the default latitudinal view angle,
or returns the current default angle if no argument is given.
\texht{$\phi$}{{\it phi}} is set to this value.

%
\item[\axiomFun{viewpoint}]\funArgs{viewport, \subscriptText{float}{x},
\subscriptText{float}{y}, \subscriptText{float}{z}}
sets the viewing position in Cartesian coordinates.

%
\item[\axiomFun{viewpoint}]\funArgs{viewport,
\subscriptText{float}{\texht{$\theta$}{\axiom{theta}}},
\subscriptText{Float}{\texht{$\phi$}{\axiom{phi}}}}
sets the viewing position in spherical coordinates.

%
\item[\axiomFun{viewpoint}]\funArgs{viewport,
\subscriptText{Float}{\texht{$\theta$}{\axiom{theta}}},
\subscriptText{Float}{\texht{$\phi$}{\axiom{phi}}},
\subscriptText{Float}{scaleFactor},
\subscriptText{Float}{xOffset}, \subscriptText{Float}{yOffset}}
sets the viewing position in spherical coordinates,
the scale factor, and offsets.
\texht{$\theta$}{{\it theta}} (longitude) and
\texht{$\phi$}{{\it phi}} (latitude) are in radians.

%
\item[\axiomFun{viewPosDefault}]\funArgs{\optArg{list\argDef{[0,0]}}}
sets or indicates the position of the upper
left-hand corner of a \twodim{} viewport, relative to the display root
window (the upper left-hand corner of the display is \axiom{[0, 0]}).
```

```
%
\item[\axiomFun{viewSizeDefault}]\funArgs{\optArg{list\argDef{[400,400]}}}
sets or indicates the width and height dimensions
of a viewport.

%
\item[\axiomFun{viewThetaDefault}]
\funArgs{\optArg{float\argDef{\texht{$\pi$}{{\it pi}}/4}}}
resets the default longitudinal view angle,
or returns the current default angle if no argument is given.
When a parameter is specified, the default longitudinal view angle
\texht{$\theta$}{{\it theta}} is set to this value.

%
\item[\axiomFun{viewWriteAvailable}]
\funArgs{\optArg{list\argDef{["pixmap",
"bitmap", "postscript", "image"}}}
indicates the possible file types
that can be created with the
\axiomFunFrom{write}{ThreeDimensionalViewport} function.

%
\item[\axiomFun{viewWriteDefault}]\funArgs{\optArg{list\argDef{[]}}}
sets or indicates the default types of files
that are created in addition to the {\bf data} file when a
\axiomFunFrom{write}{ThreeDimensionalViewport} command
is executed on a viewport.

%
\item[\axiomFun{viewScaleDefault}]\funArgs{\optArg{float}}
sets the default scaling factor, or returns
the current factor if no argument is given.

%
\item[\axiomFun{write}]\funArgs{viewport, directory, \optArg{option}}
writes the file {\bf data} for {\it viewport}
in the directory {\it directory}.
An optional third argument specifies a file type (one of {\tt
pixmap}, {\tt bitmap}, {\tt postscript}, or {\tt image}), or a
list of file types.
An additional file is written for each file type listed.

%
\item[\axiomFun{scale}]\funArgs{viewport, float\argDef{2.5}}
specifies the scaling factor.

which font type is used for displaying the graph numbers and
slots in the {\bf Graphs} section of the \twodim{} control-panel.
\xdefault{Rom22}
%
\item[{\tt Axiom.3D.headerFont:\ \it font}] \ \newline
This indicates which
font type is used for the axes labels and potentiometer
header names on \threedim{} viewport windows.
This is also used for \twodim{} control-panels for indicating
which font type is used for potentionmeter header names and
multiple graph title headers.
%for example, {\tt Axiom.2D.headerFont: 8x13}.
\xdefault{Itl14}
%
```

```
\item[{\tt Axiom*inverse:\ \it switch}] \ \newline
This indicates whether the
background color is to be inverted from white to black.
If {\tt on}, the graph viewports use black as the background
color.
If {\tt off} or no declaration is made, the graph viewports use a
white background.
\xdefault{off}
%
\item[{\tt Axiom.3D.lightingFont:\ \it font}] \quad (3D only) \newline
This indicates which font type is used for the {\bf x},
{\bf y}, and {\bf z} labels of the two lighting axes potentiometers,
and for the {\bf Intensity} title on the lighting control-panel.
\xdefault{Rom10}
%
\item[
{\tt Axiom.2D.messageFont, Axiom.3D.messageFont:\ \it font}] \ \newline
These indicate the font type
to be used for the text in the control-panel message window.
\xdefault{Rom14}
%
\item[{\tt Axiom*monochrome:\ \it switch}] \ \newline
This indicates whether the
graph viewports are to be displayed as if the monitor is black and
white, that is, a 1 bit plane.
If {\tt on} is specified, the viewport display is black and white.
If {\tt off} is specified, or no declaration for this default is
given, the viewports are displayed in the normal fashion for the
monitor in use.
\xdefault{off}
%
\item[{\tt Axiom.2D.postScript:\ \it filename}] \ \newline
This specifies
the name of the file that is generated when a 2D PostScript graph
is saved.
\xdefault{axiom2D.ps}
%
\item[{\tt Axiom.3D.postScript:\ \it filename}] \ \newline
This specifies
the name of the file that is generated when a 3D PostScript graph
is saved.
\xdefault{axiom3D.ps}
%
\item[{\tt Axiom*titleFont \it font}] \ \newline
This
indicates which font type is used
for the title text and, for \threedim{} graphs,
in the lighting and viewing-volume control-panel windows.
\xdefault{Rom14}
%
```

```
\item[{\tt Axiom.2D.unitFont:\ \it font}] \quad (2D only) \newline
This indicates
which font type is used for displaying the unit labels on
\twodim{} viewport graphs.
\xdefault{6x10}
%
\item[{\tt Axiom.3D.volumeFont:\ \it font}] \quad (3D only) \newline
This indicates which font type is used for the {\bf x},
{\bf y}, and {\bf z} labels of the clipping region sliders; for the
{\bf Perspective}, {\bf Show Region}, and {\bf Clipping On} buttons under
{\bf Settings}, and above the windows for the {\bf Hither} and
{\bf Eye Distance} sliders in the {\bf Viewing Volume Panel} of the
\threedim{} control-panel.

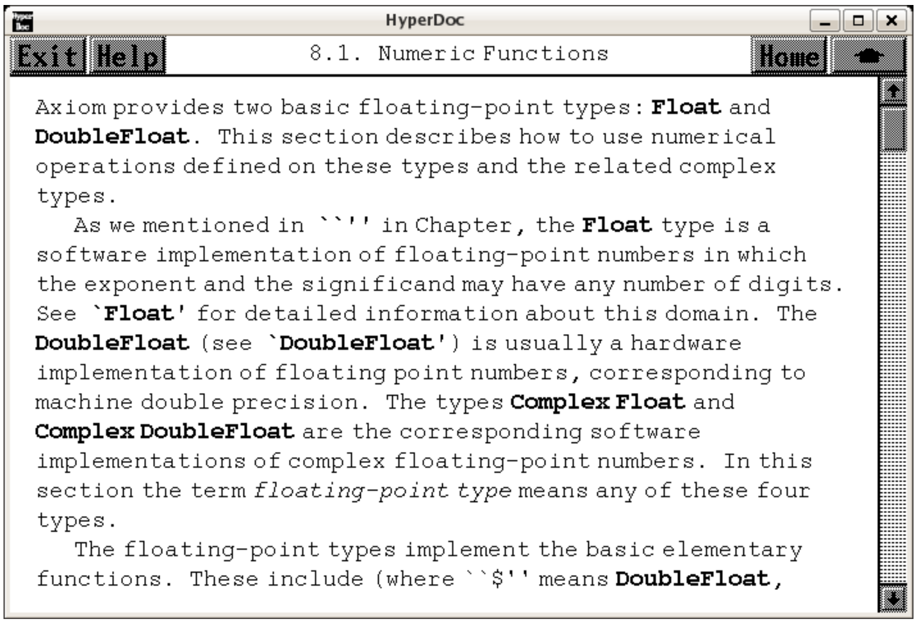
9.0.83 Numeric Functions



Axiom provides two basic floating-point types: **Float** and **DoubleFloat**. This section describes how to use numerical operations defined on these types and the related complex types.
As we mentioned in ``'' in Chapter, the **Float** type is a software implementation of floating-point numbers in which the exponent and the significand may have any number of digits. See **`Float'** for detailed information about this domain. The **DoubleFloat** (see **`DoubleFloat'**) is usually a hardware implementation of floating point numbers, corresponding to machine double precision. The types **Complex Float** and **Complex DoubleFloat** are the corresponding software implementations of complex floating-point numbers. In this section the term *floating-point type* means any of these four types.
The floating-point types implement the basic elementary functions. These include (where ``$'' means **DoubleFloat**,

```
\begin{page}{ugProblemNumericPage}{8.1. Numeric Functions}
\beginscroll
Axiom provides two basic floating-point types: \axiomType{Float} and
\axiomType{DoubleFloat}.  This section describes how to use numerical
operations defined on these types and the related complex types.

As we mentioned in \downlink{‘‘An Overview of Axiom’’}{ugIntroPage} in
Chapter 1\ignore{ugIntro}, the \axiomType{Float} type is
a software implementation of floating-point numbers in which the
exponent and the significand may have any number of digits.  See
\downlink{‘Float’}{FloatXmpPage}\ignore{Float} for detailed
information about this domain.  The \axiomType{DoubleFloat} (see
\downlink{‘DoubleFloat’}{DoubleFloatXmpPage}\ignore{DoubleFloat}) is
usually a hardware implementation of floating point numbers,
corresponding to machine double precision.  The types
\axiomType{Complex Float} and \axiomType{Complex DoubleFloat} are the
corresponding software implementations of complex floating-point
numbers.  In this section the term {\it floating-point type} means any
```

```
of these four types.

The floating-point types implement the basic elementary functions.
These include (where \axiomSyntax{\$} means
\axiomType{DoubleFloat},
\axiomType{Float},
\axiomType{Complex DoubleFloat}, or
\axiomType{Complex Float}):

\noindent
\axiomFun{exp},  \axiomFun{log}: \axiom{\$ -> \$} \newline
\axiomFun{sin},  \axiomFun{cos}, \axiomFun{tan}, \axiomFun{cot},
\axiomFun{sec}, \axiomFun{csc}: \axiom{\$ -> \$} \newline
\axiomFun{sin},  \axiomFun{cos}, \axiomFun{tan}, \axiomFun{cot},
\axiomFun{sec}, \axiomFun{csc}: \axiom{\$ -> \$}  \newline
\axiomFun{asin}, \axiomFun{acos}, \axiomFun{atan}, \axiomFun{acot},
\axiomFun{asec}, \axiomFun{acsc}: \axiom{\$ -> \$}  \newline
\axiomFun{sinh},  \axiomFun{cosh}, \axiomFun{tanh}, \axiomFun{coth},
\axiomFun{sech}, \axiomFun{csch}: \axiom{\$ -> \$}  \newline
\axiomFun{asinh}, \axiomFun{acosh}, \axiomFun{atanh}, \axiomFun{acoth},
\axiomFun{asech}, \axiomFun{acsch}: \axiom{\$ -> \$}  \newline
\axiomFun{pi}: \axiom{() -> \$}  \newline
\axiomFun{sqrt}: \axiom{\$ -> \$} \newline
\axiomFun{nthRoot}: \axiom{(\$, Integer) -> \$}  \newline
\axiomFunFrom{**}{Float}: \axiom{(\$, Fraction Integer) -> \$} \newline
\axiomFunFrom{**}{Float}: \axiom{(\$,\$) -> \$}  \newline

The handling of roots depends on whether the floating-point type
is real or complex: for the real floating-point types,
\axiomType{DoubleFloat} and \axiomType{Float}, if a real root exists
the one with the same sign as the radicand is returned; for the
complex floating-point types, the principal value is returned.
Also, for real floating-point types the inverse functions
produce errors if the results are not real.
This includes cases such as \axiom{asin(1.2)}, \axiom{log(-3.2)},
\axiom{sqrt(-1.1)}.
%
\xtc{
The default floating-point type is \axiomType{Float} so to evaluate
functions using \axiomType{Float} or \axiomType{Complex Float}, just
use normal decimal notation.
}{
\spadpaste{exp(3.1)}
}
\xtc{
}{
\spadpaste{exp(3.1 + 4.5 * \%i)}
}
\xtc{
To evaluate functions using \axiomType{DoubleFloat}
or \axiomType{Complex DoubleFloat},
a declaration or conversion is required.
}{
\spadpaste{r: DFLOAT := 3.1; t: DFLOAT := 4.5; exp(r + t*\%i)}
}
\xtc{
}{
\spadpaste{exp(3.1::DFLOAT + 4.5::DFLOAT * \%i)}
}

A number of special functions are provided by the package
\axiomType{DoubleFloatSpecialFunctions} for the machine-precision
floating-point types.  The special functions provided are listed
below, where \axiom{F} stands for the types \axiomType{DoubleFloat}
and \axiomType{Complex DoubleFloat}.  The real versions of the
functions yield an error if the result is not real.

\noindent
\axiomFun{Gamma}: \axiom{F -> F}\hfill\newline
\axiom{Gamma(z)} is the Euler gamma function,
   \texht{$\Gamma(z)$}{\axiom{Gamma(z)}},
   defined by
   \texht{
\narrowDisplay{\Gamma(z) = \int_{0}^{\infty} t^{z-1} e^{-t} dt.}%
   }{
\newline
\centerline{{
\axiom{Gamma(z) = integrate(t**(z-1)*exp(-t), t=0..\%infinity).}}}
   }

\noindent
\axiomFun{Beta}: \axiom{F -> F}\hfill\newline
   \axiom{Beta(u, v)} is the Euler Beta function,
   \texht{$B(u,v)$}{\axiom{B(u,v)}}, defined by
   \texht{\narrowDisplay{B(u,v) = \int_{0}^{1} t^{u-1} (1-t)^{v-1} dt.}%
   }{
\newline
\centerline{{
\axiom{Beta(u,v) = integrate(t**(u-1)*(1-t)**(b-1), t=0..1).}}}
   }
   This is related to \texht{$\Gamma(z)$}{\axiom{Gamma(z)}} by
   \texht{\narrowDisplay{B(u,v) =
\frac{\Gamma(u) \Gamma(v)}{\Gamma(u + v)}.}%
   }{
\newline
\centerline{{      \axiom{Beta(u,v) = Gamma(u)*Gamma(v)/Gamma(u + v).}}}
   }%

\noindent
\axiomFun{logGamma}: \axiom{F -> F}\hfill\newline
```

```
   \axiom{logGamma(z)} is the natural logarithm of
\texht{$\Gamma(z)$}{\axiom{Gamma(z)}}.
   This can often be computed even if
\texht{$\Gamma(z)$}{\axiom{Gamma(z)}}
cannot.
%

\noindent
\axiomFun{digamma}: \axiom{F -> F}\hfill\newline
   \axiom{digamma(z)}, also called \axiom{psi(z)},
is the function \texht{$\psi(z)$}{\axiom{psi(z)}},
   defined by \texht{\narrowDisplay{\psi(z) = \Gamma'(z)/\Gamma(z).}%
   }{
\newline
\centerline{{      \axiom{psi(z) = Gamma'(z)/Gamma(z).}}}
  }%

\noindent
\axiomFun{polygamma}:
\axiom{(NonNegativeInteger, F) -> F}\hfill\newline
   \axiom{polygamma(n, z)} is the \eth{\axiom{n}} derivative of
   \texht{$\psi(z)$}{
\axiom{digamma(z)}}\texht{, written $\psi^{(n)}(z)$}{}.

\noindent
\axiomFun{besselJ}: \axiom{(F,F) -> F}\hfill\newline
   \axiom{besselJ(v,z)} is the Bessel function of the first kind,
   \texht{$J_\nu (z)$}{\axiom{J(v,z)}}.
   This function satisfies the differential equation
   \texht{\narrowDisplay{z^2 w''(z) + z w'(z) + (z^2-\nu^2)w(z) = 0.}%
   }{
\newline
\centerline{{      \axiom{z**2*w''(z) + z*w'(z) + (z**2-v**2)*w(z) = 0.}}}
  }%

\noindent
\axiomFun{besselY}: \axiom{(F,F) -> F}\hfill\newline
   \axiom{besselY(v,z)} is the Bessel function of the second kind,
   \texht{$Y_\nu (z)$}{\axiom{Y(v,z)}}.
   This function satisfies the same differential equation as
   \axiomFun{besselJ}.
   The implementation simply uses the relation
   \texht{\narrowDisplay{Y_\nu (z) =
\frac{J_\nu (z) \cos(\nu \pi) - J_{-\nu} (z)}{\sin(\nu \pi)}.}%
   }{
\newline
\centerline{{      \axiom{Y(v,z) =
(J(v,z)*cos(v*\%pi) - J(-v,z))/sin(v*\%pi).}}}
   }%
```

```
\noindent
\axiomFun{besselI}: \axiom{(F,F) -> F}\hfill\newline
   \axiom{besselI(v,z)} is the modified Bessel function of the first kind,
   \texht{$I_\nu (z)$}{\axiom{I(v,z)}}.
   This function satisfies the differential equation
   \texht{\narrowDisplay{z^2 w''(z) + z w'(z) - (z^2+\nu^2)w(z) = 0.}%
   }{
\newline
\centerline{{
\axiom{z**2 * w''(z) + z * w'(z) - (z**2+v**2)*w(z) = 0.}}}
   }%

\noindent
\axiomFun{besselK}: \axiom{(F,F) -> F}\hfill\newline
   \axiom{besselK(v,z)} is the modified Bessel
function of the second kind,
   \texht{$K_\nu (z)$}{\axiom{K(v,z)}}.
   This function satisfies the same differential
equation as \axiomFun{besselI}.
   The implementation simply uses the relation
   \texht{\narrowDisplay{K_\nu (z) =
\pi \frac{I_{-\nu} (z) - I_{\nu} (z)}{2 \sin(\nu \pi)}.}%
   }{
\newline
\centerline{{      \axiom{K(v,z) =
\%pi*(I(v,z) - I(-v,z))/(2*sin(v*\%pi)).}}}
   }

\noindent
\axiomFun{airyAi}: \axiom{F -> F}\hfill\newline
   \axiom{airyAi(z)} is the Airy function \texht{$Ai(z)$}{\axiom{Ai(z)}}.
   This function satisfies the differential equation
   \texht{$w''(z) - z w(z) = 0.$}{\axiom{w''(z) - z * w(z) = 0.}}
   The implementation simply uses the relation
   \texht{\narrowDisplay{Ai(-z) =
\frac{1}{3}\sqrt{z} ( J_{-1/3}
(\frac{2}{3}z^{3/2}) + J_{1/3} (\frac{2}{3}z^{3/2}) ).}%
   }{
\newline
\centerline{{      \axiom{Ai(-z) =
1/3 * sqrt(z) * (J(-1/3, 2/3*z**(3/2)) + J(1/3, 2/3*z**(3/2)) ).}}}
   }%

\noindent
\axiomFun{airyBi}: \axiom{F -> F}\hfill\newline
   \axiom{airyBi(z)} is the Airy function
\texht{$Bi(z)$}{\axiom{Bi(z)}}.
   This function satisfies the same differential
equation as \axiomFun{airyAi}.
   The implementation simply uses the relation
   \texht{\narrowDisplay{Bi(-z) =
\frac{1}{3}\sqrt{3 z} ( J_{-1/3}
(\frac{2}{3}z^{3/2}) - J_{1/3} (\frac{2}{3}z^{3/2}) ).}%
   }{
\newline
\centerline{{      \axiom{Bi(-z) = 1/3 *sqrt(3*z) *
(J(-1/3, 2/3*z**(3/2)) - J(1/3, 2/3*z**(3/2)) ).}}}
   }

\noindent
\axiomFun{hypergeometric0F1}: \axiom{(F,F) -> F}\hfill\newline
   \axiom{hypergeometric0F1(c,z)} is the hypergeometric function
   \texht{${}_0 F_1 ( ; c; z)$}{\axiom{0F1(; c; z)}}.%

\xtc{
The above special functions are defined only for small floating-point
types.  If you give \axiomType{Float} arguments, they are converted to
\axiomType{DoubleFloat} by Axiom.
}{
\spadpaste{Gamma(0.5)**2}
}
\xtc{
}{
\spadpaste{a := 2.1; b := 1.1; besselI(a + \%i*b, b*a + 1)}
}

A number of additional operations may be used to compute numerical
values.  These are special polynomial functions that can be evaluated
for values in any commutative ring \axiom{R}, and in particular for
values in any floating-point type.  The following operations are
provided by the package \axiomType{OrthogonalPolynomialFunctions}:

\noindent
\axiomFun{chebyshevT}:
\axiom{(NonNegativeInteger, R) -> R}\hbox{}\hfill\newline
   \axiom{chebyshevT(n,z)} is the \eth{\axiom{n}}
Chebyshev polynomial of the first
   kind, \texht{$T_n (z)$}{\axiom{T[n](z)}}.  These are defined by
   \texht{\narrowDisplay{\frac{1-t z}{1-2 t z+t^2} =
\sum_{n=0}^{\infty} T_n (z) t^n.}%
   }{
\newline
\centerline{{   \axiom{(1-t*z)/(1-2*t*z+t**2) =
sum(T[n](z) *t**n, n = 0..).}}}
   }%

\noindent
\axiomFun{chebyshevU}: \axiom{(NonNegativeInteger, R) -> R}
\hbox{}\hfill\newline
   \axiom{chebyshevU(n,z)} is the \eth{\axiom{n}}
```

```
Chebyshev polynomial of the second
   kind, \texht{$U_n (z)$}{\axiom{U[n](z)}}. These are defined by
   \texht{\narrowDisplay{\frac{1}{1-2 t z+t^2} =
\sum_{n=0}^{\infty} U_n (z) t^n.}%
   }{
\newline
\centerline{{   \axiom{1/(1-2*t*z+t**2) = sum(U[n](z) *t**n, n = 0..).}}}
   }%

\noindent
\axiomFun{hermiteH}:   \axiom{(NonNegativeInteger, R) -> R}
\hbox{}\hfill\newline
   \axiom{hermiteH(n,z)} is the \eth{\axiom{n}} Hermite polynomial,
   \texht{$H_n (z)$}{\axiom{H[n](z)}}.
   These are defined by
   \texht{\narrowDisplay{e^{2 t z - t^2} =
\sum_{n=0}^{\infty} H_n (z) \frac{t^n}{n!}.}%
   }{
\newline
\centerline{{   \axiom{exp(2*t*z-t**2) = sum(H[n](z)*t**n/n!, n = 0..).}}}
   }%

\noindent
\axiomFun{laguerreL}:  \axiom{(NonNegativeInteger, R) -> R}
\hbox{}\hfill\newline
   \axiom{laguerreL(n,z)} is the \eth{\axiom{n}} Laguerre polynomial,
   \texht{$L_n (z)$}{\axiom{L[n](z)}}.
   These are defined by
   \texht{\narrowDisplay{\frac{e^{-\frac{t z}{1-t}}}{1-t} =
\sum_{n=0}^{\infty} L_n (z) \frac{t^n}{n!}.}%
   }{
\newline
\centerline{{   \axiom{exp(-t*z/(1-t))/(1-t) =
sum(L[n](z)*t**n/n!, n = 0..).}}}
   }%

\noindent
\axiomFun{laguerreL}:
\axiom{(NonNegativeInteger, NonNegativeInteger, R) -> R}\hbox{}\hfill\newline
   \axiom{laguerreL(m,n,z)} is the associated Laguerre polynomial,
   \texht{$L^m_n (z)$}{\axiom{L<m>[n](z)}}.
   This is the
\eth{\axiom{m}} derivative of \texht{$L_n (z)$}{\axiom{L[n](z)}}.

\noindent
\axiomFun{legendreP}:
\axiom{(NonNegativeInteger, R) -> R}\hbox{}\hfill\newline
   \axiom{legendreP(n,z)} is the \eth{\axiom{n}} Legendre polynomial,
   \texht{$P_n (z)$}{\axiom{P[n](z)}}.  These are defined by
   \texht{\narrowDisplay{
```

```
\frac{1}{\sqrt{1-2 t z+t^2}} = \sum_{n=0}^{\infty} P_n (z) t^n.}%
   }{
\newline
\centerline{{   \axiom{1/sqrt(1-2*z*t+t**2) =
sum(P[n](z)*t**n, n = 0..).}}}
   }%

%
\xtc{

sum(B[n](z)*t**n/n! for n - 0..)}}}
   }%

\noindent
\axiomFun{eulerE}: \axiom{(NonNegativeInteger, R) -> R}
\hbox{}\hfill\newline
   \axiom{eulerE(n,z)} is the \eth{\axiom{n}} Euler polynomial,
   \texht{$E_n (z)$}{\axiom{E[n](z)}}.  These are defined by
   \texht{\narrowDisplay{\frac{2 e^{z t}}{e^t + 1} =
\sum_{n=0}^{\infty} E_n (z) \frac{t^n}{n!}.}%
   }{
```

```
\newline
\centerline{{   \axiom{2*exp(z*t)/(exp t + 1) =
sum(E[n](z)*t**n/n! for n - 0..)}}}
   }%

\noindent
\axiomFun{cyclotomic}: \axiom{(NonNegativeInteger, R) -> R}
\hbox{}\hfill\newline
   \axiom{cyclotomic(n,z)} is the \eth{\axiom{n}} cyclotomic polynomial
   \texht{$\Phi_n (z)$}{\axiom{phi(n,z)}}.  This is the polynomial whose
   roots are precisely the primitive \eth{\axiom{n}} roots of unity.
   This polynomial has degree given by the Euler totient function
   \texht{$\phi(n)$}{\axiom{phi(n)}}.

\xtc{
The expression \axiom{bernoulliB(n,z)} evaluates to the
\eth{\axiom{n}} Bernoulli polynomial.
}{
\spadpaste{bernoulliB(3, z)}
}
\xtc{
}{
\spadpaste{bernoulliB(3, 0.7 + 0.4 * \%i)}
}
\xtc{
The expression
\axiom{eulerE(n,z)} evaluates to the \eth{\axiom{n}} Euler polynomial.
}{
\spadpaste{eulerE(3, z)}
}
\xtc{
}{
\spadpaste{eulerE(3, 0.7 + 0.4 * \%i)}
}
\xtc{
The expression
\axiom{cyclotomic(n,z)} evaluates to the
\eth{\axiom{n}} cyclotomic polynomial.
}{
\spadpaste{cyclotomic(3, z)}
}
\xtc{
}{
\spadpaste{cyclotomic(3, (-1.0 + 0.0 * \%i)**(2/3))}
}

Drawing complex functions in Axiom is presently somewhat
awkward compared to drawing real functions.
It is necessary to use the \axiomFun{draw} operations that operate
on functions rather than expressions.
```

```
\psXtc{
This is the complex exponential function\texht{ (rotated
interactively).}{.}  When this is displayed in color, the height is
the value of the real part of the function and the color is the
imaginary part.  Red indicates large negative imaginary values, green
indicates imaginary values near zero and blue/violet indicates large
positive imaginary values.
}{
\graphpaste{draw((x,y)+-> real exp complex(x,y), -2..2,
-2*\%pi..2*\%pi, colorFunction ==
(x, y) +->  imag exp complex(x,y),
title=="exp(x+\%i*y)", style=="smooth")}
}{
\epsffile[0 0 295 295]{../ps/compexp.ps}
}

\psXtc{
This is the complex arctangent function.
Again, the height is the real part of the function value but here
the color indicates the function value's phase.
The position of the branch cuts are clearly visible and one can
see that the function is real only for a real argument.
}{
\graphpaste{vp := draw((x,y) +-> real atan complex(x,y),
-\%pi..\%pi, -\%pi..\%pi, colorFunction==
(x,y) +->argument atan complex(x,y),
title=="atan(x+\%i*y)", style=="shade"); rotate(vp,-160,-45); vp}
}{
\epsffile[0 0 295 295]{../ps/compatan.ps}
}

\psXtc{
This is the complex Gamma function.
}{
\graphpaste{draw((x,y) +-> max(min(real Gamma complex(x,y),4),-4),
-\%pi..\%pi, -\%pi..\%pi, style=="shade", colorFunction ==
(x,y) +-> argument Gamma complex(x,y),
title == "Gamma(x+\%i*y)", var1Steps == 50, var2Steps== 50)}
}{
\epsffile[0 0 295 295]{../ps/compgamm.ps}
}

\psXtc{
This shows the real Beta function near the origin.
}{
\graphpaste{draw(Beta(x,y)/100, x=-1.6..1.7, y = -1.6..1.7,
style=="shade", title=="Beta(x,y)", var1Steps==40, var2Steps==40)}
}{
\epsffile[0 0 295 295]{../ps/realbeta.ps}
}

\psXtc{
This is the Bessel function \texht{$J_\alpha (x)$}{\axiom{J(alpha,x)}}
for index \texht{$\alpha$}{\axiom{alpha}} in the range \axiom{-6..4} and
argument \texht{$x$}{\axiom{x}} in the range \axiom{2..14}.
}{
\graphpaste{draw((alpha,x) +-> min(max(besselJ(alpha, x+8), -6), 6),
-6..4, -6..6, title=="besselJ(alpha,x)", style=="shade",
var1Steps==40, var2Steps==40)}
}{
\epsffile[0 0 295 295]{../ps/bessel.ps}
}

\psXtc{
This is the modified Bessel function
\texht{$I_\alpha (x)$}{\axiom{I(alpha,x)}}
evaluated for various real values of the index
\texht{$\alpha$}{\axiom{alpha}}
and fixed argument \texht{$x = 5$}{\axiom{x = 5}}.
}{
\graphpaste{draw(besselI(alpha, 5), alpha = -12..12, unit==[5,20])}
}{
\epsffile[0 0 295 295]{../ps/modbess.ps}
}

\psXtc{
This is similar to the last example
except the index \texht{$\alpha$}{\axiom{alpha}}
takes on complex values in a \axiom{6 x 6} rectangle
centered on the origin.
}{
\graphpaste{draw((x,y) +-> real besselI(complex(x/20, y/20),5),
-60..60, -60..60, colorFunction ==
(x,y)+-> argument besselI(complex(x/20,y/20),5),
title=="besselI(x+i*y,5)", style=="shade")}
}{
\epsffile[0 0 295 295]{../ps/modbessc.ps}
}

9.0.88 Factoring Rational Functions

— ug08.ht —

```
\begin{page}{ugProblemFactorRatFunPage}
{8.2.4. Factoring Rational Functions}
\beginscroll

Since fractions of polynomials form a field, every element (other than
zero) divides any other, so there is no useful notion of irreducible
factors.  Thus the \axiomFun{factor} operation is not very useful for
fractions of polynomials.

\xtc{
There is, instead, a specific operation \axiomFun{factorFraction}
that separately factors the numerator and denominator and returns
a fraction of the factored results.
}{
\spadpaste{factorFraction((x**2-4)/(y**2-4))}
}
\xtc{
You can also use \axiomFun{map}. This expression
applies the \axiomFun{factor} operation
to the numerator and denominator.
}{
\spadpaste{map(factor,(x**2-4)/(y**2-4))}

{8.3. Manipulating Symbolic Roots of a Polynomial}
```

```
\beginscroll
%
In this section we show you how to work with one root or all roots
of a polynomial.
These roots are represented symbolically (as opposed to being
numeric approximations).
See \downlink{‘‘Solution of a Single Polynomial Equation’’}
{ugxProblemOnePolPage}
in Section 8.5.2\ignore{ugxProblemOnePol} and
\downlink{‘‘Solution of Systems of Polynomial Equations’’}
{ugxProblemPolSysPage} in
Section 8.5.3\ignore{ugxProblemPolSys} for
information about solving for the roots of one or more
polynomials.

9.0.90 Using a Single Root of a Polynomial

— ug08.ht —

```
\begin{page}{ugxProblemSymRootOnePage}
{8.3.1. Using a Single Root of a Polynomial}
\beginscroll

Use \axiomFun{rootOf} to get a symbolic root of a polynomial:
\axiom{rootOf(p, x)} returns a root of \axiom{p(x)}.

\labelSpace{2pc}
\xtc{
This creates an algebraic number \axiom{a}.
}{
\spadpaste{a := rootOf(a**4+1,a) \bound{a}}
}
\xtc{
To find the algebraic relation that defines \axiom{a},
use \axiomFun{definingPolynomial}.
}{
\spadpaste{definingPolynomial a \free{a}}
}
\xtc{
You can use \axiom{a} in any further expression,
including a nested \axiomFun{rootOf}.
}{
\spadpaste{b := rootOf(b**2-a-1,b) \free{a}\bound{b}}
}
\xtc{
Higher powers of the roots are automatically reduced during
calculations.
}{
\spadpaste{a + b \free{a b}\bound{c}}
}
\xtc{
}{
\spadpaste{\% ** 5 \free{c}}
}
\xtc{
The operation \axiomFun{zeroOf} is similar to \axiomFun{rootOf},
except that it may express the root using radicals in some cases.
}{
\spadpaste{rootOf(c**2+c+1,c)}
}
\xtc{
}{
\spadpaste{zeroOf(d**2+d+1,d)}
}
\xtc{
}{
\spadpaste{rootOf(e**5-2,e)}
}
\xtc{

— ug08.ht —

```
\begin{page}{ugxProblemSymRootAllPage}
{8.3.2. Using All Roots of a Polynomial}
\beginscroll

Use \axiomFun{rootsOf} to get all symbolic roots of a polynomial:
\axiom{rootsOf(p, x)} returns a
list of all the roots of \axiom{p(x)}.
If \axiom{p(x)} has a multiple root of order \axiom{n}, then that root
appears \axiom{n} times in the list.
\texht{\typeout{Make sure these variables are x0 etc}}{}

\xtc{
Compute all the roots of \axiom{x**4 + 1}.
}{
\spadpaste{l := rootsOf(x**4+1,x) \bound{l}}
}
\xtc{
As a side effect, the variables \axiom{\%x0, \%x1} and \axiom{\%x2}
are bound to the first three roots of \axiom{x**4+1}.
}{
\spadpaste{\%x0**5 \free{l}}
}
\xtc{
Although they all satisfy \axiom{x**4 + 1 = 0, \%x0, \%x1,}
and \axiom{\%x2} are different algebraic numbers.
To find the algebraic relation that defines each of them,
use \axiomFun{definingPolynomial}.
}{
\spadpaste{definingPolynomial \%x0 \free{l}}
}
\xtc{
}{
\spadpaste{definingPolynomial \%x1 \free{l}}
}
\xtc{
}{
\spadpaste{definingPolynomial \%x2 \free{l}}
}
\xtc{
We can check that the sum and product of the roots of \axiom{x**4+1} are
its trace and norm.
}{
\spadpaste{x3 := last l \free{l} \bound{x3}}
}
\xtc{
}{
\spadpaste{\%x0 + \%x1 + \%x2 + x3 \free{x3}}
}
```

```
\xtc{
}{
\spadpaste{\%x0 * \%x1 * \%x2 * x3 \free{x3}}
}
\xtc{
Corresponding to the pair of operations
\axiomFun{rootOf}/\axiomFun{zeroOf} in
\downlink{``Solution of a Single Polynomial Equation''}
{ugxProblemOnePolPage} in Section
8.5.2\ignore{ugxProblemOnePol}, there is an
operation \axiomFun{zerosOf} that, like \axiomFun{rootsOf}, computes
all the roots of a given polynomial, but which expresses some of them
in terms of radicals.
}{
\spadpaste{zerosOf(y**4+1,y) \bound{z}}
}
\xtc{
As you see, only one implicit algebraic number was created
(\axiom{\%y1}), and its defining equation is this.
The other three roots are expressed in radicals.

9.0.92 Computation of Eigenvalues and Eigenvectors

— **ug08.ht** —

```
\begin{page}{ugProblemEigenPage}
{8.4. Computation of Eigenvalues and Eigenvectors}
\beginscroll
%
In this section we show you
some of Axiom's facilities for computing and
manipulating eigenvalues and eigenvectors, also called
characteristic values and characteristic vectors,
respectively.

\texht{\vskip 4pc}{}

\xtc{
Let's first create a matrix with integer entries.
}{
\spadpaste{m1 := matrix {\tt{}1,2,1],[2,1,-2],[1,-2,4} \bound{m1}}
}
\xtc{
To get a list of the {\it rational} eigenvalues,
use the operation \axiomFun{eigenvalues}.
}{
\spadpaste{leig := eigenvalues(m1) \free{m1} \bound{leig}}
}
\xtc{
Given an explicit eigenvalue, \axiomFun{eigenvector} computes the
eigenvectors corresponding to it.
}{
\spadpaste{eigenvector(first(leig),m1) \free{m1 leig}}
}

The operation \axiomFun{eigenvectors} returns a list of pairs of values
and vectors. When an eigenvalue is rational, Axiom gives you
the value explicitly; otherwise, its minimal polynomial is given,
(the polynomial of lowest degree with the eigenvalues as roots),
together with a parametric representation of the eigenvector using the
eigenvalue.
This means that if you ask Axiom to \axiomFun{solve}
the minimal polynomial, then you can substitute these roots
into the parametric form of the corresponding eigenvectors.

\xtc{
You must be aware that unless an exact eigenvalue has been computed,
the eigenvector may be badly in error.
}{
\spadpaste{eigenvectors(m1) \free{m1}}
```

```
}
\xtc{
Another possibility is to use the operation
\axiomFun{radicalEigenvectors}
tries to compute explicitly the eigenvectors
in terms of radicals.
}{
\spadpaste{radicalEigenvectors(m1) \free{m1}}
}

Alternatively, Axiom can compute real or complex approximations to the
eigenvectors and eigenvalues using the operations
\axiomFun{realEigenvectors} or \axiomFun{complexEigenvectors}.  They
each take an additional argument \texht{$\epsilon$}{\axiom{epsilon}}
to specify the ``precision'' required.  In the real case, this means
that each approximation will be within \texht{$\pm\epsilon$}{plus or
minus \axiom{epsilon}} of the actual result.  In the complex case,
this means that each approximation will be within
\texht{$\pm\epsilon$}{plus or minus \axiom{epsilon}} of the actual
result in each of the real and imaginary parts.

\xtc{
The precision can be specified as a \axiomType{Float} if the results
are desired in floating-point notation, or as \axiomType{Fraction
Integer} if the results are to be expressed using rational (or complex
rational) numbers.
}{
\spadpaste{realEigenvectors(m1,1/1000) \free{m1}}
}
\xtc{
If an \axiom{n} by \axiom{n} matrix has \axiom{n} distinct eigenvalues
(and therefore \axiom{n} eigenvectors) the operation
\axiomFun{eigenMatrix} gives you a matrix of the eigenvectors.
}{
\spadpaste{eigenMatrix(m1) \free{m1}}
}
\xtc{
}{
\spadpaste{m2 := matrix {\tt{}-5,-2],[18,7} \bound{m2}}
}
\xtc{
}{
\spadpaste{eigenMatrix(m2) \free{m2}}
}
%
%
\xtc{
If a symmetric matrix
has a basis of orthonormal eigenvectors, then
\axiomFun{orthonormalBasis} computes a list of these vectors.
```

```
}{
\spadpaste{m3 := matrix {\tt{}1,2],[2,1} \bound{m3}}
}
\xtc{
}{
\spadpaste{orthonormalBasis(m3) \free{m3}}
}

%
In this section we discuss the Axiom facilities for solving
systems of linear equations, finding the roots of polynomials and
solving systems of polynomial equations.
For a discussion of the solution of differential equations, see
\downlink{``Solution of Differential Equations''}{ugProblemDEQPage} in
Section 8.10\ignore{ugProblemDEQ}.

9.0.94 Solution of Systems of Linear Equations

— ug08.ht —

```
\begin{page}{ugxProblemLinSysPage}
{8.5.1. Solution of Systems of Linear Equations}
\beginscroll

You can use the operation \axiomFun{solve} to solve systems of linear
equations.

The operation \axiomFun{solve} takes two arguments, the list of
equations and the list of the unknowns to be solved for.  A system of
linear equations need not have a unique solution.

\xtc{
To solve the linear system:
\centerline{{\axiom{  x +   y +   z = 8} }}
\centerline{{\axiom{3*x - 2*y +   z = 0} }}
\centerline{{\axiom{  x + 2*y + 2*z = 17}}}
evaluate this expression.
}{
\spadpaste{solve([x+y+z=8,3*x-2*y+z=0,x+2*y+2*z=17],[x,y,z])}
```

```
}

Parameters are given as new variables starting with a percent sign and
\spadSyntax{\%} and
the variables are expressed in terms of the parameters.
If the system has no solutions then the empty list is returned.

\xtc{
When you solve the linear system
\centerline{{\axiom{  x + 2*y + 3*z = 2} }}
\centerline{{\axiom{2*x + 3*y + 4*z = 2} }}
\centerline{{\axiom{3*x + 4*y + 5*z = 2}}}
with this expression
you get a solution involving a parameter.
}{
\spadpaste{solve([x+2*y+3*z=2,2*x+3*y+4*z=2,3*x+4*y+5*z=2],[x,y,z])}
}

The system can also be presented as a matrix and a vector.
The matrix contains the coefficients of the linear equations and
the vector contains the numbers appearing on the right-hand sides
of the equations.
You may input the matrix as a list of rows and the vector as a
list of its elements.

\xtc{
To solve the system:
\centerline{{\axiom{  x +   y +   z = 8} }}
\centerline{{\axiom{3*x - 2*y +   z = 0} }}
\centerline{{\axiom{  x + 2*y + 2*z = 17}}}
in matrix form you would evaluate this expression.
}{
\spadpaste{solve({\tt{}1,1,1],[3,-2,1],[1,2,2},[8,0,17])}
}

The solutions are presented as a \pspadtype{Record} with two
components: the component \texht{{\it particular}}{{\tt
particular}} contains a particular solution of the given system or
the item {\tt "failed"} if there are no solutions, the component
\texht{{\it basis}}{{\tt basis}} contains a list of vectors that
are a basis for the space of solutions of the corresponding
homogeneous system.
If the system of linear equations does not have a unique solution,
then the \texht{{\it basis}}{{\tt basis}} component contains
non-trivial vectors.

\xtc{
This happens when you solve the linear system
\centerline{{\axiom{  x + 2*y + 3*z = 2} }}
\centerline{{\axiom{2*x + 3*y + 4*z = 2} }}
```

```
\centerline{{\axiom{3*x + 4*y + 5*z = 2}}}
with this command.
}{
\spadpaste{solve({\tt{}1,2,3],[2,3,4],[3,4,5},[2,2,2])}
}

All solutions of this system are obtained by adding the particular
solution with a linear combination of the \texht{{\it basis}}{{\tt
basis}} vectors.

When no solution exists then {\tt "failed"} is returned as the
\texht{{\it particular}}{{\tt particular}} component, as follows:

\xtc{
}{
\spadpaste{solve({\tt{}1,2,3],[2,3,4],[3,4,5},[2,3,2])}
}

When you want to solve a system of homogeneous equations (that is,
a system where the numbers on the right-hand sides of the
equations are all zero) in the matrix form you can omit the second
argument and use the \axiomFun{nullSpace} operation.

\xtc{
This computes the solutions of the following system of equations:
\centerline{{\axiom{  x + 2*y + 3*z = 0} }}
\centerline{{\axiom{2*x + 3*y + 4*z = 0} }}
\centerline{{\axiom{3*x + 4*y + 5*z = 0}}}
The result is given as a list of vectors and
these vectors form a basis for the solution space.
}{
\spadpaste{nullSpace({\tt{}1,2,3],[2,3,4],[3,4,5})}
}

9.0.95 Solution of a Single Polynomial Equation

— ug08.ht —

```
\begin{page}{ugxProblemOnePolPage}
{8.5.2. Solution of a Single Polynomial Equation}
\beginscroll

Axiom can solve polynomial equations producing either approximate or
exact solutions.  Exact solutions are either members of the ground
field or can be presented symbolically as roots of irreducible
```

```
polynomials.

\xtc{
This returns the one rational root along with an irreducible
polynomial describing the other solutions.
}{
\spadpaste{solve(x**3  = 8,x)}
}
\xtc{
If you want solutions expressed in terms of radicals you would use this
instead.
}{
\spadpaste{radicalSolve(x**3  = 8,x)}
}

The \axiomFun{solve} command always returns a value but
\axiomFun{radicalSolve} returns only the solutions that it is
able to express in terms of radicals.

If the polynomial equation has rational coefficients
you can ask for approximations to its real roots by calling
solve with a second argument that specifies the ``precision''
\texht{$\epsilon$}{\axiom{epsilon}}.
This means that each approximation will be within
\texht{$\pm\epsilon$}{plus or minus \axiom{epsilon}} of the actual
result.

\xtc{
Notice that the type of second argument controls the type of the result.
}{
\spadpaste{solve(x**4 - 10*x**3 + 35*x**2 - 50*x + 25,.0001)}
}
\xtc{
If you give a floating-point precision you get a floating-point result;
if you give the precision as a rational number you get a rational result.
}{
\spadpaste{solve(x**3-2,1/1000)}
}
\xtc{
If you want approximate complex results you should use the
command \axiomFun{complexSolve} that takes the same precision argument
\texht{$\epsilon$}{\axiom{epsilon}}.
}{
\spadpaste{complexSolve(x**3-2,.0001)}
}
\xtc{
Each approximation will be within
\texht{$\pm\epsilon$}{plus or minus \axiom{epsilon}} of the actual result
in each of the real and imaginary parts.
}{
```

```
\spadpaste{complexSolve(x**2-2*\%i+1,1/100)}
}

Note that if you omit the \axiomOp{=} from the first argument
Axiom generates an equation by equating the first argument to zero.
Also, when only one variable is present in the equation, you
do not need to specify the variable to be solved for, that is,
you can omit the second argument.

\xtc{
Axiom can also solve equations involving rational functions.
Solutions where the denominator vanishes are discarded.
}{

9.0.96 Solution of Systems of Polynomial Equations

⇒ "notitle" (ugxProblemOnePolPage) 9.0.95 on page 2103

— ug08.ht —

```
\begin{page}{ugxProblemPolSysPage}
{8.5.3. Solution of Systems of Polynomial Equations}
\beginscroll

Given a system of equations of rational functions with exact coefficients:
\centerline{{\axiom{p1(x1,...,xn)} }}
\centerline{{\axiom{.}           }}
\centerline{{\axiom{.}           }}
\centerline{{\axiom{.}           }}
\centerline{{\axiom{pm(x1,...,xn)}}}
Axiom can find
numeric or symbolic solutions.
The system is first split into irreducible components, then for
each component, a triangular system of equations is found that reduces
the problem to sequential solution of univariate polynomials resulting
from substitution of partial solutions from the previous stage.
\centerline{{\axiom{q1(x1,...,xn)} }}
\centerline{{\axiom{.} }}
\centerline{{\axiom{.} }}
\centerline{{\axiom{.} }}
\centerline{{\axiom{qm(xn)}}}

Symbolic solutions can be presented using ``implicit'' algebraic numbers
defined as roots of irreducible polynomials or in terms of radicals.
Axiom can also find approximations to the real or complex roots
of a system of polynomial equations to any user-specified accuracy.

The operation \axiomFun{solve} for systems is used in a way similar
to \axiomFun{solve} for single equations.
Instead of a polynomial equation, one has to give a list of
equations and instead of a single variable to solve for, a list of
variables.
For solutions of single equations see
\downlink{``Solution of a Single Polynomial Equation''}
{ugxProblemOnePolPage} in Section 8.5.2\ignore{ugxProblemOnePol}.

%
\xtc{
Use the operation \axiomFun{solve} if you want implicitly presented
solutions.
}{
\spadpaste{solve([3*x**3 + y + 1,y**2 -4],[x,y])}
}
\xtc{
}{
\spadpaste{solve([x = y**2-19,y = z**2+x+3,z = 3*x],[x,y,z])}
}
\xtc{
Use \axiomFun{radicalSolve} if you want your solutions expressed
in terms of radicals.
}{
\spadpaste{radicalSolve([3*x**3 + y + 1,y**2 -4],[x,y])}
}

To get numeric solutions you only need to give the list of
equations and the precision desired.
The list of variables would be redundant information since there
can be no parameters for the numerical solver.

\xtc{
If the precision is expressed as a floating-point number you get
results expressed as floats.
}{
\spadpaste{solve([x**2*y - 1,x*y**2 - 2],.01)}
}
\xtc{
To get complex numeric solutions, use the operation \axiomFun{complexSolve},
which takes the same arguments as in the real case.
}{
\spadpaste{complexSolve([x**2*y - 1,x*y**2 - 2],1/1000)}
}
\xtc{
It is also possible to solve systems of equations in rational functions
over the rational numbers.
Note that \axiom{[x = 0.0, a = 0.0]} is not returned as a solution since
the denominator vanishes there.
}{
\spadpaste{solve([x**2/a = a,a = a*x],.001)}
}
\xtc{
When solving equations with
denominators, all solutions where the denominator vanishes are
discarded.
}{
\spadpaste{radicalSolve([x**2/a + a + y**3 - 1,a*y + a + 1],[x,y])}
}

9.0.97 Limits

— ug08.ht —

```
\begin{page}{ugProblemLimitsPage}{8.6. Limits}
\beginscroll
%
To compute a limit, you must specify a functional expression,
a variable, and a limiting value for that variable.
If you do not specify a direction, Axiom attempts to
compute a two-sided limit.

\xtc{
Issue this to compute the limit
\texht{$$\lim_{x \rightarrow 1}{{\displaystyle x^2 - 3x +
2}\over{\displaystyle x^2 - 1}}.$$}{
of \axiom{(x**2 - 3*x + 2)/(x**2 - 1)} as \axiom{x} approaches \axiom{1}.}
}{
\spadpaste{limit((x**2 - 3*x + 2)/(x**2 - 1),x = 1)}
}

Sometimes the limit when approached from the left is different from
the limit from the right and, in this case, you may wish to ask for a
one-sided limit.  Also, if you have a function that is only defined on
one side of a particular value, you can compute a one-sided limit.

\xtc{
The function \axiom{log(x)} is only defined to the right of zero,
that is, for \axiom{x > 0}.
Thus, when computing limits of functions involving \axiom{log(x)},
you probably want a ‘‘right-hand’’ limit.
}{
```

```
\spadpaste{limit(x * log(x),x = 0,"right")}
}
\xtc{
When you do not specify \axiom{"right"} or \axiom{"left"} as the
optional fourth argument, \axiomFun{limit} tries to compute a
two-sided limit.
Here the limit from the left does not exist, as Axiom
indicates when you try to take a two-sided limit.
}{
\spadpaste{limit(x * log(x),x = 0)}
}

A function can be defined on both sides of a particular value, but
tend to different limits as its variable approaches that value from the
left and from the right.
We can construct an example of this as follows:
Since
\texht{$\sqrt{y^2}$}{\axiom{sqrt(y**2)}}
is simply the absolute value of \axiom{y},
the function
\texht{$\sqrt{y^2} / y$}{\axiom{sqrt(y**2) / y}}
is simply the sign (\axiom{+1} or \axiom{-1}) of the nonzero
real number \axiom{y}.
Therefore,
\texht{$\sqrt{y^2} / y = -1$}{\axiom{sqrt(y**2) / y = -1}}
for \axiom{y < 0} and
\texht{$\sqrt{y^2} / y = +1$}{\axiom{sqrt(y**2) / y = +1}}
for \axiom{y > 0}.
\xtc{
This is what happens when we take the limit at \axiom{y = 0}.
The answer returned by Axiom gives both a
``left-hand'' and a ``right-hand'' limit.
}{
\spadpaste{limit(sqrt(y**2)/y,y = 0)}
}
\xtc{
Here is another example, this time using a more complicated function.
}{
\spadpaste{limit(sqrt(1 - cos(t))/t,t = 0)}
}

You can compute limits at infinity by passing either
\texht{$+\infty$ or $-\infty$}{``plus infinity'' or ``minus infinity''}
as the third argument of \axiomFun{limit}.
\xtc{
To do this, use the constants
\axiom{\%plusInfinity} and \axiom{\%minusInfinity}.
}{
\spadpaste{limit(sqrt(3*x**2 + 1)/(5*x),x = \%plusInfinity)}
}
```

```
\xtc{
}{
\spadpaste{limit(sqrt(3*x**2 + 1)/(5*x),x = \%minusInfinity)}
}

\xtc{
You can take limits of functions with parameters.
As you can see, the limit is expressed in terms of the parameters.
}{
\spadpaste{limit(sinh(a*x)/tan(b*x),x = 0)}
}

When you use \axiomFun{limit}, you are taking the limit of a real
function of a real variable.
\xtc{
When you compute this, Axiom returns \axiom{0} because, as a function
of a real variable, \axiom{sin(1/z)} is always between \axiom{-1} and
\axiom{1}, so \axiom{z * sin(1/z)} tends to \axiom{0} as \axiom{z}
tends to \axiom{0}.
}{
\spadpaste{limit(z * sin(1/z),z = 0)}
}
However, as a function of a {\it complex} variable, \axiom{sin(1/z)}
is badly behaved near \axiom{0} (one says that \axiom{sin(1/z)} has an
{\it essential singularity} at \axiom{z = 0}).
\xtc{
When viewed as a function of a complex variable, \axiom{z * sin(1/z)}
does not approach any limit as \axiom{z} tends to \axiom{0} in the
complex plane.  Axiom indicates this when we call
\axiomFun{complexLimit}.
}{
\spadpaste{complexLimit(z * sin(1/z),z = 0)}
}

You can also take complex limits at infinity, that is, limits of a
function of \axiom{z} as \axiom{z} approaches infinity on the Riemann
sphere.  Use the symbol \axiom{\%infinity} to denote ‘‘complex
infinity.’’
\xtc{
As above, to compute complex limits rather than real limits, use
\axiomFun{complexLimit}.
}{
\spadpaste{complexLimit((2 + z)/(1 - z),z = \%infinity)}
}
\xtc{
In many cases, a limit of a real function of a real variable
exists when the corresponding complex limit does not.
This limit exists.
}{
\spadpaste{limit(sin(x)/x,x = \%plusInfinity)}
}
\xtc{
But this limit does not.
}{
\spadpaste{complexLimit(sin(x)/x,x = \%infinity)}
}

9.0.98 Laplace Transforms

— ug08.ht —

```
\begin{page}{ugProblemLaplacePage}{8.7. Laplace Transforms}
\beginscroll
%
Axiom can compute some forward Laplace transforms, mostly
of elementary
functions
not involving logarithms, although some cases of
special functions are handled.
\xtc{
```

```
To compute the forward Laplace transform of \axiom{F(t)} with respect to
\axiom{t} and express the result as \axiom{f(s)}, issue the command
\axiom{laplace(F(t), t, s)}.
}{
\spadpaste{laplace(sin(a*t)*cosh(a*t)-cos(a*t)*sinh(a*t), t, s)}
}
\xtc{
Here are some other non-trivial examples.
}{
\spadpaste{laplace((exp(a*t) - exp(b*t))/t, t, s)}
}
\xtc{
}{
\spadpaste{laplace(2/t * (1 - cos(a*t)), t, s)}
}
\xtc{
}{
\spadpaste{laplace(exp(-a*t) * sin(b*t) / b**2, t, s)}
}
\xtc{
}{
\spadpaste{laplace((cos(a*t) - cos(b*t))/t, t, s)}
}
\xtc{
Axiom also knows about a few special functions.
}{
\spadpaste{laplace(exp(a*t+b)*Ei(c*t), t, s)}
}
\xtc{
}{
\spadpaste{laplace(a*Ci(b*t) + c*Si(d*t), t, s)}
}
\xtc{
When Axiom does not know about a particular transform,
it keeps it as a formal transform in the answer.
}{
\spadpaste{laplace(sin(a*t) - a*t*cos(a*t) + exp(t**2), t, s)}
}

9.0.99 Integration

⇒ “notitle” (ugxProblemSymRootAllPage) 9.0.91 on page 2085

— **ug08.ht** —

```
\begin{page}{ugProblemIntegrationPage}{8.8. Integration}
\beginscroll
%
Integration is the reverse process of differentiation, that is,
an {\it integral} of a function \axiom{f} with respect to a variable
\axiom{x} is any function \axiom{g} such that \axiom{D(g,x)}
is equal to \axiom{f}.
\xtc{
The package \axiomType{FunctionSpaceIntegration} provides the top-level
integration operation, \axiomFunFrom{integrate}{FunctionSpaceIntegration},
for integrating real-valued elementary functions.
}{
\spadpaste{integrate(cosh(a*x)*sinh(a*x), x)}
}
\xtc{
Unfortunately, antiderivatives of most functions cannot be expressed in
terms of elementary functions.
}{
\spadpaste{integrate(log(1 + sqrt(a * x + b)) / x, x)}
}
Given an elementary function to integrate, Axiom returns a formal
integral as above only when it can prove that the integral is not
elementary and not when it cannot determine the integral.
In this rare case it prints a message that it cannot
determine if an elementary integral exists.
%
\xtc{
Similar functions may have antiderivatives
that look quite different because the form of the antiderivative
depends on the sign of a constant that appears in the function.
}{
\spadpaste{integrate(1/(x**2 - 2),x)}
}
\xtc{
}{
\spadpaste{integrate(1/(x**2 + 2),x)}
}
%
If the integrand contains parameters, then there may be several possible
antiderivatives, depending on the signs of expressions of the parameters.
\xtc{
In this case Axiom returns a list of answers that cover all
the possible cases.
Here you
```

```
use the answer involving the square root of \axiom{a} when \axiom{a > 0} and
the answer involving the square root of \axiom{-a} when \axiom{a < 0}.
}{
\spadpaste{integrate(x**2 / (x**4 - a**2), x)}
}

If the parameters and the variables of integration can be complex
numbers rather than real, then the notion of sign is not defined.
In this case all the possible answers can be expressed as one
complex function.
To get that function, rather than a list of real functions, use
\axiomFunFrom{complexIntegrate}{FunctionSpaceComplexIntegration},
which is provided by the package
\axiomType{FunctionSpaceComplexIntegration}.

\xtc{
This operation is used for
integrating complex-valued elementary functions.
}{
\spadpaste{complexIntegrate(x**2 / (x**4 - a**2), x)}
}
\xtc{
As with the real case,
antiderivatives for most complex-valued functions cannot be expressed
in terms of elementary functions.
}{
\spadpaste{complexIntegrate(log(1 + sqrt(a * x + b)) / x, x)}
}

Sometimes \axiomFun{integrate} can involve symbolic algebraic numbers
such as those returned by \axiomFunFrom{rootOf}{Expression}.
To see how to work with these strange generated symbols (such as
\axiom{\%\%a0}), see
\downlink{``Using All Roots of a Polynomial''}{ugxProblemSymRootAllPage}
in Section 8.3.2\ignore{ugxProblemSymRootAll}.

Definite integration is the process of computing the area between the
\axiom{x}-axis and the curve of a function \axiom{f(x)}.  The
fundamental theorem of calculus states that if \axiom{f} is continuous
on an interval \axiom{a..b} and if there exists a function \axiom{g}
that is differentiable on \axiom{a..b} and such that \axiom{D(g, x)}
is equal to \axiom{f}, then the definite integral of \axiom{f} for
\axiom{x} in the interval \axiom{a..b} is equal to \axiom{g(b) -
g(a)}.

\xtc{
The package \axiomType{RationalFunctionDefiniteIntegration} provides
the top-level definite integration operation,
\axiomFunFrom{integrate}{RationalFunctionDefiniteIntegration},
for integrating real-valued rational functions.
```

```
}{
\spadpaste{integrate((x**4 - 3*x**2 + 6)/(x**6-5*x**4+5*x**2+4), x = 1..2)}
}
Axiom checks beforehand that the function you are integrating is
defined on the interval \axiom{a..b}, and prints an error message if it
finds that this is not case, as in the following example:
\begin{verbatim}
integrate(1/(x**2-2), x = 1..2)

    >> Error detected within library code:
       Pole in path of integration
       You are being returned to the top level
       of the interpreter.
\end{verbatim}
When parameters are present in the function, the function may or may not be
defined on the interval of integration.

\xtc{
If this is the case, Axiom issues a warning that a pole might
lie in the path of integration, and does not compute the integral.
}{
\spadpaste{integrate(1/(x**2-a), x = 1..2)}
}

If you know that you are using values of the parameter for which
the function has no pole in the interval of integration, use the
string {\tt "noPole"} as a third argument to
\axiomFunFrom{integrate}{RationalFunctionDefiniteIntegration}:

%
\xtc{
The value here is, of course, incorrect if \axiom{sqrt(a)} is between
\axiom{1} and \axiom{2.}
}{
\spadpaste{integrate(1/(x**2-a), x = 1..2, "noPole")}
}

%
Axiom has very sophisticated facilities for working with power
series.
Infinite series are represented by a list of the
coefficients that have already been determined, together with a
function for computing the additional coefficients if needed.
%
The system command that determines how many terms of a series is displayed
is \spadcmd{)set streams calculate}.
For the purposes of this book, we have used this system command to display
fewer than ten terms.
Series can be created from expressions, from functions for the
series coefficients, and from applications of operations on
existing series.
The most general function for creating a series is called
\axiomFun{series}, although you can also use \axiomFun{taylor},
\axiomFun{laurent} and \axiomFun{puiseux} in situations where you
know what kind of exponents are involved.

For information about solving differential equations in terms of
power series, see
\downlink{``Power Series Solutions of Differential Equations''}
{ugxProblemDEQSeriesPage} in
Section 8.10.3\ignore{ugxProblemDEQSeries}.

```
\begin{page}{ugxProblemSeriesCreatePage}{8.9.1. Creation of Power Series}
\beginscroll

\labelSpace{4pc}
\xtc{
This is the easiest way to create a power series.
This tells Axiom that \axiom{x} is to be treated as a power series,
so functions of \axiom{x} are again power series.
}{
\spadpaste{x := series 'x \bound{x}}
}
%
We didn't say anything about the coefficients of the power
series, so the coefficients are general expressions over the integers.
This allows us to introduce denominators, symbolic constants, and other
variables as needed.
\xtc{
Here the coefficients are integers (note that the coefficients
are the Fibonacci
numbers).
}{
\spadpaste{1/(1 - x - x**2) \free{x}}
}
\xtc{
This series has coefficients that are rational numbers.
}{
\spadpaste{sin(x) \free{x}}
}
\xtc{
When you enter this expression
you introduce the symbolic constants \axiom{sin(1)} and \axiom{cos(1).}
}{
\spadpaste{sin(1 + x) \free{x}}
}
\xtc{
When you enter the expression
the variable \axiom{a} appears in the resulting series expansion.
}{
\spadpaste{sin(a * x) \free{x}}
}
```

```
\xtc{
You can also convert an expression into a series expansion.
This expression creates the series expansion of \axiom{1/log(y)}
about \axiom{y = 1}.
For details and more examples, see
\downlink{``Converting to Power Series''}
{ugxProblemSeriesConversionsPage} in Section
8.9.5\ignore{ugxProblemSeriesConversions}.
}{
\spadpaste{series(1/log(y),y = 1)}
}

You can create power series with more general coefficients.
You normally accomplish this via a type declaration (see
\downlink{``Declarations''}{ugTypesDeclarePage} in Section
2.3\ignore{ugTypesDeclare}).
See
\downlink{``Functions on Power Series''}
{ugxProblemSeriesFunctionsPage}
in Section 8.9.4\ignore{ugxProblemSeriesFunctions}
for some warnings about working with declared series.

\xtc{
We declare that \axiom{y} is a one-variable Taylor series
(\axiomType{UTS} is the abbreviation for
\axiomType{UnivariateTaylorSeries})
in the variable \axiom{z} with \axiomType{FLOAT}
(that is, floating-point) coefficients, centered about \axiom{0.}
Then, by assignment, we obtain the Taylor expansion of
\axiom{exp(z)} with floating-point coefficients.
}{
\spadpaste{y : UTS(FLOAT,'z,0) := exp(z) \bound{y}}
}

You can also create a power series by giving an explicit formula
for its \eth{\axiom{n}} coefficient.
For details and more examples, see
\downlink{``Power Series from Formulas''}{ugxProblemSeriesFormulaPage}
in Section 8.9.6\ignore{ugxProblemSeriesFormula}.

\xtc{
To create a series about
\axiom{w = 0} whose \eth{\axiom{n}} Taylor coefficient
is \axiom{1/n!}, you can evaluate this expression.
This is the Taylor expansion of \axiom{exp(w)} at \axiom{w = 0}.
}{
\spadpaste{series(1/factorial(n),n,w = 0)}
}

9.0.102 Coefficients of Power Series

— ug08.ht —

```
\begin{page}{ugxProblemSeriesCoefficientsPage}
{8.9.2. Coefficients of Power Series}
\beginscroll

You can extract any coefficient from a power series---even one
that hasn't been computed yet.
This is possible because in Axiom, infinite series are
represented by a list of the coefficients that have already been
determined, together with a function for computing the additional
coefficients.
(This is known as {\it lazy evaluation}.) When you ask for a
coefficient that hasn't yet been computed, Axiom computes
whatever additional coefficients it needs and then stores them in
the representation of the power series.

\xtc{
Here's an example of how to extract the coefficients of a power series.
}{
\spadpaste{x := series(x) \bound{x}}
}
\xtc{
}{
\spadpaste{y := exp(x) * sin(x) \free{x} \bound{y}}
}
\xtc{
This coefficient is readily available.
}{
\spadpaste{coefficient(y,6) \free{y}}
}
\xtc{
But let's get the fifteenth coefficient of \axiom{y}.
}{
\spadpaste{coefficient(y,15) \free{y} \bound{y15}}
}
\xtc{
If you look at \axiom{y}
then you see that the coefficients up to order \axiom{15}
have all been computed.
}{
\spadpaste{y \free{y15}}
}

9.0.103 Power Series Arithmetic

— ug08.ht —

```
\begin{page}{ugxProblemSeriesArithmeticPage}
{8.9.3. Power Series Arithmetic}
\beginscroll

You can manipulate power series using the usual arithmetic operations
\axiomOpFrom{+}{UnivariatePuiseuxSeries},
\axiomOpFrom{-}{UnivariatePuiseuxSeries},
\axiomOpFrom{*}{UnivariatePuiseuxSeries}, and
\axiomOpFrom{/}{UnivariatePuiseuxSeries}.
%

\labelSpace{1pc}
\xtc{
The results of these operations are also power series.
}{
\spadpaste{x := series x \bound{x}}
}
\xtc{
}{
\spadpaste{(3 + x) / (1 + 7*x)}
}
\xtc{
You can also compute \axiom{f(x) ** g(x)}, where
\axiom{f(x)} and \axiom{g(x)}
are two power series.
}{
\spadpaste{base := 1 / (1 - x) \free{x} \bound{base}}
}
%
\xtc{
}{
\spadpaste{expon := x * base \free{x base} \bound{expon}}
}
%

9.0.104 Functions on Power Series

— ug08.ht —

```
\begin{page}{ugxProblemSeriesFunctionsPage}
{8.9.4. Functions on Power Series}
\beginscroll

Once you have created a power series, you can apply transcendental
functions
(for example, \axiomFun{exp}, \axiomFun{log},
\axiomFun{sin}, \axiomFun{tan},
\axiomFun{cosh}, etc.) to it.

\labelSpace{1pc}
%
\xtc{
To demonstrate this, we first create the power series
expansion of the rational function
\texht{
${\displaystyle x^2} \over {\displaystyle 1 - 6x + x^2}$
}{
\axiom{x**2/(1 - 6*x + x**2)}
}
about \axiom{x = 0}.
}{
\spadpaste{x := series 'x \bound{x}}
}
%
\xtc{
}{
\spadpaste{rat := x**2 / (1 - 6*x + x**2) \free{x} \bound{rat}}
}
%
%
\xtc{
If you want to compute the series expansion of
\texht{
$\sin\left({\displaystyle x^2} \over {\displaystyle 1 - 6x + x^2}\right)$
}{
\axiom{sin(x**2/(1 - 6*x + x**2))}
}
you simply compute the sine of \axiom{rat}.
}{
\spadpaste{sin(rat) \free{rat}}
}
%

\beginImportant
\noindent {\bf Warning:}
the type of the coefficients of a power series may
affect the kind of computations that you can do with that series.
This can only happen when you have made a declaration to
specify a series domain with a certain type of coefficient.
\endImportant

\xtc{
If you evaluate
then you have declared that \axiom{y} is a one variable Taylor series
(\axiomType{UTS} is the abbreviation for \axiomType{UnivariateTaylorSeries})
in the variable \axiom{y} with \axiomType{FRAC INT}
(that is, fractions of integer) coefficients, centered about \axiom{0}.
}{
\spadpaste{y : UTS(FRAC INT,y,0) := y \bound{y}}
}
%
\xtc{
You can now compute certain power series in \axiom{y},
{\it provided} that these series have rational coefficients.
}{
\spadpaste{exp(y) \free{y}}
```

```
}
%
\xtc{
You can get examples of such series
by applying transcendental functions to
series in \axiom{y} that have no constant terms.
}{
\spadpaste{tan(y**2) \free{y}}
}
%
\xtc{
}{
\spadpaste{cos(y + y**5) \free{y}}
}
%
%
\xtc{
Similarly, you can compute the logarithm of a power series with rational
coefficients if the constant coefficient is \axiom{1.}
}{
\spadpaste{log(1 + sin(y)) \free{y}}
}
%
If you wanted to apply, say, the operation \axiomFun{exp} to a power
series with a nonzero constant coefficient \texht{$a_0$}{\axiom{a0}},
then the constant coefficient of the result would be
\texht{$e^{a_0}$}{\axiom{exp(a0)}}, which is {\it not} a rational number.
Therefore, evaluating \axiom{exp(2 + tan(y))} would generate an error
message.

If you want to compute the Taylor expansion of \axiom{exp(2 +
tan(y))}, you must ensure that the coefficient domain has an operation
\axiomFun{exp} defined for it.  An example of such a domain is
\axiomType{Expression Integer}, the type of formal functional
expressions over the integers.

\xtc{
When working with coefficients of this type,
}{
\spadpaste{z : UTS(EXPR INT,z,0) := z \bound{z}}
}
\xtc{
this presents no problems.
}{
\spadpaste{exp(2 + tan(z)) \free{z}}
}
%
Another way to create Taylor series whose coefficients are expressions over
the integers is to use \axiomFun{taylor} which works similarly to
\axiomFun{series}.
```

```
%
\xtc{
This is equivalent to the previous computation, except that now we
are using the variable \axiom{w} instead of \axiom{z}.
}{
\spadpaste{w := taylor 'w \bound{w}}
}
\xtc{
}{
\spadpaste{exp(2 + tan(w)) \free{w}}
}

9.0.105 Converting to Power Series

— ug08.ht —

```
\begin{page}{ugxProblemSeriesConversionsPage}
{8.9.5. Converting to Power Series}
\beginscroll

The \axiomType{ExpressionToUnivariatePowerSeries} package provides
operations for computing series expansions of functions.

\labelSpace{1pc}
\xtc{
Evaluate this
to compute the Taylor expansion of \axiom{sin x} about
\axiom{x = 0}.
The first argument, \axiom{sin(x)}, specifies the function whose series
expansion is to be computed and the second argument, \axiom{x = 0},
specifies that the series is to be expanded in power of \axiom{(x - 0)},
that is, in power of \axiom{x}.
}{
\spadpaste{taylor(sin(x),x = 0)}
}
\xtc{
Here is the Taylor expansion of \axiom{sin x} about
\texht{$x = \frac{\pi}{6}$}{\axiom{x = \%pi/6}}:
}{
\spadpaste{taylor(sin(x),x = \%pi/6)}
}

The function to be expanded into a series may have variables other than
the series variable.
%
\xtc{
For example, we may expand \axiom{tan(x*y)} as a Taylor series in
\axiom{x}
}{
\spadpaste{taylor(tan(x*y),x = 0)}
}
%
\xtc{
or as a Taylor series in \axiom{y}.
}{
\spadpaste{taylor(tan(x*y),y = 0)}
}
\xtc{
A more interesting function is
\texht{${\displaystyle t e^{x t}} \over
{\displaystyle e^t - 1}$}{(t * \%e**(x*t))/(\%e**t - 1)}.
When we expand this function as a Taylor series in \axiom{t}
the \eth{\axiom{n}} order coefficient is the \eth{\axiom{n}} Bernoulli
polynomial
divided by \axiom{n!}.
}{
\spadpaste{bern := taylor(t*exp(x*t)/(exp(t) - 1),t = 0) \bound{bern}}
}
\xtc{
Therefore, this and the next expression
produce the same result.
}{
\spadpaste{factorial(6) * coefficient(bern,6) \free{bern}}
}
\xtc{
}{
\spadpaste{bernoulliB(6,x)}
}

Technically, a series with terms of negative degree is not considered to
```

```
be a Taylor series, but, rather, a
{\it Laurent series}.
If you try to compute a Taylor series expansion of
\texht{$\frac{x}{\log x}$}{x/log(x)}
at \axiom{x = 1} via \axiom{taylor(x/log(x),x = 1)}
you get an error message.
The reason is that the function has a {\it pole} at \axiom{x =
1}, meaning that
its series expansion about this point has terms of negative degree.
A series with finitely many terms of negative degree is called a Laurent
series.
\xtc{
You get the desired series expansion by issuing this.
}{
\spadpaste{laurent(x/log(x),x = 1)}
}

Similarly, a series with terms of fractional degree is neither a
Taylor series nor a Laurent series.  Such a series is called a {\it
Puiseux series}.  The expression \axiom{laurent(sqrt(sec(x)),x = 3 *
\%pi/2)} results in an error message because the series expansion
about this point has terms of fractional degree.

\xtc{
However, this command produces what you want.
}{
\spadpaste{puiseux(sqrt(sec(x)),x = 3 * \%pi/2)}
}

Finally, consider the case of functions that do not have Puiseux
expansions about certain points.  An example of this is
\texht{$x^x$}{\axiom{x^x}} about \axiom{x = 0}.
\axiom{puiseux(x**x,x=0)} produces an error message because of the
type of singularity of the function at \axiom{x = 0}.

\xtc{
The general function \axiomFun{series} can be used in this case.
Notice that the series returned is not, strictly speaking, a power series
because of the \axiom{log(x)} in the expansion.
}{
\spadpaste{series(x**x,x=0)}
}

\beginImportant
The operation \axiomFun{series} returns the most general type of
infinite series.
The user who is not interested in distinguishing
between various types of infinite series may wish to use this operation
exclusively.
\endImportant

— **ug08.ht** —

```
\begin{page}{ugxProblemSeriesFormulaPage}
{8.9.6. Power Series from Formulas}
\beginscroll

The \axiomType{GenerateUnivariatePowerSeries} package enables you to
create power series from explicit formulas for their \eth{\axiom{n}}
coefficients.  In what follows, we construct series expansions for
certain transcendental functions by giving formulas for their
coefficients.  You can also compute such series expansions directly
```

```
simply by specifying the function and the point about which the series
is to be expanded.  See
\downlink{``Converting to Power Series''}
{ugxProblemSeriesConversionsPage} in Section
8.9.5\ignore{ugxProblemSeriesConversions}
for more information.

Consider the Taylor expansion of \texht{$e^x$}{\axiom{\%e**x}}
about \axiom{x = 0}:
\texht{\narrowDisplay{%
\begin{array}{ccl}
e^x &=& \displaystyle 1 + x + \frac{x^2}{2} + \frac{x^3}{6} + \cdots \\ \\
    &=& \displaystyle\sum_{n=0}^\infty \frac{x^n}{n!}
\end{array}}%
}{
\begin{verbatim}
%e**x = 1 + x + x**2/2 + x**3/6 + ...
      = sum from n=0 to n=%infty of x**n / n!
\end{verbatim}
}
The \eth{\axiom{n}} Taylor coefficient is \axiom{1/n!}.
%
\xtc{
This is how you create this series in Axiom.
}{
\spadpaste{series(n +-> 1/factorial(n),x = 0)}
}

The first argument specifies a formula for the \eth{\axiom{n}}
coefficient by giving a function that maps \axiom{n} to \axiom{1/n!}.
The second argument specifies that the series is to be expanded in
powers of \axiom{(x - 0)}, that is, in powers of \axiom{x}.  Since we
did not specify an initial degree, the first term in the series was
the term of degree 0 (the constant term).  Note that the formula was
given as an anonymous function.  These are discussed in
\downlink{``Anonymous Functions''}{ugUserAnonPage} in Section
6.17\ignore{ugUserAnon}.

Consider the Taylor expansion of \axiom{log x} about \axiom{x = 1}:
\texht{\narrowDisplay{%
\begin{array}{ccl}
\log(x) &=& \displaystyle (x - 1) - \frac{(x - 1)^2}{2} +
\frac{(x - 1)^3}{3} - \cdots \\ \\
        &=& \displaystyle\sum_{n = 1}^\infty (-1)^{n-1} \frac{(x - 1)^n}{n}
\end{array}}%
}{
\begin{verbatim}
log x = (x - 1) - \(x - 1)^2/2 + (x - 1)^3/3 - ...
      = sum from n=1 to n=%infty of (-1)**(n-1) (x - 1)**n / n
\end{verbatim}
```

```
}
If you were to evaluate the expression
\axiom{series(n +-> (-1)**(n-1) / n, x = 1)}
you would get an error message because Axiom would try to
calculate a term of degree \axiom{0} and therefore divide by \axiom{0.}

\xtc{
Instead, evaluate this.
The third argument, \axiom{1..}, indicates that only terms of degree
\axiom{n = 1, ...} are to be computed.
}{
\spadpaste{series(n +-> (-1)**(n-1)/n,x = 1,1..)}
}
%

Next consider the Taylor expansion of an odd function, say,
\axiom{sin(x)}:
\begin{verbatim}
sin x = x - x**3/3! + x**5/5! - ...
\end{verbatim}
Here every other coefficient is zero and we would like to give an
explicit formula only for the odd Taylor coefficients.
%
\xtc{
This is one way to do it.  The third argument, \axiom{1..}, specifies
that the first term to be computed is the term of degree 1.  The
fourth argument, \axiom{2}, specifies that we increment by \axiom{2}
to find the degrees of subsequent terms, that is, the next term is of
degree \axiom{1 + 2}, the next of degree \axiom{1 + 2 + 2}, etc.
}{
\spadpaste{series(n +-> (-1)**((n-1)/2)/factorial(n),x = 0,1..,2)}
}
%

\xtc{
The initial degree and the increment do not have to be integers.
For example, this expression produces a series expansion of
\texht{$\sin(x^{\frac{1}{3}})$}{\axiom{sin(x**(1/3))}}.
}{
\spadpaste{series(n +-> (-1)**((3*n-1)/2)/factorial(3*n),x = 0,1/3..,2/3)}
}
\xtc{
While the increment must be positive, the initial degree may be negative.
This yields the Laurent expansion of \axiom{csc(x)} at
\axiom{x = 0}.
%
}{
\spadpaste{cscx :=
series(n +-> (-1)**((n-1)/2) * 2 * (2**n-1) * bernoulli(numer(n+1))
/ factorial(n+1), x=0, -1..,2) \bound{cscx}}
```

```
}
\xtc{
Of course, the reciprocal of this power series is the Taylor expansion
of \axiom{sin(x)}.
}{
\spadpaste{1/cscx \free{cscx}}
}
%
\xtc{
As a final example,
here is the Taylor expansion of \axiom{asin(x)} about \axiom{x = 0}.
}{
\spadpaste{asinx := series(n +-> binomial(n-1,(n-1)/2)/(n*2**(n-1)),
x=0,1..,2) \bound{asinx}}
}
\xtc{
When we compute the \axiom{sin} of this series, we get \axiom{x}
(in the sense that all higher terms computed so far are zero).
}{
\spadpaste{sin(asinx) \free{asinx}}
}

As we discussed in
\downlink{``Converting to Power Series''}
{ugxProblemSeriesConversionsPage} in Section
8.9.5\ignore{ugxProblemSeriesConversions},
you can also use the operations \axiomFun{taylor}, \axiomFun{laurent} and
\axiomFun{puiseux} instead of \axiomFun{series} if you know ahead of time
what kind of exponents a series has.
You can't go wrong using \axiomFun{series}, though.

9.0.107 Substituting Numerical Values in Power Series

— ug08.ht —

```
\begin{page}{ugxProblemSeriesSubstitutePage}
{8.9.7. Substituting Numerical Values in Power Series}
\beginscroll

Use \axiomFunFrom{eval}{UnivariatePowerSeriesCategory}
to substitute a numerical value for a variable in
a power series.
For example, here's a way to obtain numerical approximations of
\axiom{\%e} from the Taylor series
expansion of \axiom{exp(x)}.

\labelSpace{1pc}
\xtc{
First you create the desired Taylor expansion.
}{
\spadpaste{f := taylor(exp(x)) \bound{f}}
}
\xtc{
Then you evaluate the series at the value \axiom{1.0}.
The result is a sequence of the partial sums.
}{
\spadpaste{eval(f,1.0)}
}
```

```

\begin{page}{ugxProblemSeriesBernoulliPage}
{8.9.8. Example: Bernoulli Polynomials and Sums of Powers}
\beginscroll

Axiom provides operations for computing definite and
indefinite sums.

\labelSpace{3pc}
\xtc{
You can compute the sum of the first
ten fourth powers by evaluating this.
This creates a list whose entries are
\texht{$m^4$}{\axiom{m**4}} as \texht{$m$}{\axiom{m}} ranges from 1
to 10, and then computes the sum of the entries of that list.
}{
\spadpaste{reduce(+,[m**4 for m in 1..10])}
}
\xtc{
You can also compute a formula for the sum of the first
\texht{$k$}{\axiom{k}} fourth powers, where \texht{$k$}{\axiom{k}} is an
unspecified positive integer.
}{
\spadpaste{sum4 := sum(m**4, m = 1..k) \bound{sum4}}
}
\xtc{
This formula is valid for any positive integer \texht{$k$}{\axiom{k}}.
For instance, if we replace \texht{$k$}{\axiom{k}} by 10,
we obtain the number we computed earlier.
}{
\spadpaste{eval(sum4, k = 10) \free{sum4}}
}

You can compute a formula for the sum of the first
\texht{$k$}{\axiom{k}} \eth{\axiom{n}} powers in a similar fashion.
Just replace the \axiom{4} in the definition of \userfun{sum4} by
any expression not involving \texht{$k$}{\axiom{k}}.
Axiom computes these formulas using Bernoulli polynomials;
we
use the rest of this section to describe this method.

%
\xtc{
First consider this function of \axiom{t} and \axiom{x}.
}{
\spadpaste{f := t*exp(x*t) / (exp(t) - 1) \bound{f}}
}
\noOutputXtc{
Since the expressions involved get quite large, we tell
Axiom to show us only terms of degree up to \axiom{5.}
}{
\spadpaste{)set streams calculate 5 \bound{set}}
}
%
%
\xtc{
If we look at the Taylor expansion of \axiom{f(x, t)} about \axiom{t = 0,}
we see that the coefficients of the powers of \axiom{t} are polynomials
in \axiom{x}.
}{
\spadpaste{ff := taylor(f,t = 0) \free{f set} \bound{ff}}
}

In fact, the \eth{\axiom{n}} coefficient in this series is essentially
the \eth{\axiom{n}} Bernoulli polynomial: the \eth{\axiom{n}}
coefficient of the series is
\texht{${1 \over {n!}} B_n(x)$}{\axiom{1/n! * Bn(x)}},
where \texht{$B_n(x)$}{\axiom{Bn(x)}}
is the \eth{\axiom{n}} Bernoulli polynomial.  Thus, to obtain the
\eth{\axiom{n}} Bernoulli polynomial, we multiply the \eth{\axiom{n}}
coefficient of the series \axiom{ff} by \axiom{n!}.

\xtc{
For example, the sixth Bernoulli polynomial is this.
}{
\spadpaste{factorial(6) * coefficient(ff,6) \free{ff}}
}
%
\xtc{
We derive some properties of the function \axiom{f(x,t)}.
First we compute \axiom{f(x + 1,t) - f(x,t)}.
}{
\spadpaste{g := eval(f, x = x + 1) - f \bound{g} \free{f}}
}
%
\xtc{
If we normalize \axiom{g}, we see that it has a particularly simple form.
}{
\spadpaste{normalize(g) \free{g}}
}
%
From this it follows that the \eth{\axiom{n}}
coefficient in the Taylor expansion of
\axiom{g(x,t)} at \axiom{t = 0} is
\texht{${1\over{(n-1)\:!}}\:x^{n-1}$}{\axiom{1/(n-1)! * x**(n-1)}}.
\xtc{
```

```
If you want to check this, evaluate the next expression.
}{
\spadpaste{taylor(g,t = 0) \free{g}}
}
%
However, since \axiom{g(x,t) = f(x+1,t)-f(x,t)}, it follows that the
\eth{\axiom{n}} coefficient is
\texht{${1 \over {n!}}\:(B_n(x+1)-B_n(x))$}{\axiom{1/n! * (Bn(x + 1) -
Bn(x))}}.
Equating coefficients, we see that
\texht{${1\over{(n-1)\:!}}\:x^{n-1} = {1\over{n!}}\:(B_n(x + 1) -
B_n(x))$}{\axiom{1/(n-1)! * x**(n-1) = 1/n! * (Bn(x + 1) - Bn(x))}}
and, therefore,
\texht{$x^{n-1} = {1\over{n}}\:(B_n(x + 1) -
B_n(x))$}{\axiom{x**(n-1) = 1/n * (Bn(x + 1) - Bn(x))}}.
%
Let's apply this formula repeatedly, letting \axiom{x} vary between two
integers \axiom{a} and \axiom{b}, with \axiom{a < b}:
%
\begin{verbatim}
  a**(n-1)        = 1/n * (Bn(a + 1) - Bn(a))
  (a + 1)**(n-1) = 1/n * (Bn(a + 2) - Bn(a + 1))
  (a + 2)**(n-1) = 1/n * (Bn(a + 3) - Bn(a + 2))
     .
     .
     .
  (b - 1)**(n-1) = 1/n * (Bn(b) - Bn(b - 1))
  b**(n-1)        = 1/n * (Bn(b + 1) - Bn(b))
\end{verbatim}

When we add these equations we find that
the sum of the left-hand sides is
\texht{$\sum_{m=a}^{b} m^{n-1},$}{\axiom{sum(m = a..b,m ** (n-1))},}%
the sum of the
\texht{$(n-1)^{\hbox{\small\rm st}}$}{\axiom{(n-1)}-st}
powers from \axiom{a} to \axiom{b}.
The sum of the right-hand sides is a ``telescoping series.''
After cancellation, the sum is simply
\texht{${1\over{n}}\:(B_n(b + 1) -
B_n(a))$}{\axiom{1/n * (Bn(b + 1) - Bn(a))}}.

Replacing \axiom{n} by \axiom{n + 1}, we have shown that
\centerline{{\axiom{sum(m = a..b,m ** n) = 1/(n + 1) *
(B<n+1>(b + 1) - B<n+1>(a))}.}}

Let's use this to obtain the formula for the sum of fourth powers.
\xtc{
First we obtain the Bernoulli polynomial \texht{$B_5$}{\axiom{B5}}.
}{
\spadpaste{B5 := factorial(5) * coefficient(ff,5) \free{ff} \bound{B5}}
```

```
}
%
\xtc{
To find the sum of the first \texht{$k$}{\axiom{k}} 4th powers,
we multiply \axiom{1/5} by
\texht{$B_5(k+1) - B_5(1)$}{\axiom{B5(k + 1) - B5(1)}}.
}{
\spadpaste{1/5 * (eval(B5, x = k + 1) - eval(B5, x = 1)) \free{B5}}
}
%
\xtc{
This is the same formula that we obtained via \axiom{sum(m**4, m = 1..k)}.
}{
\spadpaste{sum4 \free{sum4}}
}

At this point you may want to do the same computation, but with an
exponent other than \axiom{4.}
For example, you might try to find a formula for the sum of the
first \texht{$k$}{\axiom{k}} 20th powers.

%
In this section we discuss Axiom's facilities for
solving
differential equations in closed-form and in series.

Axiom provides facilities for closed-form solution of
single differential equations of the following kinds:
\indent{4}
\beginitems
\item[-] linear ordinary differential equations, and
\item[-] non-linear first order ordinary differential equations
when integrating factors can be found just by integration.
\enditems
\indent{0}
```

```
For a discussion of the solution of systems of linear and polynomial
equations, see
\downlink{``Solution of Linear and Polynomial Equations''}

9.0.110 Closed-Form Solutions of Linear Differential Equations

— ug08.ht —

```
\begin{page}{ugxProblemLDEQClosedPage}
{8.10.1. Closed-Form Solutions of Linear Differential Equations}
\beginscroll

A {\it differential equation} is an equation involving an unknown
{\it function} and one or more of its derivatives.  The equation is
called {\it ordinary} if derivatives with respect to only one dependent
variable appear in the equation (it is called {\it partial}
otherwise).  The package \axiomType{ElementaryFunctionODESolver}
provides the top-level operation \spadfun {solve} for finding
closed-form solutions of ordinary differential equations.

To solve a differential equation, you must first create an operator for
the unknown function.
%
\xtc{
We let \axiom{y} be the unknown function in terms of \axiom{x}.
}{
\spadpaste{y := operator 'y \bound{y}}
}
```

```
%
You then type the equation using \axiomFun{D} to create the
derivatives of the unknown function \axiom{y(x)} where \axiom{x} is any
symbol you choose (the so-called {\it dependent variable}).
%
\xtc{
This is how you enter
the equation \axiom{y'' + y' + y = 0}.
}{
\spadpaste{deq := D(y x, x, 2) + D(y x, x) + y x = 0\bound{e1}\free{y}}
}
%
The simplest way to invoke the \axiomFun{solve} command is with three
arguments.
\begin{items}
\item the differential equation,
\item the operator representing the unknown function,
\item the dependent variable.
\end{items}
%
\xtc{
So, to solve the above equation, we enter this.
}{
\spadpaste{solve(deq, y, x) \free{e1}\free{y}}
}
%
Since linear ordinary differential equations have infinitely many
solutions, \axiomFun{solve} returns a {\it particular solution}
\texht{$f_p$}{\axiom{f_p}}
and a basis
\texht{$f_1,\dots,f_n$}{\axiom{f1,...,fn}}
for the solutions of the corresponding homogenuous equation.
Any expression of the form
\texht{$f_p + c_1 f_1 + \dots c_n f_n$}{\axiom{fp + c1 f1 + ... + cn fn}}
where the \texht{$c_i$}{\axiom{ci}} do not involve
the dependent variable is also a solution.
This is similar to what you get when you solve systems of linear
algebraic equations.

A way to select a unique solution is to specify {\it initial
conditions}: choose a value \axiom{a} for the dependent variable
and specify the values of the unknown function and its derivatives
at \axiom{a}.
If the number of initial conditions is equal to the order of the
equation, then the solution is unique (if it exists in closed
form!) and \axiomFun{solve} tries to find it.
To specify initial conditions to \axiomFun{solve}, use an
\axiomType{Equation} of the form \axiom{x = a} for the third
parameter instead of the dependent variable, and add a fourth
parameter consisting of the list of values \axiom{y(a), y'(a), ...}.
```

```
\xtc{
To find the solution of \axiom{y'' + y = 0} satisfying \axiom{y(0) =
y'(0) = 1}, do this.
}{
\spadpaste{deq := D(y x, x, 2) + y x \bound{e2}\free{y}}
}
\xtc{
You can omit the \axiom{= 0} when you enter the equation to be solved.
}{
\spadpaste{solve(deq, y, x = 0, [1, 1]) \free{e2}\free{y}}
}
%

Axiom is not limited to linear differential equations with constant
coefficients.  It can also find solutions when the coefficients are
rational or algebraic functions of the dependent variable.
Furthermore, Axiom is not limited by the order of the equation.

\xtc{
Axiom can solve the following third order equations with
polynomial coefficients.
}{
\spadpaste{deq := x**3 * D(y x, x, 3) + x**2 * D(y x, x, 2) - 2 *
x * D(y x, x) + 2 * y x = 2 * x**4 \bound{e3}\free{y}}
}
\xtc{
}{
\spadpaste{solve(deq, y, x) \free{e3}\free{y}}
}
%
%
\xtc{
Here we are solving a homogeneous equation.
}{
\spadpaste{deq := (x**9+x**3) * D(y x, x, 3) + 18 * x**8 *
D(y x, x, 2) - 90 * x * D(y x, x) - 30 * (11 * x**6 - 3) * y x
\bound{e4}\free{y}}
}
\xtc{
}{
\spadpaste{solve(deq, y, x) \free{e4}\free{y}}
}

On the other hand, and in contrast with the operation
\axiomFun{integrate}, it can happen that Axiom finds no solution and
that some closed-form solution still exists.  While it is
mathematically complicated to describe exactly when the solutions are
guaranteed to be found, the following statements are correct and form
good guidelines for linear ordinary differential equations:
```

```
\begin{items}
\item If the coefficients are constants, Axiom finds a complete basis
of solutions (i,e, all solutions).
\item If the coefficients are rational functions in the dependent variable,
Axiom at least finds all solutions that do not involve algebraic
functions.
\end{items}
%
Note that this last statement does not mean that Axiom does not find
the solutions that are algebraic functions.
It means that it is not
guaranteed that the algebraic function solutions will be found.
%
\xtc{
This is an example where all the algebraic solutions are found.
}{
\spadpaste{deq := (x**2 + 1) * D(y x, x, 2) + 3 * x *
D(y x, x) + y x = 0 \bound{e5}\free{y}}
}
\xtc{
}{
\spadpaste{solve(deq, y, x) \free{e5}\free{y}}
}

9.0.111 Closed-Form Solutions of Non-Linear DEs

— ug08.ht —

```
\begin{page}{ugxProblemNLDEQClosedPage}
{8.10.2. Closed-Form Solutions of Non-Linear DEs}
\beginscroll

This is an example that shows how to solve a non-linear
first order ordinary differential equation manually when an integrating
factor can be found just by integration.
At the end, we show you how to solve it directly.

Let's solve the differential equation \axiom{y' = y / (x + y log y)}.
%
\xtc{
Using the notation
\axiom{m(x, y) + n(x, y) y' = 0},
we have \axiom{m = -y} and \axiom{n = x + y log y}.
}{
\spadpaste{m := -y \bound{m}}
}
\xtc{
}{
\spadpaste{n := x + y * log y \bound{n}}
}
%
\xtc{
We first check for exactness, that is, does \axiom{dm/dy = dn/dx}?
}{
\spadpaste{D(m, y) - D(n, x) \free{m n}}
}
%
This is not zero, so the equation is not exact.
Therefore we must look for
an integrating factor: a function \axiom{mu(x,y)} such that
\axiom{d(mu m)/dy = d(mu n)/dx}.
Normally, we first search for \axiom{mu(x,y)} depending only on
\axiom{x} or only on \axiom{y}.
%
\xtc{
Let's search for such a \axiom{mu(x)} first.
}{
\spadpaste{mu := operator 'mu \bound{mu}}
}
\xtc{
}{
\spadpaste{a := D(mu(x) * m, y) - D(mu(x) * n, x) \bound{a}\free{m n mu}}
}
```

```
%
%
\xtc{
If the above is zero for a function
\axiom{mu} that does {\it not} depend on \axiom{y}, then
\axiom{mu(x)} is an integrating factor.
}{
\spadpaste{solve(a = 0, mu, x) \free{mu a}}
}
%
The solution depends on \axiom{y}, so there is no integrating
factor that depends on \axiom{x} only.
%
\xtc{
Let's look for one that depends on \axiom{y} only.
}{
\spadpaste{b := D(mu(y) * m, y) - D(mu(y) * n, x) \bound{b}\free{mu m}}
}
\xtc{
}{
\spadpaste{sb := solve(b = 0, mu, y) \free{mu b}\bound{sb}}
}
\noindent
We've found one!
%
\xtc{
The above \axiom{mu(y)} is an integrating factor.
We must multiply our initial equation
(that is, \axiom{m} and \axiom{n}) by the integrating factor.
}{
\spadpaste{intFactor := sb.basis.1 \bound{intFactor}\free{sb}}
}
\xtc{
}{
\spadpaste{m := intFactor * m \bound{m1}\free{m intFactor}}
}
\xtc{
}{
\spadpaste{n := intFactor * n \bound{n1}\free{n intFactor}}
}
%
\xtc{
Let's check for exactness.
}{
\spadpaste{D(m, y) - D(n, x) \free{m1 n1}}
}
%
We must solve the exact equation, that is, find a function
\axiom{s(x,y)} such that
\axiom{ds/dx = m}  and \axiom{ds/dy = n}.
```

```
%
\xtc{
We start by writing \axiom{s(x, y) = h(y) + integrate(m, x)}
where \axiom{h(y)} is an unknown function of \axiom{y}.
This guarantees that \axiom{ds/dx = m}.
}{
\spadpaste{h := operator 'h \bound{h}}
}
\xtc{
}{
\spadpaste{sol := h y + integrate(m, x) \bound{sol}\free{h m1}}
}
%
%
\xtc{
All we want is to find \axiom{h(y)} such that
\axiom{ds/dy = n}.
}{
\spadpaste{dsol := D(sol, y) \free{sol}\bound{dsol}}
}
\xtc{
}{
\spadpaste{nsol := solve(dsol = n, h, y) \free{dsol n1 h}\bound{nsol}}
}
%
\xtc{
The above particular solution is the \axiom{h(y)} we want, so we just
replace \axiom{h(y)} by it in the implicit solution.
}{
\spadpaste{eval(sol, h y = nsol.particular) \free{sol h nsol}}
}
%
A first integral of the initial equation is obtained by setting
this result equal to an arbitrary constant.

Now that we've seen how to solve the equation ``by hand,''
we show you how to do it with the \axiomFun{solve} operation.
\xtc{
First define \axiom{y} to be an operator.
}{
\spadpaste{y := operator 'y \bound{y}}
}
\xtc{
Next we create the differential equation.
}{
\spadpaste{deq := D(y x, x) = y(x) / (x + y(x) * log y x)
\bound{deqi}\free{y}}
}
\xtc{
Finally, we solve it.
}{
\spadpaste{solve(deq, y, x) \free{deqi y}}
}

9.0.112 Power Series Solutions of Differential Equations

— ug08.ht —

```
\begin{page}{ugxProblemDEQSeriesPage}
{8.10.3. Power Series Solutions of Differential Equations}
\beginscroll

The command to solve differential equations in power
series
around
a particular initial point with specific initial conditions is called
\axiomFun{seriesSolve}.
It can take a variety of parameters, so we illustrate
its use with some examples.

\labelSpace{1pc}
\noOutputXtc{
Since the coefficients of some solutions
are quite large, we reset the default to compute only seven terms.
}{
\spadpaste{)set streams calculate 7 \bound{c7}}
}

You can solve a single nonlinear equation of any order. For example,
we solve  \axiom{y''' = sin(y'') * exp(y) + cos(x)}
subject to \axiom{y(0) = 1, y'(0) = 0, y''(0) = 0}.

\xtc{
We first tell Axiom
```

```
that the symbol \axiom{'y} denotes a new operator.
}{
\spadpaste{y := operator 'y \bound{y}}
}
\xtc{
Enter the differential equation using \axiom{y} like any system
function.
}{
\spadpaste{eq := D(y(x), x, 3) - sin(D(y(x), x, 2))*exp(y(x)) =
cos(x)\bound{eq}\free{y}}
}
%
\xtc{
Solve it around \axiom{x = 0} with the initial conditions
\axiom{y(0) = 1, y'(0) = y''(0) = 0}.
}{
\spadpaste{seriesSolve(eq, y, x = 0, [1, 0, 0])\free{y}\free{eq}\free{c7}}
}

You can also solve a system of nonlinear first order equations.
For example, we solve a system that has \axiom{tan(t)} and
\axiom{sec(t)} as solutions.

\xtc{
We tell Axiom that \axiom{x} is also an operator.
}{
\spadpaste{x := operator 'x\bound{x}}
}
\xtc{
Enter the two equations forming our system.
}{
\spadpaste{eq1 := D(x(t), t) = 1 + x(t)**2\free{x}\free{y}\bound{eq1}}
}
%
\xtc{
}{
\spadpaste{eq2 := D(y(t), t) = x(t) * y(t)\free{x}\free{y}\bound{eq2}}
}
%
\xtc{
Solve the system around \axiom{t = 0} with the initial conditions
\axiom{x(0) = 0} and \axiom{y(0) = 1}.
Notice that since we give the unknowns in the
order \axiom{[x, y]}, the answer is a list of two series in the order
\axiom{[series for x(t), series for y(t)]}.
}{
\spadpaste{seriesSolve([eq2, eq1], [x, y], t = 0,
[y(0) = 1, x(0) = 0])\free{x}\free{y}\free{eq1}\free{eq2}\free{c7}}
}
\noindent
```

```
The order in which we give the
equations and the initial conditions has no effect on the order of
the solution.

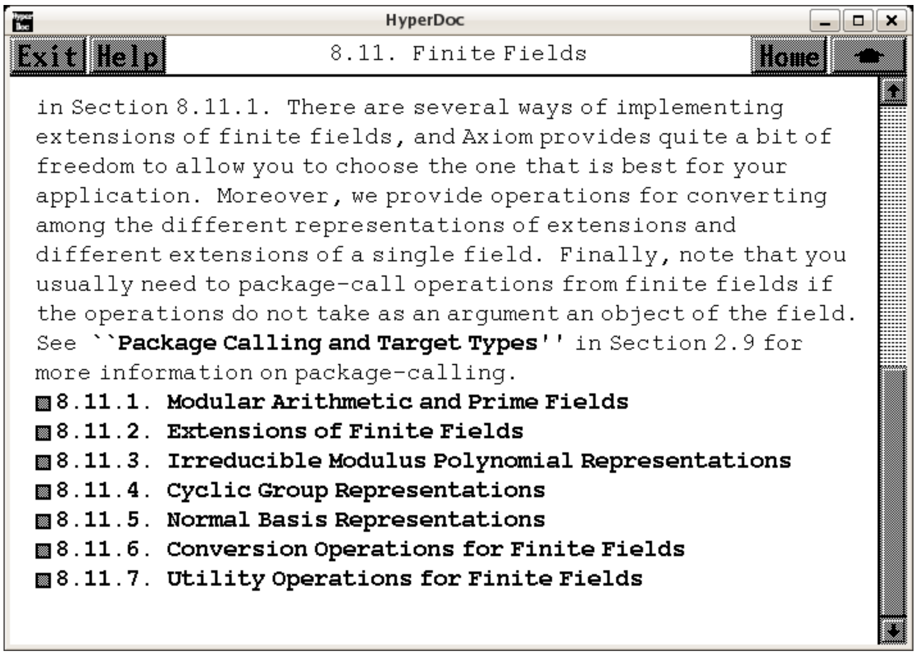
9.0.113 Finite Fields



in Section 8.11.1. There are several ways of implementing extensions of finite fields, and Axiom provides quite a bit of freedom to allow you to choose the one that is best for your application. Moreover, we provide operations for converting among the different representations of extensions and different extensions of a single field. Finally, note that you usually need to package-call operations from finite fields if the operations do not take as an argument an object of the field. See **``Package Calling and Target Types''** in Section 2.9 for more information on package-calling.

\begin{page}{ugProblemFinitePage}{8.11. Finite Fields}
\beginscroll
A {\it finite field} (also called a {\it Galois field}) is a
finite algebraic structure where one can add, multiply and divide
under the same laws (for example, commutativity, associativity or
distributivity) as apply to the rational, real or complex numbers.
Unlike those three fields, for any finite field there exists a
positive prime integer \smath{p}, called the
\axiomFun{characteristic}, such that
\texht{$p \: x = 0$}{\axiom{p * x = 0}}
for any element \smath{x} in the finite field.
In fact, the number of elements in a finite field is a power of
the characteristic and for each prime \smath{p} and positive
integer \smath{n} there exists exactly one finite field with
\texht{$p^n$}{\axiom{p**n}} elements, up to
isomorphism.\footnote{For more information about the algebraic
structure and properties of finite fields, see, for example, S.
Lang, {\it Algebra}, Second Edition, New York: Addison-Wesley
Publishing Company, Inc., 1984, ISBN 0 201 05487 6; or R.
Lidl, H.
Niederreiter, {\it Finite Fields}, Encyclopedia of Mathematics and
Its Applications, Vol.
20, Cambridge: Cambridge Univ.
Press, 1983, ISBN 0 521 30240 4.}

When \axiom{n = 1,} the field has \smath{p} elements and is
called a {\it prime field}, discussed in \texht{the next
section}{
\downlink{``Modular Arithmetic and Prime Fields''}
{ugxProblemFinitePrimePage}
in Section 8.11.1\ignore{ugxProblemFinitePrime}}.
There are several ways of implementing extensions of finite
fields, and Axiom provides quite a bit of freedom to allow
you to choose the one that is best for your application.
Moreover, we provide operations for converting among the different
representations of extensions and different extensions of a single
field.
Finally, note that you usually need to package-call operations
from finite fields if the operations do not take as an argument an
object of the field.
See \downlink{``Package Calling and Target Types''}
{ugTypesPkgCallPage} in Section 2.9\ignore{ugTypesPkgCall} for more
information on package-calling.

9.0.114 Modular Arithmetic and Prime Fields

— ug08.ht —

```
\begin{page}{ugxProblemFinitePrimePage}
{8.11.1. Modular Arithmetic and Prime Fields}
\beginscroll

Let \smath{n} be a positive integer.
It is well known that you can get the same result if you perform
addition, subtraction or multiplication of integers and then take
the remainder on dividing by \smath{n} as if
you had first done such remaindering on the operands, performed the
arithmetic and then (if necessary) done remaindering again.
This allows us to speak of arithmetic
{\it modulo} \smath{n} or, more simply
{\it mod} \smath{n}.
\xtc{
In Axiom, you use \axiomType{IntegerMod} to do such arithmetic.
}{
\spadpaste{(a,b) : IntegerMod 12 \bound{abdec}}
}
\xtc{
}{
\spadpaste{(a, b) := (16, 7) \free{abdec}\bound{a b}}
}
\xtc{
}{
\spadpaste{[a - b, a * b] \free{a b}}
}
\xtc{
```

```
If \smath{n} is not prime, there is only a limited notion of
reciprocals and division.
}{
\spadpaste{a / b \free{a b}}
}
\xtc{
}{
\spadpaste{recip a \free{a}}
}
\xtc{
Here \axiom{7} and \axiom{12} are relatively prime, so \axiom{7}
has a multiplicative inverse modulo \axiom{12}.
}{
\spadpaste{recip b \free{b}}
}

If we take \smath{n} to be a prime number \smath{p},
then taking inverses and, therefore, division are generally defined.
\xtc{
Use \axiomType{PrimeField} instead of \axiomType{IntegerMod}
for \smath{n} prime.
}{
\spadpaste{c : PrimeField 11 := 8 \bound{c}}
}
\xtc{
}{
\spadpaste{inv c \free{c}}
}
\xtc{
You can also use \axiom{1/c} and \axiom{c**(-1)} for the inverse of
\smath{c}.
}{
\spadpaste{9/c \free{c}}
}

\axiomType{PrimeField} (abbreviation \axiomType{PF}) checks if its
argument is prime when you try to use an operation from it.
If you know the argument is prime (particularly if it is large),
\axiomType{InnerPrimeField} (abbreviation \axiomType{IPF}) assumes
the argument has already been verified to be prime.
If you do use a number that is not prime, you will eventually get
an error message, most likely a division by zero message.
For computer science applications, the most important finite fields
are \axiomType{PrimeField 2} and its extensions.

\xtc{
In the following examples, we work with the finite field with
\smath{p = 101} elements.
}{
\spadpaste{GF101 := PF 101 \bound{GF101} }
```

```
}
\xtc{
Like many domains in Axiom, finite fields provide an operation
for returning a random element of the domain.
}{
\spadpaste{x := random()\$GF101 \bound{x}\free{GF101}}
}
\xtc{
}{
\spadpaste{y : GF101 := 37 \bound{y}\free{GF101}}
}
\xtc{
}{
\spadpaste{z := x/y \bound{z}\free{x y}}
}
\xtc{
}{
\spadpaste{z * y - x \free{x y z}}
}
%
\xtc{
The element \axiom{2} is a {\it primitive element} of this field,
}{
\spadpaste{pe := primitiveElement()\$GF101 \bound{pe}\free{GF101}}
}
%
\xtc{
in the sense that its powers enumerate all nonzero elements.
}{
\spadpaste{[pe**i for i in 0..99] \free{pe}}
}
%
%
\xtc{
If every nonzero element is a power of a primitive element, how do you
determine what the exponent is?
Use
\axiomFun{discreteLog}.
}{
\spadpaste{ex := discreteLog(y) \bound{ex}\free{y}}
}
\xtc{
}{
\spadpaste{pe ** ex \free{ex pe}}
}
%
\xtc{
The \axiomFun{order} of a nonzero element \smath{x} is the
smallest positive integer \smath{t} such
\texht{$x^t = 1$}{\axiom{x**t = 1}}.
```

```
}{
\spadpaste{order y \free{y}}
}
\xtc{
The order of a primitive element is the defining \smath{p-1}.
}{
\spadpaste{order pe \free{pe}}
}

9.0.115 Extensions of Finite Fields

— ug08.ht —

```
\begin{page}{ugxProblemFiniteExtensionFinitePage}
{8.11.2. Extensions of Finite Fields}
\beginscroll
```

```
When you want to work with an extension of a finite field in Axiom,
you have three choices to make:
\indent{4}
\beginitems
\item[1. ] Do you want to generate an extension of the prime field
(for example, \axiomType{PrimeField 2}) or an extension of a given field?
%
\item[2. ] Do you want to use a representation that is particularly
efficient for multiplication, exponentiation and addition but
uses a lot of computer memory (a representation that models the cyclic
group structure of the multiplicative group of the field extension
and uses a Zech logarithm table),  one that
uses a normal basis for the vector space structure of the field
extension, or one that performs arithmetic modulo an irreducible
polynomial?
The cyclic group representation is only usable up to ``medium''
(relative to your machine's performance)
sized fields.
If the field is large and the normal basis is relatively simple,
the normal basis representation is more efficient for exponentiation than
the irreducible polynomial representation.
%
\item[3. ] Do you want to provide a polynomial explicitly, a root of which
``generates'' the extension in one of the three senses in (2),
or do you wish to have the polynomial generated for you?
\enditems
\indent{0}

This illustrates one of the most important features of Axiom:
you can choose exactly the right data-type and representation to
suit your application best.

We first tell you what domain constructors to use for each case
above, and then give some examples.

\texht{\hangafter=1\hangindent=2pc}{\noindent}
Constructors that automatically generate extensions of the prime field:
\newline
\axiomType{FiniteField} \newline
\axiomType{FiniteFieldCyclicGroup} \newline
\axiomType{FiniteFieldNormalBasis}

\texht{\hangafter=1\hangindent=2pc}{\noindent}
Constructors that generate extensions of an arbitrary field:
\newline
\axiomType{FiniteFieldExtension} \newline
\axiomType{FiniteFieldExtensionByPolynomial} \newline
\axiomType{FiniteFieldCyclicGroupExtension} \newline
\axiomType{FiniteFieldCyclicGroupExtensionByPolynomial} \newline
```

```
\axiomType{FiniteFieldNormalBasisExtension} \newline
\axiomType{FiniteFieldNormalBasisExtensionByPolynomial}

\texht{\hangafter=1\hangindent=2pc}{\noindent}
Constructors that use a cyclic group representation:
\newline
\axiomType{FiniteFieldCyclicGroup} \newline
\axiomType{FiniteFieldCyclicGroupExtension} \newline
\axiomType{FiniteFieldCyclicGroupExtensionByPolynomial}

\texht{\hangafter=1\hangindent=2pc}{\noindent}
Constructors that use a normal basis representation:
\newline
\axiomType{FiniteFieldNormalBasis} \newline
\axiomType{FiniteFieldNormalBasisExtension} \newline
\axiomType{FiniteFieldNormalBasisExtensionByPolynomial}

\texht{\hangafter=1\hangindent=2pc}{\noindent}
Constructors that use an irreducible modulus polynomial representation:
\newline
\axiomType{FiniteField} \newline
\axiomType{FiniteFieldExtension} \newline
\axiomType{FiniteFieldExtensionByPolynomial}

\texht{\hangafter=1\hangindent=2pc}{\noindent}
Constructors that generate a polynomial for you:
\newline
\axiomType{FiniteField} \newline
\axiomType{FiniteFieldExtension} \newline
\axiomType{FiniteFieldCyclicGroup} \newline
\axiomType{FiniteFieldCyclicGroupExtension} \newline
\axiomType{FiniteFieldNormalBasis} \newline
\axiomType{FiniteFieldNormalBasisExtension}

\texht{\hangafter=1\hangindent=2pc}{\noindent}
Constructors for which you provide a polynomial:
\newline
\axiomType{FiniteFieldExtensionByPolynomial} \newline
\axiomType{FiniteFieldCyclicGroupExtensionByPolynomial} \newline
\axiomType{FiniteFieldNormalBasisExtensionByPolynomial}

These constructors are discussed in the following sections where
we collect together descriptions of extension fields that have the
same underlying representation.\footnote{For
more information on the implementation aspects of finite
fields, see
J. Grabmeier, A. Scheerhorn, {\it Finite Fields in AXIOM,}
Technical Report, IBM Heidelberg Scientific Center, 1992.}

If you don't really care about all this detail, just use
```

```
\axiomType{FiniteField}.
As your knowledge of your application and its Axiom implementation
grows, you can come back and choose an alternative constructor that
may improve the efficiency of your code.
Note that the exported operations are almost the same for all constructors
of finite field extensions and include the operations exported by
\axiomType{PrimeField}.

9.0.116 Irreducible Mod Polynomial Representations

⇒ “notitle” (ugxProblemFiniteExtensionFinitePage) 9.0.115 on page 2214

— **ug08.ht** —

```
\begin{page}{ugxProblemFiniteModulusPage}
{8.11.3. Irreducible Mod Polynomial Representations}
\beginscroll

All finite field extension constructors discussed in this
section
use a representation that performs arithmetic with univariate
(one-variable) polynomials modulo an irreducible polynomial.
This polynomial may be given explicitly by you or automatically
generated.
The ground field may be the prime field or one you specify.
See
\downlink{‘‘Extensions of Finite Fields’’}
{ugxProblemFiniteExtensionFinitePage} in Section 8.11.2
\ignore{ugxProblemFiniteExtensionFinite}
for general information about finite field extensions.

For \axiomType{FiniteField} (abbreviation \axiomType{FF}) you provide a
prime number \smath{p} and an extension degree \smath{n}.
This degree can be 1.
%
\xtc{
Axiom uses the prime field \axiomType{PrimeField(p)},
here \axiomType{PrimeField 2},
and it chooses an irreducible polynomial of degree \smath{n},
here 12, over the ground field.
}{
\spadpaste{GF4096 := FF(2,12); \bound{GF4096}}
}
%

The objects in the generated field extension are polynomials
of degree at most \smath{n-1} with coefficients in the
prime field.
The polynomial indeterminate is automatically chosen by Axiom and
is typically something like \axiom{\%A} or \axiom{\%D}.
These (strange) variables are {\it only} for output display;
there are several ways to construct elements of this field.

The operation \axiomFun{index} enumerates the elements of the field
extension and accepts as argument the integers from 1 to
\smath{p \texht{^}{**} n}.
%
\xtc{
The expression
\axiom{index(p)} always gives the indeterminate.
}{
\spadpaste{a := index(2)\$GF4096 \bound{a}\free{GF4096}}
}
%
%
\xtc{
You can build polynomials in \smath{a} and calculate in
\axiom{GF4096}.
}{
\spadpaste{b := a**12 - a**5 + a \bound{b}\free{a}}
}
\xtc{
}{
\spadpaste{b ** 1000 \free{b}}
}
\xtc{
}{
\spadpaste{c := a/b \free{a b}\bound{c}}
}
%
\xtc{
Among the available operations are \axiomFun{norm} and \axiomFun{trace}.
}{
\spadpaste{norm c \free{c}}
}
\xtc{
}{
\spadpaste{trace c \free{c}}
}
%
%
```

```
Since any nonzero element is a power of a primitive element, how
do we discover what the exponent is?
%
\xtc{
The operation \axiomFun{discreteLog} calculates
the exponent and,
if it is called with only one argument, always refers to the primitive
element returned by \axiomFun{primitiveElement}.
}{
\spadpaste{dL := discreteLog a \free{a}\bound{dL}}
}
\xtc{
}{
\spadpaste{g ** dL \free{dL g}}
}

\axiomType{FiniteFieldExtension} (abbreviation \axiomType{FFX}) is
similar to \axiomType{FiniteField} except that the
ground-field for \axiomType{FiniteFieldExtension} is arbitrary and
chosen by you.
%
\xtc{
In case you select the prime field as ground field, there is
essentially no difference between the constructed two finite field
extensions.
}{
\spadpaste{GF16 := FF(2,4); \bound{GF16}}
}
\xtc{
}{
\spadpaste{GF4096 := FFX(GF16,3); \bound{GF4096x}\free{GF16}}
}
\xtc{
}{
\spadpaste{r := (random()\$GF4096) ** 20 \free{GF4096x}\bound{r}}
}
\xtc{
}{
\spadpaste{norm(r) \free{r}}
}
%

\axiomType{FiniteFieldExtensionByPolynomial} (abbreviation \axiomType{FFP})
is similar to \axiomType{FiniteField} and \axiomType{FiniteFieldExtension}
but is more general.
%
\xtc{
}{
\spadpaste{GF4 := FF(2,2); \bound{GF4}}
}
```

```
\xtc{
}{
\spadpaste{f := nextIrreduciblePoly(random(6)\$FFPOLY(GF4))\$FFPOLY(GF4)
\free{GF4}\bound{f}}
}
\xtc{
For \axiomType{FFP} you choose both the
ground field and the irreducible polynomial used in the representation.
The degree of the extension is the degree of the polynomial.
}{
\spadpaste{GF4096 := FFP(GF4,f); \bound{GF4096y}\free{f GF4}}
}
\xtc{
}{
\spadpaste{discreteLog random()\$GF4096 \free{GF4096y}}
}
%

9.0.117 Cyclic Group Representations

⇒ "notitle" (ugxProblemFiniteUtilityPage) 9.0.120 on page 2248
— **ug08.ht** —

```
\begin{page}{ugxProblemFiniteCyclicPage}
{8.11.4. Cyclic Group Representations}
\beginscroll

In every finite field there exist elements whose powers are all the
nonzero elements of the field.
Such an element is called a {\it primitive element}.

In \axiomType{FiniteFieldCyclicGroup} (abbreviation \axiomType{FFCG})
the nonzero elements are represented by the powers of a fixed
primitive element of the field (that is, a generator of its cyclic
multiplicative group).  Multiplication (and hence exponentiation)
using this representation is easy.  To do addition, we consider our
primitive element as the root of a primitive polynomial (an
irreducible polynomial whose roots are all primitive).  See
\downlink{``Utility Operations for Finite Fields''}
{ugxProblemFiniteUtilityPage} in Section
8.11.7\ignore{ugxProblemFiniteUtility} for
examples of how to compute such a polynomial.

%
\xtc{
To use \axiomType{FiniteFieldCyclicGroup} you provide a prime number and an
extension degree.
}{
\spadpaste{GF81 := FFCG(3,4); \bound{GF81}}
}
%
%
\xtc{
Axiom uses the prime field, here \axiomType{PrimeField 3}, as the
ground field and it chooses a primitive polynomial of degree
\smath{n}, here 4, over the prime field.
}{
\spadpaste{a := primitiveElement()\$GF81 \bound{a}\free{GF81}}
}
%
%
\xtc{
You can calculate in \axiom{GF81}.
}{
\spadpaste{b  := a**12 - a**5 + a \bound{b}\free{a}}
}
%
```

```
\xtc{
In this representation of finite fields the discrete logarithm
of an element can be seen directly in its output form.
}{
\spadpaste{b \free{b}}
}
\xtc{
}{
\spadpaste{discreteLog b \free{b}}
}
%

\axiomType{FiniteFieldCyclicGroupExtension} (abbreviation
\axiomType{FFCGX}) is similar to \axiomType{FiniteFieldCyclicGroup}
except that the ground field for
\axiomType{FiniteFieldCyclicGroupExtension} is arbitrary and chosen
by you.
In case you select the prime field as ground field, there is
essentially no difference between the constructed two finite field
extensions.
%
\xtc{
}{
\spadpaste{GF9 := FF(3,2); \bound{GF9}}
}
\xtc{
}{
\spadpaste{GF729 := FFCGX(GF9,3); \bound{GF729}\free{GF9}}
}
\xtc{
}{
\spadpaste{r := (random()\$GF729) ** 20 \free{GF729}\bound{r}}
}
\xtc{
}{
\spadpaste{trace(r) \free{r}}
}
%

\axiomType{FiniteFieldCyclicGroupExtensionByPolynomial} (abbreviation
\axiomType{FFCGP}) is similar to \axiomType{FiniteFieldCyclicGroup}
and \axiomType{FiniteFieldCyclicGroupExtension} but is more general.
For \axiomType{FiniteFieldCyclicGroupExtensionByPolynomial} you choose
both the ground field and the irreducible polynomial used in the
representation.  The degree of the extension is the degree of the
polynomial.

\xtc{
}{
\spadpaste{GF3  := PrimeField 3; \bound{GF3}}
}
\xtc{
We use a utility operation to generate an irreducible primitive
polynomial (see
\downlink{``Utility Operations for Finite Fields''}
{ugxProblemFiniteUtilityPage}
in Section 8.11.7\ignore{ugxProblemFiniteUtility}).
The polynomial has one variable that is ``anonymous'': it displays
as a question mark.
}{
\spadpaste{f := createPrimitivePoly(4)\$FFPOLY(GF3) \bound{f}\free{GF3}}
}
\xtc{
}{
\spadpaste{GF81 := FFCGP(GF3,f); \bound{GF81x}\free{f GF3}}
}
\xtc{
Let's look at a random element from this field.
}{
\spadpaste{random()\$GF81 \free{GF81x}}

9.0.118 Normal Basis Representations

⇒ “notitle” (ugxProblemFiniteUtilityPage) 9.0.120 on page 2248

— **ug08.ht** —

```
\begin{page}{ugxProblemFiniteNormalPage}
{8.11.5. Normal Basis Representations}
\beginscroll
```

```
Let \smath{K} be a finite extension of degree \smath{n} of the
finite field \smath{F} and let \smath{F} have \smath{q}
elements.
An element \smath{x} of \smath{K} is said to be
{\it normal} over \smath{F} if the elements
\centerline{{\axiom{1, x**q, x**(q**2), ..., x**(q**(n-1))}}}
form a basis of \smath{K} as a vector space over \smath{F}.
Such a basis is called a {\it normal basis}.\footnote{This
agrees with the general definition of a normal basis because the
\smath{n} distinct powers of the automorphism
\texht{$x \mapsto x^q$}{\axiom{x +-> x**q}}
constitute the Galois group of \smath{K/F}.}

If \smath{x} is normal over \smath{F}, its minimal
polynomial is also said to be {\it normal} over \smath{F}.
There exist normal bases for all finite extensions of arbitrary
finite fields.

In \axiomType{FiniteFieldNormalBasis} (abbreviation
\axiomType{FFNB}), the elements of the finite field are represented
by coordinate vectors with respect to a normal basis.

\xtc{
You provide a prime \smath{p} and an extension degree
\smath{n}.
}{
\spadpaste{K := FFNB(3,8) \bound{K}}
}

Axiom uses the prime field \axiomType{PrimeField(p)}, here
\axiomType{PrimeField 3}, and it chooses a normal polynomial of degree
\smath{n}, here 8, over the ground field.  The remainder class of the
indeterminate is used as the normal element.  The polynomial
indeterminate is automatically chosen by Axiom and is typically
something like \axiom{\%A} or \axiom{\%D}.  These (strange) variables
are only for output display; there are several ways to construct
elements of this field.  The output of the basis elements is something
like
\texht{$\%A^{q^i}.$}{
\begin{verbatim}
   i
  q
%A  .
\end{verbatim}
}
%
\xtc{
}{
\spadpaste{a := normalElement()\$K \bound{a}\free{K}}
}
```

```
%
%
\xtc{
You can calculate in \smath{K} using \smath{a}.
}{
\spadpaste{b  := a**12 - a**5 + a \bound{b}\free{a}}
}

\axiomType{FiniteFieldNormalBasisExtension}
(abbreviation \axiomType{FFNBX}) is similar to
\axiomType{FiniteFieldNormalBasis}
except that the groundfield for
\axiomType{FiniteFieldNormalBasisExtension} is arbitrary and chosen
by you.  In case you select the prime field as ground field, there
is essentially no difference between the constructed two finite field
extensions.

\xtc{
}{
\spadpaste{GF9 := FFNB(3,2); \bound{GF9}}
}
\xtc{
}{
\spadpaste{GF729 := FFNBX(GF9,3); \bound{GF729}\free{GF9}}
}
\xtc{
}{
\spadpaste{r := random()\$GF729 \bound{r}\free{GF729}}
}
\xtc{
}{
\spadpaste{r + r**3 + r**9 + r**27 \free{r}}
}

\axiomType{FiniteFieldNormalBasisExtensionByPolynomial}
(abbreviation \axiomType{FFNBP}) is similar to
\axiomType{FiniteFieldNormalBasis} and
\axiomType{FiniteFieldNormalBasisExtension} but is more general.
For \axiomType{FiniteFieldNormalBasisExtensionByPolynomial} you
choose both the ground field and the irreducible polynomial used
in the representation.
The degree of the extension is the degree of the polynomial.

%
\xtc{
}{
\spadpaste{GF3 := PrimeField 3; \bound{GF3}}
}
\xtc{
We use a utility operation to generate an irreducible normal
polynomial (see
\downlink{``Utility Operations for Finite Fields''}
{ugxProblemFiniteUtilityPage}
in Section 8.11.7\ignore{ugxProblemFiniteUtility}).
The polynomial has one variable that is ``anonymous'': it displays
as a question mark.
}{
\spadpaste{f := createNormalPoly(4)\$FFPOLY(GF3) \free{GF3}\bound{f}}
}
\xtc{
}{
\spadpaste{GF81 := FFNBP(GF3,f); \bound{GF81}\free{f GF3}}
}
\xtc{
Let's look at a random element from this field.
}{
\spadpaste{r := random()\$GF81 \free{GF81}\bound{r1}}
}
\xtc{
}{
\spadpaste{r * r**3 * r**9 * r**27 \free{r1}}
}
\xtc{
}{
\spadpaste{norm r \free{r1}}
}

9.0.119 Conversion Operations for Finite Fields

⇒ "notitle" (ugxProblemFiniteExtensionFinitePage) 9.0.115 on page 2214
— **ug08.ht** —

```
\begin{page}{ugxProblemFiniteConversionPage}
{8.11.6. Conversion Operations for Finite Fields}
\beginscroll

\labelSpace{5pc}
%
\xtc{
Let \texht{$K$}{\axiom{K}} be a finite field.
}{
\spadpaste{K := PrimeField 3 \bound{K}}
}
%
An extension field \texht{$K_m$}{\axiom{Km}} of degree
\smath{m} over \texht{$K$}{\axiom{K}} is a subfield of an
extension field \texht{$K_n$}{\axiom{Kn}} of degree \smath{n}
over \texht{$K$}{\axiom{K}} if and only if \smath{m} divides
\smath{n}.
\texht{
\centerline{{\begin{tabular}{ccc}}}
\centerline{{$K_n$ }}
\centerline{{$|$ }}
\centerline{{$K_m$ & $\Longleftrightarrow$ & $m | n$ }}
\centerline{{$|$ }}
\centerline{{K}}
\centerline{{\end{tabular}}}
}{
\begin{verbatim}
Kn
|
Km   <==>  m | n
|
K
\end{verbatim}
}
\axiomType{FiniteFieldHomomorphisms} provides conversion operations
between different extensions of one
fixed finite ground field and between different representations of
these finite fields.
\xtc{
Let's choose \smath{m} and \smath{n},
}{
\spadpaste{(m,n) := (4,8) \bound{m n}}
}
\xtc{
```

```
build the field extensions,
}{
\spadpaste{Km := FiniteFieldExtension(K,m) \bound{Km}\free{K m}}
}
\xtc{
and pick two random elements from the smaller field.
}{
\spadpaste{Kn := FiniteFieldExtension(K,n) \bound{Kn}\free{K n}}
}
\xtc{
}{
\spadpaste{a1 := random()\$Km \bound{a1}\free{Km}}
}
\xtc{
}{
\spadpaste{b1 := random()\$Km \bound{b1}\free{Km}}
}
%
\xtc{
Since \smath{m} divides \smath{n},
\texht{$K_m$}{\axiom{Km}} is a subfield of \texht{$K_n$}{\axiom{Kn}}.
}{
\spadpaste{a2 := a1 :: Kn \bound{a2}\free{a1 Kn}}
}
\xtc{
Therefore we can convert the elements of \texht{$K_m$}{\axiom{Km}}
into elements of \texht{$K_n$}{\axiom{Kn}}.
}{
\spadpaste{b2 := b1 :: Kn \bound{b2}\free{b1 Kn}}
}
%
%
\xtc{
To check this, let's do some arithmetic.
}{
\spadpaste{a1+b1 - ((a2+b2) :: Km) \free{a1 a2 b1 b2 Km Kn}}
}
\xtc{
}{
\spadpaste{a1*b1 - ((a2*b2) :: Km) \free{a1 a2 b1 b2 Km Kn}}
}
%
There are also conversions available for the
situation, when \texht{$K_m$}{\axiom{Km}} and \texht{$K_n$}{\axiom{Kn}}
are represented in different ways (see
\downlink{``Extensions of Finite Fields''}
{ugxProblemFiniteExtensionFinitePage} in Section 8.11.2
\ignore{ugxProblemFiniteExtensionFinite}).
For example let's choose \texht{$K_m$}{\axiom{Km}} where the
representation is 0 plus the cyclic multiplicative group and
```

```
\texht{$K_n$}{\axiom{Kn}} with a normal basis representation.
\xtc{
}{
\spadpaste{Km := FFCGX(K,m) \bound{Km2}\free{K m}}
}
\xtc{
}{
\spadpaste{Kn := FFNBX(K,n) \bound{Kn2}\free{K n}}
}
\xtc{
}{
\spadpaste{(a1,b1) := (random()\$Km,random()\$Km)
\bound{a12 b12}\free{Km2}}
}
\xtc{
}{
\spadpaste{a2 := a1 :: Kn \bound{a22}\free{a12 Kn2}}
}
\xtc{
}{
\spadpaste{b2 := b1 :: Kn \bound{b22}\free{b12 Kn2}}
}
%
\xtc{
Check the arithmetic again.
}{
\spadpaste{a1+b1 - ((a2+b2) :: Km) \free{a12 a22 b12 b22 Km2}}
}
\xtc{
}{
\spadpaste{a1*b1 - ((a2*b2) :: Km) \free{a12 a22 b12 b22 Km2}}
}

9.0.120 Utility Operations for Finite Fields

— **ug08.ht** —

```
\begin{page}{ugxProblemFiniteUtilityPage}
{8.11.7. Utility Operations for Finite Fields}
\beginscroll

\axiomType{FiniteFieldPolynomialPackage} (abbreviation
\axiomType{FFPOLY})
provides operations for generating, counting and testing polynomials
over finite fields. Let’s start with a couple of definitions:
\indent{4}
\beginitems
\item[-] A polynomial is {\it primitive} if its roots are primitive
elements in an extension of the coefficient field of degree equal
to the degree of the polynomial.
\item[-] A polynomial is {\it normal} over its coefficient field
if its roots are linearly independent
elements in an extension of the coefficient field of degree equal
to the degree of the polynomial.
\enditems
```

```
\indent{0}
In what follows, many of the generated polynomials have one
‘‘anonymous’’ variable.
This indeterminate is displayed as a question mark (\spadSyntax{?}).

\xtc{
To fix ideas, let’s use the field with five elements for the first
few examples.
}{
\spadpaste{GF5 := PF 5; \bound{GF5}}
}
%
%
\xtc{
You can generate irreducible polynomials of any (positive) degree
(within the storage capabilities of the computer and your ability
to wait) by using
\axiomFunFrom{createIrreduciblePoly}{FiniteFieldPolynomialPackage}.
}{
\spadpaste{f := createIrreduciblePoly(8)\$FFPOLY(GF5) \bound{f}\free{GF5}}
}
%
\xtc{
Does this polynomial have other important properties? Use
\axiomFun{primitive?} to test whether it is a primitive polynomial.
}{
\spadpaste{primitive?(f)\$FFPOLY(GF5) \free{f}}
}
\xtc{
Use \axiomFun{normal?} to test whether it is a normal polynomial.
}{
\spadpaste{normal?(f)\$FFPOLY(GF5) \free{f}}
}
\noindent
Note that this is actually a trivial case,
because a normal polynomial of degree \smath{n}
must have a nonzero term of degree \smath{n-1}.
We will refer back to this later.

\xtc{
To get a primitive polynomial of degree 8 just issue this.
}{
\spadpaste{p := createPrimitivePoly(8)\$FFPOLY(GF5) \bound{p}\free{GF5}}
}
\xtc{
}{
\spadpaste{primitive?(p)\$FFPOLY(GF5) \free{p}}
}
\xtc{
This polynomial is not normal,
}{
\spadpaste{normal?(p)\$FFPOLY(GF5) \free{p}}
}
\xtc{
but if you want a normal one simply write this.
}{
\spadpaste{n := createNormalPoly(8)\$FFPOLY(GF5) \bound{n} \free{GF5}}
}
\xtc{
This polynomial is not primitive!
}{
\spadpaste{primitive?(n)\$FFPOLY(GF5) \free{n}}
}
This could have been seen directly, as
the constant term is 1 here, which is not a primitive
element up to the factor (\axiom{-1}) raised to the degree of the
polynomial.\footnote{Cf. Lidl, R. \& Niederreiter,
H., {\it Finite Fields,} Encycl. of Math. 20, (Addison-Wesley, 1983),
p.90, Th. 3.18.}

What about
polynomials that are both primitive and normal?
The existence of such a polynomial is by no means obvious.
\footnote{The existence of such polynomials is proved in
Lenstra, H. W. \& Schoof, R. J., {\it Primitive
Normal Bases for Finite Fields,} Math. Comp. 48, 1987, pp. 217-231.}
%
\xtc{
If you really need one use either
\axiomFunFrom{createPrimitiveNormalPoly}{FiniteFieldPolynomialPackage} or
\axiomFunFrom{createNormalPrimitivePoly}{FiniteFieldPolynomialPackage}.
}{
\spadpaste{createPrimitiveNormalPoly(8)\$FFPOLY(GF5) \free{GF5}}
}
%

If you want to obtain additional polynomials of the various types above
as given by the {\bf create...} operations above, you can use the {\bf
next...} operations.
For instance,
\axiomFunFrom{nextIrreduciblePoly}{FiniteFieldPolynomialPackage} yields
the next monic irreducible polynomial with the same degree as the input
polynomial.
By ``next'' we mean ``next in a natural order using the terms and
coefficients.''
This will become more clear in the following examples.

\xtc{
This is the field with five elements.
}{
```

```
\spadpaste{GF5 := PF 5; \bound{GF5}}
}
%
\xtc{
Our first example irreducible polynomial, say
of degree 3, must be ``greater'' than this.
}{
\spadpaste{h := monomial(1,8)\$SUP(GF5) \bound{h}\free{GF5}}
}
\xtc{
You can generate it by doing this.
}{
\spadpaste{nh := nextIrreduciblePoly(h)\$FFPOLY(GF5) \bound{nh}\free{h}}
}
%
\xtc{
Notice that this polynomial is not the same as the one
\axiomFunFrom{createIrreduciblePoly}{FiniteFieldPolynomialPackage}.
}{
\spadpaste{createIrreduciblePoly(3)\$FFPOLY(GF5) \free{GF5}}
}
\xtc{
You can step through all irreducible polynomials of degree 8 over
the field with 5 elements by repeatedly issuing this.
}{
\spadpaste{nh := nextIrreduciblePoly(nh)\$FFPOLY(GF5) \free{nh}}
}
\xtc{
You could also ask for the total number of these.
}{
\spadpaste{numberOfIrreduciblePoly(5)\$FFPOLY(GF5) \free{GF5}}
}

We hope that ``natural order'' on polynomials is now clear:
first we compare the number of monomials of
two polynomials (``more'' is ``greater'');
then, if necessary, the degrees of these monomials (lexicographically),
and lastly their coefficients (also
lexicographically, and using the operation \axiomFun{lookup} if
our field is not a prime field).
Also note that we make both polynomials monic before looking at the
coefficients:
multiplying either polynomial  by a nonzero constant
produces the same result.

%
\xtc{
The package
\axiomType{FiniteFieldPolynomialPackage} also provides similar
operations for primitive and normal polynomials. With
```

```
the exception of the number of primitive normal polynomials;
we're not aware of any known formula for this.
}{
\spadpaste{numberOfPrimitivePoly(3)\$FFPOLY(GF5) \free{GF5}}
}
%
%
\xtc{
Take these,
}{
\spadpaste{m := monomial(1,1)\$SUP(GF5) \bound{m}\free{GF5}}
}
\xtc{
}{
\spadpaste{f := m**3 + 4*m**2 + m + 2 \bound{fx}\free{m}}
}
%
%
\xtc{
and then we have:
}{
\spadpaste{f1 := nextPrimitivePoly(f)\$FFPOLY(GF5) \free{fx}\bound{f1}}
}
\xtc{
What happened?
}{
\spadpaste{nextPrimitivePoly(f1)\$FFPOLY(GF5) \free{f1}}
}
%
Well, for the ordering used in
\axiomFunFrom{nextPrimitivePoly}{FiniteFieldPolynomialPackage} we
use as first criterion a comparison of the constant terms of the
polynomials.
Analogously, in
\axiomFunFrom{nextNormalPoly}{FiniteFieldPolynomialPackage} we first
compare the monomials of degree 1 less than the degree of the
polynomials (which is nonzero, by an earlier remark).
%
\xtc{
}{
\spadpaste{f := m**3 + m**2 + 4*m + 1 \bound{fy} \free{m}}
}
\xtc{
}{
\spadpaste{f1 := nextNormalPoly(f)\$FFPOLY(GF5) \free{fy}\bound{f1y}}
}
\xtc{
}{
\spadpaste{nextNormalPoly(f1)\$FFPOLY(GF5) \free{f1y}}
}
```

```
%
\noindent
We don't have to restrict ourselves to prime fields.
%
\xtc{
Let's consider, say, a field with 16 elements.
}{
\spadpaste{GF16 := FFX(FFX(PF 2,2),2); \bound{GF16} }
}
%
%
\xtc{
We can apply any of the operations described above.
}{
\spadpaste{createIrreduciblePoly(5)\$FFPOLY(GF16) \free{GF16}}
}

\xtc{
Axiom also provides operations
for producing random polynomials of a given degree
}{
\spadpaste{random(5)\$FFPOLY(GF16) \free{GF16}}
}
\xtc{
or with degree between two given bounds.
}{
\spadpaste{random(3,9)\$FFPOLY(GF16) \free{GF16}}
}

\axiomType{\axiom{FiniteFieldPolynomialPackage2}} (abbreviation
\axiomType{FFPOLY2})
exports an operation \axiomFun{rootOfIrreduciblePoly}
for finding one root of an irreducible polynomial \axiom{f}
in an extension field of the coefficient field.
The degree of the extension has to be a multiple of the degree of \axiom{f}.
It is not checked whether \axiom{f} actually is irreducible.

%
\xtc{
To illustrate this operation, we fix a ground field \axiom{GF}
}{
\spadpaste{GF2 := PrimeField 2; \bound{GF2}}
}
%
%
\xtc{
and then an extension field.
}{
\spadpaste{F := FFX(GF2,12) \bound{F}\free{GF2}}
}
```

```
%
%
\xtc{
We construct an irreducible polynomial over \axiom{GF2}.
}{
\spadpaste{f := createIrreduciblePoly(6)\$FFPOLY(GF2)
\bound{fz}\free{GF2}}
}
%
%
\xtc{
We compute a root of \axiom{f}.
}{
\spadpaste{root := rootOfIrreduciblePoly(f)\$FFPOLY2(F,GF2)
\free{F GF2 fz}\bound{root}}
}
%
%and check the result
%\spadcommand{eval(f, monomial(1,1)\$SUP(F) = root) \free{fz F root}}

9.0.121 Primary Decomposition of Ideals

— ug08.ht —

```
\begin{page}{ugProblemIdealPage}{8.12. Primary Decomposition of Ideals}
\beginscroll

Axiom provides a facility for
the primary decomposition of polynomial ideals over fields of
characteristic zero.  The algorithm
and works in essentially two steps:
\indent{4}
\beginitems
\item[1. ] the problem is solved for 0-dimensional ideals by ``generic''
projection on the last coordinate
\item[2. ] a ``reduction process''
uses localization and ideal quotients to reduce the general case to
the 0-dimensional one.
\enditems
\indent{0}

The Axiom constructor
\axiomType{PolynomialIdeals} represents ideals with coefficients in
any field and supports the basic ideal operations, including
intersection, sum and quotient.  \axiomType{IdealDecompositionPackage}
contains the specific operations for the primary decomposition and the
computation of the radical of an ideal with polynomial coefficients in
a field of characteristic 0 with an effective algorithm for factoring
polynomials.

The following examples illustrate the capabilities of this facility.
%
\xtc{
First consider the ideal generated by
\texht{$x^2 + y^2 - 1$}{\axiom{x**2 + y**2 - 1}}
```

```
(which defines a circle in the \axiom{(x,y)}-plane) and the ideal
generated by \texht{$x^2 - y^2$}{\axiom{x**2 - y**2}} (corresponding to the
straight lines \axiom{x = y} and \axiom{x = -y}.
}{
\spadpaste{(n,m) : List DMP([x,y],FRAC INT) \bound{nm}}
}
\xtc{
}{
\spadpaste{m := [x**2+y**2-1] \free{nm} \bound{m}}
}
\xtc{
}{
\spadpaste{n := [x**2-y**2] \free{nm} \bound{n}}
}
%
%
\xtc{
We find the equations defining the intersection of the two loci.
This correspond to the sum of the associated ideals.
}{
\spadpaste{id := ideal m  + ideal n \free{n m} \bound{id}}
}
%
%
\xtc{
We can check if the locus contains only a finite number of points,
that is, if the ideal is zero-dimensional.
}{
\spadpaste{zeroDim? id \free{id}}
}
\xtc{
}{
\spadpaste{zeroDim?(ideal m) \free{m}}
}
\xtc{
}{
\spadpaste{dimension ideal m \free{m}}
}
\xtc{
We can find polynomial relations among the generators
(\axiom{f} and \axiom{g} are the parametric equations of the knot).
}{
\spadpaste{(f,g):DMP([x,y],FRAC INT) \bound{fg}}
}
\xtc{
}{
\spadpaste{f := x**2-1 \free{fg} \bound{f}}
}
\xtc{
}{
```

```
\spadpaste{g := x*(x**2-1) \free{fg} \bound{g}}
}
\xtc{
}{
\spadpaste{relationsIdeal [f,g] \free{f g}}
}

\xtc{
We can compute the primary decomposition of an ideal.
}{
\spadpaste{l: List DMP([x,y,z],FRAC INT) \bound{ll}}
}
\xtc{
}{
\spadpaste{l:=[x**2+2*y**2,x*z**2-y*z,z**2-4] \free{ll} \bound{l}}
}
\xtc{
}{
\spadpaste{ld:=primaryDecomp ideal l \free{l} \bound{ld}}
}
\xtc{
We can intersect back.
}{
\spadpaste{reduce(intersect,ld) \free{ld}}
}

\xtc{
We can compute the radical of every primary component.
}{
\spadpaste{reduce(intersect,[radical ld.i for i in 1..2]) \free{ld}}
}
\xtc{
Their intersection is equal to the radical of the ideal of \axiom{l}.
}{
\spadpaste{radical ideal l \free{l}}
}

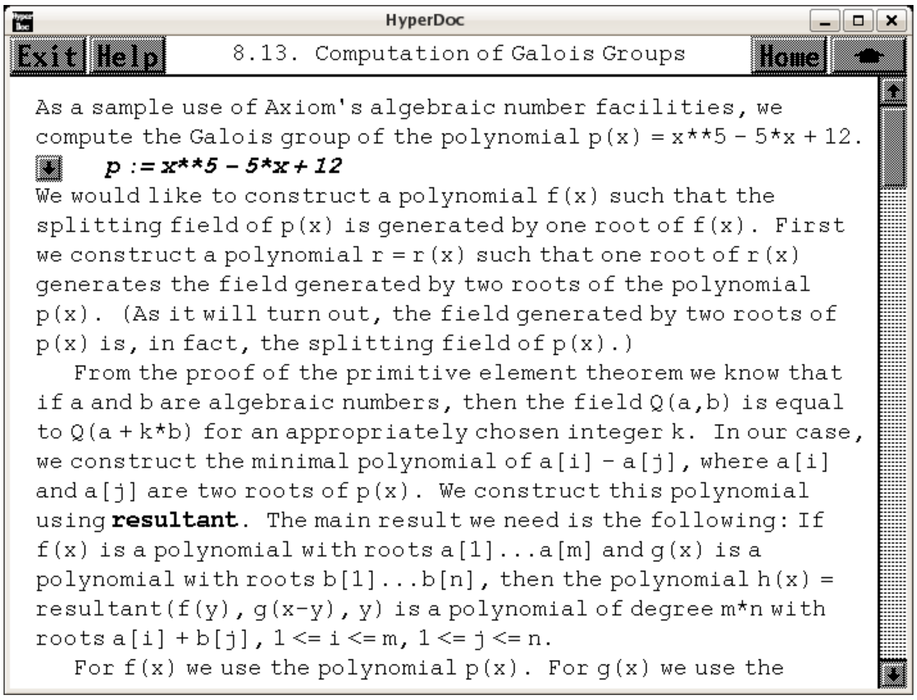
9.0.122 Computation of Galois Groups



As a sample use of Axiom's algebraic number facilities, we compute the Galois group of the polynomial p(x) = x**5 - 5*x + 12.

```
p := x**5 - 5*x + 12
```

We would like to construct a polynomial f(x) such that the splitting field of p(x) is generated by one root of f(x). First we construct a polynomial r = r(x) such that one root of r(x) generates the field generated by two roots of the polynomial p(x). (As it will turn out, the field generated by two roots of p(x) is, in fact, the splitting field of p(x).)

From the proof of the primitive element theorem we know that if a and b are algebraic numbers, then the field Q(a,b) is equal to Q(a + k*b) for an appropriately chosen integer k. In our case, we construct the minimal polynomial of a[i] - a[j], where a[i] and a[j] are two roots of p(x). We construct this polynomial using **resultant**. The main result we need is the following: If f(x) is a polynomial with roots a[1]...a[m] and g(x) is a polynomial with roots b[1]...b[n], then the polynomial h(x) = resultant(f(y), g(x-y), y) is a polynomial of degree m*n with roots a[i] + b[j], 1 <= i <= m, 1 <= j <= n.

For f(x) we use the polynomial p(x). For g(x) we use the

```
\begin{page}{ugProblemGaloisPage}{8.13. Computation of Galois Groups}
\beginscroll
%
As a sample use of Axiom's algebraic number facilities,
we compute
the Galois group of the polynomial
\texht{$p(x) = x^5 - 5 x + 12$}{\axiom{p(x) = x**5 - 5*x + 12}}.
%
\xtc{
}{
\spadpaste{p := x**5 - 5*x + 12 \bound{p}}
}
%
We would like to construct a polynomial \smath{f(x)}
such that the splitting
field
of \smath{p(x)} is generated by one root of \smath{f(x)}.
First we construct a polynomial \smath{r = r(x)} such that one
```

```
root of \smath{r(x)} generates the field generated by two roots of
the polynomial \smath{p(x)}.
(As it will turn out, the field generated by two roots of
\smath{p(x)} is, in fact, the splitting field of
\smath{p(x)}.)

From the proof of the primitive element theorem we know that
if \smath{a} and \smath{b} are
algebraic numbers, then the field
\texht{${\bf Q}(a,b)$}{\axiom{Q(a,b)}} is equal to
\texht{${\bf Q}(a+kb)$}{\axiom{Q(a + k*b)}} for an
appropriately chosen integer \smath{k}.
In our case, we construct the minimal polynomial of
\texht{$a_i - a_j$}{\axiom{a[i] - a[j]}}, where
\texht{$a_i$}{\axiom{a[i]}} and
\texht{$a_j$}{\axiom{a[j]}} are two roots of \smath{p(x)}.
We construct this polynomial using \axiomFun{resultant}.
The main result we  need is the following:
If \smath{f(x)} is a polynomial with roots
\texht{$a_i \ldots a_m$}{\axiom{a[1]...a[m]}} and
\smath{g(x)} is a polynomial
with roots
\texht{$b_i \ldots b_n$}{\axiom{b[1]...b[n]}}, then the polynomial
\axiom{h(x) = resultant(f(y), g(x-y), y)}
is a polynomial of degree \smath{m*n} with
roots
\texht{$a_i + b_j, i = 1 \ldots m, j = 1 \ldots n$}
{\axiom{a[i] + b[j], 1 <= i <= m, 1 <= j <= n}}.

\xtc{
For \smath{f(x)} we use the polynomial \smath{p(x)}.
For \smath{g(x)} we use the polynomial \smath{-p(-x)}.
Thus, the polynomial we  first construct is
\axiom{resultant(p(y), -p(y-x), y)}.
}{
\spadpaste{q := resultant(eval(p,x,y),-eval(p,x,y-x),y) \free{p} \bound{q}}
}
%
The roots of \smath{q(x)} are
\texht{$a_i - a_j, i \leq 1, j \leq 5$}
{\axiom{a[i] - a[j], 1 <= i,j <= 5}}.
Of course, there are five pairs \smath{(i,j)} with \smath{i = j},
so \axiom{0} is a 5-fold root of \smath{q(x)}.
%
\xtc{
Let's get rid of this factor.
}{
\spadpaste{q1 := exquo(q, x**5) \free{q} \bound{q1}}
}
\xtc{
```

```
Factor the polynomial \axiom{q1}.
}{
\spadpaste{factoredQ := factor q1 \free{q1} \bound{factoredQ}}
}

We see that \axiom{q1} has two irreducible factors, each of degree
\axiom{10}.  (The fact that the polynomial \axiom{q1} has two factors
of degree \axiom{10} is enough to show that the Galois group of
\smath{p(x)} is the dihedral group of order \axiom{10}.\footnote{See
McKay, Soicher, Computing Galois Groups over the Rationals, Journal of
Number Theory 20, 273-281 (1983).  We do not assume the results of
this paper, however, and we continue with the computation.}  Note that
the type of \axiom{factoredQ} is \axiomType{FR POLY INT}, that is,
\axiomType{Factored Polynomial Integer}.  This is a special data type
for recording factorizations of polynomials with integer coefficients
(see \downlink{‘Factored’}{FactoredXmpPage} \ignore{Factored}).

\xtc{
We can access the individual factors using the operation
\axiomFunFrom{nthFactor}{Factored}.
}{
\spadpaste{r := nthFactor(factoredQ,1) \free{factoredQ} \bound{r}}
}
%

Consider the polynomial \smath{r = r(x)}.
This is the minimal polynomial of the difference of two roots of
\smath{p(x)}.
Thus, the splitting field of \smath{p(x)} contains a subfield of
degree \axiom{10}.
We show that this subfield is, in fact, the splitting field of
\smath{p(x)} by showing that \smath{p(x)} factors completely
over this field.
%
\xtc{
First we create a symbolic root of the polynomial \smath{r(x)}.
(We replaced \axiom{x} by \axiom{b} in the
polynomial \axiom{r} so that our symbolic root would be
printed as \axiom{b}.)
}{
\spadpaste{beta:AN := rootOf(eval(r,x,b)) \free{r} \bound{beta}}
}
\xtc{
We next tell Axiom to view \smath{p(x)} as a univariate polynomial
in \axiom{x}
with algebraic number coefficients.
This is accomplished with this type declaration.
}{
\spadpaste{p := p::UP(x,INT)::UP(x,AN) \free{p} \bound{declareP}}
}
```

```
%
%
\xtc{
Factor \smath{p(x)} over the field
\texht{${\bf Q}(\beta)$}{\axiom{Q(beta)}}.
(This computation will take some time!)
}{
\spadpaste{algFactors := factor(p,[beta]) \free{declareP beta}
\bound{algFactors}}
}
%
When factoring over number fields, it is important to specify the
field over which the polynomial is to be factored, as polynomials
have different factorizations over different fields.
When you use the operation \axiomFun{factor}, the field over which
the polynomial is factored is the field generated by
\indent{4}
\beginitems
\item[1. ] the algebraic numbers that appear
in the coefficients of the polynomial, and
\item[2. ] the algebraic numbers that
appear in a list passed as an optional second argument of the operation.
\enditems
\indent{0}
In our case, the coefficients of \axiom{p}
are all rational integers and only \axiom{beta}
appears in the list, so the field is simply
\texht{${\bf Q}(\beta)$}{\axiom{Q(beta)}}.
%
\xtc{
It was necessary to give the list \axiom{[beta]}
as a second argument of the operation
because otherwise the polynomial would have been factored over the field
generated by its coefficients, namely the rational numbers.
}{
\spadpaste{factor(p) \free{declareP}}
}
%
We have shown that the splitting field of \smath{p(x)} has degree
\axiom{10}.
Since the symmetric group of degree 5 has only one transitive subgroup
of order \axiom{10}, we know that the Galois group of \smath{p(x)} must be
this group, the dihedral group
of order \axiom{10}.
Rather than stop here, we explicitly compute the action of the Galois
group on the roots of \smath{p(x)}.

First we assign the roots of \smath{p(x)} as the values of five
variables.
\xtc{
```

```
We can obtain an individual root by negating the constant coefficient of
one of the factors of \smath{p(x)}.
}{
\spadpaste{factor1 := nthFactor(algFactors,1) \free{algFactors}
\bound{factor1}}
}
\xtc{
}{
\spadpaste{root1 := -coefficient(factor1,0) \free{factor1} \bound{root1}}
}
%
%
\xtc{
We can obtain a list of all the roots in this way.
}{
\spadpaste{
roots := [-coefficient(nthFactor(algFactors,i),0) for i in 1..5]
\free{algFactors} \bound{roots}}
}

The expression
\begin{verbatim}
- coefficient(nthFactor(algFactors, i), 0)}
\end{verbatim}
is the \eth{\axiom{i }} root
of \smath{p(x)} and the elements of \axiom{roots} are the \eth{\axiom{i }}
roots of \smath{p(x)} as \axiom{i} ranges from \axiom{1} to \axiom{5}.

\xtc{
Assign the roots as the values of the variables \axiom{a1,...,a5}.
}{
\spadpaste{
(a1,a2,a3,a4,a5) := (roots.1,roots.2,roots.3,roots.4,roots.5)
\free{roots} \bound{ais}}
}
%

Next we express the roots of \smath{r(x)} as polynomials in
\axiom{beta}.  We could obtain these roots by calling the operation
\axiomFun{factor}: \axiom{factor(r, [beta])} factors \axiom{r(x)} over
\texht{${\bf Q}(\beta)$}{\axiom{Q(beta)}}.  However, this is a lengthy
computation and we can obtain the roots of \smath{r(x)} as differences
of the roots \axiom{a1,...,a5} of \smath{p(x)}.  Only ten of these
differences are roots of \smath{r(x)} and the other ten are roots of
the other irreducible factor of \axiom{q1}.  We can determine if a
given value is a root of \smath{r(x)} by evaluating \smath{r(x)} at
that particular value.  (Of course, the order in which factors are
returned by the operation \axiomFun{factor} is unimportant and may
change with different implementations of the operation.  Therefore, we
cannot predict in advance which differences are roots of \smath{r(x)}
```

```
and which are not.)

\xtc{
Let's look at four examples (two are roots of \smath{r(x)} and
two are not).
}{
\spadpaste{eval(r,x,a1 - a2) \free{ais}}
}
\xtc{
}{
\spadpaste{eval(r,x,a1 - a3) \free{ais}}
}
\xtc{
}{
\spadpaste{eval(r,x,a1 - a4) \free{ais}}
}
\xtc{
}{
\spadpaste{eval(r,x,a1 - a5) \free{ais}}
}
%

Take one of the differences that was a root of \smath{r(x)}
and assign it to the variable \axiom{bb}.
\xtc{
For example, if \axiom{eval(r,x,a1 - a4)} returned \axiom{0}, you would
enter this.
}{
\spadpaste{bb := a1 - a4 \free{ais} \bound{bb}}
}
Of course, if the difference is, in fact, equal to the root \axiom{beta},
you should choose another root of \smath{r(x)}.

Automorphisms of the splitting field are given by mapping a generator of
the field, namely \axiom{beta}, to other roots of its minimal polynomial.
Let's see what happens when \axiom{beta} is mapped to \axiom{bb}.
%
\xtc{
We compute the images of the roots \axiom{a1,...,a5}
under this automorphism:
}{
\spadpaste{aa1 := subst(a1,beta = bb) \free{beta bb ais} \bound{aa1}}
}
\xtc{
}{
\spadpaste{aa2 := subst(a2,beta = bb) \free{beta bb ais} \bound{aa2}}
}
\xtc{
}{
\spadpaste{aa3 := subst(a3,beta = bb) \free{beta bb ais} \bound{aa3}}
```

```
}
\xtc{
}{
\spadpaste{aa4 := subst(a4,beta = bb) \free{beta bb ais} \bound{aa4}}
}
\xtc{
}{
\spadpaste{aa5 := subst(a5,beta = bb) \free{beta bb ais} \bound{aa5}}
}
%
Of course, the values \axiom{aa1,...,aa5} are simply a permutation
of the values \axiom{a1,...,a5}.
%
\xtc{
Let's find the value of \axiom{aa1} (execute as many of the
following five commands as necessary).
}{
\spadpaste{(aa1 = a1) :: Boolean \free{aa1}}
}
\xtc{
}{
\spadpaste{(aa1 = a2) :: Boolean \free{aa1}}
}
\xtc{
}{
\spadpaste{(aa1 = a3) :: Boolean \free{aa1}}
}
\xtc{
}{
\spadpaste{(aa1 = a4) :: Boolean \free{aa1}}
}
\xtc{
}{
\spadpaste{(aa1 = a5) :: Boolean \free{aa1}}
}

Proceeding in this fashion, you can find the values of
\axiom{aa2,...aa5}.\footnote{Here you should use the \Clef{} line
editor.  See \downlink{``Clef''}{ugAvailCLEFPage} in
Section 1.1.1\ignore{ugAvailCLEF} for more information
about \Clef{}.}  You have represented the automorphism \axiom{beta ->
bb} as a permutation of the roots \axiom{a1,...,a5}.  If you wish, you
can repeat this computation for all the roots of \smath{r(x)} and
represent the Galois group of \smath{p(x)} as a subgroup of the
symmetric group on five letters.

Here are two other problems that you may attack in a similar fashion:
\indent{4}
\beginitems
\item[1. ] Show that the Galois group of
```

```
\texht{$p(x) = x^4 + 2 x^3 - 2 x^2 - 3 x + 1$}{\axiom{
p(x) = x**4 + 2*x**3 - 2*x**2 - 3*x + 1}}
is the dihedral group of order eight.
(The splitting field of this polynomial is the Hilbert class field
of
the quadratic field
\texht{${\bf Q}(\sqrt{145})$}{\axiom{Q(sqrt(145))}}.)
\item[2. ] Show that the Galois group of
\texht{$p(x) = x^6 + 108$}{\axiom{p(x) = x**6 + 108}}
has order 6 and is
isomorphic to \texht{$S_3,$}{} the symmetric group on three letters.
(The splitting field of this polynomial is the splitting field of
\texht{$x^3 - 2$}{\axiom{x**3 - 2}}.)

9.0.123 Non-Associative Algebras and Genetic Laws

⇒ “notitle” (OctonionXmpPage) 3.77.1 on page 1027

— ug08.ht —

```
\begin{page}{ugProblemGeneticPage}
{8.14. Non-Associative Algebras and Genetic Laws}
\beginscroll

Many algebraic structures of mathematics and Axiom
have a multiplication operation \axiomOp{*} that satisfies
the associativity law
\texht{$a*(b*c) = (a*b)*c$}{\spad{a*(b*c) = (a*b)*c}}
for all \smath{a}, \smath{b} and \smath{c}.
The octonions (see
\downlink{`Octonion'}{OctonionXmpPage}\ignore{Octonion})
are a well known exception.
There are many other interesting non-associative structures,
such as the class of
Lie algebras.\footnote{Two Axiom implementations of Lie algebras
are \spadtype{LieSquareMatrix} and \spadtype{FreeNilpotentLie}.}
Lie algebras can be used, for example, to analyse Lie symmetry
algebras of partial differential equations.
In this section we show a different application of non-associative
algebras, the modelling of genetic laws.

The Axiom library contains several constructors for
creating non-assoc\-i\-a\-tive structures,
ranging from the categories \spadtype{Monad},
\spadtype{NonAssociativeRng}, and
\spadtype{FramedNonAssociativeAlgebra}, to the domains
\spadtype{AlgebraGivenByStructuralConstants} and
\spadtype{GenericNonAssociativeAlgebra}.
Furthermore, the package \spadtype{AlgebraPackage} provides
operations for analysing the structure of such algebras.\footnote{%
The interested reader can learn more about these aspects of the
Axiom library from the paper
``Computations in Algebras of Finite Rank,''
by Johannes Grabmeier and Robert Wisbauer,
Technical Report, IBM Heidelberg Scientific Center, 1992.}

Mendel's genetic laws are often written in a form like
\texht{
\narrowDisplay{
Aa \times Aa = {1\over 4}AA + {1\over 2}Aa + {1\over 4}aa.}}
{\spad{Aa * Aa = (1/4)*AA + (1/2)*Aa + (1/4)*aa.}
}
The implementation of general algebras in Axiom allows us to
use this as the definition for multiplication in an algebra.
Hence, it is possible to study
questions of genetic inheritance using Axiom.
To demonstrate this more precisely,  we discuss one example from a
monograph of \texht{A. W\"orz-Busekros}{A. Woerz-Busekros},
where you can also find a general setting of this theory.\footnote{%
\texht{W\"{o}rz-Busekros}{Woerz-Busekros}, A.,
{\it Algebras in Genetics},
Springer Lectures Notes in Biomathematics 36, Berlin e.a. (1980).
In particular, see example 1.3.}

We assume that there is an infinitely large random mating population.
Random mating of two gametes \texht{$a_i$}{\spad{ai}}  and
\texht{$a_j$}{\spad{aj}} gives zygotes
\texht{$a_ia_j$}{\spad{ai aj}}, which produce new gametes.
In classical Mendelian segregation we have
\texht{$a_ia_j = {1 \over 2}a_i+{1 \over 2}a_j$}
{\spad{ai aj = (1/2)*ai+(1/2)*aj}}.
In general, we have
\texht{\narrowDisplay{a_ia_j = \sum_{k=1}^n \gamma_{i,j}^k\ a_k.}}%
{\spad{ai aj = gammaij1 a1 + gammaij2 a2 + ... + gammaijn an}}
The segregation rates \texht{$\gamma_{i,j}$}{\spad{gammaij}}
are  the structural constants of an
\smath{n}-dimensional algebra.
This is provided in Axiom by
the constructor \spadtype{AlgebraGivenByStructuralConstants}
(abbreviation \spadtype{ALGSC}).

Consider two coupled autosomal loci with alleles
\smath{A},\smath{a}, \smath{B}, and \smath{b}, building four
different gametes
\texht{$a_1 =  AB, a_2 =  Ab, a_3 =  aB,$ and $a_4 =  ab$}%
{\spad{a1 :=  AB, a2 :=  Ab, a3 :=  aB,} and \spad{a4 :=  ab}}.
The zygotes \texht{$a_ia_j$}{\spad{ai aj}}
produce gametes \texht{$a_i$}{\spad{ai}} and
\texht{$a_j$}{\spad{aj}}
with classical Mendelian segregation.
Zygote \texht{$a_1a_4$}{a1 a4} undergoes transition
to \texht{$a_2a_3$}{\spad{a2 a3}}
and vice versa with probability
\texht{$0 \le \theta \le {1\over 2}$}{0 <= theta <= 1/2}.

\xtc{
Define a list
\texht{$[(\gamma_{i,j}^k) 1 \le k \le 4]$}{\spad{[(gammaijk) 1 <= k <= 4]}}
of four four-by-four matrices giving the segregation
rates.
We use the value \smath{1/10} for \smath{\theta}.
}{
\spadpaste{segregationRates : List SquareMatrix(4,FRAC INT) :=
[matrix [ [1, 1/2, 1/2, 9/20], [1/2, 0, 1/20, 0], [1/2, 1/20, 0, 0],
[9/20, 0, 0, 0] ], matrix [ [0, 1/2, 0, 1/20], [1/2, 1, 9/20, 1/2],
[0, 9/20, 0, 0], [1/20, 1/2, 0, 0] ], matrix [ [0, 0, 1/2, 1/20],
[0, 0, 9/20, 0], [1/2, 9/20, 1, 1/2], [1/20, 0, 1/2, 0] ],
matrix [ [0, 0, 0, 9/20], [0, 0, 1/20, 1/2], [0, 1/20, 0, 1/2],
[9/20, 1/2, 1/2, 1] ] ] \bound{segregationRates}}
}
\xtc{
Choose the appropriate symbols for the basis of gametes,
}{
\spadpaste{gametes := ['AB,'Ab,'aB,'ab]  \bound{gametes}}
}
\xtc{
Define the algebra.
}{
\spadpaste{A := ALGSC(FRAC INT, 4, gametes, segregationRates);
\bound{A}\free{gametes, segregationRates}}
}

\xtc{
What are the probabilities for zygote
\texht{$a_1a_4$}{a1 a4} to produce the different gametes?
}{
\spadpaste{a := basis()\$A;  a.1*a.4}
}

Elements in this algebra whose coefficients sum to one play a
distinguished role.
They represent a population with the distribution of gametes
reflected by the coefficients with respect to the basis of
gametes.

Random mating of different populations \smath{x} and \smath{y}
is described by their product \smath{x*y}.

\xtc{
This product is commutative only
if the gametes are not sex-dependent, as in our example.
}{
\spadpaste{commutative?()\$A \free{A}}
}
\xtc{
In general, it is not associative.
}{
\spadpaste{associative?()\$A \free{A}}
}

Random mating within a population \smath{x} is described by
\smath{x*x.}
The next generation is \smath{(x*x)*(x*x).}

\xtc{
Use decimal numbers to compare the distributions more easily.
}{
\spadpaste{x : ALGSC(DECIMAL, 4, gametes, segregationRates) :=
convert [3/10, 1/5, 1/10, 2/5]\bound{x}\free{gametes, segregationRates}}
}
\xtc{
To compute directly the gametic distribution in the fifth
generation, we use \spadfun{plenaryPower}.
}{
\spadpaste{plenaryPower(x,5) \free{x}}
}

We now ask two questions:
Does this distribution converge to an equilibrium state?
What are the distributions that are stable?

\xtc{
This is an invariant of the algebra and it is used to answer
the first question.
The new indeterminates describe a symbolic distribution.
}{
\spadpaste{q := leftRankPolynomial()
\$GCNAALG(FRAC INT, 4, gametes, segregationRates) ::
UP(Y, POLY FRAC INT)\bound{q}\free{gametes, segregationRates}}
}
\xtc{
Because the coefficient \texht{${9 \over 20}$}{\axiom{9/20}} has absolute
value less than 1, all distributions do converge,
by a theorem of this theory.
}{
\spadpaste{factor(q :: POLY FRAC INT) \free{q}}
}
\xtc{
The second question is answered by searching for idempotents in the
algebra.
}{
\spadpaste{cI := conditionsForIdempotents()
\$GCNAALG(FRAC INT, 4, gametes, segregationRates)
\bound{cI} \free{gametes, segregationRates}}
}
\xtc{
Solve these equations and look at the first solution.
}{
\spadpaste{gbs:= groebnerFactorize cI; gbs.1\free{cI}\bound{gbs}}
}

Further analysis using the package \spadtype{PolynomialIdeals}
shows that there is a two-dimensional variety of equilibrium states and all
other solutions are contained in it.

\xtc{
Choose one equilibrium state by setting two indeterminates to
concrete values.
```

```
}{
\spadpaste{sol := solve concat(gbs.1,[\%x1-1/10,\%x2-1/10])
\bound{sol} \free{gbs}}
}
\xtc{
}{
\spadpaste{e : A := represents reverse (map(rhs, sol.1)
:: List FRAC INT)\bound{e} \free{A, sol}}
}
\xtc{
Verify the result.
}{
\spadpaste{e*e-e \free{e}}
}
\endscroll
\autobuttons

Programming in the interpreter is easy.
So is the use of Axiom’s graphics facility.
Both are rather flexible and allow you to use them for many
interesting applications.
However, both require learning some basic ideas and skills.

All graphics examples in the \Gallery{} section are either
produced directly by interactive commands or by interpreter
programs.
Four of these programs are introduced here.
```

```
By the end of this chapter you will know enough about graphics and
programming in the interpreter to not only understand all these
examples, but to tackle interesting and difficult problems on your
own.
\downlink{``Programs for Axiom Images''}{ugAppGraphicsPage} in
Appendix G\ignore{ugAppGraphics} lists
all the remaining commands and
programs used to create these images.

10.0.125 Drawing Ribbons Interactively

⇒ “notitle” (ugGraphPage) **??** on page **??**

— **ug10.ht** —

```
\begin{page}{ugIntProgDrawingPage}{10.1. Drawing Ribbons Interactively}
\beginscroll
%

We begin our discussion of interactive graphics with the creation
of a useful facility: plotting ribbons of two-graphs in
three-space.
```

```
Suppose you want to draw the \twodim{} graphs of \smath{n}
functions \texht{$f_i(x), 1 \leq i \leq n,$}{\spad{f_i(x), 1 <= i
<= 5,}} all over some fixed range of \smath{x}.
One approach is to create a \twodim{} graph for each one, then
superpose one on top of the other.
What you will more than likely get is a jumbled mess.
Even if you make each function a different color, the result is
likely to be confusing.

A better approach is to display each of the \smath{f_i(x)} in three
dimensions as a ‘‘ribbon’’ of some appropriate width along the
\smath{y}-direction, laying down each  ribbon next to the
previous one.
A ribbon is simply a function of \smath{x} and \smath{y} depending
only on \smath{x.}

We illustrate this for \smath{f_i(x)} defined as simple powers of
\smath{x} for \smath{x} ranging between \smath{-1} and \smath{1}.

\psXtc{
Draw the ribbon for \texht{$z = x^2$}{\spad{z=x ** 2}}.
}{
\graphpaste{draw(x**2,x=-1..1,y=0..1)}
}{
\epsffile[0 0 295 295]{../ps/ribbon1.ps}
}

Now that was easy!
What you get is a ‘‘wire-mesh’’ rendition of the ribbon.
That’s fine for now.
Notice that the mesh-size is small in both the \smath{x} and the
\smath{y} directions.
Axiom normally computes points in both these directions.
This is unnecessary.
One step is all we need in the \smath{y}-direction.
To have Axiom economize on \spad{y}-points, we re-draw the
ribbon with option \spad{var2Steps == 1}.

\psXtc{
Re-draw the ribbon, but with option \spad{var2Steps == 1}
so that only \spad{1} step is computed in the
\smath{y} direction.
}{
\graphpaste{vp := draw(x**2,x=-1..1,y=0..1,var2Steps==1) \bound{d1}}
}{
\epsffile[0 0 295 295]{../ps/ribbon2.ps}
}

The operation has created a viewport, that is, a graphics window
on your screen.
```

```
We assigned the viewport to \spad{vp} and now we manipulate
its contents.

Graphs are objects, like numbers and algebraic expressions.
You may want to do some experimenting with graphs.
For example, say
\begin{verbatim}
showRegion(vp, "on")
\end{verbatim}
to put a bounding box around the ribbon.
Try it!
Issue \spad{rotate(vp, -45, 90)} to rotate the
figure \smath{-45} longitudinal degrees and \smath{90} latitudinal
degrees.

\psXtc{
Here is a different rotation.
This turns the graph so you can view it along the \smath{y}-axis.
}{
\spadpaste{rotate(vp, 0, -90)\bound{d3}\free{d1}}
}{
\epsffile[0 0 295 295]{../ps/ribbon2r.ps}
}

There are many other things you can do.
In fact, most everything you can do interactively using the
\threedim{} control panel (such as translating, zooming, resizing,
coloring, perspective and lighting selections) can also be done
directly by operations (see \downlink{``Graphics''}{ugGraphPage}
in Chapter 7\ignore{ugGraph} for more details).

When you are done experimenting, say \spad{reset(vp)} to restore the
picture to its original position and settings.

Let's add another ribbon to our picture---one
for \texht{$x^3$}{\spad{x**3}}.
Since \smath{y} ranges from \smath{0} to \smath{1} for the
first ribbon, now let \smath{y} range from \smath{1} to
\smath{2.}
This puts the second ribbon next to the first one.

How do you add a second ribbon to the viewport?
One method is
to extract the ``space'' component from the
viewport using the operation
\spadfunFrom{subspace}{ThreeDimensionalViewport}.
You can think of the space component as the object inside the
window (here, the ribbon).
```

```
Let's call it \spad{sp}.
To add the second ribbon, you draw the second ribbon using the
option \spad{space == sp}.

\xtc{
Extract the space component of \spad{vp}.
}{
\spadpaste{sp := subspace(vp)\bound{d5}\free{d1}}
}

\psXtc{
Add the ribbon for
\texht{$x^3$}{\spad{x**3}} alongside that for
\texht{$x^2$}{\spad{x**2}}.
}{
\graphpaste{vp := draw(x**3,x=-1..1,y=1..2,var2Steps==1, space==sp)
\bound{d6}\free{d5}}
}{
\epsffile[0 0 295 295]{../ps/ribbons.ps}
}

Unless you moved the original viewport, the new viewport covers
the old one.
You might want to check that the old object is still there by
moving the top window.

Let's show quadrilateral polygon outlines on the ribbons and then
enclose the ribbons in a box.

\psXtc{
Show quadrilateral polygon outlines.
}{
\spadpaste{drawStyle(vp,"shade");outlineRender(vp,"on")
\bound{d10}\free{d6}}
}{
\epsffile[0 0 295 295]{../ps/ribbons2.ps}
}
\psXtc{
Enclose the ribbons in a box.
}{
\spadpaste{rotate(vp,20,-60); showRegion(vp,"on")\bound{d11}\free{d10}}
}{
\epsffile[0 0 295 295]{../ps/ribbons2b.ps}
}

This process has become tedious!
If we had to add two or three more ribbons, we would have to
repeat the above steps several more times.
It is time to write an interpreter program to help us take care of
the details.

10.0.126 A Ribbon Program

⇒ "notitle" (ugUserPage) **??** on page **??**
⇒ "notitle" (ugLangBlocksPage) 8.0.51 on page 1728
— **ug10.ht** —

```
\begin{page}{ugIntProgRibbonPage}{10.2. A Ribbon Program}
\beginscroll
%

The above approach creates a new viewport for each additional
ribbon.
A better approach is to build one object composed of all ribbons
before creating a viewport.
To do this, use \spadfun{makeObject} rather than \spadfun{draw}.
The operations have similar formats, but
\spadfun{draw} returns a viewport and
\spadfun{makeObject} returns a space object.

We now create a function \userfun{drawRibbons} of two arguments:
\spad{flist}, a list of formulas for the ribbons you want to draw,
and \spad{xrange}, the range over which you want them drawn.
Using this function, you can just say
\begin{verbatim}
drawRibbons([x**2, x**3], x=-1..1)
\end{verbatim}
to do all of the work required in the last section.
Here is the \userfun{drawRibbons} program.
Invoke your favorite editor and create a file called {\bf ribbon.input}
containing the following program.

\beginImportant

\noindent
{\tt 1.\ \ \ drawRibbons(flist,\ xrange)\ ==}\newline
{\tt 2.\ \ \ \ \ sp\ :=\ createThreeSpace()}\newline
{\tt 3.\ \ \ \ \ y0\ :=\ 0}\newline
{\tt 4.\ \ \ \ \ for\ f\ in\ flist\ repeat}\newline
{\tt 5.\ \ \ \ \ \ \ makeObject(f,\ xrange,\ y=y0..y0+1,\ }\newline
{\tt 6.\ \ \ \ \ \ \ \ \ \ space==sp,\ var2Steps\ ==\ 1)}\newline
{\tt 7.\ \ \ \ \ \ \ y0\ :=\ y0\ +\ 1}\newline
{\tt 8.\ \ \ \ \ vp\ :=\ makeViewport3D(sp,\ "Ribbons")}\newline
{\tt 9.\ \ \ \ \ drawStyle(vp,\ "shade")}\newline
{\tt 10.\ \ \ \ outlineRender(vp,\ "on")}\newline
{\tt 11.\ \ \ \ showRegion(vp,"on")}\newline
{\tt 12.\ \ \ \ n\ :=\ \#\ flist}\newline
{\tt 13.\ \ \ \ zoom(vp,n,1,n)}\newline
{\tt 14.\ \ \ \ rotate(vp,0,75)}\newline
{\tt 15.\ \ \ \ vp}\newline
\caption{The first \protect\pspadfun{drawRibbons} function.}
\label{fig-ribdraw1}
\endImportant
```

Here are some remarks on the syntax used in the \pspadfun{drawRibbons}
function (consult
\downlink{‘‘User-Defined Functions, Macros and Rules’’}{ugUserPage}
in Chapter 6\ignore{ugUser} for more details). Unlike most other
programming languages which use semicolons, parentheses, or {\it
begin}--{\it end} brackets to delineate the structure of programs, the
structure of an Axiom program is determined by indentation. The first
line of the function definition always begins in column 1. All other
lines of the function are indented with respect to the first line and
form a \spadgloss{pile} (see
\downlink{‘‘Blocks’’}{ugLangBlocksPage} in Section
5.2\ignore{ugLangBlocks}).

The definition of \userfun{drawRibbons} consists of a pile of
expressions to be executed one after another. Each expression of the
pile is indented at the same level. Lines 4-7 designate one single
expression: since lines 5-7 are indented with respect to the others,
these lines are treated as a continuation of line 4. Also since lines
5 and 7 have the same indentation level, these lines designate a pile
within the outer pile.

The last line of a pile usually gives the value returned by the pile.
Here it is also the value returned by the function. Axiom knows this
is the last line of the function because it is the last line of the
file. In other cases, a new expression beginning in column one
signals the end of a function.

The line \spad{drawStyle(vp,"shade")} is given after the viewport has
been created to select the draw style. We have also used the
\spadfunFrom{zoom}{ThreeDimensionalViewport} option. Without the
zoom, the viewport region would be scaled equally in all three
coordinate directions.

Let’s try the function \userfun{drawRibbons}.
First you must read the file to give Axiom the function definition.

```
\xtc{
Read the input file.
}{
\spadpaste{)read ribbon \bound{s0}}
}
\psXtc{
Draw ribbons for \texht{$x, x^2,\dots, x^5$}{x, x**2,...,x**5}
for \texht{$-1 \leq x \leq 1$}{-1 <= x <= 1}
}{
\graphpaste{drawRibbons([x**i for i in 1..5],x=-1..1) \free{s0}}
}{
\epsffile[0 0 295 295]{../ps/ribbons5.ps}
}

10.0.127 Coloring and Positioning Ribbons

— **ug10.ht** —

```
\begin{page}{ugIntProgColorPage}{10.3. Coloring and Positioning Ribbons}
\beginscroll
%

Before leaving the ribbon example, we  make two improvements.
Normally, the color given to each point in the space is a
function of its height within a bounding box.
The points at the bottom of the
box are red, those at the top are purple.

To change the normal coloring, you can give
an option \spad{colorFunction == {\it function}}.
When Axiom goes about displaying the data, it
determines the range of colors used for all points within the box.
Axiom then distributes these numbers uniformly over the number of hues.
Here we use the simple color function
\texht{$(x,y) \mapsto i$}{(x,y) +-> i} for the
\eth{\smath{i}} ribbon.

Also, we add an argument \spad{yrange} so you can give the range of
\spad{y} occupied by the ribbons.
For example, if the \spad{yrange} is given as
\spad{y=0..1} and there are \smath{5} ribbons to be displayed, each
ribbon would have width \smath{0.2} and would appear in the
range \texht{$0 \leq y \leq 1$}{\spad{0 <= y <= 1}}.

Refer to lines 4-9.
Line 4 assigns to \spad{yVar} the variable part of the
\spad{yrange} (after all, it need not be \spad{y}).
Suppose that \spad{yrange} is given as \spad{t = a..b} where \spad{a} and
\spad{b} have numerical values.
Then line 5 assigns the value of \spad{a} to the variable \spad{y0}.
Line 6 computes the width of the ribbon by dividing the difference of
\spad{a} and \spad{b} by the number, \spad{num}, of ribbons.
The result is assigned to the variable \spad{width}.
Note that in the for-loop in line 7, we are iterating in parallel; it is
not a nested loop.

\beginImportant

\noindent
{\tt 1.\ \ \ drawRibbons(flist,\ xrange,\ yrange)\ ==}\newline
{\tt 2.\ \ \ \ \ sp\ :=\ createThreeSpace()}\newline
{\tt 3.\ \ \ \ \ num\ :=\ \#\ flist}\newline
{\tt 4.\ \ \ \ \ yVar\ :=\ variable\ yrange}\newline
```

```
{\tt 5.\ \ \ \ \ y0:Float\ \ \ \ :=\ lo\ segment\ yrange}\newline
{\tt 6.\ \ \ \ \ width:Float\ :=\ (hi\ segment\ yrange\ -\ y0)/num}
\newline
{\tt 7.\ \ \ \ \ for\ f\ in\ flist\ for\ color\ in\ 1..num\ repeat}
\newline
{\tt 8.\ \ \ \ \ \ \ makeObject(f,\ xrange,\ yVar\ =\ y0..y0+width,}
\newline
{\tt 9.\ \ \ \ \ \ \ \ \ var2Steps\ ==\ 1,\ colorFunction\ ==\
(x,y)\ +->\ color,\ \_}\newline
{\tt 10.\ \ \ \ \ \ \ \ space\ ==\ sp)}\newline
{\tt 11.\ \ \ \ \ \ y0\ :=\ y0\ +\ width}\newline
{\tt 12.\ \ \ \ vp\ :=\ makeViewport3D(sp,\ "Ribbons")}\newline
{\tt 13.\ \ \ \ drawStyle(vp,\ "shade")}\newline
{\tt 14.\ \ \ \ outlineRender(vp,\ "on")}\newline
{\tt 15.\ \ \ \ showRegion(vp,\ "on")}\newline
{\tt 16.\ \ \ \ vp}\newline

———-

10.0.128 Points, Lines, and Curves

— ug10.ht —

```
\begin{page}{ugIntProgPLCPage}{10.4. Points, Lines, and Curves}
\beginscroll
%
What you have seen so far is a high-level program using the
graphics facility.
We now turn to the more basic notions of points, lines, and curves
in \threedim{} graphs.
These facilities use small floats (objects
of type \spadtype{DoubleFloat}) for data.
Let us first give names to the small float values \smath{0} and
\smath{1}.
\xtc{
The small float 0.
}{
\spadpaste{zero := 0.0@DFLOAT \bound{d1}}
}
```

```
\xtc{
The small float 1.
}{
\spadpaste{one  := 1.0@DFLOAT \bound{d2}}
}
The \spadSyntax{@} sign means ‘‘of the type.’’ Thus \spad{zero} is
\smath{0.0} of the type \spadtype{DoubleFloat}.
You can also say \spad{0.0::DFLOAT}.

Points can have four small float components: \smath{x, y, z}
coordinates and an optional color.  A ‘‘curve’’ is simply a list of
points connected by straight line segments.
\xtc{
Create the point \spad{origin} with color zero, that is, the lowest color
on the color map.
}{
\spadpaste{origin := point [zero,zero,zero,zero] \free{d1}\bound{d3}}
}
\xtc{
Create the point \spad{unit} with color zero.
}{
\spadpaste{unit := point [one,one,one,zero] \free{d1 d2}\bound{d4}}
}
\xtc{
Create the curve (well, here, a line) from
\spad{origin} to \spad{unit}.
}{
\spadpaste{line := [origin, unit] \free{d3 d4} \bound{d5}}
}

We make this line segment into an arrow by adding an arrowhead.
The arrowhead extends to,
say, \spad{p3} on the left, and to, say, \spad{p4} on the right.
To describe an arrow, you tell Axiom to draw the two curves
\spad{[p1, p2, p3]} and \spad{[p2, p4].}
We also decide through experimentation on
values for \spad{arrowScale}, the ratio of the size of
the arrowhead to the stem of the arrow, and \spad{arrowAngle},
the angle between the arrowhead and the arrow.

Invoke your favorite editor and create
an input file called {\bf arrows.input}.
This input file first defines the values of
%\spad{origin},\spad{unit},
\spad{arrowAngle} and \spad{arrowScale}, then
defines the function \userfun{makeArrow}\texht{$(p_1, p_2)$}{(p1, p2)} to
draw an arrow from point \texht{$p_1$}{p1} to \texht{$p_2$}{p2}.

\beginImportant
```

```
\noindent
{\tt 1.\ \ \ arrowAngle\ :=\ \%pi-\%pi/10.0@DFLOAT}\newline
{\tt 2.\ \ \ arrowScale\ :=\ 0.2@DFLOAT}\newline
{\tt 3.\ \ \ }\newline
{\tt 4.\ \ \ makeArrow(p1,\ p2)\ ==}\newline
{\tt 5.\ \ \ \ \ delta\ :=\ p2\ -\ p1}\newline
{\tt 6.\ \ \ \ \ len\ :=\ arrowScale\ *\ length\ delta}\newline
{\tt 7.\ \ \ \ \ theta\ :=\ atan(delta.1,\ delta.2)}\newline
{\tt 8.\ \ \ \ \ c1\ :=\ len*cos(theta\ +\ arrowAngle)}\newline
{\tt 9.\ \ \ \ \ s1\ :=\ len*sin(theta\ +\ arrowAngle)}\newline
{\tt 10.\ \ \ \ c2\ :=\ len*cos(theta\ -\ arrowAngle)}\newline
{\tt 11.\ \ \ \ s2\ :=\ len*sin(theta\ -\ arrowAngle)}\newline
{\tt 12.\ \ \ \ z\ \ :=\ p2.3*(1\ -\ arrowScale)}\newline
{\tt 13.\ \ \ \ p3\ :=\ point\ [p2.1\ +\ c1,\ p2.2\ +\ s1,\ z,\ p2.4]}
\newline
{\tt 14.\ \ \ \ p4\ :=\ point\ [p2.1\ +\ c2,\ p2.2\ +\ s2,\ z,\ p2.4]}
\newline
{\tt 15.\ \ \ \ {\tt{}p1,{\char92}\ p2,{\char92}\ p3],{\char92}\ [p2,{\char92}\ p4}}\newline
\endImportant

Read the file and then create
an arrow from the point \spad{origin} to the point \spad{unit}.
\xtc{
Read the input file defining \userfun{makeArrow}.
}{
\spadpaste{)read arrows\bound{v1}}
}
\xtc{
Construct the arrow (a list of two curves).
}{
\spadpaste{arrow := makeArrow(origin,unit)\bound{v2}\free{v1 d3 d4}}
}
\xtc{
Create an empty object \spad{sp} of type \spad{ThreeSpace}.
}{
\spadpaste{sp := createThreeSpace()\bound{c1}}
}
\xtc{
Add each curve of the arrow to the space \spad{sp}.
}{
\spadpaste{for a in arrow repeat sp := curve(sp,a)
\bound{v3}\free{v2}\free{c1}}
}
\psXtc{
Create a \threedim{} viewport containing that space.
}{
\graphpaste{vp := makeViewport3D(sp,"Arrow")\bound{v4}\free{v3}}
}{
\epsffile[0 0 295 295]{../ps/arrow.ps}
}
```

```
\psXtc{

{\char92}beginscroll\nwnewline
\nwnewline
Let's\ draw\ a\ ``bouquet''\ of\ arrows.\nwnewline
Each\ arrow\ is\ identical.\ The\ arrowheads\ are\nwnewline
uniformly\ placed\ on\ a\ circle\ parallel\ to\ the\ {\char92}smath{\char123}xy{\char125}-plane.\nwnewli
Thus\ the\ position\ of\ each\ arrow\ differs\ only\nwnewline
by\ the\ angle\ {\char92}texht{\char123}{\char36}{\char92}theta{\char36}{\char125}{\char123}theta{\char1
{\char92}texht{\char123}{\char36}0\ {\char92}leq\ {\char92}theta\ <\ 2{\char92}pi{\char36}{\char125}{\ch
between\ the\ arrow\ and\nwnewline
the\ {\char92}smath{\char123}x{\char125}-axis\ on\ the\ {\char92}smath{\char123}xy{\char125}-plane.\nwne
\nwnewline
Our\ bouquet\ is\ rather\ special:\ each\ arrow\ has\ a\ different\nwnewline
color\ (which\ won't\ be\ evident\ here,\ unfortunately).\nwnewline
This\ is\ arranged\ by\ letting\ the\ color\ of\ each\ successive\ arrow\ be\nwnewline
denoted\ by\ {\char92}texht{\char123}{\char36}{\char92}theta{\char36}{\char125}{\char123}theta{\char125}
In\ this\ way,\ the\ color\ of\ arrows\ ranges\ from\ red\ to\ green\ to\ violet.\nwnewline
Here\ is\ a\ program\ to\ draw\ a\ bouquet\ of\ {\char92}smath{\char123}n{\char125}\ arrows.\nwnewline

We\ now\ put\ our\ arrows\ to\ good\ use\ drawing\ complex\ vector\ fields.\nwnewline
These\ vector\ fields\ give\ a\ representation\ of\ complex-valued\nwnewline
```

```
functions\ of\ complex\ variables.\nwnewline
Consider\ a\ Cartesian\ coordinate\ grid\ of\ points\ {\char92}smath{\char123}(x,\ y){\char125}\ in\nwne
the\ plane,\ and\ some\ complex-valued\ function\ {\char92}smath{\char123}f{\char125}\ defined\ on\nwnew
this\ grid.\nwnewline
At\ every\ point\ on\ this\ grid,\ compute\ the\ value\ of\ {\char92}texht{\char123}{\char36}f(x\ +\nwne
iy){\char36}{\char125}{\char123}f(x\ +\ y*{\char92}{\char37}i){\char125}\ and\ call\ it\ {\char92}smath{
Since\ {\char92}smath{\char123}z{\char125}\ has\ both\ a\ real\ and\ imaginary\ value\ for\ a\ given\nwn
{\char92}smath{\char123}(x,y){\char125}\ grid\ point,\ there\ are\ four\ dimensions\ to\ plot.\nwnewline
What\ do\ we\ do?\nwnewline
We\ represent\ the\ values\ of\ {\char92}smath{\char123}z{\char125}\ by\ arrows\ planted\ at\ each\nwnew
grid\ point.\nwnewline
Each\ arrow\ represents\ the\ value\ of\ {\char92}smath{\char123}z{\char125}\ in\ polar\ coordinates\nwn
{\char92}texht{\char123}{\char36}(r,{\char92}theta){\char36}{\char125}{\char123}(r,\ theta){\char125}.\n
The\ length\ of\ the\ arrow\ is\ proportional\ to\ {\char92}smath{\char123}r{\char125}.\nwnewline
Its\ direction\ is\ given\ by\ {\char92}texht{\char123}{\char36}{\char92}theta{\char36}{\char125}{\char1
\nwnewline
The\ code\ for\ drawing\ vector\ fields\ is\ in\ the\ file\ {\char123}{\char92}bf\ vectors.input{\char12
We\ discuss\ its\ contents\ from\ top\ to\ bottom.\nwnewline
\nwnewline
Before\ showing\ you\ the\ code,\ we\ have\ two\ small\nwnewline
matters\ to\ take\ care\ of.\nwnewline
First,\ what\ if\ the\ function\ has\ large\ spikes,\ say,\ ones\ that\ go\ off\nwnewline
to\ infinity?\nwnewline
We\ define\ a\ variable\ {\char92}spad{\char123}clipValue{\char125}\ for\ this\ purpose.\ When\nwnewline
{\char92}spad{\char123}r{\char125}\ exceeds\ the\ value\ of\ {\char92}spad{\char123}clipValue{\char125},
{\char92}spad{\char123}clipValue{\char125}\ is\ used\ instead\ of\ that\ for\ {\char92}spad{\char123}r{\
For\ convenience,\ we\ define\ a\ function\ {\char92}spad{\char123}clipFun(x){\char125}\ which\ uses\nwn
{\char92}spad{\char123}clipValue{\char125}\ to\ ‘‘clip’’\ the\ value\ of\ {\char92}spad{\char123}x{\char

{\char123}{\char92}tt\ 2.{\char92}\ {\char92}\ {\char92}\ clipFun(x){\char92}\ =={\char92}\ min(max(x,-c
{\char92}endImportant\nwnewline
\nwnewline
Notice\ that\ we\ identify\ {\char92}spad{\char123}clipValue{\char125}\ as\ a\ small\ float\ but\ do\nwn
not\ declare\ the\ type\ of\ the\ function\ {\char92}userfun{\char123}clipFun{\char125}.\nwnewline
As\ it\ turns\ out,\ {\char92}userfun{\char123}clipFun{\char125}\ is\ called\ with\ a\nwnewline
small\ float\ value.\nwnewline
This\ declaration\ ensures\ that\ {\char92}userfun{\char123}clipFun{\char125}\ never\ does\ a\nwnewline
conversion\ when\ it\ is\ called.\nwnewline
\nwnewline
The\ second\ matter\ concerns\ the\ possible\ ‘‘poles’’\ of\ a\nwnewline
function,\ the\ actual\ points\ where\ the\ spikes\ have\ infinite\nwnewline
values.\nwnewline
Axiom\ uses\ normal\ {\char92}spadtype{\char123}DoubleFloat{\char125}\ arithmetic\ \ which\nwnewline
does\ not\ directly\ handle\ infinite\ values.\nwnewline
If\ your\ function\ has\ poles,\ you\ must\ adjust\ your\ step\ size\ to\nwnewline
```

```
avoid\ landing\ directly\ on\ them\ (Axiom\ calls\ {\char92}spadfun{\char123}error{\char125}
when\ asked\ to\ divide\ a\ value\ by\ {\char92}axiom{\char123}0{\char125},\ for\ example).\n
\nwnewline
We\ set\ the\ variables\ {\char92}spad{\char123}realSteps{\char125}\ and\ {\char92}spad{\char
hold\ the\ number\ of\ steps\ taken\ in\ the\ real\ and\ imaginary\nwnewline
directions,\ respectively.\nwnewline
Most\ examples\ will\ have\ ranges\ centered\ around\ the\ origin.\nwnewline
To\ avoid\ a\ pole\ at\ the\ origin,\ the\ number\ of\ points\ is\ taken\nwnewline
to\ be\ odd.\nwnewline
\nwnewline
{\char92}beginImportant\nwnewline
\ \ \nwnewline
{\char92}noindent\nwnewline
{\char123}{\char92}tt\ 1.{\char92}\ {\char92}\ {\char92}\ realSteps:{\char92}\ INT{\char92}\

{\char92}beginscroll\nwnewline
\nwnewline
```

```
We\ resume\nwnewline
our\ continuing\ saga\ of\ arrows\ and\ complex\ functions.\nwnewline
Suppose\ we\ want\ to\ investigate\ the\ behavior\ of\ Newton's\ iteration\ function\nwnewlin
in\ the\ complex\ plane.\nwnewline
Given\ a\ function\ {\char92}smath{\char123}f{\char125},\ we\ want\ to\ find\ the\ complex\ v
{\char92}smath{\char123}z{\char125}\ such\ that\ {\char92}smath{\char123}f(z)\ =\ 0{\char125
\nwnewline
The\ first\ step\ is\ to\ produce\ a\ Newton\ iteration\ formula\ for\nwnewline
a\ given\ {\char92}smath{\char123}f{\char125}:\nwnewline
{\char92}texht{\char123}{\char36}x{\char95}{\char123}n+1{\char125}\ =\ x{\char95}n\ -\ {\char
{\char92}spad{\char123}x(n+1)\ =\ x(n)\ -\ f(x(n))/f'(x(n)){\char125}.{\char125}\nwnewline
We\ represent\ this\ formula\ by\ a\ function\ {\char92}smath{\char123}g{\char125}\nwnewline
that\ performs\ the\ computation\ on\ the\ right-hand\ side,\ that\ is,\nwnewline
{\char92}texht{\char123}{\char36}x{\char95}{\char123}n+1{\char125}\ =\ {\char123}g{\char125}
\nwnewline
The\ type\ {\char92}spadtype{\char123}Expression\ Integer{\char125}\ (abbreviated\ {\char92}s
INT{\char125})\ is\ used\ to\ represent\ general\ symbolic\ expressions\ in\nwnewline
Axiom.\nwnewline
To\ make\ our\ facility\ as\ general\ as\ possible,\ we\ assume\nwnewline
{\char92}smath{\char123}f{\char125}\ has\ this\ type.\nwnewline
Given\ {\char92}smath{\char123}f{\char125},\ we\ want\nwnewline
to\ produce\ a\ Newton\ iteration\ function\ {\char92}spad{\char123}g{\char125}\ which,\nwnew
given\ a\ complex\ point\ {\char92}texht{\char123}{\char36}x{\char95}n{\char36}{\char125}{\ch
Newton\ iteration\ point\ {\char92}texht{\char123}{\char36}x{\char95}{\char123}n+1{\char125}
\nwnewline
This\ time\ we\ write\ an\ input\ file\ called\ {\char123}{\char92}bf\ newton.input{\char125
We\ need\ to\ import\ {\char92}spadtype{\char123}MakeUnaryCompiledFunction{\char125}\ (discus
in\ the\ last\ section),\ call\ it\ with\ appropriate\ types,\ and\ then\ define\nwnewline
the\ function\ {\char92}spad{\char123}newtonStep{\char125}\ which\ references\ it.\nwnewline
Here\ is\ the\ function\ {\char92}spad{\char123}newtonStep{\char125}:\nwnewline

{\char92}begin{\char123}page{\char125}{\char123}ugPackagesPage{\char125}{\char123}11.\ Packag
{\char92}beginscroll\nwnewline
\nwnewline
Packages\ provide\ the\ bulk\ of\nwnewline
Axiom's\ algorithmic\ library,\ from\ numeric\ packages\ for\ computing\nwnewline
special\ functions\ to\ symbolic\ facilities\ for\nwnewline
differential\ equations,\ symbolic\ integration,\ and\ limits.\nwnewline
\nwnewline
In\ {\char92}downlink{\char123}``Interactive\ Programming''{\char125}{\char123}ugIntProgPage
10{\char92}ignore{\char123}ugIntProg{\char125},\ we\ developed\ several\ useful\nwnewline
functions\ for\ drawing\ vector\ fields\ and\ complex\ functions.\ \ We\ now\nwnewline
show\ you\ how\ you\ can\ add\ these\ functions\ to\ the\ Axiom\ library\ to\ make\nwnewline
them\ available\ for\ general\ use.\nwnewline
\nwnewline
The\ way\ we\ created\ the\ functions\ in\nwnewline
{\char92}downlink{\char123}``Interactive\ Programming''{\char125}{\char123}ugIntProgPage{\cha
10{\char92}ignore{\char123}ugIntProg{\char125}\ is\ typical\ of\ how\ you,\ as\ an\nwnewline
advanced\ Axiom\ user,\ may\ interact\ with\ Axiom.\ \ You\ have\ an\nwnewline
application.\ \ You\ go\ to\ your\ editor\ and\ create\ an\ input\ file\ defining\nwnewline
some\ functions\ for\ the\ application.\ \ Then\ you\ run\ the\ file\ and\ try\ the\nwnewlin
functions.\ \ Once\ you\ get\ them\ all\ to\ work,\ you\ will\ often\ want\ to\nwnewline
extend\ them,\ add\ new\ features,\ perhaps\ write\ additional\ functions.\nwnewline
\nwnewline
Eventually,\ when\ you\ have\ a\ useful\ set\ of\ functions\ for\ your\nwnewline
application,\ you\ may\ want\ to\ add\ them\ to\ your\ local\ Axiom\ library.\ \ To\nwnewlin
do\ this,\ you\ embed\ these\ function\ definitions\ in\ a\ package\ and\ add\nwnewline
that\ package\ to\ the\ library.\nwnewline
\nwnewline
To\ introduce\ new\ packages,\ categories,\ and\ domains\ into\ the\ system,\nwnewline
you\ need\ to\ use\ the\ Axiom\ compiler\ to\ convert\ the\ constructors\ into\nwnewline
executable\ machine\ code.\ \ An\ existing\ compiler\ in\ Axiom\ is\ available\nwnewline
on\ an\ ``as-is''\ basis.\ \ A\ new,\ faster\ compiler\ will\ be\ available\ in\nwnewline
version\ 2.0\ of\ Axiom.\nwnewline

{\char92}spadkey{\char123}add{\char125}\nwnewline
part\ of\ the\ definition\ is\ called\ a\ {\char92}spadgloss{\char123}capsule{\char125}.\nwnewline
The\ purpose\ of\ a\ capsule\ is:\nwnewline
{\char92}indent{\char123}4{\char125}\nwnewline
{\char92}beginitems\nwnewline
{\char92}item[-]\ to\ define\ a\ function\ for\ each\ exported\ operation,\ and\nwnewline
{\char92}item[-]\ to\ define\ a\ {\char92}spadgloss{\char123}local\ environment{\char125}\ \nwnewline
for\ these\ functions\ to\ run.\nwnewline
{\char92}enditems\nwnewline
{\char92}indent{\char123}0{\char125}\nwnewline
\nwnewline
What\ is\ a\ local\ environment?\nwnewline
First,\ what\ is\ an\ environment?\nwnewline
Think\ of\ the\ capsule\ as\ an\ input\ file\ that\ Axiom\ reads\ from\ top\ to\nwnewline
bottom.\nwnewline
Think\ of\ the\ input\ file\ as\ having\ a\ {\char92}axiom{\char123})clear\ all{\char125}\ at\ the\ top\
so\ that\ initially\ no\ variables\ or\ functions\ are\ defined.\nwnewline
When\ this\ file\ is\ read,\ variables\ such\ as\ {\char92}axiom{\char123}realSteps{\char125}\ and\nwnew
{\char92}axiom{\char123}arrowSize{\char125}\ in\ {\char92}nonLibAxiomType{\char123}DrawComplex{\char125}
values.\ Also,\ all\ the\ functions\ defined\ in\ the\ capsule\ are\ compiled.\nwnewline
These\ include\ those\ that\ are\ exported\ (like\ {\char92}axiom{\char123}drawComplex{\char125}),\ and\
those\ that\ are\ not\ (like\ {\char92}axiom{\char123}makeArrow{\char125}).\nwnewline
At\ the\ end,\ you\ get\ a\ set\ of\ name-value\ pairs:\nwnewline
variable\ names\ (like\ {\char92}axiom{\char123}realSteps{\char125}\ and\ {\char92}axiom{\char123}arrowS
are\ paired\ with\ assigned\ values,\ while\nwnewline
operation\ names\ (like\ {\char92}axiom{\char123}drawComplex{\char125}\ and\ {\char92}axiom{\char123}mak
are\ paired\ with\ function\ values.\nwnewline
\nwnewline
This\ set\ of\ name-value\ pairs\ is\ called\ an\ {\char92}spadgloss{\char123}environment{\char125}.\nwn
Actually,\ we\ call\ this\ environment\ the\ ‘‘initial\ environment’’\ of\ a\nwnewline
package:\ it\ is\ the\ environment\ that\ exists\ immediately\ after\ the\nwnewline
package\ is\ first\ built.\ \ Afterwards,\ functions\ of\ this\ capsule\ can\nwnewline
access\ or\ reset\ a\ variable\ in\ the\ environment.\ \ The\ environment\ is\nwnewline
called\ {\char123}{\char92}it\ local{\char125}\ since\ any\ changes\ to\ the\ value\ of\ a\ variable\ in
this\ environment\ can\ be\ seen\ {\char123}{\char92}it\ only{\char125}\ by\ these\ functions.\nwnewline
\nwnewline
Only\ the\ functions\ from\ the\ package\ can\ change\ the\ variables\ in\ the\nwnewline
local\ environment.\ \ When\ two\ functions\ are\ called\ successively\ from\ a\nwnewline
package,\ any\ changes\ caused\ by\ the\ first\ function\ called\ are\ seen\ by\nwnewline
the\ second.\nwnewline
```

```
\nwnewline
Since\ the\ environment\ is\ local\ to\ the\ package,\ its\ names\ don't\ get\nwnewline
mixed\ up\ with\ others\ in\ the\ system\ or\ your\ workspace.\ \ If\ you\ happen\nwnewline
to\ have\ a\ variable\ called\ {\char92}axiom{\char123}realSteps{\char125}\ in\ your\ workspa
not\ affect\ what\ the\ {\char92}nonLibAxiomType{\char123}DrawComplex{\char125}\ functions\ d
way.\nwnewline
\nwnewline
The\ functions\ in\ a\ package\ are\ compiled\ into\ machine\ code.\ \ Unlike\nwnewline
function\ definitions\ in\ input\ files\ that\ may\ be\ compiled\ repeatedly\ as\nwnewline
you\ use\ them\ with\ varying\ argument\ types,\ functions\ in\ packages\ have\ a\nwnewline
unique\ type\ (generally\ parameterized\ by\ the\ argument\ parameters\ of\ a\nwnewline
package)\ and\ a\ unique\ compilation\ residing\ on\ disk.\nwnewline
\nwnewline
The\ capsule\ itself\ is\ turned\ into\ a\ compiled\ function.\ \ This\ so-called\nwnewline
{\char123}{\char92}it\ capsule\ function{\char125}\ is\ what\ builds\ the\ initial\ environme
of\ above.\ \ If\ the\ package\ has\ arguments\ (see\ below),\ then\ each\ call\ to\nwnewline
the\ package\ constructor\ with\ a\ distinct\ pair\ of\ arguments\ builds\ a\nwnewline
distinct\ package,\ each\ with\ its\ own\ local\ environment.\nwnewline
\nwnewline

{\char92}beginscroll\nwnewline
{\char37}\nwnewline
A\ good\ question\ at\ this\ point\ would\ be\ \nwnewline
``Is\ writing\ a\ package\ more\ difficult\ than\ writing\ an\ input\ file?''\nwnewline
\nwnewline
The\ programs\ in\ input\ files\ are\ designed\ for\ flexibility\ and\nwnewline
ease-of-use.\ \ Axiom\ can\ usually\ work\ out\ all\ of\ your\ types\ as\ it\ reads\nwnewline
your\ program\ and\ does\ the\ computations\ you\ request.\ \ Let's\ say\ that\nwnewline
you\ define\ a\ one-argument\ function\ without\ giving\ its\ type.\ \ When\ you\nwnewline
first\ apply\ the\ function\ to\ a\ value,\ this\ value\ is\ understood\ by\ Axiom\nwnewline
as\ identifying\ the\ type\ for\ the\ argument\ parameter.\ \ Most\ of\ the\ time\nwnewline
Axiom\ goes\ through\ the\ body\ of\ your\ function\ and\ figures\ out\ the\nwnewline
target\ type\ that\ you\ have\ in\ mind.\ \ Axiom\ sometimes\ fails\ to\ get\ it\nwnewline
right.\ \ Then---and\ only\ then---do\ you\ need\ a\ declaration\ to\ tell\ Axiom\nwnewline
what\ type\ you\ want.\nwnewline
\nwnewline
Input\ files\ are\ usually\ written\ to\ be\ read\ by\ Axiom---and\ by\ you.\nwnewline
Without\ suitable\ documentation\ and\ declarations,\ your\ input\ files\nwnewline
are\ likely\ incomprehensible\ to\ a\ colleague---and\ to\ you\ some\nwnewline
months\ later!\nwnewline
\nwnewline
Packages\ are\ designed\ for\ legibility,\ as\ well\ as\ run-time\ efficiency.\nwnewline
There\ are\ few\ new\ concepts\ you\ need\ to\ learn\ to\ write\nwnewline
packages.\ Rather,\ you\ just\ have\ to\ be\ explicit\ about\ types\ and\ type\nwnewline
conversions.\ \ The\ types\ of\ all\ functions\ are\ pre-declared\ so\ that\nwnewline
Axiom---and\ the\ reader---\ knows\ precisely\ what\ types\ of\ arguments\ can\nwnewline
be\ passed\ to\ and\ from\ the\ functions\ (certainly\ you\ don't\ want\ a\nwnewline
colleague\ to\ guess\ or\ to\ have\ to\ work\ this\ out\ from\ context!).\ \ The\nwnewline
types\ of\ local\ variables\ are\ also\ declared.\ \ Type\ conversions\ are\nwnewline
explicit,\ never\ automatic.{\char92}footnote{\char123}There\ is\ one\ exception\ to\ this\nwnewline
rule:\ conversions\ from\ a\ subdomain\ to\ a\ domain\ are\ automatic.\ \ After\nwnewline
all,\ the\ objects\ both\ have\ the\ domain\ as\ a\ common\ type.{\char125}\nwnewline
\nwnewline
In\ summary,\ packages\ are\ more\ tedious\ to\ write\ than\ input\ files.\ \ When\nwnewline
writing\ input\ files,\ you\ can\ casually\ go\ ahead,\ giving\ some\ facts\ now,\nwnewline
leaving\ others\ for\ later.\ \ Writing\ packages\ requires\ forethought,\ care\nwnewline
and\ discipline.\nwnewline

\nwnewline
The\ power\ of\ packages\ becomes\ evident\ when\ packages\ have\ parameters.\nwnewline
Usually\ these\ parameters\ are\ domains\ and\ the\ exported\ operations\ have\nwnewline
types\ involving\ these\ parameters.\nwnewline
\nwnewline
In\ {\char92}downlink{\char123}``Using\ Types\ and\ Modes''{\char125}{\char123}ugTypesPage{\c
2{\char92}ignore{\char123}ugTypes{\char125},\ you\ learned\ that\ categories\ denote\nwnewlin
classes\ of\ domains.\ \ Although\ we\ cover\ this\ notion\ in\ detail\ in\ the\nwnewline
next\ chapter,\ we\ now\ give\ you\ a\ sneak\ preview\ of\ its\ usefulness.\nwnewline
\nwnewline
In\ {\char92}downlink{\char123}``Functions\ Defined\ with\ Blocks''{\char125}{\char123}ugUser
Section\ 6.15{\char92}ignore{\char123}ugUserBlocks{\char125},\ we\ defined\ functions\nwnewli
```

```
{\char92}axiom{\char123}bubbleSort(m){\char125}\ and\ {\char92}axiom{\char123}insertionSort(m){\char125}
integers.\ \ If\ you\ look\ at\ the\ code\ for\ these\ functions,\ you\ see\ that\nwnewline
they\ may\ be\ used\ to\ sort\ {\char123}{\char92}it\ any{\char125}\ structure\ {\char92}axiom{\char123}
properties.\ \ Also,\ the\ functions\ can\ be\ used\ to\ sort\ lists\ of\ {\char123}{\char92}it\nwnewlin
any{\char125}\ elements---not\ just\ integers.\ \ Let\ us\ now\ recall\ the\ code\ for\nwnewline
{\char92}axiom{\char123}bubbleSort{\char125}.\nwnewline
\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
bubbleSort(m)\ ==\nwnewline
\ \ n\ :=\ {\char35}m\nwnewline
\ \ for\ i\ in\ 1..(n-1)\ repeat\nwnewline
\ \ \ \ for\ j\ in\ n..(i+1)\ by\ -1\ repeat\nwnewline
\ \ \ \ \ \ if\ m.j\ <\ m.(j-1)\ then\ swap!(m,j,j-1)\nwnewline
\ \ m\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
\nwnewline
What\ properties\ of\ ``lists\ of\ integers''\ are\ assumed\ by\ the\ sorting\nwnewline
algorithm?\ \ In\ the\ first\ line,\ the\ operation\ {\char92}spadfun{\char123}{\char92}{\char35}{\char1
maximum\ index\ of\ the\ list.\ \ The\ first\ obvious\ property\ is\ that\nwnewline
{\char92}axiom{\char123}m{\char125}\ must\ have\ a\ finite\ number\ of\ elements.\ \ In\ Axiom,\ this\ i
done\ by\ your\ telling\ Axiom\ that\ {\char92}axiom{\char123}m{\char125}\ has\ the\ ``attribute''\nwnew
{\char92}spadatt{\char123}finiteAggregate{\char125}.\ \ An\ {\char92}spadgloss{\char123}attribute{\char1
that\ a\ domain\ either\ has\ or\ does\ not\ have.\ \ As\ we\ show\ later\ in\nwnewline
{\char92}downlink{\char123}``Attributes''{\char125}{\char123}ugCategoriesAttributesPage{\char125}\nwnewl
in\ Section\ 12.9{\char92}ignore{\char123}ugCategoriesAttributes{\char125},\ programs\nwnewline
can\ query\ domains\ as\ to\ the\ presence\ or\ absence\ of\ an\ attribute.\nwnewline
\nwnewline
The\ operation\ {\char92}spadfunX{\char123}swap{\char125}\ swaps\ elements\ of\ {\char92}axiom{\char123}
Using\ {\char92}Browse{\char123}{\char125},\ you\ find\ that\ {\char92}spadfunX{\char123}swap{\char125}\
elements\ to\ come\ from\ a\ domain\ of\ category\nwnewline
{\char92}axiomType{\char123}IndexedAggregate{\char125}\ with\ attribute\nwnewline
{\char92}spadatt{\char123}shallowlyMutable{\char125}.\nwnewline
This\ attribute\ means\ that\ you\ can\ change\ the\ internal\ components\nwnewline
of\ {\char92}axiom{\char123}m{\char125}\ without\ changing\ its\ external\ structure.\nwnewline
Shallowly-mutable\ data\ structures\ include\ lists,\ streams,\ one-\ and\nwnewline
two-dimensional\ arrays,\ vectors,\ and\ matrices.\nwnewline
\nwnewline
The\ category\ {\char92}axiomType{\char123}IndexedAggregate{\char125}\ designates\ the\ class\ of\nwnewl
aggregates\ whose\ elements\ can\ be\ accessed\ by\ the\ notation\nwnewline
{\char92}axiom{\char123}m.s{\char125}\ for\ suitable\ selectors\ {\char92}axiom{\char123}s{\char125}.\nw
The\ category\ {\char92}axiomType{\char123}IndexedAggregate{\char125}\ takes\ two\ arguments:\nwnewline
{\char92}axiom{\char123}Index{\char125},\ a\ domain\ of\ selectors\ for\ the\ aggregate,\ and\nwnewline
{\char92}axiom{\char123}Entry{\char125},\ a\ domain\ of\ entries\ for\ the\ aggregate.\nwnewline
Since\ the\ sort\ functions\ access\ elements\ by\ integers,\ we\ must\nwnewline
choose\ {\char92}axiom{\char123}Index\ =\ {\char125}{\char92}axiomType{\char123}Integer{\char125}.\nwnew
The\ most\ general\ class\ of\ domains\ for\ which\ {\char92}axiom{\char123}bubbleSort{\char125}\ and\nw
{\char92}axiom{\char123}insertionSort{\char125}\ are\ defined\ are\ those\ of\nwnewline
category\ {\char92}spadtype{\char123}IndexedAggregate(Integer,Entry){\char125}\ with\ the\ two\nwnewline
attributes\ {\char92}spadatt{\char123}shallowlyMutable{\char125}\ and\nwnewline
{\char92}spadatt{\char123}finiteAggregate{\char125}.\nwnewline
```

```
\nwnewline
Using\ {\char92}Browse{\char123}{\char125},\ you\ can\ also\ discover\ that\ Axiom\ has\ many
domains\ with\ attribute\ {\char92}spadatt{\char123}shallowlyMutable{\char125}.\ \ Those\ of\
{\char92}axiomType{\char123}IndexedAggregate(Integer,Entry){\char125}\ include\ {\char92}axio
{\char92}axiomType{\char123}FlexibleArray{\char125},\ {\char92}axiomType{\char123}OneDimensio
{\char92}axiomType{\char123}List{\char125},\ {\char92}axiomType{\char123}String{\char125},\ a
{\char92}axiomType{\char123}HashTable{\char125}\ and\ {\char92}axiomType{\char123}EqTable{\ch
Although\ you\ may\ never\ want\ to\ sort\ all\ such\ structures,\ we\nwnewline
nonetheless\ demonstrate\ Axiom's\ ability\ to\ do\ so.\nwnewline
\nwnewline
Another\ requirement\ is\ that\ {\char92}nonLibAxiomType{\char123}Entry{\char125}\ has\ an\ o
{\char92}axiomOp{\char123}<{\char125}.\ \ One\ way\ to\ get\ this\ operation\ is\ to\ assume\
{\char92}nonLibAxiomType{\char123}Entry{\char125}\ has\ category\ {\char92}axiomType{\char123
definition,\ will\ then\ export\ a\ {\char92}axiomOp{\char123}<{\char125}\ operation.\ \ A\ m
approach\ is\ to\ allow\ any\ comparison\ function\ {\char92}axiom{\char123}f{\char125}\ to\
sorting.\ \ This\ function\ will\ be\ passed\ as\ an\ argument\ to\ the\ sorting\nwnewline
functions.\nwnewline
\nwnewline
Our\ sorting\ package\ then\ takes\ two\ arguments:\ a\ domain\ {\char92}axiom{\char123}S{\ch
objects\ of\ {\char123}{\char92}it\ any{\char125}\ type,\ and\ a\ domain\ {\char92}axiom{\cha
type\ {\char92}axiomType{\char123}IndexedAggregate(Integer,\ S){\char125}\ with\ the\ above\
attributes.\ \ Here\ is\ its\ definition\ using\ what\ are\ close\ to\ the\nwnewline
original\ definitions\ of\ {\char92}axiom{\char123}bubbleSort{\char125}\ and\ {\char92}axiom{
for\ sorting\ lists\ of\ integers.\ \ The\ symbol\ {\char92}axiomSyntax{\char123}!{\char125}\
the\ ends\ of\ the\ operation\ names.\ \ This\ uniform\ naming\ convention\ is\nwnewline
used\ for\ Axiom\ operation\ names\ that\ destructively\ change\ one\ or\ more\nwnewline
of\ their\ arguments.\nwnewline
\nwnewline

{\char92}beginscroll\nwnewline
\nwnewline
Recall\ that\ packages\ as\ abstract\ datatypes\ are\ compiled\ independently\nwnewline
and\ put\ into\ the\ library.\ \ The\ curious\ reader\ may\ ask:\ ‘‘How\ is\ the\nwnewline
interpreter\ able\ to\ find\ an\ operation\ such\ as\nwnewline
{\char92}fakeAxiomFun{\char123}bubbleSort!{\char125}?\ \ Also,\ how\ is\ a\ single\ compiled\
such\ as\ {\char92}fakeAxiomFun{\char123}bubbleSort!{\char125}\ able\ to\ sort\ data\ of\ di
types?’’\nwnewline
\nwnewline
After\ the\ interpreter\ loads\ the\ package\ {\char92}nonLibAxiomType{\char123}SortPackage{\
the\ four\ operations\ from\ the\ package\ become\ known\ to\ the\ interpreter.\nwnewline
Each\ of\ these\ operations\ is\ expressed\ as\ a\ {\char123}{\char92}it\ modemap{\char125}\
type\ of\ the\ operation\ is\ written\ in\ terms\ of\ symbolic\ domains.\nwnewline
\nwnewline
{\char92}nullXtc{\char123}\nwnewline
See\ the\ modemaps\ for\ {\char92}fakeAxiomFun{\char123}bubbleSort!{\char125}.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123})display\ op\ bubbleSort!{\char125}\nwnewline
{\char125}\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
There\ are\ 2\ exposed\ functions\ called\ bubbleSort!\ :\nwnewline
\nwnewline
\ \ \ [1]\ D1\ ->\ D1\ from\ SortPackage(D2,D1)\nwnewline
\ \ \ \ \ \ \ \ \ if\ D2\ has\ ORDSET\ and\ D2\ has\ OBJECT\ and\ D1\ has\nwnewline
\ \ \ \ \ \ \ \ \ IndexedAggregate(Integer,\ D2)\ with\nwnewline
\ \ \ \ \ \ \ \ \ \ \ \ \ \ finiteAggregate\nwnewline
\ \ \ \ \ \ \ \ \ \ \ \ \ \ shallowlyMutable\nwnewline
\nwnewline
\ \ \ [2]\ (D1,((D3,D3)\ ->\ Boolean))\ ->\ D1\ from\ SortPackage(D3,D1)\nwnewline
\ \ \ \ \ \ \ \ \ if\ D3\ has\ OBJECT\ and\ D1\ has\nwnewline
\ \ \ \ \ \ \ \ \ IndexedAggregate(Integer,D3)\ with\nwnewline
\ \ \ \ \ \ \ \ \ \ \ \ \ \ finiteAggregate\nwnewline
\ \ \ \ \ \ \ \ \ \ \ \ \ \ shallowlyMutable\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
\nwnewline
What\ happens\ if\ you\ ask\ for\ {\char92}axiom{\char123}bubbleSort!([1,-5,3]){\char125}?\nwnewline
There\ is\ a\ unique\ modemap\ for\ an\ operation\ named\nwnewline
{\char92}fakeAxiomFun{\char123}bubbleSort!{\char125}\ with\ one\ argument.\nwnewline
Since\ {\char92}axiom{\char123}[1,-5,3]{\char125}\ is\ a\ list\ of\ integers,\ the\ symbolic\ domain\nwn
{\char92}axiom{\char123}D1{\char125}\ is\ defined\ as\ {\char92}axiomType{\char123}List(Integer){\char12
For\ some\ operation\ to\ apply,\ it\ must\ satisfy\ the\ predicate\ for\nwnewline
some\ {\char92}axiom{\char123}D2{\char125}.\nwnewline
What\ {\char92}axiom{\char123}D2{\char125}?\nwnewline
The\ third\ expression\ of\ the\ {\char92}axiom{\char123}and{\char125}\ requires\ {\char123}{\char92}tt\
IndexedAggregate(Integer,\ D2)\ with{\char125}\ two\ attributes.\nwnewline
So\ the\ interpreter\ searches\ for\ an\ {\char92}axiomType{\char123}IndexedAggregate{\char125}\nwnewlin
among\ the\ ancestors\ of\ {\char92}axiomType{\char123}List\ (Integer){\char125}\ (see\nwnewline
\nwnewline
{\char92}downlink{\char123}``Hierarchies''{\char125}{\char123}ugCategoriesHierPage{\char125}\ in\ Sectio
12.4{\char92}ignore{\char123}ugCategoriesHier{\char125}).\ \ It\ finds\ one:\nwnewline
{\char92}axiomType{\char123}IndexedAggregate(Integer,\ Integer){\char125}.\ \ The\ interpreter\ tries\nw
defining\ {\char92}axiom{\char123}D2{\char125}\ as\ {\char92}axiomType{\char123}Integer{\char125}.\ \ Af
{\char92}axiom{\char123}D1{\char125}\ and\ {\char92}axiom{\char123}D2{\char125},\ the\ predicate\ evalua
An\ applicable\ operation\ has\ been\ found!\nwnewline
\nwnewline
Now\ Axiom\ builds\ the\ package\ {\char92}axiomType{\char123}SortPackage(List(Integer),\nwnewline
Integer){\char125}.\ \ According\ to\ its\ definition,\ this\ package\ exports\ the\nwnewline
required\ operation:\ {\char92}fakeAxiomFun{\char123}bubbleSort!{\char125}:\ {\char92}spadsig{\char123}L
Integer{\char125}{\char123}List\ Integer{\char125}.\ \ The\ interpreter\ then\ asks\ the\ package\ for\
function\ implementing\ this\ operation.\ \ The\ package\ gets\ all\ the\nwnewline
functions\ it\ needs\ (for\ example,\ {\char92}axiomFun{\char123}rest{\char125}\ and\ {\char92}axiomFunX
from\ the\ appropriate\ domains\ and\ then\ it\ returns\ a\nwnewline
{\char92}fakeAxiomFun{\char123}bubbleSort!{\char125}\ to\ the\ interpreter\ together\ with\ the\ local\n
environment\ for\ {\char92}fakeAxiomFun{\char123}bubbleSort!{\char125}.\ \ The\ interpreter\ applies\nwn
the\ function\ to\ the\ argument\ {\char92}axiom{\char123}[1,-5,3]{\char125}.\ \ The\nwnewline
{\char92}fakeAxiomFun{\char123}bubbleSort!{\char125}\ function\ is\ executed\ in\ its\ local\nwnewline
environment\ and\ produces\ the\ result.\ \ {\char92}endscroll\ {\char92}autobuttons\nwnewline

\nwnewline
This\ chapter\ unravels\ the\ mysteries\ of\ categories---what\nwnewline
they\ are,\ how\ they\ are\ related\ to\ domains\ and\ packages,\nwnewline
how\ they\ are\ defined\ in\ Axiom,\ and\ how\ you\ can\ extend\ the\nwnewline
system\ to\ include\ new\ categories\ of\ your\ own.\nwnewline
\nwnewline
We\ assume\ that\ you\ have\ read\ the\ introductory\ material\ on\ domains\ and\nwnewline
categories\ in\nwnewline
{\char92}downlink{\char123}‘‘Domain\ Constructors’’{\char125}{\char123}ugTypesBasicDomainCon
in\ Section\ 2.1.1{\char92}ignore{\char123}ugTypesBasicDomainCons{\char125}.\ \ There\nwnewl
you\ learned\ that\ the\ notion\ of\ packages\ covered\ in\ the\ previous\nwnewline
chapter\ are\ special\ cases\ of\ domains.\ \ While\ this\ is\ in\ fact\ the\ case,\nwnewlin
it\ is\ useful\ here\ to\ regard\ domains\ as\ distinct\ from\ packages.\nwnewline
\nwnewline
Think\ of\ a\ domain\ as\ a\ datatype,\ a\ collection\ of\ objects\ (the\ objects\nwnewline
of\ the\ domain).\ \ From\ your\ ‘‘sneak\ preview’’\ in\ the\ previous\ chapter,\nwnewline
you\ might\ conclude\ that\ categories\ are\ simply\ named\ clusters\ of\nwnewline
operations\ exported\ by\ domains.\ \ As\ it\ turns\ out,\ categories\ have\ a\nwnewline
much\ deeper\ meaning.\ \ Categories\ are\ fundamental\ to\ the\ design\ of\nwnewline
Axiom.\ \ They\ control\ the\ interactions\ between\ domains\ and\ algorithmic\nwnewline
packages,\ and,\ in\ fact,\ between\ all\ the\ components\ of\ Axiom.\nwnewline
```

```
\nwnewline
Categories\ form\ hierarchies\ as\ shown\ on\ the\ inside\ cover\ pages\ of\ this\nwnewline
book.\ \ The\ inside\ front-cover\ pages\ illustrate\ the\ basic\ algebraic\nwnewline
hierarchy\ of\ the\ Axiom\ programming\ language.\ \ The\ inside\ back-cover\nwnewline
pages\ show\ the\ hierarchy\ for\ data\ structures.\nwnewline
\nwnewline
Think\ of\ the\ category\ structures\ of\ Axiom\ as\ a\ foundation\ for\ a\ city\nwnewline
on\ which\ superstructures\ (domains)\ are\ built.\ \ The\ algebraic\nwnewline
hierarchy,\ for\ example,\ serves\ as\ a\ foundation\ for\ constructive\nwnewline
mathematical\ algorithms\ embedded\ in\ the\ domains\ of\ Axiom.\ \ Once\ in\nwnewline
place,\ domains\ can\ be\ constructed,\ either\ independently\ or\ from\ one\nwnewline
another.\nwnewline
\nwnewline
Superstructures\ are\ built\ for\ quality---domains\ are\ compiled\ into\nwnewline
machine\ code\ for\ run-time\ efficiency.\ \ You\ can\ extend\ the\ foundation\nwnewline
in\ directions\ beyond\ the\ space\ directly\ beneath\ the\ superstructures,\nwnewline
then\ extend\ selected\ superstructures\ to\ cover\ the\ space.\ \ Because\ of\nwnewline
the\ compilation\ strategy,\ changing\ components\ of\ the\ foundation\nwnewline
generally\ means\ that\ the\ existing\ superstructures\ (domains)\ built\ on\nwnewline
the\ changed\ parts\ of\ the\ foundation\ (categories)\ have\ to\ be\nwnewline
rebuilt---that\ is,\ recompiled.\nwnewline
\nwnewline
Before\ delving\ into\ some\ of\ the\ interesting\ facts\ about\ categories,\nwnewline
let's\ see\ how\ you\ define\ them\ in\ Axiom.\nwnewline
\nwnewline

{\char92}beginscroll\nwnewline
```

```
\nwnewline
A\ category\ is\ defined\ by\ a\ function\ with\ exactly\ the\ same\ format\ as\nwnewline
any\ other\ function\ in\ Axiom.\nwnewline
\nwnewline
{\char92}beginImportant\nwnewline
The\ definition\ of\ a\ category\ has\ the\ syntax:\nwnewline
{\char92}centerline{\char123}{\char123}{\char123}{\char92}it\ CategoryForm{\char125}\ :\ {\c
{\char123}{\char92}it\ Extensions{\char125}\ {\char123}{\char92}tt\ [\ with{\char125}\ {\cha
\nwnewline
The\ brackets\ {\char123}{\char92}tt\ [\ ]{\char125}\ here\ indicate\ optionality.\nwnewline
{\char92}endImportant\nwnewline
\nwnewline
\nwnewline
The\ first\ example\ of\ a\ category\ definition\ is\nwnewline
{\char92}spadtype{\char123}SetCategory{\char125},\nwnewline
the\ most\ basic\ of\ the\ algebraic\ categories\ in\ Axiom.\nwnewline
\nwnewline
{\char92}beginImportant\nwnewline
\ \ \nwnewline
{\char92}noindent\nwnewline
{\char123}{\char92}tt\ 1.{\char92}\ {\char92}\ {\char92}\ SetCategory():{\char92}\ Category{
{\char123}{\char92}tt\ 2.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ J
{\char123}{\char92}tt\ 3.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {
{\char92}endImportant\nwnewline
\nwnewline
The\ definition\ starts\ off\ with\ the\ name\ of\ the\nwnewline
category\ ({\char92}spadtype{\char123}SetCategory{\char125});\ this\ is\nwnewline
always\ in\ column\ one\ in\ the\ source\ file.\nwnewline
{\char37}{\char37}\ maybe\ talk\ about\ naming\ conventions\ for\ source\ files?\ .spad\ or\
All\ parts\ of\ a\ category\ definition\ are\ then\ indented\ with\ respect\ to\ this\nwnewl
first\ line.\nwnewline
\nwnewline
In\ {\char92}downlink{\char123}``Using\ Types\ and\ Modes''{\char125}{\char123}ugTypesPage{\
2{\char92}ignore{\char123}ugTypes{\char125},\ we\ talked\ about\ {\char92}spadtype{\char123}
denoting\ the\ class\ of\ all\ domains\ that\ are\ rings,\ in\ short,\ the\ class\nwnewline
of\ all\ rings.\ \ While\ this\ is\ the\ usual\ naming\ convention\ in\ Axiom,\ it\nwnewline
is\ also\ common\ to\ use\ the\ word\ ``Category''\ at\ the\ end\ of\ a\ category\nwnewline
name\ for\ clarity.\ \ The\ interpretation\ of\ the\ name\nwnewline
{\char92}spadtype{\char123}SetCategory{\char125}\ is,\ then,\ ``the\ category\ of\ all\ doma
are\ (mathematical)\ sets.''\nwnewline
\nwnewline
The\ name\ {\char92}spadtype{\char123}SetCategory{\char125}\ is\ followed\ in\ the\ definiti
formal\ parameters\ enclosed\ in\ parentheses\ {\char92}spadSyntax{\char123}(){\char125}.\nw
Here\ there\ are\ no\ parameters.\nwnewline
As\ required,\ the\ type\ of\ the\ result\ of\ this\ category\ function\ is\ the\nwnewline
distinguished\ name\ {\char123}{\char92}sf\ Category{\char125}.\nwnewline
\nwnewline
Then\ comes\ the\ {\char92}spadSyntax{\char123}=={\char125}.\nwnewline
As\ usual,\ what\ appears\ to\ the\ right\ of\ the\ {\char92}spadSyntax{\char123}=={\char125
definition,\ here,\ a\ category\ definition.\nwnewline
```

```
A\ category\ definition\ always\ has\ two\ parts\ separated\ by\ the\ reserved\ word\nwnewline
{\char92}spadkey{\char123}with{\char125}\nwnewline
{\char92}spad{\char123}with{\char125}.\nwnewline
{\char37}{\char92}footnote{\char123}Debugging\ hint:\ it\ is\ very\ easy\ to\ forget\nwnewline
{\char37}the\ {\char92}spad{\char123}with{\char125}!{\char125}\nwnewline
\nwnewline
The\ first\ part\ tells\ what\ categories\ the\ category\ extends.\nwnewline
Here,\ the\ category\ extends\ two\ categories:\ {\char92}spadtype{\char123}Type{\char125},\ the\nwnewli
category\ of\ all\ domains,\ and\nwnewline
{\char92}spadtype{\char123}CoercibleTo(OutputForm){\char125}.\nwnewline
{\char37}{\char92}footnote{\char123}{\char92}spadtype{\char123}CoercibleTo(OutputForm){\char125}\nwnewli
{\char37}can\ also\ be\ written\ (and\ is\ written\ in\ the\ definition\ above)\ without\nwnewline
{\char37}parentheses.{\char125}\nwnewline
The\ operation\ {\char92}spad{\char123}Join{\char125}\ is\ a\ system-defined\ operation\ that\nwnewline
{\char92}spadkey{\char123}Join{\char125}\nwnewline
forms\ a\ single\ category\ from\ two\ or\ more\ other\ categories.\nwnewline
\nwnewline
Every\ category\ other\ than\ {\char92}spadtype{\char123}Type{\char125}\ is\ an\ extension\ of\ some\ ot
category.\nwnewline
If,\ for\ example,\ {\char92}spadtype{\char123}SetCategory{\char125}\ extended\ only\ the\ category\nwne
{\char92}spadtype{\char123}Type{\char125},\ the\ definition\ here\ would\ read\ ‘‘{\char123}{\char92}tt\
...{\char125}’’.\nwnewline
In\ fact,\ the\ {\char123}{\char92}tt\ Type{\char125}\ is\ optional\ in\ this\ line;\ ‘‘{\char123}{\char
...{\char125}’’\ suffices.\nwnewline

\nwnewline
We\ say\ a\ category\ designates\ a\ class\ of\ domains.\nwnewline
What\ class\ of\ domains?\nwnewline
That\ is,\ how\ does\ Axiom\ know\ what\ domains\ belong\ to\ what\ categories?\nwnewline
The\ simple\ answer\ to\ this\ basic\ question\ is\ key\ to\ the\ design\ of\nwnewline
Axiom:\nwnewline
\nwnewline
{\char92}beginImportant\nwnewline
{\char92}centerline{\char123}{\char123}{\char123}{\char92}bf\ Domains\ belong\ to\ categories\ by\ asser
{\char92}endImportant\nwnewline
\nwnewline
When\ a\ domain\ is\ defined,\ it\ is\ asserted\ to\ belong\ to\ one\ or\ more\nwnewline
categories.\nwnewline
Suppose,\ for\ example,\ that\ an\ author\ of\ domain\ {\char92}spadtype{\char123}String{\char125}\ wish
use\ the\ binary\ operator\ {\char92}spadop{\char123}*{\char125}\ to\ denote\ concatenation.\nwnewline
Thus\ {\char92}spad{\char123}"hello\ "\ *\ "there"{\char125}\ would\ produce\ the\ string\nwnewline
{\char92}spad{\char123}"hello\ there"{\char125}{\char92}footnote{\char123}Actually,\ concatenation\ of\
Axiom\ is\ done\ by\ juxtaposition\ or\ by\ using\ the\ operation\nwnewline
{\char92}spadfunFrom{\char123}concat{\char125}{\char123}String{\char125}.\nwnewline
The\ expression\ {\char92}spad{\char123}"hello\ "\ "there"{\char125}\ produces\ the\ string\nwnewline
{\char92}spad{\char123}"hello\ there"{\char125}.{\char125}.\nwnewline
The\ author\ of\ {\char92}spadtype{\char123}String{\char125}\ could\ then\ assert\ that\ {\char92}spadty
is\ a\ member\ of\ {\char92}spadtype{\char123}SemiGroup{\char125}.\nwnewline
According\ to\ our\ definition\ of\ {\char92}spadtype{\char123}SemiGroup{\char125},\ strings\nwnewline
would\ then\ also\ have\ the\ operation\ {\char92}spadop{\char123}**{\char125}\ defined\ automatically.\
Then\ {\char92}spad{\char123}"--"\ **\ 4{\char125}\ would\ produce\ a\ string\ of\ eight\ dashes\nwnewli
{\char92}spad{\char123}"--------"{\char125}.\nwnewline
Since\ {\char92}spadtype{\char123}String{\char125}\ is\ a\ member\ of\ {\char92}spadtype{\char123}SemiGr
a\ member\ of\ {\char92}spadtype{\char123}SetCategory{\char125}\ and\ thus\ has\ an\ operation\nwnewline
{\char92}spadop{\char123}={\char125}\ for\ testing\ that\ two\ strings\ are\ equal.\nwnewline
\nwnewline
{\char92}texht{\char123}Now\ turn\ to\ the\ algebraic\ category\ hierarchy\ inside\ the\nwnewline
front\ cover\ of\ this\ book.{\char125}{\char123}{\char125}\nwnewline
Any\ domain\ that\ is\ a\ member\ of\ a\nwnewline
category\ extending\ {\char92}spadtype{\char123}SemiGroup{\char125}\ is\ a\ member\ of\nwnewline
{\char92}spadtype{\char123}SemiGroup{\char125}\ (that\ is,\ it\ {\char123}{\char92}it\ is{\char125}\ a\
In\ particular,\ any\ domain\ asserted\ to\ be\ a\ {\char92}spadtype{\char123}Ring{\char125}\ is\ a\nwne
semigroup\ since\ {\char92}spadtype{\char123}Ring{\char125}\ extends\ {\char92}spadtype{\char123}Monoid{
in\ turn,\ extends\ {\char92}spadtype{\char123}SemiGroup{\char125}.\nwnewline
The\ definition\ of\ {\char92}spadtype{\char123}Integer{\char125}\ in\ Axiom\ asserts\ that\nwnewline
```

```
{\char92}spadtype{\char123}Integer{\char125}\ is\ a\ member\ of\ category\nwnewline
{\char92}spadtype{\char123}IntegerNumberSystem{\char125},\ that,\ in\ turn,\ asserts\ that\ i
a\ member\ of\ {\char92}spadtype{\char123}EuclideanDomain{\char125}.\nwnewline
Now\ {\char92}spadtype{\char123}EuclideanDomain{\char125}\ extends\nwnewline
{\char92}spadtype{\char123}PrincipalIdealDomain{\char125}\ and\ so\ on.\nwnewline
If\ you\ trace\ up\ the\ hierarchy,\ you\ see\ that\nwnewline
{\char92}spadtype{\char123}EuclideanDomain{\char125}\ extends\ {\char92}spadtype{\char123}Rin
therefore,\ {\char92}spadtype{\char123}SemiGroup{\char125}.\nwnewline
Thus\ {\char92}spadtype{\char123}Integer{\char125}\ is\ a\ semigroup\ and\ also\ exports\ the
operations\ {\char92}spadop{\char123}*{\char125}\ and\ {\char92}spadop{\char123}**{\char125}

{\char92}beginscroll\nwnewline
\nwnewline
While\ such\ statements\ are\ only\ comments,\nwnewline
Axiom\ can\ enforce\ their\ intention\ simply\ by\ shifting\ the\ burden\ of\nwnewline
responsibility\ onto\ the\ author\ of\ a\ domain.\nwnewline
A\ domain\ belongs\ to\ category\ {\char92}spad{\char123}Ring{\char125}\ only\ if\ the\nwnewline
author\ asserts\ that\ the\ domain\ \ belongs\ to\ {\char92}spadtype{\char123}Ring{\char125}\ or\nwnewli
to\ a\ category\ that\ extends\ {\char92}spadtype{\char123}Ring{\char125}.\nwnewline
\nwnewline
This\ principle\ of\ assertion\ is\ important\ for\ large\ user-extendable\nwnewline
systems.\nwnewline
Axiom\ has\ a\ large\ library\ of\ operations\ offering\ facilities\ in\nwnewline
many\ areas.\nwnewline
Names\ such\ as\ {\char92}spadfun{\char123}norm{\char125}\ and\ {\char92}spadfun{\char123}product{\char1
diverse\ meanings\ in\ diverse\ contexts.\nwnewline
An\ inescapable\ hindrance\ to\ users\ would\ be\ to\ force\ those\ who\ wish\ to\nwnewline
extend\ Axiom\ to\ always\ invent\ new\ names\ for\ operations.\nwnewline
{\char37}>>\ I\ don't\ think\ disambiguate\ is\ really\ a\ word,\ though\ I\ like\ it\nwnewline
Axiom\ allows\ you\ to\ reuse\ names,\ and\ then\ use\ context\ to\ disambiguate\ one\nwnewline
from\ another.\nwnewline
\nwnewline
Here\ is\ another\ example\ of\ why\ this\ is\ important.\ \ Some\ languages,\nwnewline
such\ as\ {\char123}{\char92}bf\ APL{\char125},\ denote\ the\ {\char92}spadtype{\char123}Boolean{\char12
and\ {\char92}spad{\char123}false{\char125}\ by\ the\ integers\ {\char92}spad{\char123}1{\char125}\ and\
to\ let\ infix\ operators\ {\char92}spadop{\char123}+{\char125}\ and\ {\char92}spadop{\char123}*{\char12
operators\ {\char92}spadfun{\char123}or{\char125}\ and\ {\char92}spadfun{\char123}and{\char125},\ respec
this:\ {\char92}spadtype{\char123}Boolean{\char125}\ is\ not\ a\ ring.\ \ The\ {\char123}{\char92}it\ in
{\char92}spadtype{\char123}Ring{\char125}\ states:\nwnewline
\nwnewline
{\char92}centerline{\char123}\nwnewline
{\char123}Every\ element\ {\char92}spad{\char123}x{\char125}\ has\ an\ additive\ inverse\ {\char92}spad{
{\char92}centerline{\char123}{\char123}{\char92}spad{\char123}x\ +\ y\ =\ 0{\char125}.{\char125}{\char12
{\char37}\nwnewline
{\char92}spadtype{\char123}Boolean{\char125}\ is\ not\ a\ ring\ since\ {\char92}spad{\char123}true{\char
no\ inverse---there\ is\ no\ inverse\ element\ {\char92}spad{\char123}a{\char125}\ such\ that\nwnewline
{\char92}spad{\char123}1\ +\ a\ =\ 0{\char125}\ (in\ terms\ of\ booleans,\ {\char92}spad{\char123}(true\
Nonetheless,\ Axiom\ {\char123}{\char92}it\ could{\char125}\ easily\ and\ correctly\ implemen
{\char92}spadtype{\char123}Boolean{\char125}\ this\ way.\nwnewline
{\char92}spadtype{\char123}Boolean{\char125}\ simply\ would\ not\ assert\ that\ it\ is\ of\ c
{\char92}spadtype{\char123}Ring{\char125}.\nwnewline
Thus\ the\ {\char92}spadop{\char123}+{\char125}\ for\ {\char92}spadtype{\char123}Boolean{\cha
is\ not\ confused\ with\ the\ one\ for\ {\char92}spadtype{\char123}Ring{\char125}.\nwnewline
Since\ the\ {\char92}spadtype{\char123}Polynomial{\char125}\ constructor\ requires\ its\ argu
to\ be\ a\ ring,\ Axiom\ would\ then\ refuse\ to\ build\ the\nwnewline
domain\ {\char92}spadtype{\char123}Polynomial(Boolean){\char125}.\ Also,\ Axiom\ would\ refus
wrongfully\ apply\ algorithms\ to\ {\char92}spadtype{\char123}Boolean{\char125}\ elements\ th
presume\ that\ the\ ring\ axioms\ for\ {\char92}spadop{\char123}+{\char125}\ hold.\nwnewline

{\char125}\nwnewline
\nwnewline
Attributes\ are\ used\ to\ conditionally\ export\ and\ define\nwnewline
operations\ for\ a\ domain\ (see\ \nwnewline
{\char92}downlink{\char123}‘‘Category\ Assertions’’{\char125}{\char123}ugDomainsAssertionsPage{\char125}
Section\ 13.3{\char92}ignore{\char123}ugDomainsAssertions{\char125}).\nwnewline
Attributes\ can\ also\ be\ asserted\ in\ a\ category\ definition.\nwnewline
\nwnewline
After\ mentioning\ category\ {\char92}spadtype{\char123}Ring{\char125}\ many\ times\ in\ this\ book,\nwn
it\ is\ high\ time\ that\ we\ show\ you\ its\ definition:\nwnewline
\nwnewline
{\char92}beginImportant\nwnewline
\ \ \nwnewline
{\char92}noindent\nwnewline
{\char123}{\char92}tt\ 1.{\char92}\ {\char92}\ {\char92}\ Ring():{\char92}\ Category{\char92}\ =={\char1
{\char123}{\char92}tt\ 2.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ Join(Rng,Monoid,LeftModu
{\char123}{\char92}tt\ 3.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\
{\char123}{\char92}tt\ 4.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\
{\char123}{\char92}tt\ 5.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\
{\char123}{\char92}tt\ 6.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ ad
{\char123}{\char92}tt\ 7.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\
{\char123}{\char92}tt\ 8.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\
{\char92}endImportant\nwnewline
\nwnewline
There\ are\ only\ two\ new\ things\ here.\ \ First,\ look\ at\ the\nwnewline
{\char92}spadSyntax{\char123}{\char92}{\char36}{\char92}{\char36}{\char125}\ on\ the\ last\ line.\ \ Thi
The\ first\ {\char92}spadSyntax{\char123}{\char92}{\char36}{\char125}\ says\ that\ the\ {\char92}spad{\c
domain.\ \ The\ second\ {\char92}spadSyntax{\char123}{\char92}{\char36}{\char125}\ says\ that\ the\ doma
domain.’’\ \ If\ {\char92}spadSyntax{\char123}{\char92}{\char36}{\char125}\ is\ {\char92}spadtype{\char1
line\ reads\ {\char123}{\char92}tt\ coerce(n)\ ==\ n\ *\ 1{\char92}{\char36}Fraction(Integer){\char125}.
\nwnewline
The\ second\ new\ thing\ is\ the\ presence\ of\ attribute\nwnewline
‘‘{\char92}spad{\char123}unitsKnown{\char125}’’.\ \ Axiom\ can\ always\ distinguish\ an\ attribute\ from
an\ operation.\ \ An\ operation\ has\ a\ name\ and\ a\ type.\ An\ attribute\ has\ no\nwnewline
type.\ \ The\ attribute\ {\char92}spadatt{\char123}unitsKnown{\char125}\ asserts\ a\ rather\ subtle\nwne
mathematical\ fact\ that\ is\ normally\ taken\ for\ granted\ when\ working\ with\nwnewline
rings.{\char92}footnote{\char123}With\ this\ axiom,\ the\ units\ of\ a\ domain\ are\ the\ set\ of\nwnewl
elements\ {\char92}spad{\char123}x{\char125}\ that\ each\ have\ a\ multiplicative\ inverse\ {\char92}spa
the\ domain.\ \ Thus\ {\char92}spad{\char123}1{\char125}\ and\ {\char92}spad{\char123}-1{\char125}\ are\
{\char92}spadtype{\char123}Integer{\char125}.\ \ Also,\ for\ {\char92}spadtype{\char123}Fraction\ Intege
of\ rational\ numbers,\ all\ non-zero\ elements\ are\ units.{\char125}\ \ Because\nwnewline
programs\ can\ test\ for\ this\ attribute,\ Axiom\ can\ correctly\ handle\nwnewline
rather\ more\ complicated\ mathematical\ structures\ (ones\ that\ are\ similar\nwnewline
to\ rings\ but\ do\ not\ have\ this\ attribute).\nwnewline

Like\ domain\ constructors,\ category\ constructors\ can\ also\ have\nwnewline
parameters.\ \ For\ example,\ category\ {\char92}spadtype{\char123}MatrixCategory{\char125}\
parameterized\ category\ for\ defining\ matrices\ over\ a\ ring\ {\char92}spad{\char123}R{\ch
that\ the\ matrix\ domains\ can\ have\ different\ representations\ and\nwnewline
indexing\ schemes.\ \ Its\ definition\ has\ the\ form:\nwnewline
\nwnewline
{\char92}beginImportant\nwnewline
\ \ \nwnewline
{\char92}noindent\nwnewline
{\char123}{\char92}tt\ 1.{\char92}\ {\char92}\ {\char92}\ MatrixCategory(R,Row,Col):{\char92}
{\char123}{\char92}tt\ 2.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\
{\char92}endImportant\nwnewline
\nwnewline
The\ category\ extends\ {\char92}spadtype{\char123}TwoDimensionalArrayCategory{\char125}\ with\ the\nwne
same\ arguments.\ \ You\ cannot\ find\nwnewline
{\char92}spadtype{\char123}TwoDimensionalArrayCategory{\char125}\ in\ the\ algebraic\ hierarchy\nwnewlin
listing.\ \ Rather,\ it\ is\ a\ member\ of\ the\ data\ structure\ hierarchy,\nwnewline
given\ inside\ the\ back\ cover\ of\ this\ book.\ \ In\ particular,\nwnewline
{\char92}spadtype{\char123}TwoDimensionalArrayCategory{\char125}\ is\ an\ extension\ of\nwnewline
{\char92}spadtype{\char123}HomogeneousAggregate{\char125}\ since\ its\ elements\ are\ all\ one\ type.\nw
\nwnewline
The\ domain\ {\char92}spadtype{\char123}Matrix(R){\char125},\ the\ class\ of\ matrices\ with\ coefficien
from\ domain\ {\char92}spad{\char123}R{\char125},\ asserts\ that\ it\ is\ a\ member\ of\ category\nwnewl
{\char92}spadtype{\char123}MatrixCategory(R,\ Vector(R),\ Vector(R)){\char125}.\nwnewline
The\ parameters\ of\ a\ category\ must\ also\ have\ types.\nwnewline
The\ first\ parameter\ to\ {\char92}spadtype{\char123}MatrixCategory{\char125}\nwnewline
{\char92}spad{\char123}R{\char125}\ is\ required\ to\ be\ a\ ring.\nwnewline
The\ second\ and\ third\ are\ required\ to\ be\ domains\ of\ category\nwnewline
{\char92}spadtype{\char123}FiniteLinearAggregate(R){\char125}.{\char92}footnote{\char123}{\char37}\nwnew
This\ is\ another\ extension\ of\nwnewline
{\char92}spadtype{\char123}HomogeneousAggregate{\char125}\ that\ you\ can\ see\ in\nwnewline
the\ data\ structure\ hierarchy.{\char125}\nwnewline
In\ practice,\ examples\ of\ categories\ having\ parameters\ other\ than\nwnewline
domains\ are\ rare.\nwnewline
\nwnewline
Adding\ the\ declarations\ for\ parameters\ to\ the\ definition\ for\nwnewline
{\char92}spadtype{\char123}MatrixCategory{\char125},\ we\ have:\nwnewline

{\char92}beginscroll\nwnewline
\nwnewline
```

```
As\ categories\ have\ parameters,\ the\ actual\ operations\ exported\ by\ a\nwnewline
category\ can\ depend\ on\ these\ parameters.\nwnewline
As\ an\ example,\ the\ operation\ {\char92}spadfunFrom{\char123}determinant{\char125}{\char1
from\ category\ {\char92}spadtype{\char123}MatrixCategory{\char125}\ is\ only\ exported\ wher
underlying\ domain\ {\char92}spad{\char123}R{\char125}\ has\ commutative\ multiplication:\nwn
\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
if\ R\ has\ commutative("*")\ then\nwnewline
\ \ \ determinant:\ {\char36}\ ->\ R\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
\nwnewline
Conditionals\ can\ also\ define\ conditional\ extensions\ of\ a\ category.\nwnewline
Here\ is\ a\ portion\ of\ the\ definition\ of\ {\char92}spadtype{\char123}QuotientFieldCatego
\nwnewline
{\char92}beginImportant\nwnewline
\ \ \nwnewline
{\char92}noindent\nwnewline
{\char123}{\char92}tt\ 1.{\char92}\ {\char92}\ {\char92}\ QuotientFieldCategory(R){\char92}\
{\char123}{\char92}tt\ 2.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\
{\char123}{\char92}tt\ 3.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\
{\char123}{\char92}tt\ 4.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\
{\char123}{\char92}tt\ 5.{\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\char92}\ {\
{\char92}endImportant\nwnewline
\nwnewline
Think\ of\ category\ {\char92}spadtype{\char123}QuotientFieldCategory(R){\char125}\ as\nwnewl
denoting\ the\ domain\ {\char92}spadtype{\char123}Fraction(R){\char125},\ the\nwnewline
class\ of\ all\ fractions\ of\ the\ form\ {\char92}smath{\char123}a/b{\char125}\ for\ element
The\ first\ conditional\ means\ in\ English:\nwnewline
``If\ the\ elements\ of\ {\char92}spad{\char123}R{\char125}\ are\ totally\ ordered\ ({\char92
is\ an\ {\char92}spadtype{\char123}OrderedSet{\char125}),\ then\ so\ are\ the\ fractions\ {\c
\nwnewline
The\ second\ conditional\ is\ used\ to\ conditionally\ export\ an\nwnewline
operation\ {\char92}spadfun{\char123}ceiling{\char125}\ which\ returns\ the\ smallest\ intege
greater\ than\ or\ equal\ to\ its\ argument.\nwnewline
Clearly,\ ``ceiling''\ makes\ sense\ for\ integers\ but\ not\ for\nwnewline
polynomials\ and\ other\ algebraic\ structures.\nwnewline
Because\ of\ this\ conditional,\nwnewline
the\ domain\ {\char92}spadtype{\char123}Fraction(Integer){\char125}\ exports\nwnewline
an\ operation\nwnewline
{\char92}spadfun{\char123}ceiling{\char125}:\ {\char92}spadsig{\char123}Fraction\ Integer{\ch
{\char92}spadtype{\char123}Fraction\ Polynomial\ Integer{\char125}\ does\ not.\nwnewline
\nwnewline
Conditionals\ can\ also\ appear\ in\ the\ default\ definitions\ for\ the\nwnewline
operations\ of\ a\ category.\nwnewline
For\ example,\ a\ default\ definition\ for\ {\char92}spadfunFrom{\char123}ceiling{\char125}{\
within\ the\ part\ following\ the\ {\char92}spadop{\char123}add{\char125}\ reads:\nwnewline
\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
if\ R\ has\ IntegerNumberSystem\ then\nwnewline
\ \ \ \ ceiling\ x\ ==\ ...\nwnewline
```

```
{\char92}end{\char123}verbatim{\char125}\nwnewline
\nwnewline
Here\ the\ predicate\ used\ is\ identical\ to\ the\ predicate\ in\ the\ {\char123}{\char92}tt\nwnewline
Exports{\char125}\ part.\ \ This\ need\ not\ be\ the\ case.\ \ See\nwnewline

{\char92}beginscroll\nwnewline
\nwnewline
Packages\ are\ special\ cases\ of\ domains.\ \ What\ is\ the\ difference\ between\nwnewline
a\ package\ and\ a\ domain\ that\ is\ not\ a\ package?\ \ By\ definition,\ there\ is\nwnewline
only\ one\ difference:\ a\ domain\ that\ is\ not\ a\ package\ has\ the\ symbol\nwnewline
{\char92}axiomSyntax{\char123}{\char92}{\char36}{\char125}\ appearing\ somewhere\ among\ the\ types\ of\
operations.\ \ The\ {\char92}axiomSyntax{\char123}{\char92}{\char36}{\char125}\ denotes\ ``this\ domain.
{\char92}axiomSyntax{\char123}{\char92}{\char36}{\char125}\ appears\ before\ the\ {\char92}axiomSyntax{\
signature,\ it\ means\ the\ operation\ takes\ an\ element\ from\ the\ domain\ as\nwnewline
an\ argument.\ \ If\ it\ appears\ after\ the\ {\char92}axiomSyntax{\char123}->{\char125},\ then\ the\nwn
operation\ returns\ an\ element\ of\ the\ domain.\nwnewline
\nwnewline
If\ no\ exported\ operations\ mention\ {\char92}axiomSyntax{\char123}{\char92}{\char36}{\char125},\ then
there\ is\ nothing\ of\ interest\ to\ do\ with\ the\ objects\ of\ the\ domain.\nwnewline
You\ might\ then\ say\ that\ a\ package\ is\ a\ ``boring''\ domain!\ \ But,\ as\ you\nwnewline
saw\ in\ {\char92}downlink{\char123}``Packages''{\char125}{\char123}ugPackagesPage{\char125}\ in\ Chapte
11{\char92}ignore{\char123}ugPackages{\char125},\ packages\ are\ a\ very\ useful\nwnewline
notion\ indeed.\ \ The\ exported\ operations\ of\ a\ package\ depend\ solely\ on\nwnewline
the\ parameters\ to\ the\ package\ constructor\ and\ other\ explicit\ domains.\nwnewline
\nwnewline
To\ summarize,\ domain\ constructors\ are\ versatile\ structures\ that\ serve\nwnewline
two\ distinct\ practical\ purposes:\ Those\ like\ {\char92}axiomType{\char123}Polynomial{\char125}\ and\
{\char92}axiomType{\char123}List{\char125}\ describe\ classes\ of\ computational\ objects;\ others,\nwne
like\ {\char92}pspadtype{\char123}SortPackage{\char125},\ describe\ packages\ of\ useful\ operations.\nw
As\ in\ the\ last\ chapter,\ we\ focus\ here\ on\ the\ first\ kind.\nwnewline

```
\begin{page}{ugDomainsBrowsePage}{13.5. Browse}
\beginscroll

The \Browse{} facility of Hyperdoc is useful for
investigating
the properties of domains, packages, and categories.
From the main Hyperdoc menu, move your mouse to {\bf Browse} and
click on the left mouse button.
This brings up the \Browse{} first page.
Now, with your mouse pointer somewhere in this window, enter the
string ``quadraticform'' into the input area (all lower case
letters will do).
Move your mouse to {\bf Constructors} and click.
Up comes a page describing \axiomType{QuadraticForm}.

From here, click on {\bf Description}.
This gives you a page that includes a part labeled by ``{\it
Description:}''.
You also see the types for arguments \axiom{n} and \axiom{K}
displayed as well as the fact that \axiomType{QuadraticForm}
returns an \axiomType{AbelianGroup}.
You can go and experiment a bit by selecting {\bf Field} with
your mouse.
Eventually, use
\UpButton{}
several times to return to the first page on
```

```
\axiomType{QuadraticForm}.

Select {\bf Operations} to get a list of operations for
\axiomType{QuadraticForm}.
You can select an operation by clicking on it
to get an individual page with information about that operation.
Or you can select the buttons along the bottom to see alternative
views or get additional information on the operations.
Then return to the page on \axiomType{QuadraticForm}.

Select {\bf Cross Reference} to get another menu.
This menu has buttons for {\bf Parents}, {\bf Ancestors}, and
others.
Clicking on {\bf Parents}, you see that \axiomType{QuadraticForm}
has one parent \axiomType{AbelianMonoid}.

10.0.130 Representation

⇒ "notitle" (ugDomainsDemoPage) ?? on page ??
— **ug13.ht** —

```
\begin{page}{ugDomainsRepPage}{13.6. Representation}
\beginscroll
%
The {\tt Implementation} part of an Axiom capsule for a
domain constructor uses the special variable \axiom{Rep} to
identify the lower level data type used to represent the objects
of the domain.
The \axiom{Rep} for quadratic forms is \axiomType{SquareMatrix(n, K)}.
This means that all objects of the domain are required to be
\axiom{n} by \axiom{n} matrices with elements from \axiomType{K}.

The code for \axiomFun{quadraticForm} in Figure \ref{fig-quadform} on
page \pageref{fig-quadform} checks that the matrix is symmetric and
then converts it to \axiomSyntax{\$}, which means, as usual, ``this
domain.'' Such explicit conversions \index{conversion} are generally
required by the compiler.  Aside from checking that the matrix is
symmetric, the code for this function essentially does nothing.  The
{\frenchspacing\tt m :: \$} on line 28 coerces \axiom{m} to a
quadratic form.  In fact, the quadratic form you created in step (3)
of \downlink{``A Demo''}{ugDomainsDemoPage} in Section
```

```
13.4\ignore{ugDomainsDemo} is just the matrix you
passed it in disguise!  Without seeing this definition, you would not
know that.  Nor can you take advantage of this fact now that you do
know!  When we try in the next step of
\downlink{``A Demo''}{ugDomainsDemoPage} in Section
13.4\ignore{ugDomainsDemo} to regard \axiom{q} as a
matrix by asking for \axiomFun{nrows}, the number of its rows, Axiom
gives you an error message saying, in effect, ``Good try, but this
won't work!''

The definition for the \spadfunFrom{matrix}{QuadraticForm}
function could hardly be simpler:
it just returns its argument after explicitly
\spadglossSee{coercing}{coerce} its argument to a matrix.
Since the argument is already a matrix, this coercion does no
computation.

Within the context of a capsule, an object of \axiomSyntax{\$} is
regarded both as a quadratic form {\it and} as a
matrix.\footnote{In case each of \axiomSyntax{\$} and \axiom{Rep}
have the same named operation available,
the one from \axiom{\$} takes precedence.
Thus, if you want the one from \axiomSyntax{Rep}, you must
package call it using a \axiomSyntax{\$Rep} suffix.}
This makes the definition of \axiom{q.v} easy---it
just calls the \spadfunFrom{dot}{DirectProduct} product from
\axiomType{DirectProduct} to perform the indicated operation.

10.0.131 Multiple Representations

⇒ "notitle" (ugTypesUnionsPage) **??** on page **??**
— **ug13.ht** —

```
\begin{page}{ugDomainsMultipleRepsPage}{13.7. Multiple Representations}
\beginscroll
%

To write functions that implement the operations of a domain, you
want to choose the most computationally efficient
data structure to represent the elements of your domain.
```

```
A classic problem in computer algebra is the optimal choice for an
internal representation of polynomials.
If you create a polynomial, say \texht{$3x^2+ 5$}{\axiom{3*x**2 + 5}},
how does Axiom hold this value internally?
There are many ways.
Axiom has nearly a dozen different representations of
polynomials, one to suit almost any purpose.
Algorithms for solving polynomial equations work most
efficiently with polynomials represented one way, whereas those for
factoring polynomials are most efficient using another.
One often-used representation is  a list of terms, each term
consisting of exponent-coefficient records written in the order
of decreasing exponents.
For example, the polynomial \texht{$3x^2+5$}{3*x**2+5} is
%>> I changed the k's in next line to e's as I thought that was
%>> clearer.
represented by the list \axiom{{\tt{}e:2,\ c:3],\ [e:0,\ c:5}}.

What is the optimal data structure for a matrix?
It depends on the application.
For large sparse matrices, a linked-list structure of records
holding only the non-zero elements may be optimal.
If the elements can be defined by a simple formula
\texht{$f(i,j)$}{\axiom{f(i,j)}}, then a compiled function for
\axiom{f} may be optimal.
Some programmers prefer to represent ordinary matrices as vectors
of vectors.
Others prefer to represent matrices by one big linear array where
elements are accessed with linearly computable indexes.

While all these simultaneous structures tend to be confusing,
Axiom provides a helpful organizational tool for such a purpose:
categories.
\axiomType{PolynomialCategory}, for example, provides a uniform user
interface across all polynomial types.
Each kind of polynomial implements functions for
all these operations, each in its own way.
If you use only the top-level operations in
\axiomType{PolynomialCategory} you usually do not care what kind
of polynomial implementation is used.

%>> I've often thought, though, that it would be nice to be
%>> be able to use conditionals for representations.

Within a given domain, however, you define (at most) one
representation.\footnote{You can make that representation a
\pspadtype{Union} type, however.  See
\downlink{``Unions''}{ugTypesUnionsPage} in Section
2.5\ignore{ugTypesUnions} for examples of unions.}
If you want to have multiple representations (that is, several
domains, each with its own representation), use a category to describe
the {\tt Exports}, then define separate domains for each
representation.

\endscroll
\autobuttons
\end{page}
```

———-

10.0.132 Add Domain

⇒ "notitle" (ugDomainsDemoPage) ?? on page ??
— **ug13.ht** —

```
\begin{page}{ugDomainsAddDomainPage}{13.8. Add Domain}
\beginscroll
%

The capsule part of {\tt Implementation} defines functions that
implement the operations exported by the domain---usually only some of
the operations.  In our demo in
\downlink{``A Demo''}{ugDomainsDemoPage} in Section
13.4\ignore{ugDomainsDemo}, we asked for the value of
\axiom{3*q-q+q}.  Where do the operations \axiomOp{*}, \axiomOp{+},
and \axiomOp{-} come from?  There is no definition for them in the
capsule!

The {\tt Implementation} part of a definition can optionally specify
an ``add-domain'' to the left of an {\tt add} \spadkey{add} (for
\axiomType{QuadraticForm}, defines \axiomType{SquareMatrix(n,K)} is
the add-domain).  The meaning of an add-domain is simply this: if the
capsule part of the {\tt Implementation} does not supply a function
for an operation, Axiom goes to the add-domain to find the function.
So do \axiomOpFrom{*}{QuadraticForm}, \axiomOpFrom{+}{QuadraticForm}
and \axiomOpFrom{-}{QuadraticForm} come from
\axiomType{SquareMatrix(n,K)}?

\endscroll
\autobuttons
\end{page}
```

———-

10.0.133 Defaults

⇒ "notitle" (ugPackagesPage) ?? on page ??
⇒ "notitle" (ugCategoriesDefaultsPage) ?? on page ??
— **ug13.ht** —

```
\begin{page}{ugDomainsDefaultsPage}{13.9. Defaults}
\beginscroll
%
In \downlink{‘‘Packages’’}{ugPackagesPage} in
Chapter 11\ignore{ugPackages}, we saw that
categories can provide
default implementations for their operations.
How and when are they used?
When Axiom finds that \axiomType{QuadraticForm(2, Fraction Integer)}
does not implement the operations \axiomOp{*},
\axiomOp{+}, and \axiomOp{-}, it goes to
\axiomType{SquareMatrix(2,Fraction Integer)} to find it.
As it turns out, \axiomType{SquareMatrix(2, Fraction Integer)} does
not implement {\it any} of these operations!

What does Axiom do then?  Here is its overall strategy.  First, Axiom
looks for a function in the capsule for the domain.  If it is not
there, Axiom looks in the add-domain for the operation.  If that
fails, Axiom searches the add-domain of the add-domain, and so on.  If
all those fail, it then searches the default packages for the
categories of which the domain is a member.  In the case of
\axiomType{QuadraticForm}, it searches \axiomType{AbelianGroup}, then
its parents, grandparents, and so on.  If this fails, it then searches
the default packages of the add-domain.  Whenever a function is found,
the search stops immediately and the function is returned.  When all
fails, the system calls \axiomFun{error} to report this unfortunate
news to you.  To find out the actual order of constructors searched
for \axiomType{QuadraticForm}, consult \Browse{}: from the
\axiomType{QuadraticForm}, click on {\bf Cross Reference}, then on
{\bf Lineage}.

Let’s apply this search strategy for our example \axiom{3*q-q+q}.  The
scalar multiplication comes first.  Axiom finds a default
implementation in \axiomType{AbelianGroup\&}.  Remember from
\downlink{‘‘Defaults’’}{ugCategoriesDefaultsPage} in
Section 12.6\ignore{ugCategoriesDefaults} that
\axiomType{SemiGroup} provides a default definition for
\texht{$x^n$}{x**n} by repeated squaring?  \axiomType{AbelianGroup}
similarly provides a definition for \texht{$n x$}{n*x} by repeated
doubling.

But the search of the defaults for \axiomType{QuadraticForm} fails to
```

```
find any \axiomOp{+} or \axiomOp{*} in the default packages for the
ancestors of \axiomType{QuadraticForm}.  So it now searches among
those for \axiomType{SquareMatrix}.  Category
\axiomType{MatrixCategory}, which provides a uniform interface for all
matrix domains, is a grandparent of \axiomType{SquareMatrix} and has a
capsule defining many functions for matrices, including matrix
addition, subtraction, and scalar multiplication.  The default package
\axiomType{MatrixCategory\&} is where the functions for
\axiomOpFrom{+}{QuadraticForm} and \spadfunFrom{-}{QuadraticForm} come
from.

You can use \Browse{} to discover where the operations for
\axiomType{QuadraticForm} are implemented.  First, get the page
describing \axiomType{QuadraticForm}.  With your mouse somewhere in
this window, type a ``2'', press the \texht{\fbox{\bf Tab}}{{\bf Tab}}
key, and then enter ``Fraction Integer'' to indicate that you want the
domain \axiomType{QuadraticForm(2, Fraction Integer)}.  Now click on
{\bf Operations} to get a table of operations and on \axiomOp{*} to
get a page describing the \axiomOp{*} operation.  Finally, click on
{\bf implementation} at the bottom.

\endscroll
\autobuttons
\end{page}
```

10.0.134 Origins

— ug13.ht —

```
\begin{page}{ugDomainsOriginsPage}{13.10. Origins}
\beginscroll
%

Aside from the notion of where an operation is implemented, a useful
notion is the {\it origin} or ``home'' of an operation.  When an
operation (such as \spadfunFrom{quadraticForm}{QuadraticForm}) is
explicitly exported by a domain (such as \axiomType{QuadraticForm}),
you can say that the origin of that operation is that domain.  If an
operation is not explicitly exported from a domain, it is inherited
from, and has as origin, the (closest) category that explicitly
exports it.  The operations \axiomOpFrom{+}{AbelianMonoid} and
\axiomOpFrom{-}{AbelianMonoid} of \axiomType{QuadraticForm}, for
example, are inherited from \axiomType{AbelianMonoid}.  As it turns
out, \axiomType{AbelianMonoid} is the origin of virtually every
\axiomOp{+} operation in Axiom!
```

```
Again, you can use \Browse{} to discover the origins of operations.
From the \Browse{} page on \axiomType{QuadraticForm}, click on {\bf
Operations}, then on {\bf origins} at the bottom of the page.

The origin of the operation is the {\it only} place where on-line
documentation is given.  However, you can re-export an operation to
give it special documentation.  Suppose you have just invented the
world's fastest algorithm for inverting matrices using a particular
internal representation for matrices.  If your matrix domain just
declares that it exports \axiomType{MatrixCategory}, it exports the
\axiomFun{inverse} operation, but the documentation the user gets from
\Browse{} is the standard one from \axiomType{MatrixCategory}.  To
give your version of \axiomFun{inverse} the attention it deserves,
simply export the operation explicitly with new documentation.  This
redundancy gives \axiomFun{inverse} a new origin and tells \Browse{}
to present your new documentation.

\autobuttons
\end{page}
```

———-

10.0.135 Short Forms

— ug13.ht —

```
\begin{page}{ugDomainsShortFormsPage}{13.11. Short Forms}
\beginscroll

In Axiom, a domain could be defined using only an add-domain and no
capsule.  Although we talk about rational numbers as quotients of
integers, there is no type \pspadtype{RationalNumber} in Axiom.  To
create such a type, you could compile the following ``short-form''
definition:

\beginImportant

\noindent
{\tt 1.\ \ \ RationalNumber()\ ==\ Fraction(Integer)}\newline
\endImportant

The {\tt Exports} part of this definition is missing and is taken to
be equivalent to that of \axiomType{Fraction(Integer)}.  Because of
the add-domain philosophy, you get precisely what you want.  The
effect is to create a little stub of a domain.  When a user asks to
```

```
add two rational numbers, Axiom would ask \pspadtype{RationalNumber}
for a function implementing this \axiomOp{+}.  Since the domain has no
capsule, the domain then immediately sends its request to
\axiomType{Fraction (Integer)}.

The short form definition for domains is used to
define such domains as \axiomType{MultivariatePolynomial}:

\beginImportant

\noindent
{\tt 1.\ \ \ MultivariatePolynomial(vl:\ List\ Symbol,\ R:\ Ring)\ ==}
\newline
{\tt 2.\ \ \ \ \ \ SparseMultivariatePolynomial(R,}\newline
{\tt 3.\ \ \ \ \ \ \ \ \ OrderedVariableList\ vl)}\newline
\endImportant

\endscroll
\autobuttons
\end{page}
```

10.0.136 Example 1: Clifford Algebra

⇒ "notitle" (CliffordAlgebraXmpPage) 3.15.2 on page 220
— **ug13.ht** —

```
\begin{page}{ugDomainsCliffordPage}{13.12. Example 1: Clifford Algebra}
\beginscroll
%

Now that we have \axiomType{QuadraticForm} available,
let's put it to use.
Given some quadratic form \smath{Q} described by an
\smath{n} by \smath{n} matrix over a field \smath{K}, the domain
\axiomType{CliffordAlgebra(n, K, Q)} defines a vector space of
dimension \texht{$2^n$}{2**n} over \smath{K}.
This is an interesting domain since complex numbers, quaternions,
exterior algebras and spin algebras are all examples of Clifford
algebras.

The basic idea is this:
the quadratic form \axiom{Q} defines a basis
\texht{$e_1,e_2\ldots,e_n$}{e1,e2,...,en} for the
vector space \texht{$K^n$}{K**n}---the direct product of \axiom{K}
with itself \axiom{n} times.
```

```
From this, the Clifford algebra generates a basis of
\texht{$2^n$}{2**n} elements given by all the possible products
of the \texht{$e_i$}{\axiom{ei}} in order without duplicates, that is,
\texht{
1,
$e_1$,
$e_2$,
$e_1e_2$,
$e_3$,
$e_1e_3$,
$e_2e_3$,
$e_1e_2,e_3$}{1, e1, e2, e1*e2, e3, e1*e3, e2*e3, e1*e2*e3},
and so on.

The algebra is defined by the relations
\begin{verbatim}
ei*ei = Q(ei)
ei*ej = -ej*ei,  i ^= j
\end{verbatim}

Now look at the snapshot of its definition given in Figure
\ref{fig-clifalg}.
Lines 9-10 show part of the definitions of the {\tt Exports}.
A Clifford algebra over a field \axiom{K} is asserted to be a ring,
an algebra over \axiom{K}, and a vector space over \axiom{K}.
Its explicit exports include
\axiom{e(n),} which returns the \eth{\axiom{n}} unit element.

\caption{Part of the \protect\axiomType{CliffordAlgebra} domain.}
\label{fig-clifalg}
\endImportant

The {\tt Implementation} part begins by defining a local variable
\axiom{Qeelist} to hold the list of all \axiom{q.v} where \axiom{v}
runs over the unit vectors from 1 to the dimension \axiom{n}.
Another local variable \axiom{dim} is set to \texht{$2^n$}{2**n},
computed once and for all.
The representation for the domain is
\axiomType{PrimitiveArray(K)},
which is a basic array of elements from domain \axiom{K}.
Line 18 defines \axiom{New} as shorthand for the more lengthy
expression \axiom{new(dim, 0\$K)\$Rep}, which computes a primitive
array of length \texht{$2^n$}{2**n} filled with \axiom{0}'s from
domain \axiom{K}.

Lines 19-22 define the sum of two elements \axiom{x} and \axiom{y}
straightforwardly.
First, a new array of all \axiom{0}'s is created, then filled with
the sum of the corresponding elements.
Indexing for primitive arrays starts at 0.
The definition of the product of \axiom{x} and \axiom{y} first requires
the definition of a local function \userfun{addMonomProd}.
Axiom knows it is local since it is not an exported function.
The types of all local functions must be declared.

For a demonstration of \axiomType{CliffordAlgebra}, see
\downlink{`CliffordAlgebra'}{CliffordAlgebraXmpPage}

\begin{page}{ugDomsinsDatabasePage}
{13.13. Example 2: Building A Query Facility}
\beginscroll
%
We now turn to an entirely different kind of application,
building a query language for a database.

Here is the practical problem to solve.
The \Browse{} facility of Axiom has a
database for all operations and constructors which is
stored on disk and accessed by Hyperdoc.
For our purposes here, we regard each line of this file as having
eight fields:
{\tt class, name, type, nargs, exposed, kind, origin,} and {\tt condition.}
Here is an example entry:

\begin{verbatim}
o`determinant`$->R`1`x`d`Matrix(R)`has(R,commutative("*"))
\end{verbatim}

In English, the entry means:
\texht{\begin{quotation}}{\newline}
\texht{\raggedright}{}
The operation \axiomFun{determinant}: \spadsig{\$}{R} with {\it 1}
argument, is
{\it exposed} and is exported by {\it domain} \axiomType{Matrix(R)}
```

```
if {\tt R has commutative("*")}.
\texht{\end{quotation}}{\newline}

Our task is to create a little query language that allows us
to get useful information from this database.

```

———-

10.0.138 A Little Query Language

— ug13.ht —

```
\begin{page}{ugDomainsQueryLanguagePage}{13.13.1. A Little Query Language}
\beginscroll

First we design a simple language for accessing information from
the database.
We have the following simple model in mind for its design.
Think of the database as a box of index cards.
There is only one search operation---it
takes the name of a field and a predicate
(a boolean-valued function) defined on the fields of the
index cards.
When applied, the search operation goes through the entire box
selecting only those index cards for which the predicate is true.
The result of a search is a new box of index cards.
This process can be repeated again and again.

The predicates all have a particularly simple form: {\it symbol}
{\tt =} {\it pattern}, where {\it symbol} designates one of the
fields, and {\it pattern} is a ‘‘search string’’---a string
```

```
that may contain a ‘‘{\tt *}’’ as a
wildcard.
Wildcards match any substring, including the empty string.
Thus the pattern {\tt "*ma*t"} matches
{\tt "mat", "doormat"} and {\tt "smart".}

To illustrate how queries are given, we give you a sneak preview
of the facility we are about to create.

\xtc{
Extract the database of all Axiom operations.
}{
\spadpaste{ops := getDatabase("o")\bound{o1}}
}
\xtc{
How many exposed three-argument \axiomFun{map} operations involving
streams?
}{
\spadpaste{ops.(name="map").(nargs="3").(type="*Stream*")
\bound{o2}\free{o1}}
}

As usual, the arguments of \axiomFun{elt} (\axiomSyntax{.})
associate to the left.
The first \axiomFun{elt} produces the set of all operations with
name {\tt map}.
The second \axiomFun{elt} produces the set of all map operations
with three arguments.
The third \axiomFun{elt} produces the set of all three-argument map
operations having a type mentioning \axiomType{Stream}.

Another thing we’d like to do is to extract one field from each of
the index cards in the box and look at the result.
Here is an example of that kind of request.

\xtc{
What constructors explicitly export a \axiomFun{determinant} operation?
}{
\spadpaste{
elt(elt(elt(elt(ops,name="determinant"),origin),sort),unique)\free{o1}}
}

The first \axiomFun{elt} produces the set of all index cards with
name {\tt determinant}.
The second \axiomFun{elt} extracts the {\tt origin} component from
each index card. Each origin component
is the name of a constructor which directly
exports the operation represented by the index card.
Extracting a component from each index card produces what we call
a {\it datalist}.
```

```
The third \axiomFun{elt}, {\tt sort}, causes the datalist of
origins to be sorted in alphabetic
order.
The fourth, {\tt unique}, causes duplicates to be removed.

Before giving you a more extensive demo of this facility,
we now build the necessary domains and packages to implement it.
%We will introduce a few of our minor conveniences.

10.0.139 The Database Constructor

— ug13.ht —

```
\begin{page}{ugDomainsDatabaseConstructorPage}
{13.13.2. The Database Constructor}
\beginscroll

We work from the top down. First, we define a database,
our box of index cards, as an abstract datatype.
For sake of illustration and generality,
we assume that an index card is some type \axiom{S}, and
that a database is a box of objects of type \axiom{S}.
Here is the Axiom program defining the \pspadtype{Database}
domain.

\beginImportant

\noindent
{\tt 1.\ \ \ PI\ ==>\ PositiveInteger}\newline
{\tt 2.\ \ \ Database(S):\ Exports\ ==\ Implementation\ where}\newline
{\tt 3.\ \ \ \ \ S:\ Object\ with\ }\newline
{\tt 4.\ \ \ \ \ \ \ elt:\ (\$,\ Symbol)\ ->\ String}\newline
{\tt 5.\ \ \ \ \ \ \ display:\ \$\ ->\ Void}\newline
{\tt 6.\ \ \ \ \ \ \ fullDisplay:\ \$\ ->\ Void}\newline
{\tt 7.\ \ \ }\newline
{\tt 8.\ \ \ \ \ Exports\ ==\ with}\newline
{\tt 9.\ \ \ \ \ \ \ elt:\ (\$,QueryEquation)\ ->\ \$}\newline
{\tt 10.\ \ \ \ \ \ elt:\ (\$,\ Symbol)\ ->\ DataList\ String}\newline
{\tt 11.\ \ \ \ \ \ "+":\ (\$,\$)\ ->\ \$}\newline
{\tt 12.\ \ \ \ \ \ "-":\ (\$,\$)\ ->\ \$}\newline
```

```
{\tt 13.\ \ \ \ \ \ display:\ \$\ ->\ Void}\newline
{\tt 14.\ \ \ \ \ \ fullDisplay:\ \$\ ->\ Void}\newline
{\tt 15.\ \ \ \ \ \ fullDisplay:\ (\$,PI,PI)\ ->\ Void}\newline
{\tt 16.\ \ \ \ \ \ coerce:\ \$\ ->\ OutputForm}\newline
{\tt 17.\ \ \ \ Implementation\ ==\ add}\newline
{\tt 18.\ \ \ \ \ \ \ \ ...}\newline
\endImportant

The domain constructor takes a parameter \axiom{S}, which
stands for the class of index cards.
We describe an index card later.
Here think of an index card as a string which has
the eight fields mentioned above.

First, we tell Axiom what operations we are going to require
from index cards.
We need an \axiomFun{elt} to extract the contents of a field
(such as {\tt name} and {\tt type}) as a string.
For example,
\axiom{c.name} returns a string that is the content of the
\axiom{name} field on the index card \axiom{c}.
We need to display an index card in two ways:
\pspadfun{display} shows only the name and type of an
operation;
\pspadfun{fullDisplay} displays all fields.
The display operations return no useful information and thus have
return type \axiomType{Void}.

Next, we tell Axiom what operations the user can apply
to the database.
This part defines our little query language.
The most important operation is
{\frenchspacing\tt db . field = pattern} which
returns a new database, consisting of all index
cards of {\tt db} such that the \axiom{field} part of the index
card is matched by the string pattern called \axiom{pattern}.
The expression {\tt field = pattern} is an object of type
\axiomType{QueryEquation} (defined in the next section).

Another \axiomFun{elt} is needed to produce a \pspadtype{DataList}
object.
Operation \axiomOp{+} is to merge two databases together;
\axiomOp{-} is used to subtract away common entries in a second
database from an initial database.
There are three display functions.
The \pspadfun{fullDisplay} function has two versions: one
that prints all the records, the other that prints only a fixed
number of records.
A \axiomFun{coerce} to \axiomType{OutputForm} creates a display
object.
```

```
The {\tt Implementation} part of \axiomType{Database} is straightforward.
\beginImportant

\noindent
{\tt 1.\ \ \ \ \ Implementation\ ==\ add}\newline
{\tt 2.\ \ \ \ \ \ \ s:\ Symbol}\newline
{\tt 3.\ \ \ \ \ \ \ Rep\ :=\ List\ S}\newline
{\tt 4.\ \ \ \ \ \ \ elt(db,equation)\ ==\ ...}\newline
{\tt 5.\ \ \ \ \ \ \
elt(db,key)\ ==\ [x.key\ for\ x\ in\ db]::DataList(String)}\newline
{\tt 6.\ \ \ \ \ \ \
display(db)\ ==\ \ for\ x\ in\ db\ repeat\ display\ x}\newline
{\tt 7.\ \ \ \ \ \ \
fullDisplay(db)\ ==\ for\ x\ in\ db\ repeat\ fullDisplay\ x}\newline
{\tt 8.\ \ \ \ \ \ \
fullDisplay(db,\ n,\ m)\ ==\ for\ x\ in\ db\ for\ i\ in\ 1..m}\newline
{\tt 9.\ \ \ \ \ \ \ \ \ repeat}\newline
{\tt 10.\ \ \ \ \ \ \ \ \ \ if\ i\ >=\ n\ then\ fullDisplay\ x}\newline
{\tt 11.\ \ \ \ \ \ x+y\ ==\ removeDuplicates!\ merge(x,y)}\newline
{\tt 12.\ \ \ \ \ \ x-y\ ==\ mergeDifference(copy(x::Rep),}\newline
{\tt 13.\ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \ \
y::Rep)\$MergeThing(S)}\newline
{\tt 14.\ \ \ \ \ \ coerce(db):\ OutputForm\ ==\ (\#db)::\ OutputForm}
\newline
\endImportant

The database is represented by a list of elements of \axiom{S}
(index cards).
We leave the definition of the first \axiomFun{elt} operation
(on line 4) until the next section.
The second \axiomFun{elt} collects all the strings with field name
{\it key} into a list.
The \axiomFun{display} function and first \axiomFun{fullDisplay} function
simply call the corresponding functions from \axiom{S}.
The second \axiomFun{fullDisplay} function provides an efficient way of
printing out a portion of a large list.
The \axiomOp{+} is defined by using the existing
\spadfunFrom{merge}{List} operation defined on lists, then
removing duplicates from the result.
The \axiomOp{-} operation requires writing a corresponding
subtraction operation.
A package \axiomType{MergeThing} (not shown) provides this.

The \axiomFun{coerce} function converts the database to an
\axiomType{OutputForm} by computing the number of index cards.
This is a good example of the independence of
the representation of an Axiom object from how it presents
itself to the user. We usually do not want to look at a database---but
do care how many ``hits'' we get for a given query.
```

```
So we define the output representation of a database to be simply
the number of index cards our query finds.
\endscroll
\autobuttons
\end{page}
```

———-

10.0.140 Query Equations

— ug13.ht —

```
\begin{page}{ugDomainsQueryEquationsPage}{13.13.3. Query Equations}
\beginscroll

The predicate for our search is given by an object of type
\pspadtype{QueryEquation}.
Axiom does not have such an object yet so we
have to invent it.

\beginImportant

\noindent
{\tt 1.\ \ \ QueryEquation():\ Exports\ ==\ Implementation\ where}\newline
{\tt 2.\ \ \ \ \ Exports\ ==\ with}\newline
{\tt 3.\ \ \ \ \ \ \ equation:\ (Symbol,\ String)\ ->\ \$}\newline
{\tt 4.\ \ \ \ \ \ \ variable:\ \$\ ->\ Symbol}\newline
{\tt 5.\ \ \ \ \ \ \ value:\\ \\ \\ \\ \$\ ->\ String}\newline
{\tt 6.\ \ \ }\newline
{\tt 7.\ \ \ \ \ Implementation\ ==\ add}\newline
{\tt 8.\ \ \ \ \ \ \ Rep\ :=\ Record(var:Symbol,\ val:String)}\newline
{\tt 9.\ \ \ \ \ \ \ equation(x,\ s)\ ==\ [x,\ s]}\newline
{\tt 10.\ \ \ \ \ \ variable\ q\ ==\ q.var}\newline
{\tt 11.\ \ \ \ \ \ value\\ \\ \\ \\ q\ ==\ q.val}\newline
\endImportant

Axiom converts an input expression of the form
\axiom{{\it a} = {\it b}} to \axiom{equation({\it a, b})}.
Our equations always have a symbol on the left and a string
on the right.
The {\tt Exports} part thus specifies an operation
\axiomFun{equation} to create a query equation, and
\pspadfun{variable} and \pspadfun{value} to select the left- and
right-hand sides.
The {\tt Implementation} part uses \pspadtype{Record} for a
space-efficient representation of an equation.
```

```
Here is the missing definition for the \axiomFun{elt} function of
\pspadtype{Database} in the last section:

\beginImportant

\noindent
{\tt 1.\ \ \ \ \ \ \ elt(db,eq)\ ==}\newline
{\tt 2.\ \ \ \ \ \ \ \ \ field\\ \ :=\ variable\ eq}\newline
{\tt 3.\ \ \ \ \ \ \ \ \ value\ :=\ value\ eq}\newline
{\tt 4.\ \ \ \ \ \ \ \ \
[x\ for\ x\ in\ db\ |\ matches?(value,x.field)]}\newline
\endImportant

Recall that a database is represented by a list.
Line 4 simply runs over that list collecting all elements
such that the pattern (that is, \axiom{value})
matches the selected field of the element.

\endscroll
\autobuttons
\end{page}
```

———-

10.0.141 DataLists

— **ug13.ht** —

```
\begin{page}{ugDomainsDataListsPage}{13.13.4. DataLists}
\beginscroll

Type \pspadtype{DataList} is a new type invented to hold the result
of selecting one field from each of the index cards in the box.
It is useful to make datalists extensions of lists---lists that
have special \axiomFun{elt} operations defined on them for
sorting and removing duplicates.

\beginImportant

\noindent
{\tt 1.\ \ \ DataList(S:OrderedSet)\ :\ Exports\ ==\
Implementation\ where}\newline
{\tt 2.\ \ \ \ \ Exports\ ==\ ListAggregate(S)\ with}\newline
{\tt 3.\ \ \ \ \ \ \ elt:\ (\$,"unique")\ ->\ \$}\newline
{\tt 4.\ \ \ \ \ \ \ elt:\ (\$,"sort")\ ->\ \$}\newline
{\tt 5.\ \ \ \ \ \ \ elt:\ (\$,"count")\ ->\ NonNegativeInteger}\newline
{\tt 6.\ \ \ \ \ \ \ coerce:\ List\ S\ ->\ \$}\newline
```

```
{\tt 7.\ \ \ }\newline
{\tt 8.\ \ \ \ \ Implementation\ ==\ \ List(S)\ add}\newline
{\tt 9.\ \ \ \ \ \ \ Rep\ :=\ List\ S}\newline
{\tt 10.\ \ \ \ \ \ elt(x,"unique")\ ==\ removeDuplicates(x)}\newline
{\tt 11.\ \ \ \ \ \ elt(x,"sort")\ ==\ sort(x)}\newline
{\tt 12.\ \ \ \ \ \ elt(x,"count")\ ==\ \#x}\newline
{\tt 13.\ \ \ \ \ \ coerce(x:List\ S)\ ==\ x\ ::\ \$}\newline
\endImportant

The {\tt Exports} part asserts that datalists belong to the
category \axiomType{ListAggregate}.
Therefore, you can use all the usual list operations on datalists,
such as \spadfunFrom{first}{List}, \spadfunFrom{rest}{List}, and
\spadfunFrom{concat}{List}.
In addition, datalists have four explicit operations.
Besides the three \axiomFun{elt} operations, there is a
\axiomFun{coerce} operation that creates datalists from lists.

The {\tt Implementation} part needs only to define four functions.
All the rest are obtained from \axiomType{List(S)}.

\endscroll
\autobuttons
\end{page}
```

———-

10.0.142 Index Cards

— ug13.ht —

```
\begin{page}{ugDomainsDatabasePage}{13.13.5. Index Cards}
\beginscroll

An index card comes from a file as one long string.  We define
functions that extract substrings from the long string.  Each field
has a name that is passed as a second argument to \axiomFun{elt}.

\beginImportant

\noindent
{\tt 1.\ \ \ IndexCard()\ ==\ Implementation\ where}\newline
{\tt 2.\ \ \ \ \ Exports\ ==\ with}\newline
{\tt 3.\ \ \ \ \ \ \ elt:\ (\$,\ Symbol)\ ->\ String}\newline
{\tt 4.\ \ \ \ \ \ \ display:\ \$\ ->\ Void}\newline
{\tt 5.\ \ \ \ \ \ \ fullDisplay:\ \$\ ->\ Void}\newline
{\tt 6.\ \ \ \ \ \ \ coerce:\ String\ ->\ \$}\newline
```

```
{\tt 7.\ \ \ \ \ Implementation\ ==\ String\ add\ ...}\newline
\endImportant

We leave the {\tt Implementation} part to the reader.
All operations involve straightforward string manipulations.

\endscroll
\autobuttons
\end{page}
```

———-

10.0.143 Creating a Database

— ug13.ht —

```
\begin{page}{ugDomainsCreatingPage}{13.13.6. Creating a Database}
\beginscroll

We must not forget one important operation: one that builds the
database in the first place!  We'll name it \pspadfun{getDatabase} and
put it in a package.  This function is implemented by calling the
\Lisp{} function \axiom{getBrowseDatabase(s)} to get appropriate
information from \Browse{}.  This operation takes a string indicating
which lines you want from the database: \axiom{"o"} gives you all
operation lines, and \axiom{"k"}, all constructor lines.  Similarly,
\axiom{"c"}, \axiom{"d"}, and \axiom{"p"} give you all category,
domain and package lines respectively.

\beginImportant

\noindent
{\tt 1.\ \ \ OperationsQuery():\ Exports\ ==\ Implementation\ where}
\newline
{\tt 2.\ \ \ \ \ Exports\ ==\ with}\newline
{\tt 3.\ \ \ \ \ \ \ getDatabase:\ String\ ->\ Database(IndexCard)}
\newline
{\tt 4.\ \ \ }\newline
{\tt 5.\ \ \ \ \ Implementation\ ==\ add}\newline
{\tt 6.\ \ \ \ \ \ \ getDatabase(s)\ ==\ getBrowseDatabase(s)\$Lisp}
\newline
\endImportant

We do not bother creating a special name for databases of index
cards.
\pspadtype{Database (IndexCard)} will do.
Notice that we used the package \pspadtype{OperationsQuery} to
```

```
create, in effect,
a new kind of domain: \pspadtype{Database(IndexCard)}.

\endscroll
\autobuttons
\end{page}
```

———-

10.0.144 Putting It All Together

— ug13.ht —

```
\begin{page}{ugDomainsPuttingPage}{13.13.7. Putting It All Together}
\beginscroll

To create the database facility, you put all these constructors
into one file.\footnote{You could use separate files, but we
are putting them all together because, organizationally, that is
the logical thing to do.}
At the top of the file put \spadcmd{)abbrev} commands, giving the
constructor abbreviations you created.

\beginImportant

\noindent
{\tt 1.\ \ \ )abbrev\ domain\ \ ICARD\ \ \ IndexCard}\newline
{\tt 2.\ \ \ )abbrev\ domain\ \ QEQUAT\ \ QueryEquation}\newline
{\tt 3.\ \ \ )abbrev\ domain\ \ MTHING\ \ MergeThing}\newline
{\tt 4.\ \ \ )abbrev\ domain\ \ DLIST\ \ \ DataList}\newline
{\tt 5.\ \ \ )abbrev\ domain\ \ DBASE\ \ \ Database}\newline
{\tt 6.\ \ \ )abbrev\ package\ OPQUERY\ OperationsQuery}\newline
\endImportant

With all this in {\bf alql.spad}, for example, compile it using
\begin{verbatim}
)compile alql
\end{verbatim}
and then load each of the constructors:
\begin{verbatim}
)load ICARD QEQUAT MTHING DLIST DBASE OPQUERY
\end{verbatim}
You are ready to try some sample queries.

10.0.145 Example Queries

— ug13.ht —

```
\begin{page}{ugDomainsExamplesPage}{13.13.8. Example Queries}
\beginscroll

Our first set of queries give some statistics on constructors in
the current Axiom system.

\xtc{
How many constructors does Axiom have?
}{
\spadpaste{ks := getDatabase "k"\bound{q1}}
}
\xtc{
Break this down into the number of categories, domains, and packages.
}{
\spadpaste{[ks.(kind=k) for k in ["c","d","p"]]\bound{q3}\free{q1}}
}
\xtc{
What are all the domain constructors that take no parameters?
}{
\spadpaste{elt(ks.(kind="d").(nargs="0"),name)\bound{q4}\free{q1}}
}
\xtc{
How many constructors have ‘‘Matrix’’ in their name?
}{
\spadpaste{mk := ks.(name="*Matrix*")\bound{q5}\free{q1}}
}
\xtc{
What are the names of those that are domains?
}{
\spadpaste{elt(mk.(kind="d"),name)\bound{q6}\free{q5}}
}
\xtc{
How many operations are there in the library?
}{
\spadpaste{o := getDatabase "o"\bound{o1}}
}
\xtc{
Break this down into categories, domains, and packages.
}{
\spadpaste{[o.(kind=k) for k in ["c","d","p"]]\free{o1}}
```

```
}

The query language is helpful in getting information about a
particular operation you might like to apply.
While this information can be obtained with
\Browse{}, the use of the query database gives you data that you
can manipulate in the workspace.

\xtc{
How many operations have ‘‘eigen’’ in the name?
}{
\spadpaste{eigens := o.(name="*eigen*")\bound{eigens}\free{o1}}
}
\xtc{
What are their names?
}{
\spadpaste{elt(eigens,name)\free{eigens}}
}
\xtc{
Where do they come from?
}{
\spadpaste{elt(elt(elt(eigens,origin),sort),unique) \free{eigens}}
}

The operations \axiomOp{+} and \axiomOp{-} are useful for
constructing small databases and combining them.
However, remember that the only matching you can do is string
matching.
Thus a pattern such as {\tt "*Matrix*"} on the type field
matches
any type containing \axiomType{Matrix}, \axiomType{MatrixCategory},
\axiomType{SquareMatrix}, and so on.

\xtc{
How many operations mention ‘‘Matrix’’ in their type?
}{
\spadpaste{tm := o.(type="*Matrix*")\bound{x10}\free{o1}}
}
\xtc{
How many operations come from constructors with ‘‘Matrix’’ in
their name?
}{
\spadpaste{fm := o.(origin="*Matrix*")\bound{x11}\free{o1}}
}
\xtc{
How many operations are in \axiom{fm} but not in \axiom{tm}?
}{
\spadpaste{fm-tm \bound{x12}\free{x10 x11}}
}
\xtc{
```

```
Display the operations that both mention ‘‘Matrix’’ in their type
and come from a constructor having ‘‘Matrix’’ in their name.
}{
\spadpaste{fullDisplay(fm-\%) \bound{x13}\free{x12}}
}
\xtc{
How many operations involve matrices?
}{
\spadpaste{m := tm+fm \bound{x14}\free{x10 x11}}
}
\xtc{
Display 4 of them.
}{
\spadpaste{fullDisplay(m, 202, 205) \free{x14}}
}
\xtc{
How many distinct names of operations involving matrices are there?
}{
\spadpaste{elt(elt(elt(m,name),unique),count) \free{x14}}
}

— **ug14.ht** —

```
\begin{page}{ugBrowseStartPage}
{14.1. The Front Page: Searching the Library}
\beginscroll
To enter \Browse{}, click on {\bf Browse} on the top level page
of Hyperdoc to get the {\it front page} of \Browse{}.
%
%324pt is 4.5",180pt is 2.5",432pt is 6"=textwidth,54=(432-324)/2
%ps files are 4.5"x2.5" except source 4.5"x2.5"
%

To use this page, you first enter a \spadgloss{search string} into
the input area at the top, then click on one of the buttons below.
We show the use of each of the buttons by example.

\subsubsection{Constructors}

First enter the search string {\tt Matrix} into the input area and
click on {\bf Constructors}.  What you get is the {\it constructor
page} for \axiomType{Matrix}.  We show and describe this page in
detail in \downlink{``The Constructor Page''}{ugBrowseDomainPage} in
Section 14.2\ignore{ugBrowseDomain}.  By convention,
Axiom does a case-insensitive search for a match.  Thus {\tt matrix}
is just as good as {\tt Matrix}, has the same effect as {\tt MaTrix},
and so on.  We recommend that you generally use small letters for
names however.  A search string with only capital letters has a
special meaning (see
\downlink{``Capitalization Convention''}
{ugBrowseCapitalizationConventionPage}
in Section 14.3.3\ignore{ugBrowseCapitalizationConvention}).

Click on \UpBitmap{} to return to the \Browse{} front page.

Use the symbol ``{\tt *}'' in search strings as a \spadgloss{wild
card}.
A wild card matches any substring, including the empty string.
For example, enter the search string {\tt *matrix*} into the input
```

```
area and click on {\bf Constructors}.\footnote{To get only
categories, domains, or packages, rather than all constructors,
you can click on the corresponding button to the right of {\bf
Constructors}.}
What you get is a table of all constructors whose names contain
the string ``{\tt matrix}.''

All constructors containing the string are listed, whether
\spadglossSee{exposed}{expose} or \spadglossSee{unexposed}{expose}.
You can hide the names of the unexposed constructors by clicking on
the {\it *=}{\bf unexposed} button in the {\it Views} panel at the
bottom of the window.  (The button will change to {\bf exposed} {\it
only}.)

One of the names in this table is \axiomType{Matrix}.  Click on
\axiomType{Matrix}.  What you get is again the constructor page for
\axiomType{Matrix}.  As you see, \Browse{} gives you a large network
of information in which there are many ways to reach the same pages.

Again click on the \UpBitmap{} to return to the table of constructors
whose names contain {\tt matrix}.  Below the table is a {\it Views}
panel.  This panel contains buttons that let you view constructors in
different ways.  To learn about views of constructors, skip to
\downlink{``Views Of Constructors''}{ugBrowseViewsOfConstructorsPage}
in Section 14.2.3\ignore{ugBrowseViewsOfConstructors}.

Click on \UpBitmap{} to return to the \Browse{} front page.

\subsubsection{Operations}

Enter {\tt *matrix} into the input area and click on {\bf Operations}.
This time you get a table of {\it operations} whose names end with
{\tt matrix} or {\tt Matrix}.

If you select an operation name, you go to a page describing all the
operations in Axiom of that name.  At the bottom of an operation page
is another kind of {\it Views} panel, one for operation pages.  To
learn more about these views, skip to
\downlink{``Views of Operations''}{ugBrowseViewsOfOperationsPage}
in Section 14.3.2\ignore{ugBrowseViewsOfOperations}.

Click on \UpBitmap{} to return to the \Browse{} front page.

\subsubsection{Attributes}

This button gives you a table of attribute names that match the
search string. Enter the search string {\tt *} and click on
{\bf Attributes} to get a list
of all system attributes.
```

```
Click on \UpBitmap{} to return to the \Browse{} front page.

Again there is a {\it Views} panel at the bottom with buttons that let
you view the attributes in different ways.

\subsubsection{General}

This button does a general search for all constructor, operation, and
attribute names matching the search string.  Enter the search string
\allowbreak {\tt *matrix*} into the input area.  Click on {\bf
General} to find all constructs that have {\tt matrix} as a part of
their name.

The summary gives you all the names under a heading when the number of
entries is less than 10.

Click on \UpBitmap{} to return to the \Browse{} front page.

\subsubsection{Documentation}

Again enter the search key {\tt *matrix*} and this time click on
{\bf Documentation}.
This search matches any constructor, operation, or attribute
name whose documentation contains a substring matching {\tt
matrix}.

Click on \UpBitmap{} to return to the \Browse{} front page.

\subsubsection{Complete}

This search combines both {\bf General} and {\bf Documentation}.

\endscroll
\autobuttons
\end{page}

11.0.148 The Constructor Page

— ug14.ht —

```
\begin{page}{ugBrowseDomainPage}{14.2. The Constructor Page}
\beginscroll
```

```
In this section we look in detail at a constructor page for domain
\axiomType{Matrix}.
Enter {\tt matrix} into the input area on the main \Browse{} page
and click on {\bf Constructors}.

The header part tells you that \axiomType{Matrix} has abbreviation
\axiomType{MATRIX} and one argument called {\tt R} that must be a
domain of category \axiomType{Ring}.
Just what domains can be arguments of \axiomType{Matrix}?
To find this out, click on the {\tt R} on the second line of the
heading.
What you get is a table of all acceptable domain parameter values
of {\tt R}, or a table of \spadgloss{rings} in Axiom.

Click on \UpBitmap{} to return to the constructor page for
\axiomType{Matrix}.
\texht{\newpage}{}

If you have access to the source code of Axiom, the third
line of the heading gives you the name of the source file
containing the definition of \axiomType{Matrix}.
Click on it to pop up an editor window containing the source code
of \axiomType{Matrix}.

We recommend that you leave the editor window up while working
through this chapter as you occasionally may want to refer to it.
\texht{\newpage}{}

11.0.149 Constructor Page Buttons

⇒ "notitle" (ugBrowseViewsOfOperationsPage) 11.0.155 on page 2445

— **ug14.ht** —

```
\begin{page}{ugBrowseDomainButtonsPage}{14.2.1. Constructor Page Buttons}
\beginscroll

We examine each button on this page in order.

\labelSpace{2pc}

\subsubsection{Description}

Click here to bring up a page with a brief description of
constructor \axiomType{Matrix}.
If you have access to system source code, note that these comments
can be found directly over the constructor definition.

\subsubsection{Operations}

Click here to get a table of operations exported by
\axiomType{Matrix}.
You may wish to widen the window to have multiple columns as
below.

If you click on an operation name, you bring up a description page for
the operations.  For a detailed description of these pages, skip to
\downlink{``Views of Operations''}{ugBrowseViewsOfOperationsPage}
in Section 14.3.2\ignore{ugBrowseViewsOfOperations}.

\subsubsection{Attributes}

Click here to get a table of the two attributes exported by
\axiomType{Matrix}:
\spadatt{\texht{fi\-nite\-Ag\-gre\-gate}{finiteAggregate}} and
\spadatt{shallowlyMutable}.
These are two computational properties that result from
\axiomType{Matrix} being regarded as a data structure.

\subsubsection{Examples}

Click here to get an {\it examples page} with examples of operations to
create and manipulate matrices.

Read through this section.
Try selecting the various buttons.
```

```
Notice that if you click on an operation name, such as
\spadfunFrom{new}{Matrix}, you bring up a description page for that
operation from \axiomType{Matrix}.

Example pages have several examples of Axiom commands.
Each example has an active button to its left.
Click on it!
A pre-computed answer is pasted into the page immediately following the
command.
If you click on the button a second time, the answer disappears.
This button thus acts as a toggle:
‘‘now you see it; now you don’t.’’

Note also that the Axiom commands themselves are active.
If you want to see Axiom execute the command, then click on it!
A new Axiom window appears on your screen and the command is
executed.

\httex{At the end of the page is generally a menu of buttons that lead
you to further sections.
Select one of these topics to explore its contents.}{}

\subsubsection{Exports}

Click here to see a page describing the exports of \axiomType{Matrix}
exactly as described by the source code.

As you see, \axiomType{Matrix} declares that it exports all the operations
and attributes exported by category
\axiomType{MatrixCategory(R, Row, Col)}.
In addition, two operations, \axiomFun{diagonalMatrix} and
\axiomFun{inverse}, are explicitly exported.

To learn a little about the structure of Axiom, we suggest you do
the following exercise.
Otherwise, click on \UpButton{} and go on to the next section.
\axiomType{Matrix} explicitly exports only two operations.
The other operations are thus exports of \axiomType{MatrixCategory}.
In general, operations are usually not explicitly exported by a domain.
Typically they are \spadglossSee{inherited}{inherit} from several
different categories.
Let’s find out from where the operations of \axiomType{Matrix} come.

\indent{4}
\beginitems
\item[1. ] Click on {\bf MatrixCategory}, then on {\bf Exports}.
Here you see that {\bf MatrixCategory} explicitly exports many matrix
operations.
Also, it inherits its operations from
```

```
\axiomType{TwoDimensionalArrayCategory}.

\item[2. ] Click on {\bf TwoDimensionalArrayCategory}, then on
{\bf Exports}.  Here you see explicit operations dealing with rows
and columns.  In addition, it inherits operations from
\axiomType{HomogeneousAggregate}.

%\item Click on {\bf HomogeneousAggregate}, then on {\bf Exports}.
%And so on.
%If you continue doing this, eventually you will

\item[3. ] Click on \UpBitmap{} and then
click on {\bf Object}, then on {\bf Exports}, where you see
there are no exports.

\item[4. ] Click on \UpBitmap{} repeatedly to return to the constructor
page for \axiomType{Matrix}.

\enditems
\indent{0}

\subsubsection{Related Operations}

Click here bringing up a table of operations that are exported by
\spadglossSee{packages}{package} but not by \axiomType{Matrix} itself.

To see a table of such packages, use the {\bf Relatives} button on the
{\bf Cross Reference} page described next.

\endscroll
\autobuttons
\end{page}
```

———-

11.0.150 Cross Reference

— ug14.ht —

```
\begin{page}{ugBrowseCrossReferencePage}{14.2.2. Cross Reference}
\beginscroll
Click on the {\bf Cross Reference} button on the main constructor page
for \axiomType{Matrix}.
This gives you a page having various cross reference information stored
under the respective buttons.
```

```
\subsubsection{Parents}

The parents of a domain are the same as the categories mentioned under
the {\bf Exports} button on the first page.
Domain \axiomType{Matrix} has only one parent but in general a domain can
have any number.

\subsubsection{Ancestors}

The \spadglossSee{ancestors}{ancestor} of a constructor consist of its
parents, the parents of its parents, and so on.  Did you perform the
exercise in the last section under {\bf Exports}?  If so, you see here
all the categories you found while ascending the {\bf Exports} chain
for \axiomType{Matrix}.

\subsubsection{Relatives}

The \spadglossSee{relatives}{relative} of a domain constructor are package
constructors that provide operations in addition to those
\spadglossSee{exported}{export} by the domain.

Try this exercise.
\indent{4}
\beginitems
\item[1. ] Click on {\bf Relatives}, bringing up a list of
\spadglossSee{packages}{package}.

\item[2. ] Click on {\bf LinearSystemMatrixPackage} bringing up its
constructor page.\footnote{You may want to widen your Hyperdoc
window to make what follows more legible.}

\item[3. ] Click on {\bf Operations}.
Here you see \axiomFun{rank}, an operation also exported by
\axiomType{Matrix} itself.

\item[4. ] Click on {\bf rank}.
This \spadfunFrom{rank}{LinearSystemMatrixPackage} has two arguments and
thus is different from the \spadfunFrom{rank}{Matrix} from
\axiomType{Matrix}.

\item[5. ] Click on \UpBitmap{} to return to the list of operations for
the package \axiomType{LinearSystemMatrixPackage}.

\item[6. ] Click on {\bf solve} to bring up a
\spadfunFrom{solve}{LinearSystemMatrixPackage} for linear systems of
equations.

\item[7. ] Click on \UpBitmap{} several times to return to the cross
```

```
reference page for \axiomType{Matrix}.
\enditems
\indent{0}

\subsubsection{Dependents}

The \spadglossSee{dependents}{dependent} of a constructor are those
\spadglossSee{domains}{domain} or \spadglossSee{packages}{package}
that mention that constructor either as an argument or in its
\spadglossSee{exports}{export}.

If you click on {\bf Dependents} two entries may surprise you:
\axiomType{RectangularMatrix} and \axiomType{SquareMatrix}.
This happens because \axiomType{Matrix}, as it turns out, appears in
signatures of operations exported by these domains.

\subsubsection{Lineage}

The term \spadgloss{lineage} refers to the {\it search order} for
functions.
If you are an expert user or curious about how the Axiom system
works, try the following exercise.
Otherwise, you best skip this button and go on to {\bf Clients}.

Clicking on {\bf Lineage} gives you a
list of domain constructors:
\axiomType{InnerIndexedTwoDimensionalArray},
\aliascon{MatrixCategory\&}{MATCAT-},
\aliascon{TwoDimensionalArrayCategory\&}{ARR2CAT-},
\aliascon{HomogeneousAggregate\&}{HOAGG-},
\aliascon{Aggregate\&}{AGG-}.
What are these constructors and how are they used?

We explain by an example.  Suppose you create a matrix using the
interpreter, then ask for its \axiomFun{rank}.  Axiom must then find a
function implementing the \axiomFun{rank} operation for matrices.  The
first place Axiom looks for \axiomFun{rank} is in the
\axiomType{Matrix} domain.

If not there, the lineage of \axiomType{Matrix} tells Axiom where else
to look.  Associated with the matrix domain are five other lineage
domains.  Their order is important.  Axiom first searches the first
one, \axiomType{InnerIndexedTwoDimensionalArray}.  If not there, it
searches the second \aliascon{MatrixCategory\&}{MATCAT-}.  And so on.

Where do these {\it lineage constructors} come from?
The source code for \axiomType{Matrix} contains this syntax for the
\spadgloss{function body} of
\axiomType{Matrix}:\footnote{\axiomType{InnerIndexedTwoDimensionalArray}
is a special domain implemented for matrix-like domains to provide
efficient implementations of \twodim{} arrays.
For example, domains of category \axiomType{TwoDimensionalArrayCategory}
can have any integer as their \spad{minIndex}.
Matrices and other members of this special ``inner'' array have their
\spad{minIndex} defined as \spad{1}.}
\begin{verbatim}
InnerIndexedTwoDimensionalArray(R,mnRow,mnCol,Row,Col)
   add ...
\end{verbatim}
where the ``{\tt ...}'' denotes all the code that follows.
In English, this means:
``The functions for matrices are defined as those from
\axiomType{InnerIndexedTwoDimensionalArray} domain augmented by those
defined in `{\tt ...}',`' where the latter take precedence.

This explains \axiomType{InnerIndexedTwoDimensionalArray}.
The other names, those with names ending with an ampersand \axiomSyntax{\&} are
\spadglossSee{default packages}{default package}
for categories to which \axiomType{Matrix} belongs.
Default packages are ordered by the notion of ``closest ancestor.''

\subsubsection{Clients}

A client of \axiomType{Matrix} is any constructor that uses
\axiomType{Matrix} in its implementation.
For example, \axiomType{Complex} is a client of \axiomType{Matrix}; it
exports several operations that take matrices as arguments or return
matrices as values.\footnote{A constructor is a client of
\axiomType{Matrix} if it handles any matrix.
For example, a constructor having internal (unexported) operations
dealing with matrices is also a client.}

\subsubsection{Benefactors}

A \spadgloss{benefactor} of \axiomType{Matrix} is any constructor that
\axiomType{Matrix} uses in its implementation.
This information, like that for clients, is gathered from run-time
structures.\footnote{The benefactors exclude constructors such as
\axiomType{PrimitiveArray} whose operations macro-expand and so vanish
from sight!}

Cross reference pages for categories have some different buttons on
them.
Starting with the constructor page of \axiomType{Matrix}, click on
\axiomType{Ring} producing its constructor page.
Click on {\bf Cross Reference},
producing the cross-reference page for \axiomType{Ring}.
Here are buttons {\bf Parents} and {\bf Ancestors} similar to the notion
for domains, except for categories the relationship between parent and
child is defined through \spadgloss{category extension}.
```

```
\subsubsection{Children}

Category hierarchies go both ways.
There are children as well as parents.
A child can have any number of parents, but always at least one.
Every category is therefore a descendant of exactly one category:
\axiomType{Object}.

\subsubsection{Descendants}

These are children, children of children, and so on.

Category hierarchies are complicated by the fact that categories take
parameters.
Where a parameterized category fits into a hierarchy {\it may} depend on
values of its parameters.
In general, the set of categories in Axiom forms a {\it directed
acyclic graph}, that is, a graph with directed arcs and no cycles.

\subsubsection{Domains}

This produces a table of all domain constructors that can possibly be
rings (members of category \axiomType{Ring}).
Some domains are unconditional rings.
Others are rings for some parameters and not for others.
To find out which, select the {\bf conditions} button in the views
panel.
For example, \axiomType{DirectProduct(n, R)} is a ring if {\tt R} is a
ring.

\endscroll
\autobuttons
\end{page}
```

———-

11.0.151 Views Of Constructors

— ug14.ht —

```
\begin{page}{ugBrowseViewsOfConstructorsPage}{14.2.3. Views Of Constructors}
\beginscroll

Below every constructor table page is a {\it Views} panel.
```

```
As an example, click on {\bf Cross Reference} from
the constructor page of \axiomType{Matrix},
then on {\bf Benefactors} to produce a
short table of constructor names.

The {\it Views} panel is at the bottom of the page.
Two items, {\it names} and {\it conditions,} are in italics.
Others are active buttons.
The active buttons are those that give you useful alternative views
on this table of constructors.
Once you select a view, you notice that the button turns
off (becomes italicized) so that you cannot reselect it.

\subsubsection{names}

This view gives you a table of names.
Selecting any of these names brings up the constructor page for that
constructor.

\subsubsection{abbrs}

This view gives you a table of abbreviations, in the same order as the
original constructor names.
nAbbreviations are in capitals and are limited to 7 characters.
They can be used interchangeably with constructor names in input areas.

\subsubsection{kinds}

This view organizes constructor names into
the three kinds: categories, domains and packages.

\subsubsection{files}

This view gives a table of file names for the source
code of the constructors in alphabetic order after removing
duplicates.

\subsubsection{parameters}

This view presents constructors with the arguments.
This view of the benefactors of \axiomType{Matrix} shows that
\axiomType{Matrix} uses as many as five different \axiomType{List} domains
in its implementation.

\subsubsection{filter}

This button is used to refine the list of names or abbreviations.
Starting with the {\it names} view, enter {\tt m*} into the input area
and click on {\bf filter}.
You then get a shorter table with only the names beginning with {\tt m}.
```

```
\subsubsection{documentation}

This gives you documentation for each of the constructors.

\subsubsection{conditions}

This page organizes the constructors according to predicates.  The
view is not available for your example page since all constructors are
unconditional.  For a table with conditions, return to the {\bf Cross
Reference} page for \axiomType{Matrix}, click on {\bf Ancestors}, then
on {\bf conditions} in the view panel.  This page shows you that
\axiomType{CoercibleTo(OutputForm)} and \axiomType{SetCategory} are
ancestors of \axiomType{Matrix(R)} only if {\tt R} belongs to category
\axiomType{SetCategory}.

\endscroll
\autobuttons
\end{page}
```

————-

11.0.152 Giving Parameters to Constructors

— ug14.ht —

```
\begin{page}{ugBrowseGivingParametersPage}
{14.2.4. Giving Parameters to Constructors}
\beginscroll
%**********************************************************************

Notice the input area at the bottom of the constructor page.  If you
leave this blank, then the information you get is for the domain
constructor \axiomType{Matrix(R)}, that is, \axiomType{Matrix} for an
arbitrary underlying domain {\tt R}.

In general, however, the exports and other information {\it do} usually
depend on the actual value of {\tt R}.
For example, \axiomType{Matrix} exports the \axiomFun{inverse} operation
only if the domain {\tt R} is a \axiomType{Field}.
To see this, try this from the main constructor page:

\indent{4}
\beginitems
\item[1. ] Enter {\tt Integer} into the input area at the bottom of
the page.
```

```
\item[2. ] Click on {\bf Operations}, producing a table of operations.
Note the number of operation names that appear at the top of the
page.

\item[3. ] Click on \UpBitmap{} to return to the constructor page.

\item[4. ] Use the
\texht{\fbox{\bf Delete}}{{\bf Delete}}
or
\texht{\fbox{\bf Backspace}}{{\bf Backspace}}
keys to erase {\tt Integer} from the input area.

\item[5. ] Click on {\bf Operations} to produce a new table of operations.
Look at the number of operations you get.
This number is greater than what you had before.
Find, for example, the operation \axiomFun{inverse}.

\item[6. ] Click on {\bf inverse} to produce a page describing the
operation \axiomFun{inverse}.  At the bottom of the description, you
notice that the {\bf Conditions} line says ``{\tt R} has
\axiomType{Field}.''  This operation is {\it not} exported by
\axiomType{Matrix(Integer)} since \axiomType{Integer} is not a
\spadgloss{field}.

Try putting the name of a domain such as \axiomType{Fraction Integer}
(which is a field) into the input area, then clicking on {\bf Operations}.
As you see, the operation \axiomFun{inverse} is exported.
\enditems
\indent{0}

\endscroll
\autobuttons
\end{page}
```

11.0.154 The Description Page for Operations

— ug14.ht —

```
\begin{page}{ugBrowseDescriptionPagePage}
{14.3.1. The Description Page for Operations}
\beginscroll
From the constructor page of \axiomType{Matrix},
click on {\bf Operations} to bring up the table of operations
for \axiomType{Matrix}.

Find the operation {\bf inverse} in the table and click on it.
This takes you to a page showing the documentation for this operation.

Here is the significance of the headings you see.

\subsubsection{Arguments}

This lists each of the arguments of the operation in turn,
paraphrasing the \spadgloss{signature} of the operation.  As for
signatures, a \axiomSyntax{\$} is used to designate {\em this domain},
that is, \axiomType{Matrix(R)}.

\subsubsection{Returns}

This describes the return value for the operation, analogous to the {\bf
Arguments} part.

\subsubsection{Origin}

This tells you which domain or category explicitly exports the
operation.
In this example, the domain itself is the {\it Origin}.
```

```
\subsubsection{Conditions}

This tells you that the operation is exported by
\axiomType{Matrix(R)} only if
``{\tt R} has \axiomType{Field},'' that is, ``{\tt R} is a member of
category \axiomType{Field}.''
When no {\bf Conditions} part is given, the operation is exported for
all values of {\tt R}.

\subsubsection{Description}

Here are the \axiomSyntax{++} comments
that appear in the source code of its {\it Origin}, here
\axiomType{Matrix}.
You find these comments in the source code for \axiomType{Matrix}.

Click on \UpBitmap{} to return to the table of operations.
Click on {\bf map}.
Here you find three different operations named \axiomFun{map}.
This should not surprise you.
Operations are identified by name and \spadgloss{signature}.
There are three operations named \axiomFun{map}, each with
different signatures.
What you see is the {\it descriptions} view of the operations.
If you like, select the button in the heading of one of these
descriptions to get {\it only} that operation.

\subsubsection{Where}

This part qualifies domain parameters mentioned in the arguments to the
operation.

\endscroll
\autobuttons
\end{page}
```

———-

11.0.155 Views of Operations

— ug14.ht —

```
\begin{page}{ugBrowseViewsOfOperationsPage}{14.3.2. Views of Operations}
\beginscroll

We suggest that you go to the constructor page for \axiomType{Matrix}
```

```
and click on {\bf Operations} to bring up a table of operations
with a {\it Views} panel at the bottom.

\subsubsection{names}

This view lists the names of the operations.
Unlike constructors, however, there may be several operations with the
same name.
The heading for the page tells you the number of unique names and the
number of distinct operations when these numbers are different.

\subsubsection{filter}

As for constructors, you can use this button to cut down the list of
operations you are looking at.
Enter, for example, {\tt m*} into the input area to the right of {\bf
filter} then click on {\bf filter}.
As usual, any logical expression is permitted.
For example, use
\begin{verbatim}
*! or *?
\end{verbatim}
to get a list of destructive operations and predicates.

\subsubsection{documentation}

This gives you the most information:
a detailed description of all the operations in the form you have seen
before.
Every other button summarizes these operations in some form.

\subsubsection{signatures}

This views the operations by showing their signatures.

\subsubsection{parameters}

This views the operations by their distinct syntactic forms with
parameters.

\subsubsection{origins}

This organizes the operations according to the constructor that
explicitly exports them.

\subsubsection{conditions}

This view organizes the operations into conditional and unconditional
operations.
```

```
\subsubsection{usage}

This button is only available if your user-level is set to {\it
development}.
The {\bf usage} button produces a table of constructors that reference this
operation.\footnote{Axiom requires an especially long time to
produce this table, so anticipate this when requesting this
information.}

\subsubsection{implementation}

This button is only available if your user-level is set to {\it
development}.
If you enter values for all domain parameters on the constructor page,
then the {\bf implementation} button appears in place of the {\bf
conditions} button.
This button tells you what domains or packages actually implement the
various operations.\footnote{This button often takes a long time; expect
a delay while you wait for an answer.}

With your user-level set to {\it development}, we suggest you try this
exercise.
Return to the main constructor page for \axiomType{Matrix}, then enter
{\tt Integer} into the input area at the bottom as the value of {\tt R}.
Then click on {\bf Operations} to produce a table of operations.
Note that the {\bf conditions} part of the {\it Views} table is
replaced by {\bf implementation}.
Click on {\bf implementation}.
After some delay, you get a page describing what implements each of
the matrix operations, organized by the various domains and packages.

\subsubsection{generalize}

This button only appears for an operation page of a constructor
involving a unique operation name.

From an operations page for \axiomType{Matrix}, select any
operation name, say {\bf rank}.
In the views panel, the {\bf filter} button is  replaced by
{\bf generalize}.
Click on it!
%% Replaced {\bf threshold} with 10 below.  MGR 1995oct31
What you get is a description of all Axiom operations
named \axiomFun{rank}.\footnote{If there were more than 10
operations of the name, you get instead a page
with a {\it Views} panel at the bottom and the message to {\bf
Select a view below}.
To get the descriptions of all these operations as mentioned
above, select the {\bf description} button.}
```

```
\subsubsection{all domains}

This button only appears on an operation page resulting from a
search from the front page of \Browse{} or from selecting
{\bf generalize} from an operation page for a constructor.

Note that the {\bf filter} button in the {\it Views} panel is
replaced by {\bf all domains}.
Click on it to produce a table of {\it all} domains or packages that
export a \axiomFun{rank} operation.

We note that this table specifically refers to all the \axiomFun{rank}
operations shown in the preceding page.
Return to the descriptions of all the \axiomFun{rank} operations and
select one of them by clicking on the button in its heading.
Select {\bf all domains}.
As you see, you have a smaller table of constructors.
When there is only one constructor, you get the
constructor page for that constructor.
\texht{\newpage}{}

\endscroll
\autobuttons
\end{page}
```

———-

11.0.156 Capitalization Convention

— ug14.ht —

```
\begin{page}{ugBrowseCapitalizationConventionPage}
{14.3.3. Capitalization Convention}
\beginscroll

When entering search keys for constructors, you can use capital
letters to search for abbreviations.
For example, enter {\tt UTS} into the input area and click on {\bf
Constructors}.
Up comes a page describing \axiomType{UnivariateTaylorSeries}
whose abbreviation is \axiomType{UTS}.

Constructor abbreviations always have three or more capital
letters.
For short constructor names (six letters or less), abbreviations
```

```
are not generally helpful as their abbreviation is typically the
constructor name in capitals.
For example, the abbreviation for \axiomType{Matrix} is
\axiomType{MATRIX}.

Abbreviations can also contain numbers.
For example, \axiomType{POLY2} is the abbreviation for constructor
\axiomType{PolynomialFunctions2}.
For default packages, the abbreviation is the same as the
abbreviation for the corresponding category with the ``\&''
replaced by ``-''.
For example, for the category default package
\aliascon{MatrixCategory\&}{MATCAT-} the abbreviation is
\axiomType{MATCAT-} since the corresponding category
\axiomType{MatrixCategory} has abbreviation \axiomType{MATCAT}.

```
\begin{page}{nagLinkIntroPage}{15.3. The NAG Library Link}
\beginscroll

The \naglib{} link allows you to call NAG Fortran
routines from within Axiom, passing Axiom objects as parameters
and getting them back as results.

The \naglib{} and, consequently, the link are divided into {\em
chapters}, which cover different areas of numerical analysis.  The
```

```
statistical and sorting {\em chapters} of the Library, however, are
not included in the link and various support and utility routines
(mainly the F06 and X {\em chapters}) have been omitted.

Each {\em chapter} has a short (at most three-letter) name; for
example, the {\em chapter} devoted to the solution of ordinary
differential equations is called D02.  When using the link via the
\downlink{Hyperdoc interface}{htxl1}, you will be presented with a
complete menu of these {\em chapters}. The names of individual
routines within each {\em chapter} are formed by adding three letters
to the {\em chapter} name, so for example the routine for solving ODEs
by Adams method is called
\axiomFunFrom{d02cjf}{NagOrdinaryDifferentialEquationsPackage}.

```
\begin{page}{nagDocumentationPage}{15.3.1. Interpreting NAG Documentation}
\beginscroll

Information about using the \naglib{} in general, and about using
individual routines in particular, can be accessed via Hyperdoc.
This documentation refers to the Fortran routines directly; the
purpose of this subsection is to explain how this corresponds to the
Axiom routines.
```

```
For general information about the \naglib{} users should consult
\downlink{Essential Introduction to the NAG Foundation Library}
{manpageXXintro}.
The documentation is in ASCII format, and a description of the conventions
used to represent mathematical symbols is given in
\downlink{Introduction to NAG On-Line Documentation}{manpageXXonline}.
Advice about choosing a routine from a particular {\em chapter} can
be found in the \downlink{Chapter Documents}{FoundationLibraryDocPage}.

\subsubsection{Correspondence Between Fortran and Axiom types}

The NAG documentation refers to the Fortran types of objects; in
general, the correspondence to Axiom types is as follows.
\indent{4}
\beginitems
\item[-] Fortran INTEGER corresponds to Axiom \axiomType{Integer}.
\item[-] Fortran DOUBLE PRECISION corresponds to Axiom
\axiomType{DoubleFloat}.
\item[-] Fortran COMPLEX corresponds to Axiom
\axiomType{Complex DoubleFloat}.
\item[-] Fortran LOGICAL corresponds to Axiom \axiomType{Boolean}.
\item[-] Fortran CHARACTER*(*) corresponds to Axiom \axiomType{String}.
\enditems
\indent{0}
(Exceptionally, for NAG EXTERNAL parameters -- ASPs in link parlance
-- REAL and COMPLEX correspond to \axiomType{MachineFloat} and
\axiomType{MachineComplex},
respectively; see
\downlink{``Providing values for Argument Subprograms''}
{aspSectionPage} in Section 15.3.3\ignore{aspSection}.)

The correspondence for aggregates is as follows.
\indent{4}
\beginitems
\item[-] A one-dimensional Fortran array corresponds to an Axiom
\texht{\linebreak}{}
      \axiomType{Matrix} with one column.
\item[-] A two-dimensional Fortran ARRAY corresponds to an Axiom
\texht{\linebreak}{}
      \axiomType{Matrix}.
\item[-] A three-dimensional Fortran ARRAY corresponds to an Axiom
\texht{\linebreak}{}
      \axiomType{ThreeDimensionalMatrix}.
\enditems
\indent{0}
Higher-dimensional arrays are not currently needed for the \naglib{}.

Arguments which are Fortran FUNCTIONs or SUBROUTINEs correspond to
special ASP domains in Axiom. See
```

```
\downlink{‘‘Providing values for Argument Subprograms’’}
{aspSectionPage} in Section 15.3.3\ignore{aspSection}.

\subsubsection{Classification of NAG parameters}

NAG parameters are classified as belonging to one (or more) of the
following categories: {\tt Input}, {\tt Output}, {\tt Workspace} or
{\tt External} procedure.  Within {\tt External} procedures a similar
classification is used, and parameters may also be {\tt Dummies}, or
{\tt User Workspace} (data structures not used by the NAG routine but
provided for the convenience of the user).

When calling a NAG routine via the link the user only provides values
for {\tt Input} and {\tt External} parameters.

The order of the parameters is, in general, different from  the order
specified in the \naglib{} documentation. The Browser description
for each routine helps in determining the correspondence. As a rule of
thumb, {\tt Input} parameters come first followed by {\tt Input/Output}
parameters. The {\tt External} parameters are always found at the end.

\subsubsection{IFAIL}

NAG routines often return diagnostic information through a parameter
called \axiom{ifail}.  With a few exceptions, the principle is that on
input \axiom{ifail} takes one of the values $-1,0,1$.  This determines
how the routine behaves when it encounters an error:
\indent{4}
\beginitems
\item[-] a value of 1 causes the NAG routine to return without printing
an error message;
\item[-] a value of 0 causes the NAG routine to print an error message
and abort;
\item[-] a value of -1 causes the NAG routine to return and print an
error message.
\enditems
\indent{0}

The user is STRONGLY ADVISED to set \axiom{ifail} to \texht{$-1$}{-1}
when using the link.  If \axiom{ifail} has been set to \texht{$1$}{1}
or \texht{$-1$}{-1} on input, then its value on output will determine
the possible cause of any error.  A value of \texht{$0$}{0} indicates
successful completion, otherwise it provides an index into a table of
diagnostics provided as part of the routine documentation (accessible
via \Browse{}).

\endscroll
\autobuttons
\end{page}
```

——–

12.0.161 Using the Link

⇒ "notitle" (htxl1) 3.60.2 on page 828
— **ug15.ht** —

```
\begin{page}{nagLinkUsagePage}{15.3.2. Using the Link}
\beginscroll

The easiest way to use the link is via the
\downlink{Hyperdoc interface}{htxl1}.
You will be presented with a set of fill-in forms where
you can specify the parameters for each call.  Initially, the forms
contain example values, demonstrating the use of each routine (these,
in fact, correspond to the standard NAG example program for the
routine in question).  For some parameters, these values can provide
reasonable defaults; others, of course, represent data.  When you
change a parameter which controls the size of an array, the data in
that array are reset to a ``neutral'' value -- usually zero.

When you are satisfied with the values entered, clicking on the
``Continue'' button will display the Axiom command needed to
run the chosen NAG routine with these values.  Clicking on the
``Do It'' button will then cause Axiom to execute this command
and return the result in the parent Axiom session, as described
below.  Note that, for some routines, multiple HyperDoc ``pages'' are
required, due to the structure of the data.  For these, returning to
an earlier page causes HyperDoc to reset the later pages (this is a
general feature of HyperDoc); in such a case, the simplest way to
repeat a call, varying a parameter on an earlier page, is probably to
modify the call displayed in the parent session.

An alternative approach is to call NAG routines directly in your
normal Axiom session (that is, using the Axiom
interpreter).  Such calls return an
object of type \axiomType{Result}.  As not
all parameters in the underlying NAG routine are required in the
Axiom call (and the parameter ordering may be different), before
calling a NAG routine you should consult the description of the
Axiom operation in the Browser.  (The quickest route to this
is to type the routine name, in lower case, into the Browser's
input area, then click on {\tt Operations}.)  The parameter names
used coincide with NAG's, although they will appear here in lower
case.  Of course, it is also possible to become familiar with the
Axiom form of a routine by first using it through the
```

```
\downlink{Hyperdoc interface}{htxl1}.

\xtc{
As an example of this mode of working, we can find a zero
of a function, lying between 3 and 4, as follows:
}{
\spadpaste{answer:=c05adf(3.0,4.0,1.0e-5,0.0,-1,sin(X)::ASP1(F))
\bound{answer} }
}
\xtc{
By default, \axiomType{Result} only displays the type of returned values,
since the amount of information returned can be quite large.  Individual
components can be examined as follows:
}{
\spadpaste{answer . x\free{answer}}
}
\xtc{
}{
\spadpaste{answer . ifail\free{answer}}
}
\xtc{
In order to avoid conflict with names defined in the workspace, you
can also get the values by using the \axiomType{String} type (the
interpreter automatically coerces them to \axiomType{Symbol})
}{
\spadpaste{answer "x"\free{answer}}
}

It is possible to have Axiom display the values of scalar or array
results automatically.  For more details, see the commands
\axiomFunFrom{showScalarValues}{Result}
and \axiomFunFrom{showArrayValues}{Result}.

\xtc{
There is also a {\bf .input} file for each NAG routine, containing
Axiom interpreter commands to set up and run the standard NAG
example for that routine.
}{
\spadpaste{)read c05adf.input}
}

———-

12.0.162 Providing values for Argument Subprograms

⇒ “notitle” (generalFortranPage) 12.0.163 on page 2463

— **ug15.ht** —

```
\begin{page}{aspSectionPage}
{15.3.3. Providing values for Argument Subprograms}
\beginscroll

There are a number of ways in which users can provide values for argument
subprograms (ASPs).  At the top level the user will see that NAG routines
require
an object from the \axiomType{Union} of a \axiomType{Filename} and an ASP.
\xtc{
For example \axiomFun{c05adf} requires an object of type
\texht{\linebreak}{} \axiomType{Union}(fn:
\axiomType{FileName},fp: \axiomType{Asp1 F})
}{
\spadpaste{)display operation c05adf}
}

The user thus has a choice of providing the name of a file containing
Fortran source code, or of somehow generating the ASP within Axiom.
If a filename is specified, it is searched for in the {\it local}
machine, i.e., the machine that Axiom is running on.

\subsubsection{Providing ASPs via \axiomType{FortranExpression}}

The \axiomType{FortranExpression} domain is used to represent
expressions which can be translated into Fortran under certain
circumstances.  It is very similar to \axiomType{Expression} except
that only operators which exist in Fortran can be used, and only
certain variables can occur.  For example the instantiation
\axiomType{FortranExpression([X],[M],MachineFloat)} is the domain of
expressions containing the scalar \axiom{X} and the array \axiom{M}.
\xtc{
This allows us to create expressions like:
}{
\spadpaste{f : FortranExpression([X],[M],MachineFloat) := sin(X)+M[3,1]}
}
\xtc{
but not
}{
\spadpaste{f : FortranExpression([X],[M],MachineFloat) := sin(M)+Y}
}

Those ASPs which represent expressions usually export a
\axiomFun{coerce} from an appropriate instantiation of
\axiomType{FortranExpression} (or perhaps \axiomType{Vector
FortranExpression} etc.).  For convenience there are also retractions
from appropriate instantiations of \axiomType{Expression},
\axiomType{Polynomial} and \axiomType{Fraction Polynomial}.

\subsubsection{Providing ASPs via \axiomType{FortranCode}}
```

```
\texht{\exptypeindex{FortranCode}}{} \axiomType{FortranCode} allows us
to build arbitrarily complex ASPs via a kind of pseudo-code.  It is
described fully in
\downlink{``General Fortran-generation utilities in Axiom''}
{generalFortranPage} in Section 15.3.4\ignore{generalFortran}.

Every ASP exports two \axiomFun{coerce} functions: one from
\axiomType{FortranCode} and one from \axiomType{List FortranCode}.
There is also a \axiomFun{coerce} from \texht{\linebreak}{}
\axiomType{Record( localSymbols: SymbolTable, code: List FortranCode)}
which is used for passing extra symbol information about the ASP.

\xtc{
So for example, to integrate the function abs(x) we could use the
built-in \axiomFun{abs} function.  But suppose we want to get back to
basics and define it directly, then we could do the following:
}{
\spadpaste{d01ajf(-1.0, 1.0, 0.0, 1.0e-5, 800, 200, -1, cond(LT(X,0),
assign(F,-X), assign(F,X))) result }
}

The \axiomFunFrom{cond}{FortranCode} operation creates a conditional
clause and the \axiomFunFrom{assign}{FortranCode} an assignment
statement.

\subsubsection{Providing ASPs via \axiomType{FileName}}

Suppose we have created the file ``asp.f'' as follows:
\begin{verbatim}
      DOUBLE PRECISION FUNCTION F(X)
      DOUBLE PRECISION X
      F=4.0D0/(X*X+1.0D0)
      RETURN
      END
\end{verbatim}
and wish to pass it to the NAG
routine \axiomFun{d01ajf} which performs one-dimensional quadrature.
We can do this as follows:
\begin{verbatim}
d01ajf(0.0 ,1.0, 0.0, 1.0e-5, 800, 200, -1, "asp.f")
\end{verbatim}

\endscroll
\autobuttons
\end{page}

\begin{patch}{aspSectionPagePatch1}
\begin{paste}{aspSectionPageFull1}{aspSectionPageEmpty1}
\pastebutton{aspSectionPageFull1}{\hidepaste}
\tab{5}\spadcommand{)display operation c05adf}
```

```
\indentrel{3}\begin{verbatim}
\end{verbatim}
\indentrel{-3}\end{paste}\end{patch}

\begin{patch}{aspSectionPageEmpty1}
\begin{paste}{aspSectionPageEmpty1}{aspSectionPagePatch1}
\pastebutton{aspSectionPageEmpty1}{\showpaste}
\tab{5}\spadcommand{)display operation c05adf}
\end{paste}\end{patch}

\begin{patch}{aspSectionPagePatch2}
\begin{paste}{aspSectionPageFull2}{aspSectionPageEmpty2}
\pastebutton{aspSectionPageFull2}{\hidepaste}
\tab{5}\spadcommand{f : FortranExpression([X],[M],MachineFloat) := sin(X)+M[3,1]}
\indentrel{3}\begin{verbatim}
   (1)  sin(X) + M
                 3,1
          Type: FortranExpression([X],[M],MachineFloat)
\end{verbatim}
\indentrel{-3}\end{paste}\end{patch}

\begin{patch}{aspSectionPageEmpty2}
\begin{paste}{aspSectionPageEmpty2}{aspSectionPagePatch2}
\pastebutton{aspSectionPageEmpty2}{\showpaste}
\tab{5}\spadcommand{f : FortranExpression([X],[M],MachineFloat) := sin(X)+M[3,1]}
\end{paste}\end{patch}

\begin{patch}{aspSectionPagePatch3}

\end{paste}\end{patch}
```

———-

12.0.163 General Fortran-generation utilities in Axiom

— ug15.ht —

```
\begin{page}{generalFortranPage}
{15.3.4. General Fortran-generation utilities in Axiom}
\beginscroll

This section describes more advanced facilities which are available to
users who wish to generate Fortran code from within Axiom.  There are
facilities to manipulate templates, store type information, and
generate code fragments or complete programs.

\subsubsection{Template Manipulation}

A template is a skeletal program which is ``fleshed out'' with data when
it is processed.  It is a sequence of {\em active} and {\em passive} parts:
active parts are sequences of Axiom commands which are processed as if they
had been typed into the interpreter; passive parts are simply echoed
verbatim on the Fortran output stream.

Suppose, for example, that we have the following template, stored in
the file ``test.tem'':
\begin{verbatim}
-- A simple template
beginVerbatim
      DOUBLE PRECISION FUNCTION F(X)
      DOUBLE PRECISION X
endVerbatim
outputAsFortran("F",f)
beginVerbatim
      RETURN
      END
endVerbatim
\end{verbatim}
The passive parts lie between the two tokens {\tt beginVerbatim} and
\texht{\linebreak}{} {\tt endVerbatim}.  There are two active
```

```
statements: one which is simply an Axiom ( \texht{\verb+--+}{\-\-})
comment, and one which produces an assignment to the current value of
{\tt f}.  We could use it as follows:
\begin{verbatim}
(4) ->f := 4.0/(1+X**2)

           4
   (4)   ------
          2
         X  + 1

(5) ->processTemplate "test.tem"
      DOUBLE PRECISION FUNCTION F(X)
      DOUBLE PRECISION X
      F=4.0D0/(X*X+1.0D0)
      RETURN
      END

   (5)  "CONSOLE"
\end{verbatim}

(A more reliable method of specifying the filename will be introduced
below.)  Note that the Fortran assignment {\tt F=4.0D0/(X*X+1.0D0)}
automatically converted 4.0 and 1 into DOUBLE PRECISION numbers; in
general, the Axiom Fortran generation facility will convert
anything which should be a floating point object into either
a Fortran REAL or DOUBLE PRECISION object.
\xtc{
Which alternative is used is determined by the command
}{
\spadpaste{)set fortran precision}
}

It is sometimes useful to end a template before the file itself ends
(e.g. to allow the template to be tested incrementally or so that a
piece of text describing how the template works can be included).  It
is of course possible to ``comment-out'' the remainder of the file.
Alternatively, the single token {\tt endInput} as part of an active
portion of the template will cause processing to be ended prematurely
at that point.

The \axiomFun{processTemplate} command comes in two flavours.  In the
first case, illustrated above, it takes one argument of domain
\axiomType{FileName}, the name of the template to be processed, and
writes its output on the current Fortran output stream.  In general, a
filename can be generated from {\em directory}, {\em name} and {\em
extension} components, using the operation \axiomFun{filename}, as in
\begin{verbatim}
processTemplate filename("","test","tem")
\end{verbatim}
```

```
There is an alternative version of \axiomFun{processTemplate}, which
takes two arguments (both of domain \axiomType{FileName}).  In this
case the first argument is the name of the template to be processed,
and the second is the file in which to write the results.  Both
versions return the location of the generated Fortran code as their
result ({\tt "CONSOLE"} in the above example).

It is sometimes useful to be able to mix active and passive parts of a
line or statement.  For example you might want to generate a Fortran
Comment describing your data set.  For this kind of application we
provide three functions as follows:
\texht
{
\begin{tabular}{p{1.8in}p{2.6in}}
\axiomFun{fortranLiteral} & writes a string on the Fortran output
stream \\
 & \\
\axiomFun{fortranCarriageReturn} & writes a carriage return on the
Fortran output stream \\
& \\
\axiomFun{fortranLiteralLine} & writes a string followed by a return
on the Fortran output stream \\
\end{tabular}
}
{
\newline
\axiomFun{fortranLiteral}\tab{25}writes a string on the Fortran
output stream\newline
\axiomFun{fortranCarriageReturn}\tab{25}writes a carriage return
on the Fortran output stream\newline
\axiomFun{fortranLiteralLine}\tab{25}writes a string followed by
a return on the Fortran output stream\newline
}
\xtc{
So we could create our comment as follows:
}{
\spadpaste{m := matrix {\tt{}}1,2,3],[4,5,6}\bound{m}}
}
\xtc{
}{
\spadpaste{fortranLiteralLine concat
["C\ \ \ \ \ \ The\ Matrix\ has\ ", nrows(m)::String, "\ rows\
and\ ", ncols(m)::String, "\ columns"]\free{m}}
}
\xtc{
or, alternatively:
}{
\spadpaste{fortranLiteral "C\ \ \ \ \ \ The\ Matrix\ has\ "}
}
\xtc{
}{
\spadpaste{fortranLiteral(nrows(m)::String)}
}
\xtc{
}{
\spadpaste{fortranLiteral "\ rows\ and\ "}
}
\xtc{
}{
\spadpaste{fortranLiteral(ncols(m)::String)\free{m}}
}
\xtc{
}{
\spadpaste{fortranLiteral "\ columns"}
}
\xtc{
}{
\spadpaste{fortranCarriageReturn()}
}

We should stress that these functions, together with the
\axiomFun{outputAsFortran} function are the {\em only} sure ways of
getting output to appear on the Fortran output stream.  Attempts to
use Axiom commands such as \axiomFun{output} or \axiomFunX{writeline}
may appear to give the required result when displayed on the console,
but will give the wrong result when Fortran and algebraic output are
sent to differing locations.  On the other hand, these functions can
be used to send helpful messages to the user, without interfering with
the generated Fortran.

\subsubsection{Manipulating the Fortran Output Stream}
\texht{\exptypeindex{FortranOutputStackPackage}}{}

Sometimes it is useful to manipulate the Fortran output stream in a
program, possibly without being aware of its current value.  The main
use of this is for gathering type declarations (see ``Fortran Types''
below) but it can be useful in other contexts as well.  Thus we
provide a set of commands to manipulate a stack of (open) output
streams.  Only one stream can be written to at any given time.  The
stack is never empty---its initial value is the console or the current
value of the Fortran output stream, and can be determined using
\xtc{
}{
\spadpaste{topFortranOutputStack()}
}
(see below).
The commands available to manipulate the stack are:
\texht{
\begin{tabular}{ll}
\axiomFun{clearFortranOutputStack} & resets the stack to the console \\
 & \\
\axiomFun{pushFortranOutputStack} & pushes a
\axiomType{FileName} onto the stack \\
 & \\
\axiomFun{popFortranOutputStack} & pops the stack \\
 & \\
\axiomFun{showFortranOutputStack} & returns the current stack \\
 & \\
\axiomFun{topFortranOutputStack} & returns the top element of the stack \\
\end{tabular}
}
{
\newline
\axiomFun{clearFortranOutputStack}\tab{25}resets the stack\newline
\axiomFun{pushFortranOutputStack}\tab{25}pushes a
\axiomType{FileName} onto the stack\newline
\axiomFun{popFortranOutputStack}\tab{25}pops the stack\newline
\axiomFun{showFortranOutputStack}\tab{25}returns the current stack\newline
\axiomFun{topFortranOutputStack}\tab{25}returns the
top element of the stack\newline
}
These commands are all part of \axiomType{FortranOutputStackPackage}.

\subsubsection{Fortran Types}

When generating code it is important to keep track of the Fortran
types of the objects which we are generating.  This is useful for a
number of reasons, not least to ensure that we are actually generating
legal Fortran code.  The current type system is built up in several
layers, and we shall describe each in turn.

\subsubsection{FortranScalarType}
\texht{\exptypeindex{FortranScalarType}}{}

This domain represents the simple Fortran datatypes: REAL,
DOUBLE PRECISION, COMPLEX, LOGICAL, INTEGER, and CHARACTER.
It is possible to \axiomFun{coerce} a \axiomType{String} or
\axiomType{Symbol} into the domain, test whether two objects are
equal, and also apply the predicate functions
\axiomFunFrom{real?}{FortranScalarType} etc.

\subsubsection{FortranType}
\texht{\exptypeindex{FortranType}}{}

This domain represents ``full'' types: i.e., datatype plus array
dimensions (where appropriate) plus whether or not the parameter is an
external subprogram.  It is possible to \axiomFun{coerce} an object of
\axiomType{FortranScalarType} into the domain or \axiomFun{construct}
one from an element of \axiomType{FortranScalarType}, a list of
\axiomType{Polynomial Integer}s (which can of course be simple
integers or symbols) representing its dimensions, and a
\axiomType{Boolean} declaring whether it is external or not.  The list
of dimensions must be empty if the \axiomType{Boolean} is {\tt true}.
The functions \axiomFun{scalarTypeOf}, \axiomFun{dimensionsOf} and
\axiomFun{external?} return the appropriate parts, and it is possible
to get the various basic Fortran Types via functions like
\axiomFun{fortranReal}.
\xtc{
For example:
}{
\spadpaste{type:=construct(real,[i,10],false)$FortranType}
}
\xtc{
or
}{
\spadpaste{type:=[real,[i,10],false]$FortranType\bound{type}}
}
\xtc{
}{
\spadpaste{scalarTypeOf type\free{type}}
}
\xtc{
}{
\spadpaste{dimensionsOf type\free{type}}
}
\xtc{
}{
\spadpaste{external?  type\free{type}}
}
\xtc{
}{
\spadpaste{fortranLogical()}
}
\xtc{
}{
\spadpaste{construct(integer,[],true)$FortranType}
}

\subsubsection{SymbolTable}
\texht{\exptypeindex{SymbolTable}}{}

This domain creates and manipulates a symbol table for generated
Fortran code.  This is used by \axiomType{FortranProgram} to represent
the types of objects in a subprogram.  The commands available are:
\texht{
\begin{tabular}{ll}
\axiomFun{empty} & creates a new \axiomType{SymbolTable} \\
 & \\
\axiomFunX{declare} & creates a new entry in a table \\
 & \\
\axiomFun{fortranTypeOf} & returns the type of an object in a table \\
 & \\
\axiomFun{parametersOf} & returns a list of all the symbols in the table \\
 & \\
\axiomFun{typeList} & returns a list of all objects of a given type \\
 & \\
\axiomFun{typeLists} &
returns a list of lists of all objects sorted by type \\
 & \\
\axiomFun{externalList} & returns a list of all {\tt EXTERNAL} objects \\
 & \\
\axiomFun{printTypes} & produces Fortran type declarations from a table\\
\end{tabular}
}
{
\newline
\axiomFun{empty}\tab{25}creates a new \axiomType{SymbolTable}\newline
\axiomFunX{declare}\tab{25}creates a new entry in a table \newline
\axiomFun{fortranTypeOf}
\tab{25}returns the type of an object in a table \newline
\axiomFun{parametersOf}
\tab{25}returns a list of all the symbols in the table \newline
\axiomFun{typeList}
\tab{25}returns a list of all objects of a given type \newline
\axiomFun{typeLists}
\tab{25}returns a list of lists of all objects sorted by type \newline
\axiomFun{externalList}
\tab{25}returns a list of all {\tt EXTERNAL} objects \newline
\axiomFun{printTypes}
\tab{25}produces Fortran type declarations from a table\newline
}
\xtc{
}{
\spadpaste{symbols := empty()$SymbolTable\bound{symbols}}
}
\xtc{
}{
\spadpaste{declare!(X,fortranReal(),symbols)\free{symbols}}
}
\xtc{
}{
\spadpaste{declare!(M,construct(real,[i,j],false)$FortranType,symbols)
\free{symbols}}
}
\xtc{
}{
\spadpaste{declare!([i,j],fortranInteger(),symbols)\free{symbols}}
}
\xtc{
}{
```

```
\spadpaste{symbols\free{symbols}}
}
\xtc{
}{
\spadpaste{fortranTypeOf(i,symbols)\free{symbols}}
}
\xtc{
}{
\spadpaste{typeList(real,symbols)\free{symbols}}
}
\xtc{
}{
\spadpaste{printTypes symbols\free{symbols}}
}

\subsubsection{TheSymbolTable}
\texht{\exptypeindex{TheSymbolTable}}{}

This domain creates and manipulates one global symbol table to be
used, for example, during template processing. It is also used when
linking to external Fortran routines. The information stored for each
subprogram (and the main program segment, where relevant) is:
\indent{4}
\beginitems
\item[-] its name;
\item[-] its return type;
\item[-] its argument list;
\item[-] and its argument types.
\enditems
\indent{0}
Initially, any information provided is deemed to be for the main program
segment.
\xtc{
Issuing the following command indicates that from now on all information
refers to the subprogram \axiom{F}.
}{
\spadpaste{newSubProgram F}
}
\xtc{
It is possible to return to processing the main program segment by issuing
the command:
}{
\spadpaste{endSubProgram()}
}
The following commands exist:
\texht{
\begin{tabular}{p{1.6in}p{2.8in}}
\axiomFunX{returnType}
& declares the return type of the current subprogram \\
 & \\
\axiomFun{returnTypeOf}
& returns the return type of a subprogram \\
 & \\
\axiomFunX{argumentList}
&  declares the argument list of the current subprogram \\
 & \\
\axiomFun{argumentListOf}
&  returns the argument list of a subprogram \\
 & \\
\axiomFunX{declare}
& provides type declarations for parameters of the current subprogram \\
 & \\
\axiomFun{symbolTableOf}
& returns the symbol table  of a subprogram \\
 & \\
\axiomFun{printHeader}
& produces the Fortran header for the current subprogram \\
\end{tabular}
}
{
\newline
\axiomFunX{returnType}
\tab{25}declares the return type of the current subprogram \newline
\axiomFun{returnTypeOf}
\tab{25}returns the return type of a subprogram \newline
\axiomFunX{argumentList}
\tab{25}declares the argument list of the current subprogram \newline
\axiomFun{argumentListOf}
\tab{25}returns the argument list of a subprogram \newline
\axiomFunX{declare}
\tab{25}provides type declarations for parameters of the
current subprogram \newline
\axiomFun{symbolTableOf}\tab{25}returns the symbol table
of a subprogram \newline
\axiomFun{printHeader}\tab{25}produce the Fortran header
for the current subprogram \newline
}
In addition there are versions of these commands which are
parameterised by the name of a subprogram, and others parameterised by
both the name of a subprogram and by an instance of
\axiomType{TheSymbolTable}.
\xtc{
}{
\spadpaste{newSubProgram F \bound{forPleasure}}
}
\xtc{
}{
\spadpaste{argumentList!(F,[X])\free{forPleasure}}
}
\xtc{
}{
\spadpaste{returnType!(F,real)\free{forPleasure}}
}
\xtc{
}{
\spadpaste{declare!(X,fortranReal(),F)\free{forPleasure}}
}
\xtc{
}{
\spadpaste{printHeader F\free{forPleasure}}
}

\subsubsection{Advanced Fortran Code Generation}

This section describes facilities for representing Fortran statements, and
building up complete subprograms from them.

\subsubsection{Switch}
\texht{\exptypeindex{Switch}}{}

This domain is used to represent statements like {\tt x < y}.  Although
these can be represented directly in Axiom, it is a little cumbersome,
since Axiom evaluates the last statement, for example, to \axiom{true}
(since \axiom{x} is  lexicographically less than \axiom{y}).

Instead we have a set of operations,
such as \axiomFun{LT} to represent \axiom{<},
to let us build such statements.  The available constructors are:
\texht{
\centerline{{\begin{tabular}{ll}}}
\centerline{{\axiomFun{LT} & $<$ }}
\centerline{{\axiomFun{GT} & $>$ }}
\centerline{{\axiomFun{LE} & $\leq$ }}
\centerline{{\axiomFun{GE} & $\geq$ }}
\centerline{{\axiomFun{EQ} & $=$ }}
\centerline{{\axiomFun{AND} & $and$}}
\centerline{{\axiomFun{OR} & $or$ }}
\centerline{{\axiomFun{NOT} & $not$ }}
\centerline{{\end{tabular}}}
}
{
\newline
\axiomFun{LT}\tab{25}\texht{$<$}{<} \newline
\axiomFun{GT}\tab{25}\texht{$>$}{>} \newline
\axiomFun{LE}\tab{25}\texht{$\leq$}{<=} \newline
\axiomFun{GE}\tab{25}\texht{$\geq$}{>=} \newline
\axiomFun{EQ}\tab{25}\texht{$=$}{=} \newline
\axiomFun{AND}\tab{25}\texht{$and$}{{\tt and}}\newline
\axiomFun{OR}\tab{25}\texht{$or$}{{\tt or}} \newline
\axiomFun{NOT}\tab{25}\texht{$not$}{{\tt not}} \newline
```

```
}
\xtc{
So for example:
}{
\spadpaste{LT(x,y)}
}

\subsubsection{FortranCode}

This domain represents code segments or operations: currently assignments,
conditionals, blocks, comments, gotos, continues, various kinds of loops,
and return statements.
\xtc{
For example we can create quite a complicated conditional statement using
assignments, and then turn it into Fortran code:
}{
\spadpaste{
c := cond(LT(X,Y),assign(F,X),cond(GT(Y,Z),assign(F,Y),assign(F,Z)))
\bound{c}}
}
\xtc{
}{
\spadpaste{printCode c\free{c}}
}

The Fortran code is printed
on the current Fortran output stream.

\subsubsection{FortranProgram}
\texht{\exptypeindex{FortranProgram}}{}

This domain is used to construct complete Fortran subprograms out of
elements of \axiomType{FortranCode}.  It is parameterised by the name
of the target subprogram (a \axiomType{Symbol}), its return type (from
\axiomType{Union}(\axiomType{FortranScalarType},``void'')), its
arguments (from \axiomType{List Symbol}), and its symbol table (from
\axiomType{SymbolTable}).  One can \axiomFun{coerce} elements of
either \axiomType{FortranCode} or \axiomType{Expression} into it.

\xtc{
First of all we create a symbol table:
}{
\spadpaste{symbols := empty()$SymbolTable\bound{symbols}}
}
\xtc{
Now put some type declarations into it:
}{
\spadpaste{declare!([X,Y],fortranReal(),symbols)\free{symbols}}
}
\xtc{
```

```
Then (for convenience)
we set up the particular instantiation of \axiomType{FortranProgram}
}{
\spadpaste{FP := FortranProgram(F,real,[X,Y],symbols)\free{symbols}
\bound{FP}}
}
\xtc{
Create an object of type \axiomType{Expression(Integer)}:
}{
\spadpaste{asp := X*sin(Y)\bound{asp}}
}
\xtc{
Now \axiomFun{coerce} it into \axiomType{FP}, and print its Fortran form:
}{
\spadpaste{outputAsFortran(asp::FP)\free{FP asp}}
}

We can generate a \axiomType{FortranProgram} using \axiom{FortranCode}.
For example:
\xtc{
Augment our symbol table:
}{
\spadpaste{declare!(Z,fortranReal(),symbols)\free{symbols}\bound{Z}}
}
\xtc{
and transform the conditional expression we prepared earlier:
}{
\spadpaste{outputAsFortran([c,returns()]::FP) \free{FP c Z}}
}

12.0.164 Some technical information

— ug15.ht —

```
\begin{page}{nagTechnicalPage}{15.3.5. Some technical information}
\beginscroll

The model adopted for the link is a server-client configuration --
Axiom acting as a client via a local agent (a process called {\tt
nagman}). The server side is implemented by the {\tt nagd} daemon
process which may run on a different host.  The {\tt nagman} local
agent is started by default whenever you start Axiom. The {\tt nagd}
server must be started separately.  Instructions for installing and
running the server are supplied in the NAG documentation.  Use the
\spadcmd{)set naglink host} system command to point your local agent
to a server in your network.

On the Axiom side, one sees a set of {\em packages}
(ask \Browse{} for {\em Nag*}) for each chapter, each exporting
operations with the same name as a routine in the \naglib{}.
The arguments and return value of each operation belong to
standard Axiom types.

The {\tt man} pages for the \naglib{} are accessible via the description
of each operation in \Browse{} (among other places).

In the implementation of each operation, the set of inputs is passed
to the local agent {\tt nagman}, which makes a Remote Procedure Call
(RPC) to the remote {\tt nagd} daemon process.  The local agent
receives the RPC results and forwards them to the Axiom workspace
where they are interpreted appropriately.

How are Fortran subroutines turned into RPC calls?  For each Fortran
routine in the \naglib{}, a C main() routine is supplied.  Its job is
to assemble the RPC input (numeric) data stream into the appropriate
Fortran data structures for the routine, call the Fortran routine from
C and serialize the results into an RPC output data stream.

Many \naglib{} routines accept ASPs (Argument Subprogram Parameters).
These specify user-supplied Fortran routines (e.g. a routine to
supply values of a function is required for numerical integration).
How are they handled? There are new facilities in Axiom to help.
A set of Axiom domains has been provided to turn values in standard
 Axiom types (such as Expression Integer) into the appropriate
piece of Fortran for each case (a filename pointing to Fortran source
for the ASP can always be supplied instead).
Ask \Browse{} for {\em Asp*} to see these domains. The Fortran fragments
are included in the outgoing RPC stream, but {\tt nagd} intercepts them,
compiles them, and links them with the main() C program before executing
```

```
the resulting program on the numeric part of the RPC stream.

```
\begin{page}{ugWhatsNewLanguagePage}
{15.4. Interactive Front-end and Language}
\beginscroll

The \axiom{leave} keyword has been replaced by the \axiom{break}
keyword for compatibility with the new Axiom extension language.  See
section \downlink{``break in Loops''}{ugLangLoopsBreakPage} in
Section 5.4.3\ignore{ugLangLoopsBreak} for more
information.

Curly braces are no longer used to create sets. Instead, use
\axiomFun{set} followed by a bracketed expression. For example,
\xtc{
}{
\spadpaste{set [1,2,3,4]}
}

Curly braces are now used to enclose a block (see section
\downlink{``Blocks''}{ugLangBlocksPage} in Section
5.2\ignore{ugLangBlocks} for more information). For
compatibility, a block can still be enclosed by parentheses as well.

New coercions to and from type \axiomType{Expression} have been
added. For example, it is now possible to map a polynomial
represented as an expression to an appropriate polynomial type.

Various messages have been added or rewritten for clarity.

12.0.166 Library

⇒ "notitle" (FullPartialFracExpansionXmpPage) 3.44.1 on page 533
— **ug15.ht** —

```
\begin{page}{ugWhatsNewLibraryPage}{15.5. Library}
\beginscroll

The \axiomType{FullPartialFracExpansion}
domain has been added. This domain computes factor-free full
partial fraction expansions.
See section
\downlink{`FullPartialFracExpansion'}
{FullPartialFracExpansionXmpPage}
\ignore{FullPartialFracExpansion}
for examples.

We have implemented the Bertrand/Cantor algorithm for integrals of
hyperelliptic functions. This brings a major speedup for some
classes of algebraic integrals.

We have implemented a new (direct) algorithm for integrating
trigonometric functions. This brings a speedup and an improvement in
the answer quality.

The {\sf SmallFloat} domain has been renamed
\axiomType{DoubleFloat} and {\sf SmallInteger} has been renamed
\axiomType{SingleInteger}. The new abbreviations as
```

```
\axiomType{DFLOAT} and \axiomType{SINT}, respectively.
We have defined the macro {\sf SF}, the old abbreviation for {\sf
SmallFloat}, to expand to \axiomType{DoubleFloat} and modified
the documentation and input file examples to use the new names
and abbreviations. You should do the same in any private Axiom
files you have.

There are many new categories, domains and packages related to the
NAG Library Link facility. See the file

\unixcommand{\env{AXIOM}/../../src/algebra/exposed.lsp}
{xterm\ -e\ vi\ +"/naglink"\ \env{AXIOM}/../../src/algebra/exposed.lsp}

for a list of constructors in the {\bf naglink} Axiom exposure group.

We have made improvements to the differential equation solvers
and there is a new facility for solving systems of first-order
linear differential equations.
In particular, an important fix was made to the solver for
inhomogeneous linear ordinary differential equations that
corrected the calculation of particular solutions.
We also made improvements to the polynomial
and transcendental equation solvers including the
ability to solve some classes of systems of transcendental
equations.

The efficiency of power series have been improved and left and right
expansions of \spad{tan(f(x))} at \spad{x =} a pole of \spad{f(x)}
can now be computed.
A number of power series bugs were fixed and the
\axiomType{GeneralUnivariatePowerSeries}
domain was added.
The power series variable can appear in the coefficients and when this
happens, you cannot differentiate or integrate the series.
Differentiation and integration with respect to other variables is
supported.

A domain was added for representing asymptotic expansions of a
function at an exponential singularity.

For limits, the main new feature is the exponential expansion domain
used to treat certain exponential singularities.  Previously, such
singularities were treated in an {\it ad hoc} way and only a few cases
were covered.  Now Axiom can do things like

\begin{verbatim}
limit( (x+1)**(x+1)/x**x - x**x/(x-1)**(x-1), x = %plusInfinity)
\end{verbatim}

in a systematic way.  It only does one level of nesting, though.  In
```

```
other words, we can handle \spad{exp(} some function with a pole
\spad{)}, but not \texht{\linebreak}{} \spad{exp(exp(} some function
with a pole \spad{)).}

The computation of integral bases has been improved through careful
use of Hermite row reduction. A P-adic algorithm for function fields
of algebraic curves in finite characteristic has also been developed.

Miscellaneous: There is improved conversion of definite and indefinite
integrals to \axiomType{InputForm}; binomial coefficients are
displayed in a new way; some new simplifications of radicals have been
implemented; the operation \spadfun{complexForm} for converting to
rectangular coordinates has been added; symmetric product operations
have been added to \axiomType{LinearOrdinaryDifferentialOperator}.

\endscroll
\autobuttons
\end{page}

12.0.167 HyperDoc

⇒ "notitle" (ugHyperKeysPage) 7.0.36 on page 1685
— **ug15.ht** —

```
\begin{page}{ugWhatsNewHyperDocPage}{15.6. \HyperName}
\beginscroll

The buttons on the titlebar and scrollbar have been replaced
with ones which have a 3D effect. You can change the foreground and
background colors of these ‘‘controls’’ by including and modifying
the following lines in your {\bf .Xdefaults} file.
\begin{verbatim}
Axiom.hyperdoc.ControlBackground: White
Axiom.hyperdoc.ControlForeground: Black
\end{verbatim}

For various reasons, Hyperdoc sometimes displays a
secondary window. You can control the size and placement of this
window by including and modifying
the following line in your {\bf .Xdefaults} file.
%
\begin{verbatim}
Axiom.hyperdoc.FormGeometry: =950x450+100+0
\end{verbatim}
%
```

```
This setting is a standard X Window System geometry specification:
you are requesting a window 950 pixels wide by 450 deep and placed in
the upper left corner.

Some key definitions have been changed to conform more closely with
the CUA guidelines. Press \texht{F9}{\downlink{F9}{ugHyperKeysPage}}
to see the current definitions.

Input boxes (for example, in the Browser) now accept paste-ins from
the X Window System. Use the second button to paste in something
you have previously copied or cut. An example of how you can use this
is that you can paste the type from an Axiom computation
into the main Browser input box.

We describe here a few additions to the on-line
version of the Axiom book which you can read with
HyperDoc.
}{}

A section has been added to the graphics chapter, describing how to
build \twodim{} graphs from lists of points. An example is given
showing how to read the points from a file.  See section
\downlink{``Building Two-Dimensional Graphs''}
{ugGraphTwoDbuildPage} in Section
7.1.9\ignore{ugGraphTwoDbuild} for details.

A further section has been added to that same chapter, describing how
to add a \twodim{} graph to a viewport which already contains other
```

```
graphs.  See section
\downlink{``Appending a Graph to a Viewport
Window Containing a Graph''}{ugGraphTwoDappendPage} in
Section 7.1.10\ignore{ugGraphTwoDappend} for
details.

Chapter 3
and the on-line Hyperdoc help have been unified.

An explanation of operation names ending in ``?'' and ``!'' has been
added to the first chapter.  See the end of the section
\downlink{``Calling Functions''}{ugIntroCallFunPage} in Section
1.3.6\ignore{ugIntroCallFun} for details.

An expanded explanation of using predicates has been added to the
sixth chapter. See the example involving \userfun{evenRule} in the
middle of the section
\downlink{``Rules and Pattern Matching''}{ugUserRulesPage} in Section
6.21\ignore{ugUserRules} for details.

13.0.170 Introduction

⇒ "notitle" (ugSysCmdsetPage) 13.0.190 on page 2529
⇒ "notitle" (ugSysCmdcompilePage) 13.0.176 on page 2507
— **ug16.ht** —

```
\begin{page}{ugSysCmdOverviewPage}{B.1. Introduction}
\beginscroll

System commands are used to perform Axiom environment management.
Among the commands are those that display what has been defined or
computed, set up multiple logical Axiom environments (frames), clear
definitions, read files of expressions and commands, show what
functions are available, and terminate Axiom.

Some commands are restricted: the commands
\begin{verbatim}
)set userlevel interpreter
)set userlevel compiler
)set userlevel development
\end{verbatim}
set the user-access level to the three possible choices.  All commands
are available at {\tt development} level and the fewest are available
at {\tt interpreter} level.  The default user-level is {\tt
interpreter}.  In addition to the \spadcmd{)set} command (discussed in
\downlink{``)set''}{ugSysCmdsetPage} in Section
B.21\ignore{ugSysCmdset}) you can use the Hyperdoc
settings facility to change the {\it user-level.}  \texht{}{Click on
\lispmemolink{Settings}{(|htSystemVariables|)} here to immediately go
to the settings facility.}

Each command listing begins with one or more syntax pattern
descriptions plus examples of related commands.  The syntax
descriptions are intended to be easy to read and do not necessarily
represent the most compact way of specifying all possible arguments
and options; the descriptions may occasionally be redundant.

All system commands begin with a right parenthesis which should be in
the first available column of the input line (that is, immediately
after the input prompt, if any).  System commands may be issued
directly to Axiom or be included in {\bf .input} files.

A system command {\it argument} is a word that directly follows the
command name and is not followed or preceded by a right parenthesis.
A system command {\it option} follows the system command and is
directly preceded by a right parenthesis.  Options may have arguments:
they directly follow the option.  This example may make it easier to
remember what is an option and what is an argument:

\centerline{{{\tt )syscmd {\it arg1 arg2} )opt1
{\it opt1arg1 opt1arg2} )opt2 {\it opt2arg1} ...}}}

In the system command descriptions, optional arguments and options are
enclosed in brackets (``\lanb'' and ``\ranb'').  If an argument or
option name is in italics, it is meant to be a variable and must have
some actual value substituted for it when the system command call is
made.  For example, the syntax pattern description

\noindent
{\tt )read} {\it fileName} {\tt \lanb{})quietly\ranb{}}

\noindent
would imply that you must provide an actual file name for
{\it fileName} but need not use the {\tt )quietly} option.
Thus
\begin{verbatim}
)read matrix.input
\end{verbatim}
is a valid instance of the above pattern.

System command names and options may be abbreviated and may be in
upper or lower case.
The case of actual arguments may be significant, depending on the
particular situation (such as in file names).
System command names and options may be abbreviated to the minimum
number of starting letters so that the name or option is unique.
Thus
\begin{verbatim}
)s Integer
\end{verbatim}
is not a valid abbreviation for the {\tt )set} command,
because both {\tt )set} and {\tt )show}
begin with the letter ``s''.
Typically, two or three letters are sufficient for disambiguating names.
In our descriptions of the commands, we have used no abbreviations for
either command names or options.

In some syntax descriptions we use a vertical line ``\vertline'' to
indicate that you must specify one of the listed choices.  For
```

```
example, in \begin{verbatim} )set output fortran on | off
\end{verbatim} only {\tt on} and {\tt off} are acceptable words for
following {\tt boot}.  We also sometimes use ‘‘...’’ to indicate that
additional arguments or options of the listed form are allowed.
Finally, in the syntax descriptions we may also list the syntax of
related commands.

\autobuttons
\end{page}
```

———-

13.0.171)abbreviation

— ug16.ht —

```
\begin{page}{ugSysCmdabbreviationPage}{B.2. )abbreviation}
\beginscroll

\par\noindent{\bf User Level Required:} compiler

\par\noindent{\bf Command Syntax:}
\begin{items}
\item {\tt )abbreviation query  \lanb{}{\it nameOrAbbrev}\ranb{}}
\item {\tt )abbreviation category  {\it abbrev  fullname} \lanb{}
)quiet\ranb{}}
\item {\tt )abbreviation domain  {\it abbrev  fullname}   \lanb{}
)quiet\ranb{}}
\item {\tt )abbreviation package  {\it abbrev  fullname}  \lanb{}
)quiet\ranb{}}
\item {\tt )abbreviation remove  {\it nameOrAbbrev}}
\end{items}

\par\noindent{\bf Command Description:}

This command is used to query, set and remove abbreviations for category,
domain and package constructors.
Every constructor must have a unique abbreviation.
This abbreviation is part of the name of the subdirectory
under which the components of the compiled constructor are
stored.
Furthermore, by issuing this command you
let the system know what file to load automatically if you use a new
constructor.
Abbreviations must start with a letter and then be followed by
```

```
up to seven letters or digits.
Any letters appearing in the abbreviation must be in uppercase.

When used with the {\tt query} argument,
this command may be used to list the name
associated with a  particular abbreviation or the  abbreviation for a
constructor.
If no abbreviation or name is given, the names and corresponding
abbreviations for {\it all} constructors are listed.

The following shows the abbreviation for the constructor \spadtype{List}:
\begin{verbatim}
)abbreviation query List
\end{verbatim}
The following shows the constructor name corresponding to the
abbreviation \spadtype{NNI}:
\begin{verbatim}
)abbreviation query NNI
\end{verbatim}
The following lists all constructor names and their abbreviations.
\begin{verbatim}
)abbreviation query
\end{verbatim}

To add an abbreviation for a constructor, use this command with
{\tt category}, {\tt domain} or {\tt package}.
The following add abbreviations to the system for a
category, domain and package, respectively:
\begin{verbatim}
)abbreviation domain   SET Set
)abbreviation category COMPCAT  ComplexCategory
)abbreviation package  LIST2MAP ListToMap
\end{verbatim}
If the {\tt )quiet} option is used,
no output is displayed from this command.
You would normally only define an abbreviation in a library source file.
If this command is issued for a constructor that has already been loaded, the
constructor will be reloaded next time it is referenced.  In particular, you
can use this command to force the automatic reloading of constructors.

To remove an abbreviation, the {\tt remove} argument is used.
This is usually
only used to correct a previous command that set an abbreviation for a
constructor name.
If, in fact, the abbreviation does exist, you are prompted
for confirmation of the removal request.
Either of the following commands
will remove the abbreviation \spadtype{VECTOR2} and the
constructor name \spadtype{VectorFunctions2} from the system:
\begin{verbatim}
```

```
)abbreviation remove VECTOR2
)abbreviation remove VectorFunctions2
\end{verbatim}

\par\noindent{\bf Command Syntax:}
\begin{items}
\item {\tt )cd} {\it directory}
\end{items}

\par\noindent{\bf Command Description:}

This command sets the Axiom working current directory.
The current directory is used for looking for
input files (for {\tt )read}),
Axiom library source files (for {\tt )compile}),
saved history environment files (for {\tt )history )restore}),
compiled Axiom library files (for \spadcmd{)library}), and
files to edit (for {\tt )edit}).
It is also used for writing
spool files (via {\tt )spool}),
writing history input files (via {\tt )history )write}) and
history environment files (via {\tt )history )save}),and
compiled Axiom library files (via {\tt )compile}).

If issued with no argument, this command sets the Axiom
```

```
current directory to your home directory.
If an argument is used, it must be a valid directory name.
Except for the ``{\tt )}'' at the beginning of the command,
this has the same syntax as the operating system {\tt cd} command.

\par\noindent{\bf Command Syntax:}
\begin{items}
\item{\tt )close}
\item{\tt )close )quietly}
\end{items}
\par\noindent{\bf Command Description:}

This command is used to close down interpreter client processes.  Such
processes are started by Hyperdoc to run Axiom examples when you click
on their text. When you have finished examining or modifying the
example and you do not want the extra window around anymore, issue
\begin{verbatim}
)close
\end{verbatim}
to the Axiom prompt in the window.

If you try to close down the last remaining interpreter client
```

```
process, Axiom will offer to close down the entire Axiom
session and return you to the operating system by displaying something
like
\begin{verbatim}
   This is the last Axiom session. Do you want to kill Axiom?
\end{verbatim}
Type "y" (followed by the Return key) if this is what you had in mind.
Type "n" (followed by the Return key) to cancel the command.

You can use the {\tt )quietly} option to force Axiom to
close down the interpreter client process without closing down
the entire Axiom session.

\item{\tt )clear mode}      {\it obj1 \lanb{}obj2 ...\ranb{}}
\end{items}
```

```
\par\noindent{\bf Command Description:}

This command is used to remove function and variable declarations,
definitions and values from the workspace.  To empty the entire
workspace and reset the step counter to 1, issue
\begin{verbatim}
)clear all
\end{verbatim}
To remove everything in the workspace but not reset the step counter,
issue
\begin{verbatim}
)clear properties all
\end{verbatim}
To remove everything about the object {\tt x}, issue
\begin{verbatim}
)clear properties x
\end{verbatim}
To remove everything about the objects {\tt x, y} and {\tt f}, issue
\begin{verbatim}
)clear properties x y f
\end{verbatim}

The word {\tt properties} may be abbreviated to the single letter
``{\tt p}''.
\begin{verbatim}
)clear p all
)clear p x
)clear p x y f
\end{verbatim}
All definitions of functions and values of variables may be removed
by either
\begin{verbatim}
)clear value all
)clear v all
\end{verbatim}
This retains whatever declarations the objects had.  To remove
definitions and
values for the specific objects {\tt x, y} and {\tt f}, issue
\begin{verbatim}
)clear value x y f
)clear v x y f
\end{verbatim}
To remove  the declarations  of everything while  leaving the
definitions and
values, issue
\begin{verbatim}
)clear mode  all
)clear m all
\end{verbatim}
To remove declarations for the specific objects {\tt x, y} and
```

```
{\tt f}, issue
\begin{verbatim}
)clear mode x y f
)clear m x y f
\end{verbatim}
The {\tt )display names} and {\tt )display properties} commands
may be used
to see what is currently in the workspace.

The command
\begin{verbatim}
)clear completely
\end{verbatim}
does everything that {\tt )clear all} does, and also clears the internal
system function and constructor caches.

— **ug16.ht** —

```
\begin{page}{ugSysCmdcompilePage}{B.7. )compile}
\beginscroll

\par\noindent{\bf User Level Required:} compiler

\par\noindent{\bf Command Syntax:}

\begin{items}
\item {\tt )compile}
```

```
\item {\tt )compile {\it fileName}}
\item {\tt )compile {\it fileName}.spad}
\item {\tt )compile {\it directory/fileName}.spad}
\item {\tt )compile {\it fileName} )quiet}
\item {\tt )compile {\it fileName} )noquiet}
\item {\tt )compile {\it fileName} )break}
\item {\tt )compile {\it fileName} )nobreak}
\item {\tt )compile {\it fileName} )library}
\item {\tt )compile {\it fileName} )nolibrary}
\item {\tt )compile {\it fileName} )vartrace}
\item {\tt )compile {\it fileName} )constructor} {\it nameOrAbbrev}
\end{items}

\par\noindent{\bf Command Description:}

You use this command to invoke the Axiom library compiler.  This
compiles files with file extension {\tt .spad} with the Axiom system
compiler. The command first looks in the standard system directories
for files with extension {\tt .spad}.

Should you not want the {\tt )library} command automatically invoked,
call {\tt )compile} with the {\tt )nolibrary} option. For example,
\begin{verbatim}
)compile mycode )nolibrary
\end{verbatim}
By default, the {\tt )library} system command exposes all domains and
categories it processes. This means that the Axiom intepreter will consider
those domains and categories when it is trying to resolve a reference to a
function.
Sometimes domains and categories should not be exposed. For example, a domain
may just be used privately by another domain and may not be meant for
top-level use. The {\tt )library} command should still be used, though, so
that the code will be loaded on demand. In this case, you should use the
{\tt )nolibrary} option on {\tt )compile} and the {\tt )noexpose} option in
the {\tt )library} command. For
example,
\begin{verbatim}
)compile mycode.spad )nolibrary
)library mycode )noexpose
\end{verbatim}
Once you have established your own collection of compiled code, you may find
it handy to use the )dir option on the )library command. This causes )library
to process all compiled code in the specified directory. For example,
\begin{verbatim}
)library )dir /u/jones/quantum
\end{verbatim}
You must give an explicit directory after )dir, even if you want all compiled
code in the current working directory processed.
\begin{verbatim}
)library )dir .
```

```
\end{verbatim}
You can compile category, domain, and package constructors contained in files
with file extension {\tt .spad}. You can compile individual constructors or
every constructor in a file.

The full filename is remembered between invocations of this command and
{\tt )edit} commands. The sequence of commands
\begin{verbatim}
)compile matrix.spad
)edit
)compile
\end{verbatim}
will call the compiler, edit, and then call the compiler again on the file
matrix.spad. If you do not specify a directory, the working current directory
(see description of command )cd ) is searched for the file. If the file is
not found, the standard system directories are searched.

If you do not give any options, all constructors within a file are compiled.
Each constructor should have an {\tt )abbreviation} command in the file in
which it is defined. We suggest that you place the {\tt )abbreviation}
commands at the top of the file in the order in which the constructors are
defined. The list of commands serves as a table of contents for the file.

The {\tt )library} option causes directories containing the compiled code
for each constructor to be created in the working current directory. The
name of such a directory consists of the constructor abbreviation and the
{\tt .nrlib} file extension. For example, the directory containing the
compiled code for the {\tt MATRIX} constructor is called {\bf MATRIX.nrlib}.
The {\tt )nolibrary} option says that such files should not be created.

The {\tt )vartrace} option causes the compiler to generate extra code for the
constructor to support conditional tracing of variable assignments.
Without this option, this code is suppressed
and one cannot use the )vars option for the trace command.

The {\tt )constructor} option is used to specify a particular constructor to
compile. All other constructors in the file are ignored. The constructor name
or abbreviation follows {\tt )constructor}. Thus either

\begin{verbatim}
)compile matrix.spad )constructor RectangularMatrix
\end{verbatim}
or
\begin{verbatim}
)compile matrix.spad )constructor RMATRIX
\end{verbatim}
compiles the {\tt RectangularMatrix} constructor defined in {\bf matrix.spad}.

The {\tt )break} and {\tt )nobreak} options determine what the compiler does
when it encounters an error. {\tt )break} is the default and it indicates that
```

```
processing should stop at the first error. The value of the {\tt )set break}
variable then controls what happens.

\item {\tt )display mode} {\it \lanb{}obj1 \lanb{}obj2 ...\ranb{}\ranb{}}
\item {\tt )display names}
\item {\tt )display operations} {\it opName}
\end{items}
\par\noindent{\bf Command Description:}

This command is  used to display the contents of  the workspace and
```

```
signatures of functions  with a  given  name.\footnote{A
\spadgloss{signature} gives the argument and return types of a
function.}

The command
\begin{verbatim}
)display names
\end{verbatim}
lists the names of all user-defined objects in the workspace.  This is
useful if you do not wish to see everything about the objects and need
only be reminded of their names.

The commands
\begin{verbatim}
)display all
)display properties
)display properties all
\end{verbatim}
all do the same thing: show the values and types and declared modes of
all variables in the workspace.  If you have defined functions, their
signatures and definitions will also be displayed.

To show all information about a  particular variable or user functions,
for example, something named {\tt d}, issue
\begin{verbatim}
)display properties d
\end{verbatim}
To just show the value (and the type) of {\tt d}, issue
\begin{verbatim}
)display value d
\end{verbatim}
To just show the declared mode of {\tt d}, issue
\begin{verbatim}
)display mode d
\end{verbatim}

All modemaps for a given operation may be displayed by using {\tt
)display operations}.  A \spadgloss{modemap} is a collection of
information about a particular reference to an operation.  This
includes the types of the arguments and the return value, the location
of the implementation and any conditions on the types.  The modemap
may contain patterns.  The following displays the modemaps for the
operation \spadfunFrom{complex}{ComplexCategory}:
\begin{verbatim}
)d op complex
\end{verbatim}

```
\begin{page}{ugSysCmdeditPage}{B.9. )edit}
\beginscroll

\par\noindent{\bf User Level Required:} interpreter

\par\noindent{\bf Command Syntax:}
\begin{items}
\item{\tt )edit} \lanb{}{\it filename}\ranb{}
\end{items}
\par\noindent{\bf Command Description:}

This command is  used to edit files.
It works in conjunction  with the {\tt )read}
and {\tt )compile} commands to remember the name
of the file on which you are working.
By specifying the name fully, you  can edit any file you wish.
Thus
\begin{verbatim}
)edit /u/julius/matrix.input
\end{verbatim}
will place  you in an editor looking at the  file
{\tt /u/julius/matrix.input}.
By default, the editor is {\tt vi},
but if you have an EDITOR shell environment variable defined, that editor
will be used.
When Axiom is running under the X Window System,
it will try to open a separate {\tt xterm} running your editor if
it thinks one is necessary.
```

```
For example, under the Korn shell, if you issue
\begin{verbatim}
export EDITOR=emacs
\end{verbatim}
then the emacs
editor will be used by \spadcmd{)edit}.

If you do not specify a file name, the last file you edited,
read or compiled will be used.
If there is no ``last file'' you will be placed in the editor editing
an empty unnamed file.

It is possible to use the {\tt )system} command to edit a file directly.
For example,
\begin{verbatim}
)system emacs /etc/rc.tcpip
\end{verbatim}
calls {\tt emacs} to edit the file.

```

```
storage, paging space, and so on.
Each frame has its own {\it step number}, {\it environment} and {\it
history.}  You can have a variable named {\tt a} in one frame and it
will have nothing to do with anything that might be called {\tt a} in
any other frame.

Some frames are created by the Hyperdoc program and these can
have pretty strange names, since they are generated automatically.
To find out the names
of all frames, issue
\begin{verbatim}
)frame names
\end{verbatim}
It will indicate the name of the current frame.

You create a new frame
``{\bf quark}'' by issuing
\begin{verbatim}
)frame new quark
\end{verbatim}
The history facility can be turned on by issuing either
{\tt )set history on} or {\tt )history )on}.
If the history facility is on and you are saving history information
in a file rather than in the Axiom environment
then a history file with filename {\bf quark.axh} will
be created as you enter commands.
If you wish to go back to what
you were doing in the
``{\bf initial}'' frame, use
\begin{verbatim}
)frame next
\end{verbatim}
or
\begin{verbatim}
)frame last
\end{verbatim}
to cycle through the ring of available frames to get back to
``{\bf initial}''.

If you want to throw
away a frame (say ``{\bf quark}''), issue
\begin{verbatim}
)frame drop quark
\end{verbatim}
If you omit the name, the current frame is dropped.

If you do use frames with the history facility on and writing to a file,
you may want to delete some of the older history files.
These are directories, so you may want to issue a command like
{\tt rm -r quark.axh} to the operating system.
```

```
You can bring things from another frame by using
{\tt )frame import}.
For example, to bring the {\tt f} and {\tt g} from the frame ``{\bf quark}''
to the current frame, issue
\begin{verbatim}
)frame import quark f g
\end{verbatim}
If you want everything from the frame ``{\bf quark}'', issue
\begin{verbatim}
)frame import quark
\end{verbatim}
You will be asked to verify that you really want everything.

There are two {\tt )set} flags
to make it easier to tell where you are.
\begin{verbatim}
)set message frame on | off
\end{verbatim}
will print more messages about frames when it is set on.
By default, it is off.
\begin{verbatim}
)set message prompt frame
\end{verbatim}
will give a prompt
that looks like
\begin{verbatim}
initial (1) ->
\end{verbatim}
when you start up. In this case, the frame name and step make up the
prompt.

— **ug16.ht** —

```
\begin{page}{ugSysCmdhistoryPage}{B.13. )history}
\beginscroll

\par\noindent{\bf User Level Required:} interpreter

\par\noindent{\bf Command Syntax:}
\begin{items}
\item{\tt )history )on}
\item{\tt )history )off}
\item{\tt )history )write} {\it historyInputFileName}
\item{\tt )history )show \lanb{}{\it n}\ranb{} \lanb{}both\ranb{}}
\item{\tt )history )save} {\it savedHistoryName}
\item{\tt )history )restore} \lanb{}{\it savedHistoryName}\ranb{}
\item{\tt )history )reset}
\item{\tt )history )change} {\it n}
\item{\tt )history )memory}
\item{\tt )history )file}
\item{\tt \%}
\item{\tt \%\%({\it n})}
\item{\tt )set history on \vertline{} off}
\end{items}

\par\noindent{\bf Command Description:}

The {\it history} facility within Axiom allows you to restore your
environment to that of another session and recall previous
computational results.
Additional commands allow you to review previous
input lines and to create an {\bf .input} file of the lines typed to
Axiom.

Axiom saves your input and output if the history facility is
turned on (which is the default).
This information is saved if either of
\begin{verbatim}
)set history on
)history )on
\end{verbatim}
has been issued.
Issuing either
\begin{verbatim}
)set history off
)history )off
\end{verbatim}
will discontinue the recording of information.
```

```
Whether the facility is disabled or not, the value of \spadSyntax{\%}
in Axiom always refers to the result of the last computation.  If you
have not yet entered anything, \spadSyntax{\%} evaluates to an object
of type \spadtype{Variable('\%)}.  The function \spadSyntax{\%\%} may
be used to refer to other previous results if the history facility is
enabled.  In that case, {\tt \%\%(n)} is the output from step {\tt n}
if {\tt n > 0}.  If {\tt n < 0}, the step is computed relative to the
current step.  Thus {\tt \%\%(-1)} is also the previous step, {\tt
\%\%(-2)}, is the step before that, and so on.  If an invalid step
number is given, Axiom will signal an error.

The {\it environment} information can either be saved in a file or
entirely in memory (the default).  Each frame
(\downlink{``)frame''}{ugSysCmdframePage} in Section
B.11\ignore{ugSysCmdframe}) has its own history
database.  When it is kept in a file, some of it may also be kept in
memory for efficiency.  When the information is saved in a file, the
name of the file is of the form {\bf FRAME.axh} where ``{\bf FRAME}''
is the name of the current frame.  The history file is placed in the
current working directory (see
\downlink{``)cd''}{ugSysCmdcdPage} in Section
B.4\ignore{ugSysCmdcd}).  Note that these history
database files are not text files (in fact, they are directories
themselves), and so are not in human-readable format.

The options to the {\tt )history} command are as follows:

\indent{0}
\beginitems
\item[{\tt )change} {\it n}]
will set the number of steps that are saved in memory to {\it n}.
This option only has effect when the history data is maintained in a
file.
If you have issued {\tt )history )memory} (or not changed the default)
there is no need to use {\tt )history )change}.

\item[{\tt )on}]
will start the recording of information.
If the workspace is not empty, you will be asked to confirm this
request.
If you do so, the workspace will be cleared and history data will begin
being saved.
You can also turn the facility on by issuing {\tt )set history on}.

\item[{\tt )off}]
will stop the recording of information.
The {\tt )history )show} command will not work after issuing this
command.
Note that this command may be issued to save time, as there is some
performance penalty paid for saving the environment data.
```

```
You can also turn the facility off by issuing {\tt )set history off}.

\item[{\tt )file}]
indicates that history data should be saved in an external file on disk.

\item[{\tt )memory}]
indicates that all history data should be kept in memory rather than
saved in a file.
Note that if you are computing with very large objects it may not be
practical to kept this data in memory.

\item[{\tt )reset}]
will flush the internal list of the most recent workspace calculations
so that the data structures may be garbage collected by the underlying
\Lisp{} system.
Like {\tt )history )change}, this option only has real effect when
history data is being saved in a file.

\item[{\tt )restore} \lanb{}{\it savedHistoryName}\ranb{}]
completely clears the environment and restores it to a saved session, if
possible.
The {\tt )save} option below allows you to save a session to a file
with a given name. If you had issued
{\tt )history )save jacobi}
the command
{\tt )history )restore jacobi}
would clear the current workspace and load the contents of the named
saved session. If no saved session name is specified, the system looks
for a file called {\bf last.axh}.

\item[{\tt )save} {\it savedHistoryName}]
is used to save  a snapshot of the environment in a file.
This file is placed in the current working directory
(see \downlink{``)cd''}{ugSysCmdcdPage}
in Section B.4\ignore{ugSysCmdcd}).
Use {\tt )history )restore} to restore the environment to the state
preserved in the file.
This option also creates an input file containing all the lines of input
since you created the workspace frame (for example, by starting your
Axiom session) or last did a \spadcmd{)clear all} or
\spadcmd{)clear completely}.

\item[{\tt )show} \lanb{}{\it n}\ranb{} \lanb{}{\tt both}\ranb{}]
can show previous input lines and output results.
{\tt )show} will display up to twenty of the last input lines
(fewer if you haven't typed in twenty lines).
{\tt )show} {\it n} will display up to {\it n} of the last input lines.
{\tt )show both} will display up to five of the last input lines and
output results.
{\tt )show} {\it n} {\tt both} will display up to {\it n} of the last
```

```
input lines and output results.

\item[{\tt )write} {\it historyInputFile}]
creates an {\bf .input} file with the input lines typed since the start
of the session/frame or the last {\tt )clear all} or {\tt )clear
completely}.
If {\it historyInputFileName} does not
contain a period (``.'') in the filename,
{\bf .input} is appended to it.
For example,
{\tt )history )write chaos}
and
{\tt )history )write chaos.input}
both write the input lines to a file called {\bf chaos.input} in your
current working directory.
If you issued one or more {\tt )undo} commands,
{\tt )history )write}
eliminates all
input lines backtracked over as a result of {\tt )undo}.
You can edit this file and then use {\tt )read} to have Axiom process
the contents.

\par\noindent{\bf User Level Required:} interpreter

\par\noindent{\bf Command Syntax:}
\begin{items}
\item{\tt )library {\it libName1  \lanb{}libName2 ...\ranb{}}}
\item{\tt )library )dir {\it dirName}}
\item{\tt )library )only {\it objName1  \lanb{}objlib2 ...\ranb{}}}
\item{\tt )library )noexpose}
\end{items}

\par\noindent{\bf Command Description:}

This command replaces the {\tt )load} system command that
was available in Axiom releases before version 2.0.
The \spadcmd{)library} command makes available to Axiom the compiled
objects in the libraries listed.

For example, if you {\tt )compile dopler.as} in your home
directory, issue {\tt )library dopler} to have Axiom look
at the library, determine the category and domain constructors present,
update the internal database with various properties of the
constructors, and arrange for the constructors to be
automatically loaded when needed.
If the {\tt )noexpose} option has not been given, the
constructors will be exposed (that is, available) in the current
frame.

If you compiled a file with the old system compiler, you will
have an {\it nrlib} present, for example, {\it DOPLER.nrlib,}
where {\tt DOPLER} is a constructor abbreviation.
The command {\tt )library DOPLER} will then do the analysis and
database updates as above.

To tell the system about all libraries in a directory, use
{\tt )library )dir dirName} where {\tt dirName} is an explicit
directory.
You may specify ``.'' as the directory, which means the current
directory from which you started the system or the one you set
via the \spadcmd{)cd} command. The directory name is required.

You may only want to tell the system about particular
constructors within a library. In this case, use the {\tt )only}
option. The command {\tt )library dopler )only Test1} will only
cause the {\sf Test1} constructor to be analyzed, autoloaded,
etc..

Finally, each constructor in a library are usually automatically
exposed when the \spadcmd{)library} command is used. Use the {\tt
```

```
)noexpose} option if you not want them exposed. At a later time you
can use {\tt )set expose add constructor} to expose any hidden
constructors.

{\bf Note for Axiom beta testers:} At various times this
command was called {\tt )local} and {\tt )with} before the name
{\tt )library} became the official name.

```
\begin{page}{ugSysCmdpquitPage}{B.18. )pquit}
\beginscroll

\par\noindent{\bf User Level Required:} interpreter

\par\noindent{\bf Command Syntax:}
\begin{items}
\item{\tt )pquit}
\end{items}
```

```
\par\noindent{\bf Command Description:}

This command is used to terminate Axiom  and return to the
operating system.
Other than by redoing all your computations or by
using the {\tt )history )restore}
command to try to restore your working environment,
you cannot return to Axiom in the same state.

{\tt )pquit} differs from the {\tt )quit} in that it always asks for
confirmation that you want to terminate Axiom (the ``p'' is for
``protected'').
When you enter the {\tt )pquit} command, Axiom responds
%
\centerline{{Please enter {\bf y} or {\bf yes}
if you really want to leave the interactive }}
\centerline{{environment and return to the operating system:}}
%
If you respond with {\tt y} or {\tt yes}, you will see the message
%
\centerline{{You are now leaving the Axiom interactive environment. }}
\centerline{{Issue the command {\bf axiom} to
the operating system to start a new session.}}
%
and Axiom will terminate and return you to the operating
system (or the environment from which you invoked the system).
If you responded with something other than {\tt y} or {\tt yes}, then
the message
%
\centerline{{You have chosen to remain in the
Axiom interactive environment.}}
%
will be displayed and, indeed, Axiom would still be running.

\par\noindent{\bf Also See:}

```
\begin{page}{ugSysCmdquitPage}{B.19. )quit}
\beginscroll

\par\noindent{\bf User Level Required:} interpreter

\par\noindent{\bf Command Syntax:}
\begin{items}
\item{\tt )quit}
\item{\tt )set quit protected \vertline{} unprotected}
\end{items}

\par\noindent{\bf Command Description:}

This command is used to terminate Axiom  and return to the
operating system.
Other than by redoing all your computations or by
using the {\tt )history )restore}
command to try to restore your working environment,
you cannot return to Axiom in the same state.

{\tt )quit} differs from the {\tt )pquit} in that it asks for
confirmation only if the command
\begin{verbatim}
)set quit protected
\end{verbatim}
has been issued.
Otherwise, {\tt )quit} will make Axiom terminate and return you
to the operating system (or the environment from which you invoked the
system).

The default setting is {\tt )set quit protected} so that {\tt )quit}
and {\tt )pquit} behave in the same way.
If you do issue
\begin{verbatim}
)set quit unprotected
\end{verbatim}
we
suggest that you do not (somehow) assign {\tt )quit} to be
```

```
executed when you press, say, a function key.

\par\noindent{\bf Also See:}

\par\noindent{\bf Command Syntax:}
\begin{items}
\item {\tt )read} {\it \lanb{}fileName\ranb{}}
\item {\tt )read} {\it \lanb{}fileName\ranb{}}
\lanb{}{\tt )quiet}\ranb{} \lanb{}{\tt )ifthere}\ranb{}
\end{items}
\par\noindent{\bf Command Description:}

This command is used to read {\bf .input} files into Axiom.
The command
\begin{verbatim}
)read matrix.input
\end{verbatim}
will read the contents of the file {\bf matrix.input} into Axiom.  The
``.input'' file extension is optional.  See
\downlink{``Input Files and Output Styles''}{ugInOutInPage} in Section 4
\ignore{ugInOutIn} for more information about {\bf
```

```
.input} files.

This command remembers the previous file you edited, read or compiled.
If you do not specify a file name, the previous file will be read.

The {\tt )ifthere} option checks to see whether the {\bf .input} file
exists.  If it does not, the {\tt )read} command does nothing.  If you
do not use this option and the file does not exist, you are asked to
give the name of an existing {\bf .input} file.

The {\tt )quiet} option suppresses output while the file is being read.

\par\noindent{\bf Also See:}
\downlink{``)compile''}{ugSysCmdcompilePage} in section B.7
\downlink{``)edit''}{ugSysCmdeditPage} in section B.9
\downlink{``)history''}{ugSysCmdhistoryPage}  section B.13

\end{page}
```

———-

13.0.190)set

⇒ "notitle" (ugSysCmdquitPage) 13.0.188 on page 2527
— **ug16.ht** —

```
\begin{page}{ugSysCmdsetPage}{B.21. )set}
\beginscroll

\par\noindent{\bf User Level Required:} interpreter

\par\noindent{\bf Command Syntax:}
\begin{items}
\item {\tt )set}
\item {\tt )set} {\it label1 \lanb{}... labelN\ranb{}}
\item {\tt )set} {\it label1 \lanb{}... labelN\ranb{} newValue}
\end{items}
\par\noindent{\bf Command Description:}

The {\tt )set} command is used to view or set system variables that
control what messages are displayed, the type of output desired, the
status of the history facility, the way Axiom user functions are
cached, and so on.
Since this collection is very large, we will not discuss them here.
```

```
Rather, we will show how the facility is used.
We urge you to explore the {\tt )set} options to familiarize yourself
with how you can modify your Axiom working environment.
There is a Hyperdoc version of this same facility available from the
main Hyperdoc menu.
\texht{}{Click \lispmemolink{here}{(|htSystemVariables|)} to go to it.}

The {\tt )set} command is command-driven with a menu display.
It is tree-structured.
To see all top-level nodes, issue {\tt )set} by itself.
\begin{verbatim}
)set
\end{verbatim}
Variables with values have them displayed near the right margin.
Subtrees of selections have ``{\tt ...}''
displayed in the value field.
For example, there are many kinds of messages, so issue
{\tt )set message} to see the choices.
\begin{verbatim}
)set message
\end{verbatim}
The current setting  for the variable that displays
whether computation times
are displayed is visible in the menu displayed by the last command.
To see more information, issue
\begin{verbatim}
)set message time
\end{verbatim}
This shows that time printing is on now.
To turn it off, issue
\begin{verbatim}
)set message time off
\end{verbatim}

As noted above, not all settings have so many qualifiers.
For example, to change the {\tt )quit} command to being unprotected
(that is, you will not be prompted for verification), you need only issue
\begin{verbatim}
)set quit unprotected
\end{verbatim}

\par\noindent{\bf Also See:}
\downlink{``)quit''}{ugSysCmdquitPage} in section B.19

\endscroll
\autobuttons

```
\begin{page}{ugSysCmdshowPage}{B.22. )show}
\beginscroll

\par\noindent{\bf User Level Required:} interpreter

\par\noindent{\bf Command Syntax:}
\begin{items}
\item{\tt )show {\it nameOrAbbrev}}
\item{\tt )show {\it nameOrAbbrev} )operations}
\item{\tt )show {\it nameOrAbbrev} )attributes}
\end{items}

\par\noindent{\bf Command Description:}
This command displays information about Axiom
domain, package and category {\it constructors}.
If no options are given, the {\tt )operations} option is assumed.
For example,
\begin{verbatim}
)show POLY
)show POLY )operations
)show Polynomial
)show Polynomial )operations
\end{verbatim}
each display basic information about the
\spadtype{Polynomial} domain constructor and then provide a
listing of operations.
Since \spadtype{Polynomial} requires a \spadtype{Ring} (for example,
\spadtype{Integer}) as argument, the above commands all refer
to a unspecified ring {\tt R}.
In the list of operations, \spadSyntax{\$} means
\spadtype{Polynomial(R)}.

The basic information displayed includes the {\it signature}
of the constructor (the name and arguments), the constructor
{\it abbreviation}, the {\it exposure status} of the constructor, and the
name of the {\it library source file} for the constructor.

If operation information about a specific domain is wanted,
the full or abbreviated domain name may be used.
For example,
\begin{verbatim}
)show POLY INT
)show POLY INT )operations
)show Polynomial Integer
)show Polynomial Integer )operations
\end{verbatim}
are among  the combinations that will
display the operations exported  by the
domain \spadtype{Polynomial(Integer)} (as opposed to the general
{\it domain constructor} \spadtype{Polynomial}).
Attributes may be listed by using the {\tt )attributes} option.

\par\noindent{\bf Also See:}

\beginscroll

\par\noindent{\bf User Level Required:} interpreter

\par\noindent{\bf Command Syntax:}
\begin{items}
\item{\tt )spool} \lanb{}{\it fileName}\ranb{}
\item{\tt )spool}
\end{items}

\par\noindent{\bf Command Description:}

This command is used to save {\it (spool)} all Axiom input and output
into a file, called a {\it spool file.}
You can only have one spool file active at a time.
To start spool, issue this command with a filename. For example,
\begin{verbatim}
```

```
)spool integrate.out
\end{verbatim}
To stop spooling, issue {\tt )spool} with no filename.

If the filename is qualified with a directory, then the output will be
placed in that directory.  If no directory information is given, the
spool file will be placed in the {\it current directory.}  The current
directory is the directory from which you started Axiom or is the
directory you specified using the {\tt )cd} command.

\par\noindent{\bf Also See:}
\downlink{``)cd''}{ugSysCmdcdPage} in section B.4
\ugSysCmdcdNumber

\endscroll
\autobuttons
\end{page}

———-

13.0.193)synonym

⇒ "notitle" (ugSysCmdsetPage) 13.0.190 on page 2529
⇒ "notitle" (ugSysCmdwhatPage) 13.0.197 on page 2544
— **ug16.ht** —

```
\begin{page}{ugSysCmdsynonymPage}{B.24. )synonym}
\beginscroll

\par\noindent{\bf User Level Required:} interpreter

\par\noindent{\bf Command Syntax:}
\begin{items}
\item{\tt )synonym}
\item{\tt )synonym} {\it synonym fullCommand}
\item{\tt )what synonyms}
\end{items}

\par\noindent{\bf Command Description:}

This command is used to create short synonyms for system command
expressions.  For example, the following synonyms might simplify
commands you often use.
\begin{verbatim}
)synonym save         history )save
```

```
)synonym restore      history )restore
)synonym mail         system mail
)synonym ls           system ls
)synonym fortran      set output fortran
\end{verbatim}
Once defined, synonyms can be
used in place of the longer  command expressions.
Thus
\begin{verbatim}
)fortran on
\end{verbatim}
is the same as the longer
\begin{verbatim}
)set fortran output on
\end{verbatim}
To list all defined synonyms, issue either of
\begin{verbatim}
)synonyms
)what synonyms
\end{verbatim}
To list, say, all synonyms that contain the substring
``{\tt ap}'', issue
\begin{verbatim}
)what synonyms ap
\end{verbatim}

\par\noindent{\bf Also See:}
\downlink{``)set''}{ugSysCmdsetPage} in section B.21
\downlink{``)what''}{ugSysCmdwhatPage} in section B.28

\endscroll

```

```
\beginscroll

\par\noindent{\bf User Level Required:} interpreter

\par\noindent{\bf Command Syntax:}
\begin{items}
\item{\tt )system} {\it cmdExpression}
\end{items}

\par\noindent{\bf Command Description:}

This command may be used to issue commands to the operating system
while remaining in Axiom.  The {\it cmdExpression} is passed to the
operating system for execution.

To get an operating system shell, issue, for example,
\spadcmd{)system sh}.
When you enter the key combination,
\texht{\fbox{\bf Ctrl}--\fbox{\bf D}}{{\bf Ctrl-D}}
(pressing and holding the
\texht{\fbox{\bf Ctrl}}{{\bf Ctrl}} key and then pressing the
\texht{\fbox{\bf D}}{{\bf D}} key)
the shell will terminate and you will return to Axiom.
We do not recommend this way of creating a shell because
\Lisp{} may field some interrupts instead of the shell.
If possible, use a shell running in another window.

If you execute programs that misbehave you may not be able to return
to Axiom.  If this happens, you may have no other choice than to
restart Axiom and restore the environment via {\tt )history )restore},
if possible.

\item{\tt )trace} {\it domainOrPackage \lanb{}options\ranb{}}
\end{items}
%
where options can be one or more of
%
\begin{items}
\item{\tt )after} {\it S-expression}
\item{\tt )before} {\it S-expression}
\item{\tt )break after}
\item{\tt )break before}
\item{\tt )cond} {\it S-expression}
\item{\tt )count}
\item{\tt )count} {\it n}
\item{\tt )depth} {\it n}
\item{\tt )local} {\it op1 \lanb{}... opN\ranb{}}
\item{\tt )nonquietly}
\item{\tt )nt}
\item{\tt )off}
\item{\tt )only} {\it listOfDataToDisplay}
\item{\tt )ops}
\item{\tt )ops} {\it op1 \lanb{}... opN \ranb{}}
\item{\tt )restore}
\item{\tt )stats}
\item{\tt )stats reset}
\item{\tt )timer}
\item{\tt )varbreak}
\item{\tt )varbreak} {\it var1 \lanb{}... varN \ranb{}}
```

```
\item{\tt )vars}
\item{\tt )vars} {\it var1 \lanb{}... varN \ranb{}}
\item{\tt )within} {\it executingFunction}
\end{items}

\par\noindent{\bf Command Description:}

This command is used to trace the execution of functions that make
up the Axiom system, functions defined by users,
and functions from the system library.
Almost all options are available for each type of function but
exceptions will be noted below.

To list all functions, constructors, domains and packages that are
traced, simply issue
\begin{verbatim}
)trace
\end{verbatim}
To untrace everything that is traced, issue
\begin{verbatim}
)trace )off
\end{verbatim}
When a function is traced, the default system action is to display
the arguments to the function and the return value when the
function is exited.
Note that if a function is left via an action such as a {\tt THROW}, no
return value will be displayed.
Also, optimization of tail recursion may decrease the number of
times a function is actually invoked and so may cause less trace
information to be displayed.
Other information can be displayed or collected when a function is
traced and this is controlled by the various options.
Most options will be of interest only to Axiom system
developers.
If a domain or package is traced, the default action is to trace
all functions exported.

Individual interpreter, lisp or boot
functions can be traced by listing their names after
{\tt )trace}.
Any options that are present must follow the functions to be
traced.
\begin{verbatim}
)trace f
\end{verbatim}
traces the function {\tt f}.
To untrace {\tt f}, issue
\begin{verbatim}
)trace f )off
\end{verbatim}
```

```
Note that if a function name contains a special character, it will
be necessary to escape the character with an underscore
%
\begin{verbatim}
)trace _/D_,1
\end{verbatim}

To trace all domains or packages that are or will be created from a
particular constructor, give the constructor name or abbreviation
after {\tt )trace}.

\begin{verbatim}
)trace MATRIX
)trace List Integer
\end{verbatim}

The first command traces all domains currently instantiated with
\spadtype{Matrix}.  If additional domains are instantiated with this
constructor (for example, if you have used \spadtype{Matrix(Integer)}
and \spadtype{Matrix(Float)}), they will be automatically traced.  The
second command traces \spadtype{List(Integer)}.  It is possible to
trace individual functions in a domain or package.  See the {\tt )ops}
option below.

The following are the general options for the {\tt )trace}
command.

%!! system command parser doesn't treat general s-expressions correctly,
%!! I recommand not documenting )after )before and )cond
\indent{0}
\beginitems
%\item[{\tt )after} {\it S-expression}]
%causes the given \Lisp{} {\it S-expression} to be
%executed after exiting the traced function.

%\item[{\tt )before} {\it S-expression}]
%causes the given \Lisp{} {\it S-expression} to be
%executed before entering the traced function.

\item[{\tt )break after}]
causes a \Lisp{} break loop to be entered after
exiting the traced function.

\item[{\tt )break before}]
causes a \Lisp{} break loop to be entered before
entering the traced function.

\item[{\tt )break}]
is the same as \spadcmd{)break before}.
```

```
%\item[{\tt )cond} {\it S-expression}]
%causes trace information to be shown only if the given
%\Lisp{} {\it S-expression} evaluates to non-NIL.  For
%example, the following command causes the system function
%{\tt resolveTT} to be traced but to have the information
%displayed only if the value of the variable
%{\tt \$reportBottomUpFlag} is non-NIL.
%\begin{verbatim}
%)trace resolveTT )cond \_\$reportBottomUpFlag}
%\end{verbatim}

\item[{\tt )count}]
causes the system to keep a count of the number of times the
traced function is entered.  The total can be displayed with
{\tt )trace )stats} and cleared with {\tt )trace )stats reset}.

\item[{\tt )count} {\it n}]
causes information about the traced function to be displayed for
the first {\it n} executions.  After the \eth{\it n} execution, the
function is untraced.

\item[{\tt )depth} {\it n}]
causes trace information to be shown for only {\it n} levels of
recursion of the traced function.  The command
\begin{verbatim}
)trace fib )depth 10
\end{verbatim}
will cause the display of only 10 levels of trace information for
the recursive execution of a user function \userfun{fib}.

\item[{\tt )math}]
causes the function arguments and return value to be displayed in the
Axiom monospace two-dimensional math format.

\item[{\tt )nonquietly}]
causes the display of additional messages when a function is
traced.

\item[{\tt )nt}]
This suppresses all normal trace information.  This option is
useful if the {\tt )count} or {\tt )timer} options are used and
you are interested in the statistics but not the function calling
information.

\item[{\tt )off}]
causes untracing of all or specific functions.  Without an
argument, all functions, constructors, domains and packages are
untraced.  Otherwise, the given functions and other objects
are untraced.  To
immediately retrace the untraced functions, issue {\tt )trace
```

```
)restore}.

\item[{\tt )only} {\it listOfDataToDisplay}]
causes only specific trace information to be shown.  The items are
listed by using the following abbreviations:
\indent{0}
\beginitems
\item[a]       display all arguments
\item[v]       display return value
\item[1]       display first argument
\item[2]       display second argument
\item[15]      display the 15th argument, and so on
\enditems
\indent{0}
\enditems
\indent{0}
\indent{0}
\beginitems

\item[{\tt )restore}]
causes the last untraced functions to be retraced.  If additional
options are present, they are added to those previously in effect.

\item[{\tt )stats}]
causes the display of statistics collected by the use of the
{\tt )count} and {\tt )timer} options.

\item[{\tt )stats reset}]
resets to 0 the statistics collected by the use of the
{\tt )count} and {\tt )timer} options.

\item[{\tt )timer}]
causes the system to keep a count of execution times for the
traced function.  The total can be displayed with {\tt )trace
)stats} and cleared with {\tt )trace )stats reset}.

%!! only for lisp, boot, may not work in any case, recommend removing
%\item[{\tt )varbreak}]
%causes a \Lisp{} break loop to be entered after
%the assignment to any variable in the traced function.

\item[{\tt )varbreak} {\it var1 \lanb{}... varN\ranb{}}]
causes a \Lisp{} break loop to be entered after
the assignment to any of the listed variables in the traced
function.

\item[{\tt )vars}]
causes the display of the value of any variable after it is assigned
in the traced function.  Note that library code must have been
compiled (see
\downlink{``)compile''}{ugSysCmdcompilePage} in Section
B.7\ignore{ugSysCmdcompile}) using the {\tt
)vartrace} option in order to support this option.

\item[{\tt )vars} {\it var1 \lanb{}... varN\ranb{}}]
causes the display of the value of any of the specified variables
after they are assigned in the traced function.  Note that library
code must have been compiled (see
\downlink{``)compile''}{ugSysCmdcompilePage} in Section
B.7\ignore{ugSysCmdcompile}) using the {\tt
)vartrace} option in order to support this option.

\item[{\tt )within} {\it executingFunction}]
causes the display of trace information only if the traced
function is called when the given {\it executingFunction} is running.
\enditems
\indent{0}

The following are the options for tracing constructors, domains
and packages.

\indent{0}
\beginitems
\item[{\tt )local} {\it \lanb{}op1 \lanb{}... opN\ranb{}\ranb{}}]
causes local functions of the constructor to be traced.  Note that
to untrace an individual local function, you must use the fully
qualified internal name, using the escape character
\spadSyntax{\_} before the semicolon.
\begin{verbatim}
)trace FRAC )local
)trace FRAC_;cancelGcd )off
\end{verbatim}

\item[{\tt )ops} {\it op1 \lanb{}... opN\ranb{}}]
By default, all operations from a domain or package are traced
when the domain or package is traced.  This option allows you to
specify that only particular operations should be traced.  The
command
%
\begin{verbatim}
)trace Integer )ops min max _+ _-
\end{verbatim}
%
traces four operations from the domain \spadtype{Integer}.  Since
{\tt +} and {\tt -} are special
characters, it is necessary
to escape them with an underscore.
\enditems

13.0.196)undo

⇒ "notitle" (ugSysCmdhistoryPage) 13.0.182 on page 2517
— **ug16.ht** —

```
\begin{page}{ugSysCmdundoPage}{B.27. )undo}
\beginscroll

\par\noindent{\bf User Level Required:} interpreter

\par\noindent{\bf Command Syntax:}
\begin{items}
\item{\tt )undo}
\item{\tt )undo} {\it integer}
\item{\tt )undo} {\it integer \lanb{}option\ranb{}}
\item{\tt )undo} {\tt )redo}
\end{items}
%
where {\it option} is one of
%
\begin{items}
\item{\tt )after}
\item{\tt )before}
\end{items}

\par\noindent{\bf Command Description:}

This command is used to
restore the state of the user environment to an earlier
point in the interactive session.
The argument of an {\tt )undo} is an integer which must designate some
step number in the interactive session.

\begin{verbatim}
)undo n
```

```
)undo n )after
\end{verbatim}
These commands return the state of the interactive
environment to that immediately after step {\tt n}.
If {\tt n} is a positive number, then {\tt n} refers to step nummber
{\tt n}. If {\tt n} is a negative number, it refers to the \eth{\tt n}
previous command (that is, undoes the effects of the last \smath{-n}
commands).

A {\tt )clear all} resets the {\tt )undo} facility.
Otherwise, an {\tt )undo} undoes the effect of {\tt )clear} with
options {\tt properties}, {\tt value}, and {\tt mode}, and
that of a previous {\tt undo}.
If any such system commands are given between steps \smath{n} and
\smath{n + 1} (\smath{n > 0}), their effect is undone
for {\tt )undo m} for any \texht{\smath{0 < m \leq n}.}{0 < m <= n}.

The command {\tt )undo} is equivalent to {\tt )undo -1} (it undoes
the effect of the previous user expression).
The command {\tt )undo 0} undoes any of the above system commands
issued since the last user expression.

\begin{verbatim}
)undo n )before
\end{verbatim}
This command returns the state of the interactive
environment to that immediately before step {\tt n}.
Any {\tt )undo} or {\tt )clear} system commands
given before step {\tt n} will not be undone.

\begin{verbatim}
)undo )redo
\end{verbatim}
This command reads the file {\tt redo.input}.
created by the last {\tt )undo} command.
This file consists of all user input lines, excluding those
backtracked over due to a previous {\tt )undo}.

\par\noindent{\bf Also See:}
\downlink{``)history''}{ugSysCmdhistoryPage} in section B.13
The command {\tt )history )write} will eliminate the ``undone'' command
lines of your program.

\endscroll
\autobuttons
\end{page}
```

— **ug16.ht** —

```
\begin{page}{ugSysCmdwhatPage}{B.28. )what}
\beginscroll

\par\noindent{\bf User Level Required:} interpreter

\par\noindent{\bf Command Syntax:}
\begin{items}
\item{\tt )what categories} {\it pattern1} \lanb{}
{\it pattern2 ...\ranb{}}
\item{\tt )what commands  } {\it pattern1} \lanb{}
{\it pattern2 ...\ranb{}}
\item{\tt )what domains   } {\it pattern1} \lanb{}
{\it pattern2 ...\ranb{}}
\item{\tt )what operations} {\it pattern1} \lanb{}
{\it pattern2 ...\ranb{}}
\item{\tt )what packages  } {\it pattern1} \lanb{}
{\it pattern2 ...\ranb{}}
\item{\tt )what synonym   } {\it pattern1} \lanb{}
{\it pattern2 ...\ranb{}}
\item{\tt )what things    } {\it pattern1} \lanb{}
{\it pattern2 ...\ranb{}}
\item{\tt )apropos        } {\it pattern1} \lanb{}
{\it pattern2 ...\ranb{}}
\end{items}

\par\noindent{\bf Command Description:}

This command is used to display lists of things in the system.  The
patterns are all strings and, if present, restrict the contents of the
lists.  Only those items that contain one or more of the strings as
substrings are displayed.  For example,
\begin{verbatim}
)what synonym
\end{verbatim}
displays all command synonyms,
\begin{verbatim}
)what synonym ver
\end{verbatim}
displays all command synonyms containing the substring ``{\tt ver}'',
\begin{verbatim}
```

```
)what synonym ver pr
\end{verbatim}
displays all command synonyms
containing the substring  ‘‘{\tt ver}’’ or  the substring
‘‘{\tt pr}’’.
Output similar to the following will be displayed
\begin{verbatim}
---------------- System Command Synonyms -----------------

user-defined synonyms satisfying patterns:
      ver pr

  )apr ......................... )what things
  )apropos ..................... )what things
  )prompt ...................... )set message prompt
  )version ..................... )lisp *yearweek*
\end{verbatim}

Several other things can be listed with the {\tt )what} command:

\indent{0}
\beginitems
\item[{\tt categories}] displays a list of category constructors.
\item[{\tt commands}]  displays a list of  system commands available
at your user-level.
Your user-level
is set via the  {\tt )set userlevel} command.
To get a description of a particular command, such as ‘‘{\tt )what}’’,
issue {\tt )help what}.
\item[{\tt domains}]   displays a list of domain constructors.
\item[{\tt operations}] displays a list of operations in  the system
library. It  is recommended that you  qualify this command with one or
more patterns, as there are thousands of operations available.  For
example, say you are looking for functions that involve computation of
eigenvalues.  To find their names, try {\tt )what operations eig}.
A rather large list of operations  is loaded into the workspace when
this command  is first issued.  This  list will be deleted  when you
clear the workspace  via {\tt )clear all} or {\tt )clear completely}.
It will be re-created if it is needed again.
\item[{\tt packages}]  displays a list of package constructors.
\item[{\tt synonym}]  lists system command synonyms.
\item[{\tt things}]    displays all  of the  above types for  items
containing the pattern strings as  substrings.
The command synonym  {\tt )apropos} is equivalent to
{\tt )what things}.

14.0.198 Programs for Axiom Images

— ug21.ht —

```
\begin{page}{ugAppGraphicsPage}{G. Programs for Axiom Images}
\beginscroll
%
This appendix contains the Axiom programs used to generate
the images in the \Gallery{} color insert of this book.
All these input files are included
with the Axiom system.
To produce the images
on page 6 of the \Gallery{} insert, for example, issue the command:
\begin{verbatim}
)read images6
\end{verbatim}

These images were produced on an IBM RS/6000 model 530 with a
standard color graphics adapter.  The smooth shaded images
were made from X Window System screen dumps.
The remaining images were produced with Axiom-generated
PostScript output.  The images were reproduced from slides made on an Agfa
ChromaScript PostScript interpreter with a Matrix Instruments QCR camera.

These images illustrate how Newton's method converges when computing
the complex cube roots of 2.  Each point in the \smath{(x,y)}-plane
represents the complex number \smath{x + iy,} which is given as a
starting point for Newton's method.  The poles in these images
represent bad starting values.  The flat areas are the regions of
convergence to the three roots.

\noindent

\userfun{ntubeDraw}{\it (spaceCurve, planeCurve,}
$u_0 .. u_1,$ $t_0 .. t_1)$ draws
{\it planeCurve} in the normal planes of {\it
spaceCurve.}  The parameter $u_0 .. u_1$ specifies the parameter range
for {\it planeCurve} and $t_0 .. t_1$ specifies the parameter range
for {\it spaceCurve}.  Additionally, the plane curve function takes a
second parameter: the current parameter of {\it spaceCurve}.  This
allows the plane curve to change shape as it goes around the space
curve.

\noindent

\noindent

In order to draw Antoine rings, we take one ring, scale it down to a
smaller size, rotate it around its central axis, translate it to the
edge of the larger ring and rotate it around the edge to a point
corresponding to its count (there are 10 positions around the edge of
the larger ring). For each of these new rings we recursively perform
the operations, each ring becoming 10 smaller rings. Notice how the
\axiomType{DHMATRIX} operations are used to build up the proper matrix
composing all these transformations.

```
\begin{page}{HTXAdvPage1}{Input areas}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}

You have probably seen input areas in other Hyperdoc
pages. They provide {\it dynamic link} capabilities.
Instead of having a choice between certain actions,
they allow you to specify an action on--the--fly.
To use them, you need the following commands:
\beginImportant
\newline
{\tt \\inputstring\{{\it label}\}\{{\it length}\}\{{\it default value}\}}
\newline
{\tt \\stringvalue\{{\it label}\}}
\endImportant

The first command puts up an input area of the {\it length}
specified. The {\it default value} is placed in it.
The first argument, {\it label} gives a name to the
contents of the input area.
You can refer to those contents by using
the second command. Never place a {\tt \\stringvalue} command
in an "exposed" part of the page. It is only meant
to be used as an argument to an {\it action}.
Here are some examples.

\beginImportant

\begin{scroll}

If you just want to make a multiple-choice
type selection, why not use the {\it radio buttons}.

You need to use bitmaps for the active areas (the buttons) but
Hyperdoc will keep track of the currently activated button.
You can use this boolean information somewhere else on your page.
The commands to use are:
\beginImportant
\newline
{\tt \\radioboxes\{{\it group name}\}\{{\it bitmap file1}\}
\{{\it bitmap file0}\}}
\newline
{\tt \\radiobox[{\it initial state}]\{{\it label}\}
\{{\it group name}\}}
\newline
{\tt \\boxvalue\{{\it label}\}}
\endImportant

The {\tt \\radioboxes} command sets up a group of {\tt \\radiobox}
buttons. The {\it group name} is a label for the group. The filenames
for the bitmaps are specified in {\it bitmap file1} and
{\it bitmap file0}.
The first one should denote an activated button and the
second a de-activated one.

To display each button in a group, use {\tt \\radiobox}.  The
{\it initial state} should be either {\tt 1} or {\tt 0} depending on
whether the button should first be displayed as activated or not.  The
second {\it label} argument defines the name by which the current
state of the button can be referred to.  The third argument specifies
which group this button belongs to.

The {\tt \\boxvalue} command can then be used in various
```

```
actions. The value of it will
be either {\tt t} or {\tt nil}.

In the example below, we use the {\tt \\htbmfile} macro
defined in {\bf util.ht} so that we do not have to write
the full bitmap file pathnames.

This is how we set up the group. The {\tt \\radioboxes} command
does not display anything.
Note that these commands cannot be included in a {\it patch}.
This is why we display this time the source and the result
at the same time.
\beginImportant
\newline
{\tt \\radioboxes\{group\}
\{\\htbmfile\{pick\}\}\{\\htbmfile\{unpick\}\}}\newline
{\tt \\newline \\table\{}\newline
{\tt \{\\radiobox[1]\{b1\}\{group\}\}}\newline
{\tt \{\\radiobox[0]\{b2\}\{group\}\}}\newline
{\tt \{\\radiobox[0]\{b3\}\{group\}\}\}}\newline
{\tt \\newline}\newline
{\tt \\lispcommand\{lisp\}\{(pprint (list}\newline
{\tt \\boxvalue\{b1\} \\boxvalue\{b2\} \\boxvalue\{b3\}))\}}\newline
{\tt \\newline}\newline
{\tt \\unixcommand\{unix\}\{echo '\\boxvalue\{b1\}}\newline
{\tt \\boxvalue\{b2\} \\boxvalue\{b3\}'\}}
\endImportant
\radioboxes{group}{\htbmfile{pick}}{\htbmfile{unpick}}
\table{
{\radiobox[1]{b1}{group}}
{\radiobox[0]{b2}{group}}
{\radiobox[0]{b3}{group}}}
\newline
\lispcommand{lisp}{(pprint (list
\boxvalue{b1} \boxvalue{b2} \boxvalue{b3}))}
\newline
\unixcommand{unix}{echo '\boxvalue{b1}
\boxvalue{b2} \boxvalue{b3}'}
\endImportant

You can only set one radio button at a time. If you want
a non--exclusive selection, try {\tt \\inputbox}.
The syntax for this command is
\beginImportant
\newline
{\tt \\inputbox[{\it initial state}]
\{{\it label}\}\{{\it bitmap file1}\}\{{\it bitmap file0}\}}
```

```
\endImportant

There is no group command for these.
\beginImportant
\newline
{\tt \\table\{}\newline
{\tt \{\\inputbox[1]\{c1\}
\{\\htbmfile\{pick\}\}\{\\htbmfile\{unpick\}\}\}}\newline
{\tt \{\\inputbox\{c2\}
\{\\htbmfile\{pick\}\}\{\\htbmfile\{unpick\}\}\}}\newline
{\tt \{\\inputbox[1]\{c3\}
\{\\htbmfile\{pick\}\}\{\\htbmfile\{unpick\}\}\}\}}\newline
{\tt \\newline}\newline
{\tt \\lispcommand\{lisp\}\{(pprint (list}\newline
{\tt \\boxvalue\{c1\} \\boxvalue\{c2\} \\boxvalue\{c3\}))\}}\newline
{\tt \\newline}\newline
{\tt \\unixcommand\{unix\}\{echo }\newline
{\tt '\\boxvalue\{c1\} \\boxvalue\{c2\} \\boxvalue\{c3\}'\}}\newline
\endImportant
\table{
{\inputbox[1]{c1}{\htbmfile{pick}}{\htbmfile{unpick}}}
{\inputbox{c2}{\htbmfile{pick}}{\htbmfile{unpick}}}
{\inputbox[1]{c3}{\htbmfile{pick}}{\htbmfile{unpick}}}}
\newline
\lispcommand{lisp}{(pprint (list
\boxvalue{c1} \boxvalue{c2} \boxvalue{c3}))}
\newline
\unixcommand{unix}{echo
'\boxvalue{c1} \boxvalue{c2} \boxvalue{c3}'}
\endImportant

Note that the {\it initial state} is an
optional argument. If omitted
the button will initially
be deactivated.

\begin{scroll}

Sometimes you may find yourself having to
write
almost the same piece of Hyperdoc
text many times. Thankfully, there is a command to ease
the work.
It is the {\tt \\newcommand} command and provides
a macro facility for Hyperdoc.
In this way, you can give a short name to a sequence of Hyperdoc
text and use that name to include the sequence in your pages.
The way this works is the following
\beginImportant
\newline
\centerline{{\tt \\newcommand\{\\{\it name}\}
[{\it number of arguments}]\{{\it Hyperdoc text}\}}}
\endImportant
and here is an example from {\bf util.ht}
\beginImportant
\newline
{\tt \\newcommand\{\\axiomSig\}[2]
\{\\axiomType\{\#1\} \{\\tt ->\} \\axiomType\{\#2\}\}}
\newline
{\tt \\newcommand\{\\axiomType\}[1]
\{\\lispdownlink\{\#1\}\{(|spadType| '|\#1|)\}\}}
\endImportant

You see that a macro's definition can invoke another.
Don't create a circular definition though!
Notice how the arguments of the macro are used
in the definition. The {\tt \#{\it n}} construct
is the place--holder of the {\it n}'th argument.

To use the macro, just treat it as an ordinary command.
For instance
\beginImportant
\newline
{\tt \\axiomSig\{Integer\}\{List Integer\}}
```

```
\endImportant
displays and acts like this
\beginImportant
\newline
\axiomSig{Integer}{List Integer}
\endImportant

The best way to familiarise yourself to
macros is to study the macros defined in
\centerline{{\bf util.ht}}
It is highly probable that a good many of them
will prove useful to you.
Clever use of macros will allow you to
create Hyperdoc text that can be
formatted by other programs (such as TeX).
The Axiom User Guide was written
in such a way as to make translation in
Hyperdoc form and TeX form a mechanical process.

15.4.1 Patch and Paste

⇒ "notitle" (HTXAdvPage5) 15.5.1 on page 2581

— **htxadvpage4.ht** —

```
\begin{page}{HTXAdvPage4}{Patch and Paste}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}

A powerful Hyperdoc feature is
the ability to {\it replace}
part of a displayed page with another part
when an active area is clicked. The group commands
{\it patch} and {\it paste} offer this facility.
A {\it paste} region can appear anywhere
```

```
within a page or a {\it patch}. A {\it patch} region must be defined
outside a page definition.

We need a few  objects to define the {\it paste}
region. These are a {\it name} with which to
refer to it, some way of specifying what it
is to be replaced by and a {\it trigger} for the
replacement. A {\it patch} is how we specify the
second of these objects.
The {\it patch} is generally a sequence of Hyperdoc
text.

If we want to have the option of returning to the original
(or ,indeed, proceeding to a {\it third} alternative)
we clearly must include a {\it paste} in the {\it patch}.

Let us start with a simple example. We wish to
have the word {\tt initial} somewhere on the page replaced by the
word {\tt final} at a click of a button.
Let us first define the {\it patch}. It will just contain
the word {\tt final}. Here is a definition of a
patch called {\tt patch1} (note that
the actual definition must be outside this page’s definition).
\beginImportant
\newline
{\tt \\begin\{patch\}\{patch1\}} \newline
{\tt final}\newline
{\tt \\end\{patch\}}
\endImportant
We now define a {\it paste} region exactly where we
want the word {\tt initial} to appear.
\beginImportant
\newline
{\tt \\begin\{paste\}\{paste1\}\{patch1\}}\newline
{\tt initial}\newline
{\tt \\end\{paste\}}
\centerline{{\it results in}}
\begin{paste}{paste1}{patch1}
initial
\end{paste}
\endImportant
We have specified first the name of the {\it paste} region
which is {\tt paste1} and then the name of the
replacement {\it patch} which is {\tt patch1}.
Something is missing -- the trigger.
To include a trigger we write
\beginImportant
\newline
{\tt \\pastebutton\{paste1\}\{trigger\}
\centerline{{\it results in}}
```

```
\pastebutton{paste1}{trigger}
\endImportant
This new command {\tt \\pastebutton} displays the second argument
as an active area. The first argument specifies the {\it paste}
region it refers to. Clicking on {\tt trigger} above will
replace the word {\tt initial} with the word {\tt final}.

We can, if we like, include the {\tt \\pastebutton} in the {\it paste}
region.
Let us improve on the situation by providing a way
of going back to the original word {\tt initial} on the page.
The {\it patch} must itself include a {\it paste}.
What will the replacement {\it patch} for this new {\it paste}
be ? Well, we  have to define a second {\it patch}
that contains all the stuff in the original {\it paste}
region. Here is the updated {\it patch} for the first replacement.
The {\tt \\MenuDotBitmap} macro is defined in {\bf util.ht}.
It displays a button bitmap.
This time we put the {\tt \\pastebutton}
inside the {\it paste}.
\beginImportant
\newline
{\tt \\begin\{patch\}\{Patch1\}}\newline
{\tt \\begin\{paste\}\{Paste2\}\{Patch2\}}\newline
{\tt \\pastebutton\{Paste2\}\{\\MenuDotBitmap\}}\newline
{\tt final}\newline
{\tt \\end\{paste\}}\newline
{\tt \\end\{patch\}}\newline
\endImportant
and the new {\tt Patch2} {\it patch}
\beginImportant
\newline
{\tt \\begin\{patch\}\{Patch2\}}\newline
{\tt \\begin\{paste\}\{Paste3\}\{Patch1\}}\newline
{\tt \\pastebutton\{Paste3\}\{\\MenuDotBitmap\}}\newline
{\tt initial}\newline
{\tt \\end\{paste\}}\newline
{\tt \\end\{patch\}}\newline
\endImportant

Remember that these {\it patch} definitons must
occur outside a {\tt \\begin\{page\} - \\end\{page\}} group.
What is left now is to define the starting {\it paste}
region.
\beginImportant
\newline
{\tt \\begin\{paste\}\{Paste1\}\{Patch1\}}\newline
{\tt \\pastebutton\{Paste1\}\{\\MenuDotBitmap\}}\newline
{\tt initial}\newline
{\tt \\end\{paste\}}
```

```
\centerline{{\it results in}}
\begin{paste}{Paste1}{Patch1}
\pastebutton{Paste1}{\MenuDotBitmap}
initial
\end{paste}
\endImportant

Clicking on the button above next to {\tt initial}
will replace the {\tt Paste1} region with
{\tt Patch1}. That {\it patch}
also contains a {\it paste} region ({\tt Paste2}).
Clicking on {\it its} button will put up
{\tt Patch2} which has a {\it paste} region ({\tt Paste3}).
Clicking on {\it its} button will put up {\tt Patch1}
again. In that way, we close the chain of replacements.

⇒ "notitle" (HTXAdvPage6) 15.6.1 on page 2584

— **htxadvpage5.ht** —

```
\begin{page}{HTXAdvPage5}{Axiom paste-ins}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}

The {\it paste} and {\it patch} facility
(see \downlink{previous page}{HTXAdvPage4})
is used to display (or hide) the Axiom output
of an Axiom command ({\tt\\axiomcommand})
included in a
Hyperdoc page.

A mechanism has been set up to {\it automatically} generate
these paste-ins. It amounts to replacing an
{\tt \\axiomcommand} by a {\tt \\pastecommand} in the
```

```
Hyperdoc page.

In the case of a \axiomOp{draw} Axiom command
, where the result is to create an interactive viewport,
the appropriate command to use is {\tt \\pastegraph}.
The effect of this is to include (as the output)
the Axiom generated {\it image} of the graph
as an active area. Clicking on it will put up an
interactive viewport.
The {\tt \\pastegraph} command should be used only when
the result of the associated Axiom operation is
to {\it create} an interactive viewport. It is {\it not} necessarily
appropriate for all commands whose result
is a \axiomType{Two{}Dimensional{}Viewport} or
\axiomType{Three{}Dimensional{}Viewport}.
The {\tt \\pastecommand} and {\tt \\pastegraph}
are  macros defined in {\bf util.ht}.

There is no automatic paste-in generation facility
for Axiom piles (the {\tt \\begin\{axiomsrc\}} command).

The automatic paste-in generation mechanism works by invoking Axiom
with a particular option.  Hyperdoc is also started automatically. It
reads the {\tt \\pastecommand} and {\tt \\pastegraph} commands in all
pages in a specified {\bf somefile.ht} and passes them to Axiom for
evaluation. Hyperdoc captures the output and writes it out (to a file
called {\bf somefile.pht}) as the body of some {\it patch}
definitions. The commands encountered are written to a file
{\bf somefile.input} which you can {\tt )read} from an Axiom session.
It also creates directories for the graphics images encountered. Those
files and directories will be written under the {\it current}
directory.  The idea is that you then include the {\it patch}
definitions in {\bf somefile.pht} in your local database using {\bf
htadd}.

You can try this feature now. Edit a file called, say, {\bf trypaste.ht}
in a directory, say {\bf /tmp}. Put the following Hyperdoc text
in it.
\beginImportant
\newline
{\tt \\begin\{page\}\{TryPaste\}\{Trying out paste-in generation\}}\newline
{\tt \\begin\{scroll\}}\newline
{\tt \\pastecommand\{f z == z**2 \\bound\{f\}\}}\newline
{\tt \\pastegraph\{draw(f,-1..1) \\free\{f\}\}}\newline
{\tt \\pastecommand\{x:= f 3 \\free\{f\}\}}\newline
{\tt \\end\{scroll\}}\newline
```

```
{\tt \\end\{page\}}\newline
\endImportant

From the directory that contains the {\bf trypaste.ht},
issue
\centerline{
{\tt htadd -l ./trypaste.ht}
}
You will get the
{\bf ht.db} database file.
Set the environment variable {\tt HTPATH} so that
it points first to your directory and then the system directory.
In the {\bf /bin/csh}, you might use
\centerline{
{\tt setenv HTPATH /tmp:\$AXIOM/doc}
}
Make sure that no {\bf trypaste.input} or {\bf trypaste.pht}
files exist in the directory.
Then issue
\centerline{
{\tt axiom -paste trypaste.ht}
}
 and wait for
Axiom to finish.

There is a modification you will wish to make to
the {\bf trypaste.pht} file.
This is because the generated Hyperdoc text will assume that
the {\it viewport} data will be located in the
{\it system} directory.
\centerline{{\bf \env{AXIOM}/doc/viewports}}
You may want to place your images in a different directory,
say, {\bf /u/sugar/viewports}.
If so, then change all occurences of
\beginImportant
\newline
{\tt \\env\{AXIOM\}/doc/viewports/}
\centerline{{\it by}}
{\tt /u/sugar/viewports/}
\endImportant
in the file {\bf trypaste.pht}. The last step
is to include the {\it patch} definitions
in {\bf trypaste.pht} to your local database.
Issue
\centerline{
{\tt htadd -l ./trypaste.pht}
}
to update the database. If you have provided
a link to your pages from the {\tt RootPage}
via the {\tt \\localinfo} macro, you should now
```

```
be able to start Axiom or Hyperdoc
and see the computed Axiom output whenever you
click on the buttons to the left of each command.

15.10 htxformatpage3.ht

15.10.1 Using different fonts

— **htxformatpage3.ht** —

```
\begin{page}{HTXFormatPage3}{Using different fonts}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}

You can use various fonts for the text. Hyperdoc makes
four {\em logical} fonts available to you: a {\em roman} font, an
{\em emphasised} font, a {\em bold} font and a
{\em typewriter} font. The actual font that corresponds to
each logical font is determined by the end user via a
defaults file. The colour for each of these fonts can also
be specified.

Normal text is displayed with the roman font.
If you want to emphasize some text, use the {\tt \\em}
command in the following way.
\beginImportant
\begin{paste}{HTXFormatPage3xPaste1}{HTXFormatPage3xPatch1}
\pastebutton{HTXFormatPage3xPaste1}{Interpret}
\newline
{\tt this is \{\\em emphasised\} text}
\end{paste}
\endImportant

Note the use of the braces to enclose command and "arguments".
All font commands are specified in the same way. The {\tt \\em} command
will in fact {\em switch} between roman and emphasised
font every time it is used.
\beginImportant
\begin{paste}{HTXFormatPage3xPaste2}{HTXFormatPage3xPatch2}
\pastebutton{HTXFormatPage3xPaste2}{Interpret}
\newline
{\tt \{\\em this is \{\\em emphasised\} text\}}
\end{paste}
\endImportant

If you want to be sure that the emphasized font will be used, specify
the {\tt \\it} command. Similarly, you can explicitly select the roman
font with the {\tt \\rm} command.
\beginImportant
\begin{paste}{HTXFormatPage3xPaste3}{HTXFormatPage3xPatch3}
\pastebutton{HTXFormatPage3xPaste3}{Interpret}
\newline
{\tt \{\\em this is \{\\it emphasised\} text and this is \{\\rm roman\}\}}
\end{paste}
\endImportant

The bold font is selected with the {\tt \\bf} command and the typewriter
font with the {\tt \\tt} command. All these commands can be applied to
individual characters, words, sentences etc.
```

```
\beginImportant
\begin{paste}{HTXFormatPage3xPaste4}{HTXFormatPage3xPatch4}
\pastebutton{HTXFormatPage3xPaste4}{Interpret}
\newline
{\tt \{\\bf U\}\{\\tt g\}\{\\it l\}\{\\rm y\}}
\end{paste}
\endImportant

Currently, Hyperdoc does not adjust its internal spacing rules
to each font individually. This means that, for consistent results,
users are encouraged to specify (in the defaults file)
"character-cell" fonts that are not
too small or too large for Hyperdoc. Here is the correspondence
between the above font commands and the defaults names:\newline
\menuitemstyle{RmFont \tab{26} {\tt \\rm} or {\tt \\em} }\newline
\menuitemstyle{BoldFont \tab{26} {\tt \\bf} }\newline
\menuitemstyle{EmphasizeFont \tab{26} {\tt \\it} or {\tt \\em} }\newline
\menuitemstyle{Ttfont \tab{26} {\tt \\tt} }\newline

Hyperdoc uses two more logical fonts that can be specified by
the end user : AxiomFont and ActiveFont. However, you cannot
explicitly use these fonts in your text. The ActiveFont is automatically
used for active area text and the AxiomFont is reserved for
active Axiom commands.

15.11 htxformatpage4.ht

15.11.1 Indentation

— htxformatpage4.ht —

```
\begin{page}{HTXFormatPage4}{Indentation}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}
```

```
You can control the indentation of lines of text in Hyperdoc with
some useful commands.
Use the command {\tt \\par} to force a new paragraph if you don't want
to use the blank-line rule. The first line of a new paragraph
will normally be indented by a standard small amount. If you
just want to start on a new line, use the {\tt \\newline}
command.
\beginImportant
\begin{paste}{HTXFormatPage4xPaste1}{HTXFormatPage4xPatch1}
\pastebutton{HTXFormatPage4xPaste1}{Interpret}
\newline
{\tt let us start a new line \\newline here }
\end{paste}
\endImportant

The  command {\tt \\indent\{{\it value}\}} will
set the left-page-margin {\it value} characters
to the right of the standard left-page-margin.
The initial (standard) state of a page can be reset by the
{\tt \\indent\{0\}} command.
The first lines of paragraphs will be indented
by the {\it extra} standard  amount. The {\tt \\indent\{{\it value}\}}
command does {\em not} force a new line or paragraph.

You can also use the {\tt \\indentrel\{{\it value}\}} command.
Here, the {\it value} argument is a {\em relative} indentation
which can be positive or negative.
Otherwise, it behaves in the same way as the {\tt \\indent} command.
\beginImportant
\begin{paste}{HTXFormatPage4xPaste2}{HTXFormatPage4xPatch2}
\pastebutton{HTXFormatPage4xPaste2}{Interpret}
\newline
{\tt let us start a new line \\newline \\indent\{10\} here }\newline
{\tt \\newline \\indentrel\{-5\} there}\newline
{\tt \\newline \\indentrel\{-5\} back}
\end{paste}
\endImportant

The {\tt \\centerline\{{\it some text}\}} command will center its
argument between the current left and right margins. The argument of
the command should not be more than a paragraph of text and should not
contain any commands that change the left margin. The centered text
will start on a new line.
\beginImportant
\begin{paste}{HTXFormatPage4xPaste3}{HTXFormatPage4xPatch3}
\pastebutton{HTXFormatPage4xPaste3}{Interpret}
\newline
{\tt previous text. \\centerline\{This could}\newline
{\tt be some heading.\} Carry on}
```

```
\end{paste}
\endImportant

Placing text in vertically aligned columns is easily done with the
{\tt \\tab\{{\it value}\}} command. The {\tt \\tab} command has the
immediate effect of placing the next word {\it value} characters to
the right of the current left margin.
\beginImportant
\begin{paste}{HTXFormatPage4xPaste4}{HTXFormatPage4xPatch4}
\pastebutton{HTXFormatPage4xPaste4}{Interpret}
\newline
{\tt \\indent\{5\}\\newline}\newline
{\tt Team A \\tab\{17\}Score\\tab\{25\}Team B\\tab\{42\}Score\\newline}
\newline
{\tt 01234567890123456789012345678901234567890\\newline}
\newline
{\tt Green-Red\\tab\{17\}4\\tab\{25\}Blue-Black\\tab\{42\}6\\newline}
\newline
{\tt \\indent\{0\}}
\end{paste}
\endImportant

If you wish to preserve the indentation of a piece of text
you can use the {\tt verbatim} group command. Simply place
a {\tt \\begin\{verbatim\}} and {\tt \\end\{verbatim\}} around
the text. Note that Hyperdoc commands will
not be interpreted within the {\tt verbatim} group.
\beginImportant
\begin{paste}{HTXFormatPage4xPaste5}{HTXFormatPage4xPatch5}
\pastebutton{HTXFormatPage4xPaste5}{Interpret}
\newline
{\tt \\begin\{verbatim\}}
\begin{verbatim}
This    spacing     will be      preserved
                    {\bf is}     preserved
\end{verbatim}

15.12 htxformatpage5.ht

15.12.1 Creating Lists and Tables

⇒ "notitle" (HTXFormatPage6) 15.13.1 on page 2611

— **htxformatpage5.ht** —

```
\begin{page}{HTXFormatPage5}{Creating Lists and Tables}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}

The {\tt \\begin\{items\} {\rm -}  \\end\{items\}}
group command constructs itemized lists.
The {\tt \\item} command separates the items in the list.
The indentation rules for the list group are different from those
of a paragraph. The first line of an item will
normally extend further to the left than the rest of the lines.
Both commands accept {\em optional} arguments.
Optional arguments are enclosed in square brackets ({\tt \[ \]}) rather
than braces.

The indentation of subsequent lines in an item is determined by the
optional argument {\it some text} in the
{\tt \\begin\{items\}\[{\it some text}\]}
command. The optional argument is {\em not}
displayed. Its width is calculated and used to indent all subsequent
lines in the group except from the first line of each new item. This
indentation rule applies to all text {\em before} the first
{\tt \\item} command as well.

The {\tt \\item\[{\it some text}\]} command specifies the start of a
new item.  The {\it some text} optional argument will be displayed in
{\em bold} font at the current left-page-margin. Then, the text
following the command will be displayed in normal fashion with the
above indentation rule.
\beginImportant
\begin{paste}{HTXFormatPage5xPaste1}{HTXFormatPage5xPatch1}
\pastebutton{HTXFormatPage5xPaste1}{Interpret}
\newline
{\tt \\indent\{5\}}\newline
{\tt \\begin\{items\}\[how wide am I\]}\newline
{\tt Here we carry on but a \\newline} \newline
{\tt new line will be indented } \newline
{\tt \\item\[how wide am I\] fits nicely.
Here is a \\newline new line in an item.}\newline
{\tt \\item\[again\] to show another item}\newline
{\tt \\item\[\\\\tab\]\\tab\{0\} can be used \\tab\{15\} effectively}
\newline
```

```
{\tt \\end\{items\}}\newline
{\tt \\indent\{0\}}\newline
\end{paste}
\endImportant

Note that the {\tt \\begin\{items\}} command immediately sets the left-
page-margin to a new value. Subsequent
{\tt \\tab} or {\tt \\centerline} commands
refer to this new margin.
Any explicit margin setting commands included
in the group {\em will} have the normal effect.
The {\tt \\par} command does not produce
the standard paragraph indentation within a list group --- it behaves
instead like {\tt \\newline}.

You can nest list groups like the following example suggests.
\beginImportant
\begin{paste}{HTXFormatPage5xPaste2}{HTXFormatPage5xPatch2}
\pastebutton{HTXFormatPage5xPaste2}{Interpret}
\newline
{\tt \\begin\{items\}\[quitealot\]}\newline
{\tt A nested list:}\newline
{\tt \\item\[The first\] item of an itemized list is on this line.}
\newline
{\tt \\item\[The second\] item of the list starts here.
It contains another}\newline
{\tt list nested inside it.}\newline
{\tt \\begin\{items\}\[somuchmore\]}\newline
{\tt \\item \[First\]\\tab\{0\}This is the first item of an
enumerated}\newline
{\tt list that is nested within the itemized list.}\newline
{\tt \\item \[Second\]\\tab\{0\}This is the second item of the
inner list.}\newline
{\tt \\end\{items\}}\newline
{\tt This is the rest of the second item of the outer list.  It}\newline
{\tt is no more interesting than any other part of the item.}\newline
{\tt \\item\[The third\] item of the list.}\newline
{\tt \\end\{items\}}\newline
\end{paste}
\endImportant

Another facility for presenting lists is the {\tt \\table} command.
The correct syntax for it is : {\tt \\table\{\{{\it item a}\}
\{{\it item b}\} {\it ..}\}}.
The items in the braces will be placed in as many aligned columns
as is possible for the current window dimensions or page width.
If one item is particularly long there will probably be only one column
in the table. Here is a table of color names.
```

```
\beginImportant
\begin{paste}{HTXFormatPage5xPaste3}{HTXFormatPage5xPatch3}
\pastebutton{HTXFormatPage5xPaste3}{Interpret}
\newline
{\tt
\\table\{
\{Dark Orchid\} \{Dark Salmon\} \{Dark Sea Green\} \{Dark Slate Blue\}
\{Dark Slate Gray\} \{Dark Turquoise\} \{Dark Violet\} \{Deep Pink\}

15.14.1 Micro-Spacing

— **htxformatpage7.ht** —

```
\begin{page}{HTXFormatPage7}{Micro-Spacing}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}
```

```
There are three commands that one can use to exercise finer control
over the appearance of text on a page: {\tt \\space}, {\tt \\hspace}
and {\tt \\vspace}.

The {\tt \\space\{{\it value}\}} command accepts an integer argument
and simply changes the position of the next character to the right or
to the left.  A negative argument will move the next character to the
left and a positive one to the right. The unit of movement is {\it the
width of a character}. In this way one can overstrike characters to
produce various effects.

\beginImportant
\begin{paste}{HTXFormatPage7xPaste1}{HTXFormatPage7xPatch1}
\pastebutton{HTXFormatPage7xPaste1}{Interpret}
\newline
{\tt 0\\space\{-1\}\\}\newline
{\tt underlined\\space\{-10\}__________}\newline
\end{paste}
\endImportant

The {\tt \\hspace\{{\it value}\}} command
is similar to the {\tt \\space\{{\it value}\}} command.
It also accepts an integer argument and
changes the position of the next character to the right or to the left.
A negative argument will move the next character to the left and a
positive one to the right. The unit of movement is {\it a pixel}.
The {\it value} argument specifies an offset from the default placement
of the character.

\beginImportant
\begin{paste}{HTXFormatPage7xPaste2}{HTXFormatPage7xPatch2}
\pastebutton{HTXFormatPage7xPaste2}{Interpret}
\newline
{\tt x\\hspace\{-4\}x\\hspace\{-3\}x\\hspace\{-2\}x\\hspace\{-1\}x\%}\newline
{\tt x\\hspace\{1\}x\\hspace\{2\}x\\hspace\{3\}x\\hspace\{4\}x}
\end{paste}
\endImportant

The {\tt \\vspace\{{\it value}\}} command is similar to the
{\tt \\hspace\{{\it value}\}} command but (as the name suggests)
works in the vertical direction. The unit of movement is {\it a
pixel}. The {\it value} argument specifies an offset from {\it
the next line}. A negative argument moves the next character up
and a positive down. This command can be used for subscripts and
superscripts. One drawback in the use of {\tt \\vspace} is that
it can only work with a particular font at a time. This is
because the inter-line spacing depends on the font being used
and the value of it is needed to get "back" on the line.
```

```
In general, the command {\tt \\vspace\{{\it - ils}\}} will
have a null effect when {\it ils} = ( font ascent + font descent + 5 ).
The example below assumes that {\it ils} = 25 e.g. the Rom14 font
on the RISC System/6000.

15.15 htxformatpage8

15.15.1 Bitmaps and Images

— htxformatpage8.ht —

```
\begin{page}{HTXFormatPage8}{Bitmaps and Images}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}

The commands {\tt \\inputbitmap\{{\it filename}\}}
and {\tt \\inputimage\{{\it filename}\}}
allow you to include an X11 bitmap or an
Axiom-generated viewport in a Hyperdoc
page.

In the case of the {\tt \\inputbitmap} command
the {\it filename} parameter must be the full pathname
of an X11 bitmap file.

\beginImportant
\begin{paste}{HTXFormatPage8xPaste1}{HTXFormatPage8xPatch1}
\pastebutton{HTXFormatPage8xPaste1}{Interpret}
\newline
{\tt \\inputbitmap\{\env{AXIOM}/doc/bitmaps/sup.bitmap\} }
\end{paste}
\endImportant

The {\it filename} parameter of the {\tt \\inputimage} command must be
the full pathname of a {\it compressed XPM image} file without the
name extensions.  Hyperdoc always adds ".xpm.Z" to whatever filename
you give and looks for the augmented filename.  Such files can be
generated by Axiom command \axiomOp{write} with the {\tt "image"} or
{\tt "pixmap"} options.

\beginImportant
\begin{paste}{HTXFormatPage8xPaste2}{HTXFormatPage8xPatch2}
\pastebutton{HTXFormatPage8xPaste2}{Interpret}
\newline
{\tt \\inputimage\{\env{AXIOM}/doc/viewports/ugProblemNumericPage30.view/image\}}
\end{paste}
\endImportant

Be careful not to break the pathname across lines.

The {\tt \\inputimage} command will automatically select
the {\it image.xpm} or the {\it image.bm} file for you
based on the capabilities of your X server.
```

```
For your convenience, there are two macros defined
in \centerline{ {\bf util.ht}.}
The {\tt \\viewport} macro eliminates the need to specify
the {\tt .view/image} part and the
{\tt \\axiomViewport} macro automatically selects viewport
files in the system directories. The above {\tt \\inputimage}
could have been written
\beginImportant
{\tt \\viewport\{\env{AXIOM}/doc/viewports/ugProblemNumericPage30\}}
\endImportant
or
\beginImportant
{\tt \\axiomViewport\{ugProblemNumericPage30\}}
\endImportant

\centerline{\fbox{{\tt \thispage}}}\newline
\beginscroll

Take a close look at the objects in the Hyperdoc window you are now
reading.  Most of them are text. Resize the window using the window
manager facilities. The text is reformatted to fit the window
border. This action is performed by Hyperdoc. At the simplest level,
it provides a method for {\em formatting} text in a window.  In fact,
it can place other things on the window as well, such as bitmaps or
color images. The {\em buttons} you see at either side at the top of
```

```
the window are bitmaps.

Move the cursor so that it rests on one of those buttons. You notice
that the cursor has changed appearance. This indicates that there is
an action associated with the button. This action will be performed
when you click the mouse button over the {\em active area}. If you are
familiar with Hyperdoc, you know that the active area can be words,
bitmaps, images or {\em input areas}. In fact, anything that can be
displayed in a Hyperdoc window can be an active area.

So, what can the action associated with an active area be? Hyperdoc
allows quite a bit of freedom in defining that action. We will have a
close look at this issue \downlink{later on}{HTXLinkTopPage}. For now,
recall the various actions that you have encountered so far ---
executing Axiom commands, popping up new windows, providing parameters
for other active areas, and replacing or changing the contents of the
window. The most common action is to bring up some Hyperdoc text in
the same or a different window.  This lets us create {\em links}
between pieces of text and images. A system with such capability is
usually called a {\em hypertext} system.  Hyperdoc is in fact much
more.

15.18.1 How Hyperdoc does it

⇒ “notitle” (HTXIntroPage3) 15.19.1 on page 2624

— **htxintropage2.ht** —

```
\begin{page}{HTXIntroPage2}{How Hyperdoc does it}
{\centerline{\fbox{{\tt \thispage}}}\newline}
\beginscroll

Hyperdoc can read the {\em hypertext} information from standard text
files. This means that you can create or change this information with
```

```
any text editor. Once this information has been entered into the
files, a special program, called {\bf htadd}, scans these files and
produces a database (another file called {\bf ht.db}) of {\em objects}
encountered in the files. Hyperdoc consults this database when it
first starts and so knows where it might find the definitions of these
objects. You can maintain several such databases on different
directories. You indicate which database you want Hyperdoc to consult
by setting an {\em environment variable} called {\bf HTPATH}.

In general, hypertext must obviously use some kind of special (that is,
non-textual) marks for all the  extra functionality it provides. In
Hyperdoc, these marks are some special characters --- special
in the sense that they are not interpreted as ordinary displayable text.
These characters, however, are part of the standard ASCII set.
There is also a way to display these special characters as text .
The Hyperdoc special characters are :

\beginImportant
\noindent{\em Special Characters}:
{\tt \table{{\$}{\\}{\{}{\}}{\[}{\]}{\%}{\#}}}
\endImportant

Hyperdoc uses the special characters to distinguish between
{\em text} and {\em commands} (by {\em text}, we mean here anything
displayable). The commands are instructions to
Hyperdoc to treat some text in a particular way. Some commands
define special Hyperdoc objects. The most important objects
are {\em pages}, {\em patches}, and {\em macros}.
A {\em page} is a description of the contents of a
Hyperdoc window. A {\em patch} is a portion of a page.
A {\em macro} is a user-defined new Hyperdoc command.
Some commands allow special text {\em formatting} and others
associate some text with an action.

In order to display anything at all in \HyperName, you must define a
{\em page}. The next section explains how to define a {\em page} and put
some simple text into it.
\endscroll

{\centerline{\fbox{{\tt \thispage}}}\newline}
\begin{scroll}

A page is defined by a {\em group} command. Group commands are used to
delimit a group, that is, to declare where a group starts and where it
ends. The proper syntax for a page definition is as follows:
\beginImportant
{\tt \\begin\{page\}\{{\it name}\}\{{\it a title}\}}
\newline
.
\newline
.
\newline
.
\newline
{\tt \\end\{page\}}
\beginImportant

Note the use of the special characters {\tt \\}, {\tt \{} and {\tt
\}}.  The {\tt \\} (backslash) character introduces a command, in this
case, {\tt begin}.  The {\tt \{ \}} (braces) delimit the {\em
parameters} to the command.  The first parameter (the word {\tt page})
specifies this as a page definition command.

The second parameter can be any single unbroken word consisting of
alphanumeric characters only, and specifies the name of the page by
which it can be referred to by other commands. You should choose this
internal name with care so as to avoid potential conflict with page
names that are defined by the Axiom system. This caveat only applies
in the case where you have started Hyperdoc with the Axiom database
--- see \downlink{later on}{HTXLinkPage6}. It is suggested that the
page names you define start with the letters {\tt UX} (standing for
{\tt U}ser e{\tt X}tensions). You can have a look at the Axiom system
database file {\centerline{\bf \env{AXIOM}/doc/ht.db} }
which contains the names of all pages, macros and patches used by
Axiom.
```

```
The third parameter specifies a title for the page.
The title of a page is the area at the very top
of the window, between the buttons. Virtually anything
that can be put in the main page can also be put in the
title. As an example, {\em this} page's
declaration is like this:\newline
{\tt \\begin\{page\}\{\thispage\}\{A simple text page\}}

Everything you type between the {\tt \\begin\{page\}} command and the
next {\tt \\end\{page\}} command will become the body of the page. It
is an error to insert another {\tt \\begin\{page\}} between the two,
that is, this group command cannot be nested.

There is another useful group command that should be mentioned here
--- the {\em scroll} command. It controls the portion of the page that
will be scrollable. Hyperdoc will split a page in three sections:
a {\em header}, a {\em scroll region} and a {\em footer}. Hyperdoc
will always try to keep the header and footer regions visible on the
page; the header at the top and the footer at the bottom. The middle
scroll region will be truncated and a scroll bar will be automatically
provided if the window becomes too small for the whole contents of the
page. Only one scroll region can be defined in a page and the correct
syntax is as follows:
\beginImportant
{\tt \\begin\{scroll\}}
\newline
.
\newline
.
\newline
.
\newline
{\tt \\end\{scroll\}}
\beginImportant

This group should be placed inside the relevant page group. The text
between the {\tt \\begin\{page\}} and {\tt \\begin\{scroll\}} commands
defines the header region, the text inside the scroll group defines
the scroll region and the text between the {\tt \\end\{scroll\}} and
{\tt \\end\{page\}} commands defines the footer region. It is
important to keep the header and footer areas small.  Use them to
display information that might be needed at any time by the user.  If
you don't define a scroll region in your page, you may find that a
portion of the page is truncated.

You are now ready to experiment with a page of your own. If you just
want to display some text on a page, you don't need any other
Hyperdoc commands. Just make sure that the text you type for the
title, header, scroll and footer regions does not contain (for the
moment) any of the Hyperdoc special characters.
```

```
\end{scroll}

Hyperdoc is both a way of presenting information and
a customisable front-end. Axiom uses
it for its own purpose as a front-end and documentation system.
Hyperdoc has special facilities that allow it to interact
very closely with Axiom.  The \Browse{} facility, the Basic
Commands section and the ability to execute Axiom commands
by clicking on Hyperdoc text are witness to this.

These pages will show you the features of Hyperdoc that might
make it appropriate for your own use in, for example, providing
documentation for Axiom code that you write or some other purpose.

It is recommended that you get familiar with the {\em use} of
Hyperdoc before proceeding.

⇒ “notitle” (HTXLinkTopPage) 15.27.1 on page 2656
⇒ “notitle” (TestHelpPage) 15.21.4 on page 2630
⇒ “notitle” (HTXLinkPage2) 15.22.1 on page 2630

— **htxlinkpage1.ht** —

```
\begin{page}{HTXLinkPage1}{Linking to a named page}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}

In Hyperdoc, hypertext links are specified by different flavors of the
{\tt \\link} command. These commands take two arguments. One argument
specifies the active area, that is, the {\it trigger} of the link. The
second argument specifies the {\it target} of the link, that is, a
page. The trigger can be quite arbitrary Hyperdoc text and can include
images or whole paragraphs. The trigger text will be formatted in the
normal fashion but its default font will be the font specified by the
ActiveFont resource.

The simplest kind of Hyperdoc link is a link to a named page.
Clicking on the trigger will cause the named page to appear in a
Hyperdoc window.
There are three flavors for such a link.
\begin{items}[123456]
\item\menuitemstyle{{\tt \\windowlink\{{\it trigger}\}
\{{\it page name}\}}}
\newline
This link command, when activated, will create a new
window for the named page.
\newline
There will be no \centerline{\UpBitmap{}  or \ReturnBitmap{}}
buttons on the new page.
The new page will have a \centerline{\ExitBitmap{}} button, however.
The original page containing the {\tt \\windowlink}
command will be unaffected.
\item\menuitemstyle{{\tt \\downlink\{{\it trigger}\}\{{\it page name}\}} }
\newline This link command, when activated, will cause the
```

```
current page to be replaced by the target page
in the same Hyperdoc window.
A \centerline{\UpBitmap{}}  button will automatically be placed
on the new page allowing you to get back to the page
containing the {\tt \\downlink} command.
If the current page has a \centerline{\ReturnBitmap{}} button then
the target page will also carry it. The associated
target page of that button will be the same as it is
in the current page.
\item\menuitemstyle{{\tt \\memolink\{{\it trigger}\}\{{\it page name}\}}}
\newline This link command is similar to the {\tt \\downlink} command.
In addition, it will cause a \centerline{\ReturnBitmap{}}
button to be included in
the target page and all pages {\tt \\downlink}ed from it.
This button will act as a
direct link to the page containing the {\tt \\memolink} command allowing
a short-cut to be taken.
\end{items}

{\tt \\downlink\{downlink to Actions menu\}\{HTXLinkTopPage\}\\newline}
\newline
{\tt \\memolink\{memolink to Actions menu\}\{HTXLinkTopPage\}}
\end{paste}
\endImportant

There is a fourth button that can appear at the top of the page
next to the \centerline{\ExitBitmap{}} button.
Its purpose is to provide access to a particular {\it help page}
associated with the current page.
That is the \centerline{\HelpBitmap{}} button. The command to use
is
\centerline{{\tt \\helppage\{{\it help page name}\}}}
The {\tt \\helppage} command {\it must } be placed
just before the {\tt \\end\{page\}} command.
For instance, to get a help button on this page
the following command is used.
\centerline{{\tt {\\helppage\{TestHelpPage\}}}}
Clicking on the help button at the top
will display the {\tt TestHelpPage} page in a new window.

— **htxlinkpage2.ht** —

```
\begin{page}{HTXLinkPage2}{Standard Pages}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}

You have reached this page after performing
a series of mouse clicks on Hyperdoc
active areas. Each time, a {\tt \\link}
command was activated. Well, how does it all
start?
The answer is that Hyperdoc always puts up
a particular page called {\tt RootPage} when
it starts up. If this page is not found in the database,
Hyperdoc will immediately exit.
It is, of course, desirable that the {\tt RootPage}
contains links to other pages!
It is possible to override
Axiom's choice of {\tt RootPage} and provide your own
to Hyperdoc. This is done in the same way as
```

```
you would override any Axiom-defined page and is
discussed in \downlink{How to use your pages with Hyperdoc}{HTXLinkPage6}.

You may have noticed that Hyperdoc
uses some pages when certain events occur.
There is a page that is put up, for instance,
whenever Hyperdoc cannot connect to Axiom.
Another page is put up whenever there is a formatting
error and yet another when a request for an unknown page
is made. Finally, there is a page that prompts
for confirmation when you press the
exit button on the initial page.

These pages have standard names and must be provided
in the Hyperdoc page database.
They are already defined in the Axiom system
Hyperdoc page database so that you do not have to
define them yourself.

Here are the pages required by Hyperdoc. You can click on any of these
to see their contents. Click on their exit buttons when you are finished.

\beginImportant
\begin{paste}{HTXLinkPage2xPaste1}{HTXLinkPage2xPatch1}
\pastebutton{HTXLinkPage2xPaste1}{Interpret}
\newline
{\tt \\table\{}\newline
{\tt \{\\windowlink\{SpadNotConnectedPage\}\{SpadNotConnectedPage\}\}}
\newline
{\tt \{\\windowlink\{UnknownPage\}\{UnknownPage\}\}}\newline
{\tt \{\\windowlink\{ErrorPage\}\{ErrorPage\}\}}\newline
{\tt \{\\windowlink\{ProtectedQuitPage\}\{ProtectedQuitPage\}\}}\newline
{\tt \}}\newline
\end{paste}
\endImportant

In addition, Hyperdoc uses certain bitmaps for its buttons.
They are also provided in the Axiom system
bitmap directory and Hyperdoc knows where to find them.

The bitmap files required by Hyperdoc are the following.
\newline
\tab{7}{\it exit.bitmap}\tab{22} = \tab{25}{\ExitBitmap{}} \newline
\tab{7}{\it help2.bitmap}\tab{22} = \tab{25}{\HelpBitmap{}} \newline
\tab{7}{\it up3.bitmap}\tab{22} = \tab{25}{\UpBitmap{}}\newline
\tab{7}{\it return3.bitmap}\tab{22} = \tab{25}{\ReturnBitmap{}}\newline
```

```
\tab{7}{\it noop.bitmap}\tab{22} = \tab{25}{\NoopBitmap{}}

These files must exist in your current directory if
the {\tt AXIOM} environment variable is not set.
If it is, then Hyperdoc will assume that it points
to the Axiom system directory and will look for
these files in
{\bf \$AXIOM/doc/bitmaps}.

15.23.1 Active Axiom commands

⇒ "notitle" (HTXLinkPage4) 15.24.1 on page 2639

— **htxlinkpage3.ht.ht** —

```
\begin{page}{HTXLinkPage3}{Active Axiom commands}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}

This section explains how to include Axiom
commands in your page. The commands we will
introduce are actually {\it macros} that are defined
in
\centerline{{\bf \env{AXIOM}/doc/util.ht}}
This means that you can use them only if you include
this file in your Hyperdoc database.

The first command to learn is
\horizontalline
{\tt \\axiomcommand\{ {\it command }
{\tt \ \\free\{}{\it var1 var2 ...}
{\tt \}\ \\bound\{}{\it var}{\tt \}\ \}} }
\horizontalline

The {\tt \\free\{\}} and {\tt \\bound\{\}} directives are optional.
We will come to them in a minute. The {\it command} above is the
text of the Axiom command. Only single line commands are allowed
here.
This text will be displayed in the reserved AxiomFont logical
```

```
font.  The area of the text will be active and clicking on it
will attempt to send the command to Axiom for evaluation.
A new Axiom interpreter window (and Axiom frame)
will be created if this was the first Axiom command
activated in the current page. If not, the command will be sent
to the already opened Axiom interpreter window for the current page.
Note that it {\it is} necessary to escape special
Hyperdoc characters with the {\tt '\\'} backslash character.
The exceptions are the characters {\tt \[\]}; they do not
need to be escaped in this context.

\beginImportant
\begin{paste}{HTXLinkPage3xPaste1}{HTXLinkPage3xPatch1}
\pastebutton{HTXLinkPage3xPaste1}{Interpret}
\newline
{\tt \\axiomcommand\{ l:=brace[1,2,3] ; length:=\\\# l ; m:=[1,2]\}}
\end{paste}
\endImportant

The optional {\tt \\free\{\}} and {\tt \\bound\{\}} directives
provide dependency control. The reader of a Hyperdoc
page is not forced to click on the commands in the
order in which in they appear on the page.  If the
correct {\tt \\free\{\}} and {\tt \\bound\{\}}
specifications are made, clicking on a command
will result in execution of all those other
commands that should be executed before it.
This will {\it only} happen the first time the command is
clicked.

So, how are the dependencies specified?  The arguments of the {\tt
\\free\{\}} directive must be space-separated words (labels). The
argument of {\tt \\bound\{\}} must be a single (unique for the page)
label. Each label in the {\tt \\free\{\}} list must exist as an
argument to one (and only one) {\tt \\bound\{\}} directive somewhere
in the current page.  When the command is activated, Hyperdoc will
look in the {\tt \\free\{\}} list and check each label.  For each
label, it will find the command that specifies that label in its {\tt
\\bound\{\}} directive and execute it if it has not been already
executed.  The order of labels in the {\tt \\free\{\}} directive list
is respected. Hyperdoc will follow all dependency links recursively.

Here is  an example.
Clicking on the third command will automatically
execute all of them in the correct sequence.
Note that in this case the order of labels in the last
line is immaterial since {\tt v2} explicitly depends on {\tt v1}.

\beginImportant
```

```
\begin{paste}{HTXLinkPage3xPaste2}{HTXLinkPage3xPatch2}
\pastebutton{HTXLinkPage3xPaste2}{Interpret}
\newline
{\tt \\axiomcommand\{a:=1;d:=4 \\bound\{v1\}\}}\newline
{\tt \\newline}\newline
{\tt \\axiomcommand\{b:=a+3 \\free\{v1\} \\bound\{v2\}\}}\newline
{\tt \\newline}\newline
{\tt \\axiomcommand\{c:=b+d \\free\{v1 v2\} \\bound\{v3\}\}}\newline
\end{paste}
\endImportant

The second command deals with multi-line Axiom
code. This is the command to use for execution of
an Axiom {\it pile}. It is a {\it group}
command. The proper syntax for it is as follows:
\horizontalline
{\tt \\begin\{spadsrc\}
\ [\\free\{{\it var1 var2} ...\}\ \\bound\{{\it var}\}]}
\newline
.
\newline
.
\newline
{\tt \\end\{spadsrc\}}
\horizontalline

Again, the {\tt \\free} and {\tt \\bound} directives are
optional. If they are specified (in exactly the same way
as {\tt \\axiomcommand}), they must be enclosed in
square brackets {\tt []}.
The lines between the {\tt \\begin} and {\tt \\end}
contain the Axiom statements. Indentation
will be respected. Hyperdoc will
actually save this part in a temporary file
and instruct Axiom to read the file
with the {\tt )read} system command.

Here is an example. The execution of the following
fragment is dependent on the {\tt v3} label.
Make sure that previous commands are active (and
hence the label {\tt v3} is "visible") before
trying to execute it. If the label {\tt v3}
is not seen in the page, Hyperdoc will
print an error message on standard output
and ignore the dependency.

\beginImportant
\begin{paste}{HTXLinkPage3xPaste3}{HTXLinkPage3xPatch3}
\pastebutton{HTXLinkPage3xPaste3}{Interpret}
```

```
\newline
{\tt \\begin\{spadsrc\}\ [\\free\{v3\}\ \\bound\{v4\}]}\newline
{\tt f\ x\ ==}\newline
{\tt \ \ \ x+c}\newline
{\tt f\ 3}\newline
{\tt \\end\{spadsrc\}}
\end{paste}
\endImportant

There is, in fact, more that one can do
with Axiom commands. In pages elsewhere
in the system, Axiom commands appear next
to button like this \ \MenuDotBitmap{}.
Clicking on this button, one can see the output
for that command. The output has been
pre-computed and is also stored in
Hyperdoc files. This is done using
{\it patch} and {\it paste}.
It is the same mechanism that
is used to alternatively display
Hyperdoc source and interpreted
result in this and other pages.
It is explained \downlink{later on}{HTXAdvPage5}.

15.24 htxlinkpage4.ht

15.24.1 Linking to Lisp

⇒ "notitle" (HTXLinkPage5) 15.25.1 on page 2648

— **htxlinkpage4.ht** —

```
\begin{page}{HTXLinkPage4}{Linking to Lisp}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}

Another feature of the Axiom\hspace{2}--Hyperdoc
link is the ability to execute {\it Lisp}
code at a click of a button.
There are two things one can do.

The first is to cause the evaluation
of a {\it Lisp} form and ignore (as far as Hyperdoc
is concerned) its value. The evaluation of the function
might have an effect however on your Axiom session.

The command for this is
\horizontalline
\centerline{ {\tt \\lispcommand\{{\it text}\}\{{\it Lisp form}\}}}
\horizontalline

Here is an example. We will first define a {\it Lisp} function
and then execute it.  Notice that the Hyperdoc
special characters must be escaped (this is on top
of {\it Lisp} escaping conventions).

\beginImportant
\begin{paste}{HTXLinkPage4xPaste1}{HTXLinkPage4xPatch1}
\pastebutton{HTXLinkPage4xPaste1}{Interpret}
\newline
{\tt \\lispcommand\{Definition\}\{(defun HTXTESTFUNCTION ()}\newline
{\tt  (print "Hello from HyperDoc \\\\\\\\ \\\% \\\{ \\\}"))\}} \newline
{\tt \\newline}\newline
{\tt \\lispcommand\{Execution\}\{(HTXTESTFUNCTION)\}} \newline
\end{paste}
\endImportant
```

```
Your command will be executed as soon as
Axiom completes any computation it might be
carrying out.

%\axiomcommand{)lisp (defun f () (pprint "hello"))}
%\lispcommand{f}{(|f|)}

The second thing you can do is quite powerful. It allows you
to delegate to a {\it Lisp} function
the {\it dynamic} creation of a page. This is used
in \Browse{} to present
the Axiom Library in a hypertext form.

The command to use is a lot like the {\tt link} commands
you encountered \downlink{earlier}{HTXLinkPage1} and comes in three
flavors.
\centerline{{\tt \\lispwindowlink\{{\it trigger}\}\{{\it Lisp form}\}}}
\centerline{{\tt \\lispdownlink\{{\it trigger}\}\{{\it Lisp form}\}}}
\centerline{{\tt \\lispmemolink\{{\it trigger}\}\{{\it Lisp form}\}}}

The difference between the three versions is the same as before.
When such a link is activated, Hyperdoc issues the
{\it Lisp form} to Axiom and waits for a full
page definition. An important point to note is that
Hyperdoc does {\it not} use
the value of the {\it Lisp form} but, instead, it
depends on its {\it side-effects}.
What {\it must} happen during evaluation
of the form is enough evaluations of a special {\it Lisp}
function called {\bf issueHT} to define a page.
The argument of {\bf issueHT} is a string
containing Hyperdoc text. Perhaps an example will clarify
matters.

First we will define a {\it Lisp} function that accepts
a string argument and calls {\bf issueHT} a few times.
The strings that are passed to {\bf issueHT} construct
a Hyperdoc page that would just contain our
original argument centered roughly on the page.
Then we write the {\tt \\lisplink} with a call to
the function. Finally, we execute a {\it Lisp}
command that just pretty--prints the function's definition.

\beginImportant
\begin{paste}{HTXLinkPage4xPaste2}{HTXLinkPage4xPatch2}
```

```
\pastebutton{HTXLinkPage4xPaste2}{Interpret}
\newline
{\tt \\lispcommand\{Definition\}\{(defun HTXTESTPAGE (x) (|issueHT|}\newline
{\tt  "\\\\\\\\begin\\\{page\\\}\\\{LispTestPage\\\}\\\{Lisp Test Page\\\}}\newline
{\tt  \\\\\\\\vspace\\\{150\\\} \\\\\\\\centerline\\\{") (|issueHT| x)
(|issueHT|}\newline
{\tt  "\\\} \\\\\\\\end\\\{page\\\}" ) ) \}}\newline
{\tt \\newline}\newline
{\tt \\lispwindowlink\{Link to it\}\{(HTXTESTPAGE "Hi there")\}}\newline
{\tt \\newline}\newline
{\tt \\lispcommand\{Show Lisp definition\}
\{(pprint (symbol-function 'HTXTESTPAGE))\}}\newline
\end{paste}
\endImportant

The {\tt '\\\{'} and {\tt '\\\}'} is required to escape
Hyperdoc's special characters {\tt '\{'} and {\tt  '\}'}.
The {\tt '\\\\\\\\'} has the following rationale.
We need to send to Hyperdoc (from {\it Lisp}) the sequence
{\tt \\begin}. But {\tt '\\'} is a special {\it Lisp}
character. Therefore the {\it Lisp} string must be
{\tt '\\\\begin'}. But to specify this
in Hyperdoc we need to escape the two {\tt '\\'}.
Therefore, we write {\tt '\\\\\\\\begin'}.

The definition of {\tt HTXTESTPAGE} would have been written in {\it Lisp}
as follows.
\begin{verbatim}
(defun HTXTESTPAGE (X)
   (|issueHT|
      "\\begin{page}{LispTestPage}{Lisp Test Page}
\\vspace{200} \\centerline{")
   (|issueHT| X)
   (|issueHT| "} \\end{page}"))
\end{verbatim}

You should not execute {\tt HTXTESTPAGE} in the
{\it Lisp} environment manually. It is meant to
be executed {\it only} in response to a
Hyperdoc request.

Can you pop-up a named page from {\it Lisp} regardless of
user action? Yes --- use {\it Lisp} function {\bf linkToHTPage}
with the page name as a string argument. Click on the
{\tt \\axiomcommand} below. Then, in your Axiom
session, you can repeat it if you like.
```

```
\beginImportant
\begin{paste}{HTXLinkPage4xPaste3}{HTXLinkPage4xPatch3}
\pastebutton{HTXLinkPage4xPaste3}{Interpret}
\newline
{\tt \\axiomcommand\{)lisp (|linkToHTPage| "RootPage")\}}
\end{paste}
\endImportant

You can also pop-up a {\it dynamic} page regardless of user action.
To do this, make sure you evaluate the {\it Lisp form}
{\bf (|startHTPage| 50)} before using {\bf issueHT}.
The example below requires the {\tt HTXTESTPAGE} function
to be defined in {\it Lisp} so you should make sure
you have executed the command above that defines it.

\beginImportant
\begin{paste}{HTXLinkPage4xPaste4}{HTXLinkPage4xPatch4}
\pastebutton{HTXLinkPage4xPaste4}{Interpret}
\newline
{\tt \\axiomcommand\{
)lisp (progn (|startHTPage| 50)(HTXTESTPAGE "Immediately"))\}}
\end{paste}
\endImportant

Now, the most important use of this facility
so far has been in the \Browse{} and Basic Commands components of
Hyperdoc. Instead of giving you details of the various
\Browse{} {\it Lisp} functions, a few macros are defined in
\centerline{{\bf \$AXIOM/doc/util.ht}}

The most important defined macros are
\beginImportant
\table{
{ {\tt \\axiomType\{{\it constructor}\}} }
{ {\tt \\axiomOp\{{\it operation}\}} }
{ {\tt \\axiomOpFrom\{{\it operation }\}\{{\it constructor}\}}}
}
\endImportant

Here are some examples of their use.
\beginImportant
\begin{paste}{HTXLinkPage4xPaste5}{HTXLinkPage4xPatch5}
\pastebutton{HTXLinkPage4xPaste5}{Interpret}
\newline
{\tt \\axiomType\{Expression Integer\}}\newline
{\tt \newline}\newline
{\tt \\axiomType\{Expression\}}\newline
{\tt \newline}\newline
{\tt \\axiomType\{EXPR\}}\newline
{\tt \newline}\newline
```

```
{\tt \\axiomOp\{reduce\}}\newline
{\tt \newline}\newline
{\tt \\axiomOp\{as*\}}\newline
{\tt \newline}\newline
{\tt \\axiomOpFrom\{reduce\}\{Expression\}}\newline
\end{paste}
\endImportant

The macro {\tt \\axiomType} brings up the \Browse{}
constructor page for the constructor specified.
You can specify a full name, or an abbreviation
or just the top level name.
The macro {\tt \\axiomOp} brings up a list of operations
matching the argument.
The macro {\tt \\axiomOpFrom} shows documentation
about the specified operation whose origin is
constructor. No wildcard in the operation name
or type abbreviation is
allowed here.  You should also specify just the top level type.

15.25 htxlinkpage5.ht

15.25.1 Linking to Unix

— htxlinkpage5.ht —

```
\begin{page}{HTXLinkPage5}{Linking to Unix}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}

Let us conclude the tour of Hyperdoc
actions that can be triggered with a click of a button
with two more facilities. These are
\beginImportant
\table{
{ {\tt \\unixcommand\{{\it trigger text}\}\{{\it unix command}\}}}
{ {\tt \\unixlink\{{\it trigger text}\}\{{\it unix command}\}}}
}
\endImportant

The first one, {\tt \\unixcommand}, is very much like
{\tt \\axiomcommand} and {\tt \\lispcommand}.
The trigger text becomes an active area. Clicking on it
will force Hyperdoc to pass the second argument
to the system as a shell command to be executed.
The shell used is {\bf /bin/sh}.
Hyperdoc ignores the output of the command.

\beginImportant
\begin{paste}{HTXLinkPage5xPaste1}{HTXLinkPage5xPatch1}
\pastebutton{HTXLinkPage5xPaste1}{Interpret}
\newline
{\tt \\unixcommand\{List \\\$HOME directory\}\{ls \\\$HOME\}}\newline
\end{paste}
\endImportant

The {\tt \\unixlink} command delegates to a another
program the creation of a dynamic page. When the trigger
text is activated, Hyperdoc will invoke the command
specified in the second argument. It will then start reading
the {\it standard output} of the command until
a complete page has been received. It is important that
a single page and nothing more is written by the command.
This command is essentially a {\tt \\downlink}, i.e.
the new page replaces the current page in the window.
There aren't any other flavours of {\tt \\unixlink}.
```

```
A trivial example is to use {\bf cat} on a Hyperdoc
file known to contain just one page.

\beginImportant
\begin{paste}{HTXLinkPage5xPaste2}{HTXLinkPage5xPatch2}
\pastebutton{HTXLinkPage5xPaste2}{Interpret}
\newline
{\tt \\unixlink\{Some file\}} \newline
{\tt \{cat\\ \\env\{AXIOM\}/doc/HTXplay.ht\}}
\end{paste}
\endImportant

Two things to notice in the second argument of
{\tt \\unixlink}: You must use a {\it hard space}
{\tt '\\\ '} to preserve the spacing in the command.
Also, the {\tt \\env} command allows you to use
an environment variable in Hyperdoc text.

With a little ingenuity (and maybe some shell and {\bf awk} scripts !)
, one can use these
facilities to create, say, a point-and-click
directory viewer which allows you to edit
a file by clicking on its name.

15.26 htxlinkpage6.ht

15.26.1 How to use your pages with Hyperdoc

— **htxlinkpage6.ht** —

```
\begin{page}{HTXLinkPage6}{How to use your pages with Hyperdoc}
\centerline{\fbox{{\tt \thispage}}}\newline
\begin{scroll}

Let us say that you have written a few Hyperdoc
pages and you would like to incorporate them in the system.
Here is what you should do.

Put all your files in some directory and make sure that
they all have the {\bf .ht} extension.

You will need a way of "hooking" into a system--defined
Hyperdoc page. The proper way to do this is to use
the {\tt \\localinfo} macro. The Axiom system
Hyperdoc page database includes, as it should,
a {\tt RootPage}. This is the page that first comes up
when you start Hyperdoc. This page contains
a line like this.
\beginImportant
\newline
{\tt \\localinfo}
\endImportant

This macro is defined in
\centerline{ {\bf \env{AXIOM}/doc/util.ht}}
to be (see \downlink{Macros}{HTXAdvPage3} to learn how to define macros):
\beginImportant
\newline
{\tt \\newcommand\{\\localinfo\}\{\}}
\endImportant
which is an empty definition (the second argument of {\tt \\newcommand}).
The idea then is that you {\it override} this definition of the macro
with your own.
To do that, include a definition like the following in one (possibly the
one that contains your top--level page) of your files. You can
```

```
put this definition in its own file if you like.
\beginImportant
\newline
{\tt \\newcommand\{\\localinfo\}
\{\\menuwindowlink\{{\it active text}\}} \newline
{\tt \{{\it page name}\} \\tab\{16\}{\it short description}\}}
\endImportant

If you have a look at the initial Hyperdoc page, you will probably be
able to decipher what this does. The macro {\tt \\menuwindowlink} is
defined (again in {\bf util.ht}) and is responsible for putting the
little square to the left of the active area.  Specify a word or two
for {\it active text}. That will become the trigger of the {\tt
\\link}. Specify the page name of your top--level page in {\it page
name}. Finally, you can give a comment about the topic under {\it
short description}. That will appear to the right of the {\it active
text}.

The next thing you need to do is to create a {\it local database}
for your files. You will use the {\bf \env{AXIOM}/bin/htadd} program.
This program will create an {\bf ht.db} file that summarises your
definitions and acts as an index. Let us present an example
of its use. Suppose you have two files {\bf user1.ht} and {\bf user2.ht}
in directory {\bf /u/sugar/Hyperdoc}. You should create the {\bf ht.db}
in that same directory. To create the {\bf ht.db} file you issue to
the unix shell:
\beginImportant
\newline
{\tt htadd -f /u/sugar/Hyperdoc
/u/sugar/Hyperdoc/user1.ht /u/sugar/Hyperdoc/user2.ht}
\centerline{or ,if you are already in /u/sugar/Hyperdoc}
{\tt htadd -l ./user1.ht ./user2.ht}
\endImportant

The options and conventions for {\bf htadd} will be explained below.
To start Hyperdoc with your own pages, you now need to tell
it where to search for {\bf ht.db} files and Hyperdoc {\bf .ht}
files. To do this, define the shell environment variable
{\bf HTPATH}. The value should be a colon {\tt ':'} separated
list of directory full pathnames.
The order of the directories is respected with earlier entries overriding
later ones. Since we want all the Axiom pages but need to override the
{\tt \\localinfo} macro, we should use the value
\centerline{{\bf /u/sugar/Hyperdoc:\env{AXIOM}/doc}}
The way that you define environment variables depends on the shell
you are using. In the {\bf /bin/csh}, it would be
\newline
{\bf setenv HTPATH /u/sugar/Hyperdoc:\env{AXIOM}{}/doc{}/hypertex{}/pages}
```

```

```
\begin{patch}{HTXLinkPage6xPatch1}
\begin{paste}{HTXLinkPage6xPaste1A}{HTXLinkPage6xPatch1A}
\pastebutton{HTXLinkPage6xPaste1A}{Hide}
\newline
Name:

{\tt htadd - create or modify a Hyperdoc database}
\vspace{}
\newline
Syntax:

{\tt htadd [ -l | -s | -f\ }{\it path}{\tt ]
[ -d | -n ]\ }{\it filename ...}
\vspace{}
\newline
```

```
Options:\indentrel{4}\newline
{\tt -l}\tab{8}\indentrel{8}
build {\bf ht.db} database in current working directory.
This is the default behaviour if no {\tt -l}, {\tt -s} or {\tt -f}
is specified.

\indentrel{-8}\newline
{\tt -s}\tab{8}\indentrel{8}
build {\bf ht.db} database in {\it system} directory. The
system directory is built as follows. If the {\tt AXIOM}
variable is defined, the {\bf \$AXIOM/doc} directory
is used. If {\tt AXIOM} is not defined, the
{\bf /usr/local/axiom/doc} directory is used.

\indentrel{-8}\newline
{\tt -f\ }{\it path}\newline\tab{8}\indentrel{8}
build {\bf ht.db} database in specified {\it path}.

\indentrel{-8}\newline
{\tt -d}\tab{8}\indentrel{8}
delete the entries in the specified files from {\bf ht.db}.

\indentrel{-8}\newline
{\tt -n}\tab{8}\indentrel{8}
delete {\bf ht.db} and create a new one using only the files
specified.

If none of {\tt -n} and {\tt -d} is specified, the {\bf ht.db}
is updated with the entries in the file specified.

\indentrel{-8}
\indentrel{-4}
\vspace{}\newline
Filename interpretation :
\indentrel{12}\newline
A full pathname (i.e. anything that has a {\tt '/'} in it)
will be taken do be a completely specified file.
Otherwise, the following interpretation will occur:
If the {\tt HTPATH} variable is defined, the directories
specified in it will be tried in order. If {\tt HTPATH}
is not defined, then, if {\tt AXIOM} is defined, the
{\bf \$AXIOM/doc} will be tried, else
the file will be deemed missing and {\bf htadd} will fail.
\indentrel{-12}

\begin{paste}{HTXLinkPage6xPaste2A}{HTXLinkPage6xPatch2A}
\pastebutton{HTXLinkPage6xPaste2A}{Hide}
\indentrel{12}\newline

The Hyperdoc program is \centerline{{\bf \env{AXIOM}/lib/hypertex}} If
{\tt AXIOM} is defined and {\tt HTPATH} is not (this is the case when
Axiom starts Hyperdoc) Hyperdoc will look in
\centerline{{\bf \env{AXIOM}/doc}}
for the {\bf ht.db} file and all
Hyperdoc pages.  If {\tt HTPATH} is defined, it is assumed that it
alone points to the directories to be searched (the above default will
NOT be searched unless explicitly specified in {\tt HTPATH}).  For
each directory in {\tt HTPATH}, the {\bf ht.db} file, if there, will
be read.  Each file listed in {\bf ht.db} will then be searched for in
the complete sequence of directories in {\tt HTPATH}. Note that the
{\bf ht.db} does not keep full pathnames of files.  If a {\it page},
{\it macro} or {\it patch} (specified in some {\bf ht.db}) happens to
be (in a file) in more than one of the directories specified in
{\tt HTPATH}, Hyperdoc will print a warning and explain which version in
which file is ignored. Generally, earlier directories in {\tt HTPATH}
are preferred over later ones.

This page allows you to quickly experiment with Hyperdoc.
It is a good idea to keep it handy as you learn about various commands.

\beginscroll

We are going to use here the Hyperdoc facilities that allow
us to communicate with external programs and files. For more
information see \downlink{later on}{HTXLinkPage5}.
\beginmenu
\item\menuitemstyle{
In order to use the buttons at the bottom of this page, you must
first specify a name for the file you are going to use to hold
Hyperdoc commands. Edit the input area below to change the
name of the file.}
\item\menuitemstyle{
If the file you specified does not yet exist, click on the
{\bf Initialize} button below. This action will fill the file
with the minimum of Hyperdoc commands necessary to define a page.}
\item\menuitemstyle{
If you want to edit the file, just click on the {\bf Edit} button.
This action will pop up a window, and invoke the {\it vi}
editor on the file. Alternatively, use an editor of your choice.}
\item\menuitemstyle{
Once you have finished making the changes to the file, update it and
click on the {\bf Link} button. Hyperdoc will then read
the file, interpret it as a new page, and display the page on
this window. If you change the file and want to display it again,
just get back to this page and click on {\bf Link} again. }
\endmenu
\endscroll
\beginmenu

NAG Library Routines

16.1 nagaux.ht

16.1.1 NAG On-line Documentation

— nagaux.ht —

```
\begin{page}{manpageXXonline}{NAG On-line Documentation}
\beginscroll
\begin{verbatim}

     DOC INTRO(3NAG)   Foundation Library (12/10/92)   DOC INTRO(3NAG)

                    Introduction to NAG On-Line Documentation

          The on-line documentation for the NAG Foundation Library has been
          generated automatically from the same base material used to
          create the printed Reference Manual. To make the documentation
          readable on the widest range of machines, only the basic set of
          ascii characters has been used.

          Certain mathematical symbols have been constructed using plain
          ascii characters:

          integral signs              /
                                      |
                                        /

          summation signs               --
                                        >
                                        --

          square root signs                ----
                                          /
                                        \/

          Large brackets are constructed using vertical stacks of the
          equivalent ascii character:

                              (  )  [  ]  {  }  |
                              (  )  [  ]  {  }  |
                              (  )  [  ]  {  }  |

          Fractions are represented as:

                                       a
                                      ---
                                      x+1

          Greek letters are represented by their names enclosed in round
          brackets:

                  (alpha)  (beta)  (gamma) .....

                  (Alpha)  (Beta)  (Gamma) .....

          Some characters are accented using:

                  ^     ~
                  X     X     X

          Other mathematical symbols are represented as follows:

                 *           times

                 <=>         left-right arrow

                 <-          left arrow

                 ~           similar to
```

```
                 ~=          similar or equal to

                 ==          equivalent to

                 >=          greater than or equal to

                 <=          less than or equal to

                 >>          much greater than

                 <<          much less than

                 >~          greater than or similar to

                 /=          not equal to

                 dd          partial derivative

                 +-          plus or minus

                 (nabla)     Nabla

\end{verbatim}
\endscroll
\end{page}
```

16.1.2 NAG Documentation: summary

— nagaux.ht —

```
\begin{page}{manpageXXsummary}{NAG Documentation: summary}
\beginscroll
\begin{verbatim}

     SUMMARY(3NAG)     Foundation Library (12/10/92)     SUMMARY(3NAG)

          Introduction                                List of Routines
          List of Routines

          The NAG Foundation Library contains three categories of routines
          which can be called by users. They are listed separately in the
```

```
three sections below.

Fully Documented Routines
      254 routines, for each of which an individual routine
      document is provided. These are regarded as the primary
      contents of the Foundation Library.

Fundamental Support Routines
      83 comparatively simple routines which are documented in
      compact form in the relevant Chapter Introductions (F06,
      X01, X02).

Routines from the NAG Fortran Library
      An additional 167 routines from the NAG Fortran Library,
      which are used as auxiliaries in the Foundation Library.
      They are not documented in this publication, but can be
      called if you are already familiar with their use in the
      Fortran Library. Only their names are given here.

Note: all the routines in the above categories have names ending
in 'F'. Occasionally this publication may refer to routines whose
names end in some other letter (e.g. 'Z', 'Y', 'X'). These are
auxiliary routines whose names may be passed as parameters to a
Foundation Library routine; you only need to know their names,
not how to call them directly.

Fully Documented Routines

The Foundation Library contains 254 user-callable routines, for
each of which an individual routine document is provided, in the
following chapters:

C02 -- Zeros of Polynomials

C02AFF  All zeros of complex polynomial, modified Laguerre method

C02AGF  All zeros of real polynomial, modified Laguerre method

C05 -- Roots of One or More Transcendental Equations

C05ADF  Zero of continuous function in given interval, Bus and
        Dekker algorithm

C05NBF  Solution of system of nonlinear equations using function
        values only

C05PBF  Solution of system of nonlinear equations using 1st
        derivatives
```

```
C05ZAF  Check user's routine for calculating 1st derivatives

C06 -- Summation of Series

C06EAF  Single 1-D real discrete Fourier transform, no extra
        workspace

C06EBF  Single 1-D Hermitian discrete Fourier transform, no extra
        workspace

C06ECF  Single 1-D complex discrete Fourier transform, no extra
        workspace

C06EKF  Circular convolution or correlation of two real vectors,
        no extra workspace

C06FPF  Multiple 1-D real discrete Fourier transforms

C06FQF  Multiple 1-D Hermitian discrete Fourier transforms

C06FRF  Multiple 1-D complex discrete Fourier transforms

C06FUF  2-D complex discrete Fourier transform

C06GBF  Complex conjugate of Hermitian sequence

C06GCF  Complex conjugate of complex sequence

C06GQF  Complex conjugate of multiple Hermitian sequences

C06GSF  Convert Hermitian sequences to general complex sequences

D01 -- Quadrature

D01AJF  1-D quadrature, adaptive, finite interval, strategy due
        to Piessens and de Doncker, allowing for badly-behaved
        integrands

D01AKF  1-D quadrature, adaptive, finite interval, method
        suitable for oscillating functions

D01ALF  1-D quadrature, adaptive, finite interval, allowing for
        singularities at user-specified break-points

D01AMF  1-D quadrature, adaptive, infinite or semi-infinite
        interval

D01ANF  1-D quadrature, adaptive, finite interval, weight
        function cos((omega)x) or sin((omega)x)
```

```
D01APF  1-D quadrature, adaptive, finite interval, weight
        function with end-point singularities of algebraico-
        logarithmic type

D01AQF  1-D quadrature, adaptive, finite interval, weight
        function 1/(x-c), Cauchy principal value (Hilbert
        transform)

D01ASF  1-D quadrature, adaptive, semi-infinite interval, weight
        function cos((omega)x) or sin((omega)x)

D01BBF  Weights and abscissae for Gaussian quadrature rules

D01FCF  Multi-dimensional adaptive quadrature over hyper-
        rectangle

D01GAF  1-D quadrature, integration of function defined by data
        values, Gill-Miller method

D01GBF  Multi-dimensional quadrature over hyper-rectangle, Monte
        Carlo method

D02 -- Ordinary Differential Equations

D02BBF  ODEs, IVP, Runge-Kutta-Merson method, over a range,
        intermediate output

D02BHF  ODEs, IVP, Runge-Kutta-Merson method, until function of
        solution is zero

D02CJF  ODEs, IVP, Adams method, until function of solution is
        zero, intermediate output

D02EJF  ODEs, stiff IVP, BDF method, until function of solution
        is zero, intermediate output

D02GAF  ODEs, boundary value problem, finite difference technique
        with deferred correction, simple nonlinear problem

D02GBF  ODEs, boundary value problem, finite difference technique
        with deferred correction, general linear problem

D02KEF  2nd order Sturm-Liouville problem, regular/singular
        system, finite/infinite range, eigenvalue and
        eigenfunction, user-specified break-points

D02RAF  ODEs, general nonlinear boundary value problem, finite
        difference technique with deferred correction,
        continuation facility
```

```
D03 -- Partial Differential Equations

D03EDF  Elliptic PDE, solution of finite difference equations by
        a multigrid technique

D03EEF  Discretize a 2nd order elliptic PDE on a rectangle

D03FAF  Elliptic PDE, Helmholtz equation, 3-D Cartesian co-
        ordinates

E01 -- Interpolation

E01BAF  Interpolating functions, cubic spline interpolant, one
        variable

E01BEF  Interpolating functions, monotonicity-preserving,
        piecewise cubic Hermite, one variable

E01BFF  Interpolated values, interpolant computed by E01BEF,
        function only, one variable

E01BGF  Interpolated values, interpolant computed by E01BEF,
        function and 1st derivative, one variable

E01BHF  Interpolated values, interpolant computed by E01BEF,
        definite integral, one variable

E01DAF  Interpolating functions, fitting bicubic spline, data on
        rectangular grid

E01SAF  Interpolating functions, method of Renka and Cline, two
        variables

E01SBF  Interpolated values, evaluate interpolant computed by
        E01SAF, two variables

E01SEF  Interpolating functions, modified Shepard's method, two
        variables

E01SFF  Interpolated values, evaluate interpolant computed by
        E01SEF, two variables

E02 -- Curve and Surface Fitting

E02ADF  Least-squares curve fit, by polynomials, arbitrary data
        points

E02AEF  Evaluation of fitted polynomial in one variable from
        Chebyshev series form (simplified parameter list)
```

E02AGF	Least-squares polynomial fit, values and derivatives may be constrained, arbitrary data points,
E02AHF	Derivative of fitted polynomial in Chebyshev series form
E02AJF	Integral of fitted polynomial in Chebyshev series form
E02AKF	Evaluation of fitted polynomial in one variable, from Chebyshev series form
E02BAF	Least-squares curve cubic spline fit (including interpolation)
E02BBF	Evaluation of fitted cubic spline, function only
E02BCF	Evaluation of fitted cubic spline, function and derivatives
E02BDF	Evaluation of fitted cubic spline, definite integral
E02BEF	Least-squares cubic spline curve fit, automatic knot placement
E02DAF	Least-squares surface fit, bicubic splines
E02DCF	Least-squares surface fit by bicubic splines with automatic knot placement, data on rectangular grid
E02DDF	Least-squares surface fit by bicubic splines with automatic knot placement, scattered data
E02DEF	Evaluation of a fitted bicubic spline at a vector of points
E02DFF	Evaluation of a fitted bicubic spline at a mesh of points
E02GAF	L_1-approximation by general linear function
E02ZAF	Sort 2-D data into panels for fitting bicubic splines

E04 -- Minimizing or Maximizing a Function

E04DGF	Unconstrained minimum, pre-conditioned conjugate gradient algorithm, function of several variables using 1st derivatives
E04DJF	Read optional parameter values for E04DGF from external file

E04DKF	Supply optional parameter values to E04DGF
E04FDF	Unconstrained minimum of a sum of squares, combined Gauss-Newton and modified Newton algorithm using function values only
E04GCF	Unconstrained minimum of a sum of squares, combined Gauss-Newton and quasi-Newton algorithm, using 1st derivatives
E04JAF	Minimum, function of several variables, quasi-Newton algorithm, simple bounds, using function values only
E04MBF	Linear programming problem
E04NAF	Quadratic programming problem
E04UCF	Minimum, function of several variables, sequential QP method, nonlinear constraints, using function values and optionally 1st derivatives
E04UDF	Read optional parameter values for E04UCF from external file
E04UEF	Supply optional parameter values to E04UCF
E04YCF	Covariance matrix for nonlinear least-squares problem

F01 -- Matrix Factorizations

F01BRF	LU factorization of real sparse matrix
F01BSF	LU factorization of real sparse matrix with known sparsity pattern
F01MAF	LL^T factorization of real sparse symmetric positive-definite matrix
F01MCF	LDL^T factorization of real symmetric positive-definite variable-bandwidth matrix
F01QCF	QR factorization of real m by n matrix (m>=n)
F01QDF	Operations with orthogonal matrices, compute QB or $Q^T B$ after factorization by F01QCF
F01QEF	Operations with orthogonal matrices, form columns of Q

```
        after factorization by F01QCF

F01RCF  QR factorization of complex m by n matrix (m>=n)

                                                     H
F01RDF  Operations with unitary matrices, compute QB or Q B after
        factorization by F01RCF

F01REF  Operations with unitary matrices, form columns of Q after
        factorization by F01RCF

F02 -- Eigenvalues and Eigenvectors

F02AAF  All eigenvalues of real symmetric matrix

F02ABF  All eigenvalues and eigenvectors of real symmetric matrix

F02ADF  All eigenvalues of generalized real symmetric-definite
        eigenproblem

F02AEF  All eigenvalues and eigenvectors of generalized real
        symmetric-definite eigenproblem

F02AFF  All eigenvalues of real matrix

F02AGF  All eigenvalues and eigenvectors of real matrix

F02AJF  All eigenvalues of complex matrix

F02AKF  All eigenvalues and eigenvectors of complex matrix

F02AWF  All eigenvalues of complex Hermitian matrix

F02AXF  All eigenvalues and eigenvectors of complex Hermitian
        matrix

F02BBF  Selected eigenvalues and eigenvectors of real symmetric
        matrix

F02BJF  All eigenvalues and optionally eigenvectors of
        generalized eigenproblem by QZ algorithm, real matrices

F02FJF  Selected eigenvalues and eigenvectors of sparse symmetric
        eigenproblem

F02WEF  SVD of real matrix

F02XEF  SVD of complex matrix

F04 -- Simultaneous Linear Equations
```

```
F04ADF  Approximate solution of complex simultaneous linear
        equations with multiple right-hand sides

F04ARF  Approximate solution of real simultaneous linear
        equations, one right-hand side

F04ASF  Accurate solution of real symmetric positive-definite
        simultaneous linear equations, one right-hand side

F04ATF  Accurate solution of real simultaneous linear equations,
        one right-hand side

F04AXF  Approximate solution of real sparse simultaneous linear
        equations (coefficient matrix already factorized by
        F01BRF or F01BSF)

F04FAF  Approximate solution of real symmetric positive-definite
        tridiagonal simultaneous linear equations, one right-hand
        side

F04JGF  Least-squares (if rank = n) or minimal least-squares (if
        rank <n) solution of m real equations in n unknowns, rank
        <=n, m>=n

F04MAF  Real sparse symmetric positive-definite simultaneous
        linear equations (coefficient matrix already factorized)

F04MBF  Real sparse symmetric simultaneous linear equations

F04MCF  Approximate solution of real symmetric positive-definite
        variable-bandwidth simultaneous linear equations
        (coefficient matrix already factorized)

F04QAF  Sparse linear least-squares problem, m real equations in
        n unknowns

F07 -- Linear Equations (LAPACK)

F07ADF  (DGETRF) LU factorization of real m by n matrix

F07AEF  (DGETRS) Solution of real system of linear equations,
        multiple right-hand sides, matrix already factorized by
        F07ADF

F07FDF  (DPOTRF) Cholesky factorization of real symmetric
        positive-definite matrix

F07FEF  (DPOTRS) Solution of real symmetric positive-definite
        system of linear equations, multiple right-hand sides,
```

matrix already factorized by F07FDF

G01 -- Simple Calculations on Statistical Data

G01AAF	Mean, variance, skewness, kurtosis etc, one variable, from raw data
G01ADF	Mean, variance, skewness, kurtosis etc, one variable, from frequency table
G01AEF	Frequency table from raw data
G01AFF	Two-way contingency table analysis, with (chi) /Fisher's exact test
G01ALF	Computes a five-point summary (median, hinges and extremes)
G01ARF	Constructs a stem and leaf plot
G01EAF	Computes probabilities for the standard Normal distribution
G01EBF	Computes probabilities for Student's t-distribution
G01ECF	Computes probabilities for (chi)^2 distribution
G01EDF	Computes probabilities for F-distribution
G01EEF	Computes upper and lower tail probabilities and probability density function for the beta distribution
G01EFF	Computes probabilities for the gamma distribution
G01FAF	Computes deviates for the standard Normal distribution
G01FBF	Computes deviates for Student's t-distribution
G01FCF	Computes deviates for the (chi)^2 distribution
G01FDF	Computes deviates for the F-distribution
G01FEF	Computes deviates for the beta distribution
G01FFF	Computes deviates for the gamma distribution
G01HAF	Computes probabilities for the bivariate Normal

```
        distribution

G02 -- Correlation and Regression Analysis

G02BNF  Kendall/Spearman non-parametric rank correlation
        coefficients, no missing values, overwriting input data

G02BQF  Kendall/Spearman non-parametric rank correlation
        coefficients, no missing values, preserving input data

G02BXF  Computes (optionally weighted) correlation and covariance
        matrices

G02CAF  Simple linear regression with constant term, no missing
        values

G02DAF  Fits a general (multiple) linear regression model

G02DGF  Fits a general linear regression model for new dependent
        variable

G02DNF  Computes estimable function of a general linear
        regression model and its standard error

G02FAF  Calculates standardized residuals and influence
        statistics

G02GBF  Fits a generalized linear model with binomial errors

G02GCF  Fits a generalized linear model with Poisson errors

G03 -- Multivariate Methods

G03AAF  Performs principal component analysis

G03ADF  Performs canonical correlation analysis

G03BAF  Computes orthogonal rotations for loading matrix,
        generalized orthomax criterion

G05 -- Random Number Generators

G05CAF  Pseudo-random double precision numbers, uniform
        distribution over (0,1)

G05CBF  Initialise random number generating routines to give
        repeatable sequence

G05CCF  Initialise random number generating routines to give non-
        repeatable sequence
```

G05CFF	Save state of random number generating routines
G05CGF	Restore state of random number generating routines
G05DDF	Pseudo-random double precision numbers, Normal distribution
G05DFF	Pseudo-random double precision numbers, Cauchy distribution
G05DPF	Pseudo-random double precision numbers, Weibull distribution
G05DYF	Pseudo-random integer from uniform distribution
G05DZF	Pseudo-random logical (boolean) value
G05EAF	Set up reference vector for multivariate Normal distribution
G05ECF	Set up reference vector for generating pseudo-random integers, Poisson distribution
G05EDF	Set up reference vector for generating pseudo-random integers, binomial distribution
G05EHF	Pseudo-random permutation of an integer vector
G05EJF	Pseudo-random sample from an integer vector
G05EXF	Set up reference vector from supplied cumulative distribution function or probability distribution function
G05EYF	Pseudo-random integer from reference vector
G05EZF	Pseudo-random multivariate Normal vector from reference vector
G05FAF	Generates a vector of pseudo-random numbers from a uniform distribution
G05FBF	Generates a vector of pseudo-random numbers from a (negative) exponential distribution
G05FDF	Generates a vector of pseudo-random numbers from a Normal distribution
G05FEF	Generates a vector of pseudo-random numbers from a beta

```
        distribution

G05FFF  Generates a vector of pseudo-random numbers from a gamma
        distribution

G05HDF  Generates a realisation of a multivariate time series
        from a VARMA model

G08 -- Nonparameteric Statistics

G08AAF  Sign test on two paired samples

G08ACF  Median test on two samples of unequal size

G08AEF  Friedman two-way analysis of variance on k matched
        samples

G08AFF  Kruskal-Wallis one-way analysis of variance on k samples
        of unequal size

G08AGF  Performs the Wilcoxon one sample (matched pairs) signed
        rank test

G08AHF  Performs the Mann-Whitney U test on two independent
        samples

G08AJF  Computes the exact probabilities for the Mann-Whitney U
        statistic, no ties in pooled sample

G08AKF  Computes the exact probabilities for the Mann-Whitney U
        statistic, ties in pooled sample

                              2
G08CGF  Performs the (chi)  goodness of fit test, for standard
        continuous distributions

G13 -- Time Series Analysis

G13AAF  Univariate time series, seasonal and non-seasonal
        differencing

G13ABF  Univariate time series, sample autocorrelation function

G13ACF  Univariate time series, partial autocorrelations from
        autocorrelations

G13ADF  Univariate time series, preliminary estimation, seasonal
        ARIMA model

G13AFF  Univariate time series, estimation, seasonal ARIMA model
```

G13AGF	Univariate time series, update state set for forecasting
G13AHF	Univariate time series, forecasting from state set
G13AJF	Univariate time series, state set and forecasts, from fully specified seasonal ARIMA model
G13ASF	Univariate time series, diagnostic checking of residuals, following G13AFF
G13BAF	Multivariate time series, filtering (pre-whitening) by an ARIMA model
G13BCF	Multivariate time series, cross correlations
G13BDF	Multivariate time series, preliminary estimation of transfer function model
G13BEF	Multivariate time series, estimation of multi-input model
G13BJF	Multivariate time series, state set and forecasts from fully specified multi-input model
G13CBF	Univariate time series, smoothed sample spectrum using spectral smoothing by the trapezium frequency (Daniell) window
G13CDF	Multivariate time series, smoothed sample cross spectrum using spectral smoothing by the trapezium frequency (Daniell) window

M01 -- Sorting

M01CAF	Sort a vector, double precision numbers
M01DAF	Rank a vector, double precision numbers
M01DEF	Rank rows of a matrix, double precision numbers
M01DJF	Rank columns of a matrix, double precision numbers
M01EAF	Rearrange a vector according to given ranks, double precision numbers
M01ZAF	Invert a permutation

S -- Approximations of Special Functions

z

```
S01EAF  Complex exponential, e

S13AAF  Exponential integral E (x)
                              1

S13ACF  Cosine integral Ci(x)

S13ADF  Sine integral Si(x)

S14AAF  Gamma function

S14ABF  Log Gamma function

S14BAF  Incomplete gamma functions P(a,x) and Q(a,x)

S15ADF  Complement of error function erfc x

S15AEF  Error function erf x

S17ACF  Bessel function Y (x)
                         0

S17ADF  Bessel function Y (x)
                         1

S17AEF  Bessel function J (x)
                         0

S17AFF  Bessel function J (x)
                         1

S17AGF  Airy function Ai(x)

S17AHF  Airy function Bi(x)

S17AJF  Airy function Ai'(x)

S17AKF  Airy function Bi'(x)

S17DCF  Bessel functions Y      (z), real a>=0, complex z,
                          (nu)+a
        (nu)=0,1,2,...

S17DEF  Bessel functions J      (z), real a>=0, complex z,
                          (nu)+a
        (nu)=0,1,2,...

S17DGF  Airy functions Ai(z) and Ai'(z), complex z

S17DHF  Airy functions Bi(z) and Bi'(z), complex z
```

```
                           (j)
S17DLF  Hankel functions H      (z), j=1,2, real a>=0, complex z,
                           (nu)+a
        (nu)=0,1,2,...

S18ACF  Modified Bessel function K (x)
                                  0

S18ADF  Modified Bessel function K (x)
                                  1

S18AEF  Modified Bessel function I (x)
                                  0

S18AFF  Modified Bessel function I (x)
                                  1

S18DCF  Modified Bessel functions K      (z), real a>=0, complex
                                   (nu)+a
        z, (nu)=0,1,2,...

S18DEF  Modified Bessel functions I      (z), real a>=0, complex
                                   (nu)+a
        z, (nu)=0,1,2,...

S19AAF  Kelvin function ber x

S19ABF  Kelvin function bei x

S19ACF  Kelvin function ker x

S19ADF  Kelvin function kei x

S20ACF  Fresnel integral S(x)

S20ADF  Fresnel integral C(x)

S21BAF  Degenerate symmetrised elliptic integral of 1st kind
        R (x,y)
         C

S21BBF  Symmetrised elliptic integral of 1st kind R (x,y,z)
                                                   F

S21BCF  Symmetrised elliptic integral of 2nd kind R (x,y,z)
                                                   D

S21BDF  Symmetrised elliptic integral of 3rd kind R (x,y,z,r)
                                                   J
```

```
X04 -- Input/Output Utilities

X04AAF  Return or set unit number for error messages

X04ABF  Return or set unit number for advisory messages

X04CAF  Print a real general matrix

X04DAF  Print a complex general matrix

X05 -- Date and Time Utilities

X05AAF  Return date and time as an array of integers

X05ABF  Convert array of integers representing date and time to
        character string

X05ACF  Compare two character strings representing date and time

X05BAF  Return the CPU time

Fundamental Support Routines

The following fundamental support routines are provided and are
documented in compact form in the relevant chapter introductory
material:

F06 -- Linear Algebra Support Routines

F06AAF  (DROTG) Generate real plane rotation

F06EAF  (DDOT) Dot product of two real vectors

F06ECF  (DAXPY) Add scalar times real vector to real vector

F06EDF  (DSCAL) Multiply real vector by scalar

F06EFF  (DCOPY) Copy real vector

F06EGF  (DSWAP) Swap two real vectors

F06EJF  (DNRM2) Compute Euclidean norm of real vector

F06EKF  (DASUM) Sum the absolute values of real vector elements

F06EPF  (DROT) Apply real plane rotation
```

F06GAF	(ZDOTU) Dot product of two complex vectors, unconjugated
F06GBF	(ZDOTC) Dot product of two complex vectors, conjugated
F06GCF	(ZAXPY) Add scalar times complex vector to complex vector
F06GDF	(ZSCAL) Multiply complex vector by complex scalar
F06GFF	(ZCOPY) Copy complex vector
F06GGF	(ZSWAP) Swap two complex vectors
F06JDF	(ZDSCAL) Multiply complex vector by real scalar
F06JJF	(DZNRM2) Compute Euclidean norm of complex vector
F06JKF	(DZASUM) Sum the absolute values of complex vector elements
F06JLF	(IDAMAX) Index, real vector element with largest absolute value
F06JMF	(IZAMAX) Index, complex vector element with largest absolute value
F06PAF	(DGEMV) Matrix-vector product, real rectangular matrix
F06PBF	(DGBMV) Matrix-vector product, real rectangular band matrix
F06PCF	(DSYMV) Matrix-vector product, real symmetric matrix
F06PDF	(DSBMV) Matrix-vector product, real symmetric band matrix
F06PEF	(DSPMV) Matrix-vector product, real symmetric packed matrix
F06PFF	(DTRMV) Matrix-vector product, real triangular matrix
F06PGF	(DTBMV) Matrix-vector product, real triangular band matrix
F06PHF	(DTPMV) Matrix-vector product, real triangular packed matrix
F06PJF	(DTRSV) System of equations, real triangular matrix
F06PKF	(DTBSV) System of equations, real triangular band matrix
F06PLF	(DTPSV) System of equations, real triangular packed

	matrix
F06PMF	(DGER) Rank-1 update, real rectangular matrix
F06PPF	(DSYR) Rank-1 update, real symmetric matrix
F06PQF	(DSPR) Rank-1 update, real symmetric packed matrix
F06PRF	(DSYR2) Rank-2 update, real symmetric matrix
F06PSF	(DSPR2) Rank-2 update, real symmetric packed matrix
F06SAF	(ZGEMV) Matrix-vector product, complex rectangular matrix
F06SBF	(ZGBMV) Matrix-vector product, complex rectangular band matrix
F06SCF	(ZHEMV) Matrix-vector product, complex Hermitian matrix
F06SDF	(ZHBMV) Matrix-vector product, complex Hermitian band matrix
F06SEF	(ZHPMV) Matrix-vector product, complex Hermitian packed matrix
F06SFF	(ZTRMV) Matrix-vector product, complex triangular matrix
F06SGF	(ZTBMV) Matrix-vector product, complex triangular band matrix
F06SHF	(ZTPMV) Matrix-vector product, complex triangular packed matrix
F06SJF	(ZTRSV) System of equations, complex triangular matrix
F06SKF	(ZTBSV) System of equations, complex triangular band matrix
F06SLF	(ZTPSV) System of equations, complex triangular packed matrix
F06SMF	(ZGERU) Rank-1 update, complex rectangular matrix, unconjugated vector
F06SNF	(ZGERC) Rank-1 update, complex rectangular matrix, conjugated vector
F06SPF	(ZHER) Rank-1 update, complex Hermitian matrix
F06SQF	(ZHPR) Rank-1 update, complex Hermitian packed matrix

```
F06SRF  (ZHER2) Rank-2 update, complex Hermitian matrix

F06SSF  (ZHPR2) Rank-2 update, complex Hermitian packed matrix

F06YAF  (DGEMM) Matrix-matrix product, two real rectangular
        matrices

F06YCF  (DSYMM) Matrix-matrix product, one real symmetric matrix,
        one real rectangular matrix

F06YFF  (DTRMM) Matrix-matrix product, one real triangular
        matrix, one real rectangular matrix

F06YJF  (DTRSM) Solves a system of equations with multiple right-
        hand sides, real triangular coefficient matrix

F06YPF  (DSYRK) Rank-k update of a real symmetric matrix

F06YRF  (DSYR2K) Rank-2k update of a real symmetric matrix

F06ZAF  (ZGEMM) Matrix-matrix product, two complex rectangular
        matrices

F06ZCF  (ZHEMM) Matrix-matrix product, one complex Hermitian
        matrix, one complex rectangular matrix

F06ZFF  (ZTRMM) Matrix-matrix product, one complex triangular
        matrix, one complex rectangular matrix

F06ZJF  (ZTRSM) Solves system of equations with multiple right-
        hand sides, complex triangular coefficient matrix

F06ZPF  (ZHERK) Rank-k update of a complex Hermitian matrix

F06ZRF  (ZHER2K) Rank-2k update of a complex Hermitian matrix

F06ZTF  (ZSYMM) Matrix-matrix product, one complex symmetric
        matrix, one complex rectangular matrix

F06ZUF  (ZSYRK) Rank-k update of a complex symmetric matrix

F06ZWF  (ZSYR2K) Rank-2k update of a complex symmetric matrix

X01 -- Mathematical Constants

X01AAF  (pi)

X01ABF  Euler's constant, (gamma)
```

X02 -- Machine Constants

X02AHF	Largest permissible argument for SIN and COS
X02AJF	Machine precision
X02AKF	Smallest positive model number
X02ALF	Largest positive model number
X02AMF	Safe range of floating-point arithmetic
X02ANF	Safe range of complex floating-point arithmetic
X02BBF	Largest representable integer
X02BEF	Maximum number of decimal digits that can be represented
X02BHF	Parameter of floating-point arithmetic model, b
X02BJF	Parameter of floating-point arithmetic model, p
X02BKF	Parameter of floating-point arithmetic model, e_{min}
X02BLF	Parameter of floating-point arithmetic model, e_{max}
X02DJF	Parameter of floating-point arithmetic model, ROUNDS

Routines from the NAG Fortran Library

A number of routines from the NAG Fortran Library are used in the Foundation Library as auxiliaries and are not documented here:

     INTRO(3NAG)       Foundation Library (12/10/92)       INTRO(3NAG)

          Introduction                               Essential Introduction
          Essential Introduction to the NAG Foundation Library

          This document is essential reading for any prospective user of
          the Library.

          This document appears in both the Handbook and the Reference
          Manual for the NAG Foundation Library, but with a different
          Section 3 to describe the different forms of routine
          documentation in the two publications.

1. The Library and its Documentation

1.1. Structure of the Library

The NAG Foundation Library is a comprehensive collection of Fortran 77 routines for the solution of numerical and statistical problems. The word 'routine' is used to denote 'subroutine' or ' function'.

The Library is divided into chapters, each devoted to a branch of numerical analysis or statistics. Each chapter has a three-character name and a title, e.g.

```
     D01 -- Quadrature
```

Exceptionally one chapter (S) has a one-character name. (The chapters and their names are based on the ACM modified SHARE classification index [1].)

All documented routines in the Library have six-character names, beginning with the characters of the chapter name, e.g.

```
     D01AJF
```

Note that the second and third characters are digits, not letters; e.g. 0 is the digit zero, not the letter O. The last letter of each routine name is always 'F'.

1.2. Structure of the Documentation

There are two types of manual for the NAG Foundation Library: a Handbook and a Reference Manual.

The Handbook has the same chapter structure as the Library: each chapter of routines in the Library has a corresponding chapter (of the same name) in the Handbook. The chapters occur in alphanumeric order. General introductory documents and indexes are placed at the beginning of the Handbook.

Each chapter in the Handbook contains a Chapter Introduction, followed by concise summaries of the functionality and parameter specifications of each routine in the chapter. Exceptionally, in some chapters (F06, X01, X02) which contain simple support routines, there are no concise summaries: all the routines are described together in the Chapter Introduction.

The Reference Manual provides complete reference documentation for the NAG Foundation Library. In the Reference Manual, each chapter consists of the following documents:

Chapter Introduction, e.g. Introduction -- D01;

Chapter Contents, e.g. Contents -- D01;

routine documents, one for each documented routine in the chapter.

A routine document has the same name as the routine which it describes. Within each chapter, routine documents occur in alphanumeric order. As in the Handbook, chapters F06, X01 and X02 do not contain separate documentation for individual routines.

The general introductory documents, indexes and chapter introductions are the same in the Reference Manual as in the Handbook. The only exception is that the Essential Introduction contains a different Section 3 in the two publications, to describe the different forms of routine documentation.

1.3. On-line Documentation

Extensive on-line documentation is included as an integral part of the Foundation Library product. This consists of a number of components:

-- general introductory material, including the Essential Introduction

-- a summary list of all documented routines

-- a KWIC Index

-- Chapter Introductions

-- routine documents

-- example programs, data and results.

The material has been derived in a number of forms to cater for different user requirements, e.g. UNIX man pages, plain text, RICH TEXT format etc, and the appropriate version is included on the distribution media. For each implementation of the Foundation Library the specific documentation (Installers' Note, Users' Note etc) gives details of what is provided.

1.4. Implementations of the Library

The NAG Foundation Library is available on many different computer systems. For each distinct system, an implementation of the Library is prepared by NAG, e.g. the IBM RISC System/6000 implementation. The implementation is distributed as a tested compiled library.

An implementation is usually specific to a range of machines; it may also be specific to a particular operating system or compilation system.

Essentially the same facilities are provided in all implementations of the Library, but, because of differences in arithmetic behaviour and in the compilation system, routines cannot be expected to give identical results on different systems, especially for sensitive numerical problems.

The documentation supports all implementations of the Library, with the help of a few simple conventions, and a small amount of implementation-dependent information, which is published in a separate Users' Note for each implementation (see Section 3.4).

1.5. Library Identification

You must know which implementation of the Library you are using or intend to use. To find out which implementation of the Library is available on your machine, you can run a program which calls the NAG Foundation Library routine A00AAF. This routine has no parameters; it simply outputs text to the advisory message unit (see Section 2.4). An example of the output is:

```
*** Start of NAG Foundation Library implementation details ***
Implementation title: IBM RISC System/6000
Precision: FORTRAN double precision
Product Code: FFIB601D
Release: 1
*** End of NAG Foundation Library implementation details ***
```

(The product code can be ignored, except possibly when communicating with NAG; see Section 4.)

1.6. Fortran Language Standards

All routines in the Library conform to ANSI Standard Fortran 90 [8].

Most of the routines in the Library were originally written to conform to the earlier Fortran 66 [6] and Fortran 77 [7] standards, and their calling sequences contain some parameters which are not strictly necessary in Fortran 90.

2. Using the Library

2.1. General Advice

A NAG Foundation Library routine cannot be guaranteed to return meaningful results, irrespective of the data supplied to it. Care and thought must be exercised in:

(a) formulating the problem;

(b) programming the use of library routines;

(c) assessing the significance of the results.

2.2. Programming Advice

The NAG Foundation Library and its documentation are designed on the assumption that users know how to write a calling program in Fortran.

When programming a call to a routine, read the routine document carefully, especially the description of the Parameters. This states clearly which parameters must have values assigned to them on entry to the routine, and which return useful values on exit. See Section 3.3 for further guidance.

If a call to a Library routine results in an unexpected error message from the system (or possibly from within the Library), check the following:

Has the NAG routine been called with the correct number of parameters?

Do the parameters all have the correct type?

Have all array parameters been dimensioned correctly?

Remember that all floating-point parameters must be declared to be double precision, either with an explicit DOUBLE PRECISION declaration (or COMPLEX(KIND(1.0D0)) if they are complex), or by using a suitable IMPLICIT statement.

Avoid the use of NAG-type names for your own program units or COMMON blocks: in general, do not use names which contain a three-character NAG chapter name embedded in them; they may clash with the names of an auxiliary routine or COMMON block used by the NAG Library.

2.3. Error handling and the Parameter IFAIL

NAG Foundation Library routines may detect various kinds of error, failure or warning conditions. Such conditions are handled in a systematic way by the Library. They fall roughly into three classes:

(i) an invalid value of a parameter on entry to a routine;

(ii) a numerical failure during computation (e.g. approximate singularity of a matrix, failure of an iteration to converge);

(iii) a warning that although the computation has been completed, the results cannot be guaranteed to be completely reliable.

All three classes are handled in the same way by the Library, and are all referred to here simply as 'errors'.

The error-handling mechanism uses the parameter IFAIL, which is the last parameter in the calling sequence of most NAG Foundation Library routines. IFAIL serves two purposes:

(i) it allows users to specify what action a Library routine should take if it detects an error;

(ii) it reports the outcome of a call to a Library routine, either success (IFAIL = 0) or failure (IFAIL /= 0, with different values indicating different reasons for the failure, as explained in Section 6 of the routine document) .

For the first purpose IFAIL must be assigned a value before calling the routine; since IFAIL is reset by the routine, it must be passed as a variable, not as an integer constant. Allowed values on entry are:

IFAIL=0: an error message is output, and execution is terminated ('hard failure');

IFAIL=+1: execution continues without any error message;

    IFAIL=-1: an error message is output, and execution
    continues.

The settings IFAIL =+-1 are referred to as 'soft failure'.
The safest choice is to set IFAIL to 0, but this is not always
convenient: some routines return useful results even though a
failure (in some cases merely a warning) is indicated. However,
if IFAIL is set to +- 1 on entry, it is essential for the program
to test its value on exit from the routine, and to take
appropriate action.

The specification of IFAIL in Section 5 of a routine document
suggests a suitable setting of IFAIL for that routine.

2.4. Input/output in the Library

Most NAG Foundation Library routines perform no output to an
external file, except possibly to output an error message. All
error messages are written to a logical error message unit. This
unit number (which is set by default to 6 in most
implementations) can be changed by calling the Library routine
X04AAF.

Some NAG Foundation Library routines may optionally output their
final results, or intermediate results to monitor the course of
computation. All output other than error messages is written to a
logical advisory message unit. This unit number (which is also
set by default to 6 in most implementations) can be changed by
calling the Library routine X04ABF. Although it is logically
distinct from the error message unit, in practice the two unit
numbers may be the same.

All output from the Library is formatted.

The only Library routines which perform input from an external
file are a few 'option-setting' routines in Chapter E04: the unit
number is a parameter to the routine, and all input is formatted.

You must ensure that the relevant Fortran unit numbers are
associated with the desired external files, either by an OPEN
statement in your calling program, or by operating system
commands.

2.5. Auxiliary Routines

In addition to those Library routines which are documented and
are intended to be called by users, the Library also contains
many auxiliary routines.

In general, you need not be concerned with them at all, although

```
you may be made aware of their existence if, for example, you
examine a memory map of an executable program which calls NAG
routines. The only exception is that when calling some NAG
Foundation Library routines, you may be required or allowed to
supply the name of an auxiliary routine from the Library as an
external procedure parameter. The routine documents give the
necessary details. In such cases, you only need to supply the
name of the routine; you never need to know details of its
parameter-list.

NAG auxiliary routines have names which are similar to the name
of the documented routine(s) to which they are related, but with
last letter 'Z', 'Y', and so on, e.g. D01AJZ is an auxiliary
routine called by D01AJF.

3. Using the Reference Manual

3.1. General Guidance

The Reference Manual is designed to serve the following
functions:

    -- to give background information about different areas of
    numerical and statistical computation;

    -- to advise on the choice of the most suitable NAG
    Foundation Library routine or routines to solve a particular
    problem;

    -- to give all the information needed to call a NAG
    Foundation Library routine correctly from a Fortran program,
    and to assess the results.

At the beginning of the Manual are some general introductory
documents. The following may help you to find the chapter, and
possibly the routine, which you need to solve your problem:

    Contents     -- a list of routines in the Library, by
    Summary      chapter;

    KWIC Index   -- a keyword index to chapters and routines.

Having found a likely chapter or routine, you should read the
corresponding Chapter Introduction, which gives background
information about that area of numerical computation, and
recommendations on the choice of a routine, including indexes,
tables or decision trees.

When you have chosen a routine, you must consult the routine
document. Each routine document is essentially self-contained (it
```

may contain references to related documents). It includes a description of the method, detailed specifications of each parameter, explanations of each error exit, and remarks on accuracy.

Example programs which illustrate the use of each routine are distributed with the Library in machine-readable form.

3.2. Structure of Routine Documents

All routine documents have the same structure, consisting of nine numbered sections:

1. Purpose

2. Specification

3. Description

4. References

5. Parameters (see Section 3.3 below)

6. Error Indicators

7. Accuracy

8. Further Comments

9. Example (see Section 3.5 below)

In a few documents, Section 5 also includes a description of printed output which may optionally be produced by the routine.

3.3. Specifications of Parameters

Section 5 of each routine document contains the specification of the parameters, in the order of their appearance in the parameter list.

3.3.1. Classification of Parameters

Parameters are classified as follows:

Input : you must assign values to these parameters on or before entry to the routine, and these values are unchanged on exit from the routine.

Output : you need not assign values to these parameters on or before entry to the routine; the routine may assign values to them.

Input/Output : you must assign values to these parameters on or before entry to the routine, and the routine may then change these values.

Workspace: array parameters which are used as workspace by the routine. You must supply arrays of the correct type and dimension, but you need not be concerned with their contents.

External Procedure: a subroutine or function which must be supplied (e.g. to evaluate an integrand or to print intermediate output). Usually it must be supplied as part of your calling program, in which case its specification includes full details of its parameter-list and specifications of its parameters (all enclosed in a box). Its parameters are classified in the same way as those of the Library routine, but because you must write the procedure rather than call it, the significance of the classification is different:

> Input : values may be supplied on entry, which your procedure must not change.
>
> Output : you may or must assign values to these parameters before exit from your procedure.
>
> Input/Output : values may be supplied on entry, and you may or must assign values to them before exit from your procedure.

Occasionally, as mentioned in Section 2.5, the procedure can be supplied from the NAG Library, and then you only need to know its name.

User Workspace: array parameters which are passed by the Library routine to an external procedure parameter. They are not used by the routine, but you may use them to pass information between your calling program and the external procedure.

3.3.2. Constraints and Suggested Values

The word 'Constraint:' or 'Constraints:' in the specification of an Input parameter introduces a statement of the range of valid values for that parameter, e.g.

> Constraint: N > 0.

If the routine is called with an invalid value for the parameter (e.g. N = 0), the routine will usually take an error exit, returning a non-zero value of IFAIL (see Section 2.3).

In newer documents constraints on parameters of type CHARACTER only list uppercase alphabetic characters, e.g.

```
    Constraint: STRING = 'A' or 'B'.
```

In practice all routines with CHARACTER parameters will permit the use of lower case characters.

The phrase 'Suggested Value:' introduces a suggestion for a reasonable initial setting for an Input parameter (e.g. accuracy or maximum number of iterations) in case you are unsure what value to use; you should be prepared to use a different setting if the suggested value turns out to be unsuitable for your problem.

3.3.3. Array Parameters

Most array parameters have dimensions which depend on the size of the problem. In Fortran terminology they have 'adjustable dimensions': the dimensions occurring in their declarations are integer variables which are also parameters of the Library routine.

For example, a Library routine might have the specification:

```
     SUBROUTINE <name> (M, N, A, B, LDB)
     INTEGER       M, N, A(N), B(LDB,N), LDB
```

For a one-dimensional array parameter, such as A in this example, the specification would begin:

```
 3:  A(N) -- DOUBLE PRECISION array                          Input
```

You must ensure that the dimension of the array, as declared in your calling (sub)program, is at least as large as the value you supply for N. It may be larger; but the routine uses only the first N elements.

For a two-dimensional array parameter, such as B in the example, the specification might be:

```
 4:  B(LDB,N) -- DOUBLE PRECISION array               Input/Output
     On entry: the m by n matrix B.
```

and the parameter LDB might be described as follows:

```
 5:  LDB -- INTEGER                                          Input
     On entry: the first dimension of the array B as declared in
     the (sub)program from which <name> is called. Constraint:
     LDB >= M.

You must supply the first dimension of the array B, as declared
in your calling (sub)program, through the parameter LDB, even
though the number of rows actually used by the routine is
determined by the parameter M. You must ensure that the first
dimension of the array is at least as large as the value you
supply for M. The extra parameter LDB is needed because Fortran
does not allow information about the dimensions of array
parameters to be passed automatically to a routine.

You must also ensure that the second dimension of the array, as
declared in your calling (sub)program, is at least as large as
the value you supply for N. It may be larger, but the routine
only uses the first N columns.

A program to call the hypothetical routine used as an example in
this section might include the statements:

     INTEGER AA(100), BB(100,50)
     LDB = 100
     .
     .
     .
     M = 80
     N = 20
     CALL <name>(M,N,AA,BB,LDB)

Fortran requires that the dimensions which occur in array
declarations, must be greater than zero. Many NAG routines are
designed so that they can be called with a parameter like N in
the above example set to 0 (in which case they would usually exit
immediately without doing anything). If so, the declarations in
the Library routine would use the 'assumed size' array dimension,
and would be given as:

     INTEGER        M, N, A(*), B(LDB,*), LDB

However, the original declaration of an array in your calling
program must always have constant dimensions, greater than or
equal to 1.

Consult an expert or a textbook on Fortran, if you have
difficulty in calling NAG routines with array parameters.

3.4. Implementation-dependent Information
```

In order to support all implementations of the Foundation Library, the Manual has adopted a convention of using bold italics to distinguish terms which have different interpretations in different implementations.

For example, machine precision denotes the relative precision to which double precision floating-point numbers are stored in the computer, e.g. in an implementation with approximately 16 decimal digits of precision, machine precision has a value of approximately 10^{-16}.

The precise value of machine precision is given by the function X02AJF. Other functions in Chapter X02 return the values of other implementation-dependent constants, such as the overflow threshold, or the largest representable integer. Refer to the X02

Chapter Introduction for more details.

For each implementation of the Library, a separate Users' Note is provided. This is a short document, revised at each Mark. At most installations it is available in machine-readable form. It gives any necessary additional information which applies specifically to that implementation, in particular:

-- the interpretation of bold italicised terms;

-- the values returned by X02 routines;

-- the default unit numbers for output (see Section 2.4).

3.5. Example Programs and Results

The last section of each routine document describes an example problem which can be solved by simple use of the routine. The example programs themselves, together with data and results, are not printed in the routine document, but are distributed in machine-readable form with the Library. The programs are designed so that they can fairly easily be modified, and so serve as the basis for a simple program to solve a user's own problem.

The results distributed with each implementation were obtained using that implementation of the Library; they may not be identical to the results obtained with other implementations.

3.6. Summary for New Users

If you are unfamiliar with the NAG Foundation Library and are thinking of using a routine from it, please follow these instructions:

(a) read the whole of the Essential Introduction;

(b) consult the Contents Summary or KWIC Index to choose an appropriate chapter or routine;

(c) read the relevant Chapter Introduction;

(d) choose a routine, and read the routine document. If the routine does not after all meet your needs, return to steps (b) or (c);

(e) read the Users' Note for your implementation;

(f) consult local documentation, which should be provided by your local support staff, about access to the NAG Library on your computing system.

You should now be in a position to include a call to the routine in a program, and to attempt to run it. You may of course need to refer back to the relevant documentation in the case of difficulties, for advice on assessment of results, and so on.

As you become familiar with the Library, some of steps (a) to (f) can be omitted, but it is always essential to:

-- be familiar with the Chapter Introduction;

-- read the routine document;

-- be aware of the Users' Note for your implementation.

4. Relationship between the Foundation Library and other NAG Libraries

4.1. NAG Fortran Library

The Foundation Library is a strict subset of the full NAG Fortran Library (Mark 15 or later). Routines in both libraries have identical source code (apart from any modifications necessary for implementation on a specific system) and hence can be called in exactly the same way, though you should consult the relevant implementation-specific documentation for details such as values of machine constants.

By its very nature, the Foundation Library cannot contain the same extensive range of routines as the full Fortran Library. If your application requires a routine which is not in the Foundation Library, then please consult NAG for information on relevant material available in the Fortran Library.

Some routines which occur as user-callable routines in the full Fortran Library are included as auxiliary routines in the Foundation Library but they are not documented in this publication and direct calls to them should only be made if you are already familiar with their use in the Fortran Library. A list of all such auxiliary routines is given at the end of the Foundation Library Contents Summary.

Whereas the full Fortran Library may be provided in either a single precision or a double precision version, the Foundation Library is always provided in double precision.

4.2. NAG Workstation Library

The Foundation Library is a successor product to an earlier, smaller subset of the full NAG Fortran Library which was called the NAG Workstation Library. The Foundation Library has greater functionality than the Workstation Library but is not strictly upwards compatible, i.e., a number of routines in the earlier product have been replaced by new material to reflect recent algorithmic developments.
If you have used the Workstation Library and wish to convert your programs to call routines from the Foundation Library, please consult the document 'Converting from the Workstation Library' in this Manual.

4.3. NAG C Library

NAG has also developed a library of numerical and statistical software for use by C programmers. This now contains over 200 user-callable functions and provides similar (but not identical) coverage to that of the Foundation Library. Please contact NAG for further details if you have a requirement for similar quality library code in C.

5. Contact between Users and NAG

If you are using the NAG Foundation Library in a multi-user environment and require further advice please consult your local support staff who will be receiving regular information from NAG. This covers such matters as:

-- obtaining a copy of the Users' Note for your implementation;

-- obtaining information about local access to the Library;

-- seeking advice about using the Library;

-- reporting suspected errors in routines or documents;

-- making suggestions for new routines or features;

-- purchasing NAG documentation.

If you are unable to make contact with a local source of support or are in a single-user environment then please contact NAG directly at any one of the addresses given at the beginning of this publication.

6. General Information about NAG

NAG produces and distributes numerical, symbolic, statistical and graphical software for the solution of problems in a wide range of applications in such areas as science, engineering, financial analysis and research.

For users who write programs and build packages NAG produces sub-program libraries in a range of computer languages (Ada, C, Fortran, Pascal, Turbo Pascal). NAG also provides a number of Fortran programming support products in the NAGWare range -- Fortran 77 programming tools, Fortran 90 compilers for a number of machine platforms (including PC-DOS) and VecPar 77 for restructuring and tuning programs for execution on vector or parallel computers.

For users who do not wish to program in the traditional sense but want the same reliability and qualities offered by our libraries, NAG provides several powerful mathematical and statistical packages for interactive use. A major addition to this range of packages is Axiom -- the powerful symbolic solver which includes a Hypertext system and graphical capabilities.

For further details of any of these products, please contact NAG at one of the addresses given at the beginning of this publication.

References [2], [3], [4], and [5] discuss various aspects of the design and development of the NAG Library, and NAG's technical policies and organisation.

     CONVERSION(3NAG)  Foundation Library (12/10/92)  CONVERSION(3NAG)

          Introduction              Converting from the Workstation Library
          Converting from the Workstation Library

          The NAG Foundation Library is a successor product to an earlier,
          smaller subset of the full NAG Fortran Library which was called
          the NAG Workstation Library. The Foundation Library has been
          designed to be upwards compatible, in terms of functionality,
          with the Workstation Library. However some routines that were
          present in the Workstation Library have been replaced by more up-
          to-date routines from the NAG Fortran Library, which provide
          improved algorithms or software design.

          The list below gives the names of those routines which were
          available in the Workstation Library, but are not included in the
          Foundation Library. For each such routine, it also gives the name
          of the routine in the Foundation Library which best covers the
          same functionality.

Notes:

1. E04ZCF checks user-supplied routines for evaluating the first derivatives of the objective function and constraint functions supplied to E04VDF. This functionality is now provided by E04UCF, using the optional parameters Verify Objective Gradients and Verify Constraint Gradients.

2. G02CEF selects variables to be included in a linear regression performed by G02CGF. This functionality is now

```
                provided by the parameter ISX of G02DAF.

          3.    A call to G05DCF can be replaced by a simple transformation
                of the result of a call to G05CAF. The statement
                     X = G05DCF(A,B)
                can be replaced by the statements

                     X = G05CAF(X)
                     X = A + B*LOG(X/(1.0D0-X))

                                                             2
          4.    G05DHF generates random numbers from a (chi)  distribution
                with N degrees of freedom. This can be achieved by calling
                G05FFF with the values DBLE(N)/2.0D0 and 2.0D0 for the
                parameters A and B respectively.

                                   Chapter C02
                              Zeros of Polynomials

          1. Scope of the Chapter

          This chapter is concerned with computing the zeros of a
          polynomial with real or complex coefficients.
```

2. Background to the Problems

Let $f(z)$ be a polynomial of degree n with complex coefficients a_i:

$$f(z)==a_0 z^n +a_1 z^{n-1} +a_2 z^{n-2} +...+a_{n-1} z+a_n , \quad a_0 /=0.$$

A complex number z_1 is called a zero of $f(z)$ (or equivalently a root of the equation $f(z)=0$), if:

$$f(z_1)=0.$$

If z_1 is a zero, then $f(z)$ can be divided by a factor $(z-z_1)$:

$$f(z)=(z-z_1)f_1(z) \qquad (1)$$

where $f_1(z)$ is a polynomial of degree $n-1$. By the Fundamental Theorem of Algebra, a polynomial $f(z)$ always has a zero, and so the process of dividing out factors $(z-z_i)$ can be continued until we have a complete factorization of $f(z)$

$$f(z)==a_0 (z-z_1)(z-z_2)...(z-z_n).$$

Here the complex numbers $z_1,z_2,...,z_n$ are the zeros of $f(z)$; they may not all be distinct, so it is sometimes more convenient to write:

$$f(z)==a_0 (z-z_1)^{m_1} (z-z_2)^{m_2} ...(z-z_k)^{m_k} , \quad k<=n,$$

with distinct zeros $z_1,z_2,...,z_k$ and multiplicities $m_i>=1$. If $m_i=1$, z_i is called a single zero, if $m_i>1$, z_i is called a multiple or repeated zero; a multiple zero is also a zero of the derivative of $f(z)$.

If the coefficients of f(z) are all real, then the zeros of f(z) are either real or else occur as pairs of conjugate complex numbers x+iy and x-iy. A pair of complex conjugate zeros are the zeros of a quadratic factor of f(z), (z^2+rz+s), with real coefficients r and s.

Mathematicians are accustomed to thinking of polynomials as pleasantly simple functions to work with. However the problem of numerically computing the zeros of an arbitrary polynomial is far from simple. A great variety of algorithms have been proposed, of which a number have been widely used in practice; for a fairly comprehensive survey, see Householder [1]. All general algorithms are iterative. Most converge to one zero at a time; the corresponding factor can then be divided out as in equation (1) above - this process is called deflation or, loosely, dividing out the zero - and the algorithm can be applied again to the polynomial $f_1(z)$. A pair of complex conjugate zeros can be divided out together - this corresponds to dividing f(z) by a quadratic factor.

Whatever the theoretical basis of the algorithm, a number of practical problems arise: for a thorough discussion of some of them see Peters and Wilkinson [2] and Wilkinson [3]. The most elementary point is that, even if z_1 is mathematically an exact zero of f(z), because of the fundamental limitations of computer arithmetic the computed value of $f(z_1)$ will not necessarily be exactly 0.0. In practice there is usually a small region of values of z about the exact zero at which the computed value of f(z) becomes swamped by rounding errors. Moreover in many algorithms this inaccuracy in the computed value of f(z) results in a similar inaccuracy in the computed step from one iterate to the next. This limits the precision with which any zero can be computed. Deflation is another potential cause of trouble, since, in the notation of equation (1), the computed coefficients of $f_1(z)$ will not be completely accurate, especially if z_1 is not an exact zero of f(z); so the zeros of the computed $f_1(z)$ will deviate from the zeros of f(z).

A zero is called ill-conditioned if it is sensitive to small changes in the coefficients of the polynomial. An ill-conditioned zero is likewise sensitive to the computational inaccuracies just mentioned. Conversely a zero is called well-conditioned if it is comparatively insensitive to such perturbations. Roughly speaking a zero which is well separated from other zeros is well-conditioned, while zeros which are close together are ill-conditioned, but in talking about 'closeness' the decisive factor is not the absolute distance between neighbouring zeros but their ratio: if the ratio is close to 1 the zeros are ill-conditioned. In particular, multiple zeros are ill-conditioned. A multiple zero is usually split into a cluster of zeros by perturbations in the polynomial or computational inaccuracies.

3. Recommendations on Choice and Use of Routines

3.1. Discussion

Two routines are available: C02AFF for polynomials with complex coefficients and C02AGF for polynomials with real coefficients.

C02AFF and C02AGF both use a variant of Laguerre's Method due to BT Smith to calculate each zero until the degree of the deflated polynomial is less than 3, whereupon the remaining zeros are obtained using the 'standard' closed formulae for a quadratic or linear equation.

The accuracy of the roots will depend on how ill-conditioned they are. Peters and Wilkinson [2] describe techniques for estimating the errors in the zeros after they have been computed.

     C02AFF(3NAG)      Foundation Library (12/10/92)      C02AFF(3NAG)

          C02 -- Zeros of Polynomials                              C02AFF
                  C02AFF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          C02AFF finds all the roots of a complex polynomial equation,
          using a variant of Laguerre's Method.

          2. Specification

                 SUBROUTINE C02AFF (A, N, SCALE, Z, W, IFAIL)
                 INTEGER          N, IFAIL
                 DOUBLE PRECISION A(2,N+1), Z(2,N), W(4*(N+1))
                 LOGICAL          SCALE

          3. Description

          The routine attempts to find all the roots of the nth degree
          complex polynomial equation
```

$$P(z)=a_0 z^n +a_1 z^{n-1} +a_2 z^{n-2} +...+a_{n-1} z+a_n =0.$$

The roots are located using a modified form of Laguerre's Method, originally proposed by Smith [2].

The method of Laguerre [3] can be described by the iterative scheme

$$L(z_k)=z_{k+1} -z_k = \frac{-n*P(z_k)}{P'(z_k)\pm\sqrt{H(z_k)}},$$

where $H(z_k)=(n-1)*[(n-1)*(P'(z_k))^2 -n*P(z_k)P''(z_k)]$, and z_0 is specified.

The sign in the denominator is chosen so that the modulus of the Laguerre step at z_k, viz. $|L(z_k)|$, is as small as possible. The method can be shown to be cubically convergent for isolated roots (real or complex) and linearly convergent for multiple roots. The routine generates a sequence of iterates z_1, z_2, z_3,..., such that $|P(z_{k+1})|<|P(z_k)|$ and ensures that $z_{k+1}+L(z_{k+1})$ 'roughly' lies inside a circular region of radius $|F|$ about z_k known to contain a zero of $P(z)$; that is, $|L(z_{k+1})|<=|F|$, where F denotes the Fejer bound (see Marden [1]) at the point z_k. Following Smith [2], F is taken to be min(B,1.445*n*R), where B is an upper bound for the magnitude of the smallest zero given by

$$B=1.0001*\min(\sqrt{n}*L(z_k),|r_1|,|a_n/a_0|^{1/n}),$$

r_1 is the zero X of smaller magnitude of the quadratic equation

$$2(P''(z_k)/(2*n*(n-1)))X^2 +2(P'(z_k)/n)X+P(z_k)=0$$

k k k

and the Cauchy lower bound R for the smallest zero is computed (using Newton's Method) as the positive root of the polynomial equation

$$|a_0|z^n+|a_1|z^{n-1}+|a_2|z^{n-2}+...+|a_{n-1}|z-|a_n|=0.$$

Starting from the origin, successive iterates are generated according to the rule $z_{k+1}=z_k+L(z_k)$ for k = 1,2,3,... and $L(z_k)$ is 'adjusted' so that $|P(z_{k+1})|<|P(z_k)|$ and $|L(z_{k+1})|<=|F|$. The iterative procedure terminates if $P(z_{k+1})$ is smaller in absolute value than the bound on the rounding error in $P(z_{k+1})$ and the current iterate $z_p=z_{k+1}$ is taken to be a zero of P(z). The deflated polynomial $\tilde{P}(z)=P(z)/(z-z_p)$ of degree n-1 is then formed, and the above procedure is repeated on the deflated polynomial until n<3, whereupon the remaining roots are obtained via the 'standard' closed formulae for a linear (n = 1) or quadratic (n = 2) equation.

To obtain the roots of a quadratic polynomial, C02AHF(*) can be used.

5. Parameters

1: A(2,N+1) -- DOUBLE PRECISION array Input
On entry: if A is declared with bounds (2,0:N), then A(1,i) and A(2,i) must contain the real and imaginary parts of a

```
                                                            i
                                         n-i
     (i.e., the coefficient of z   ), for i=0,1,...,n.
     Constraint: A(1,0) /= 0.0 or A(2,0) /= 0.0.

 2:  N -- INTEGER                                        Input
     On entry: the degree of the polynomial, n. Constraint: N >=
     1.

 3:  SCALE -- LOGICAL                                    Input
     On entry: indicates whether or not the polynomial is to be
     scaled. See Section 8 for advice on when it may be
     preferable to set SCALE = .FALSE. and for a description of
     the scaling strategy. Suggested value: SCALE = .TRUE..

 4:  Z(2,N) -- DOUBLE PRECISION array                   Output
     On exit: the real and imaginary parts of the roots are
     stored in Z(1,i) and Z(2,i) respectively, for i=1,2,...,n.

 5:  W(4*(N+1)) -- DOUBLE PRECISION array            Workspace

 6:  IFAIL -- INTEGER                             Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. For users not
     familiar with this parameter (described in the Essential
     Introduction) the recommended value is 0.

     On exit: IFAIL = 0 unless the routine detects an error (see
     Section 6).

6. Error Indicators and Warnings

Errors detected by the routine:

If on entry IFAIL = 0 or -1, explanatory error messages are
output on the current error message unit (as defined by X04AAF).

IFAIL= 1
     On entry A(1,0) = 0.0 and A(2,0) = 0.0,

     or       N < 1.

IFAIL= 2
     The iterative procedure has failed to converge. This error
     is very unlikely to occur. If it does, please contact NAG
     immediately, as some basic assumption for the arithmetic has
     been violated. See also Section 8.

IFAIL= 3
     Either overflow or underflow prevents the evaluation of P(z)
     near some of its zeros. This error is very unlikely to
```

occur. If it does, please contact NAG immediately. See also Section 8.

7. Accuracy

All roots are evaluated as accurately as possible, but because of the inherent nature of the problem complete accuracy cannot be guaranteed.

8. Further Comments

If SCALE = .TRUE., then a scaling factor for the coefficients is chosen as a power of the base B of the machine so that the largest coefficient in magnitude approaches THRESH = B^{EMAX-P}. Users should note that no scaling is performed if the largest coefficient in magnitude exceeds THRESH, even if SCALE = .TRUE.. (For definition of B, EMAX and P see the Chapter Introduction X02.)

However, with SCALE = .TRUE., overflow may be encountered when the input coefficients $a_0,a_1,a_2,...,a_n$ vary widely in magnitude, particularly on those machines for which $B^{(4*P)}$ overflows. In such cases, SCALE should be set to .FALSE. and the coefficients scaled so that the largest coefficient in magnitude does not exceed $B^{(EMAX-2*P)}$.

Even so, the scaling strategy used in C02AFF is sometimes insufficient to avoid overflow and/or underflow conditions. In such cases, the user is recommended to scale the independent variable (z) so that the disparity between the largest and smallest coefficient in magnitude is reduced. That is, use the routine to locate the zeros of the polynomial d*P(cz) for some suitable values of c and d. For example, if the original polynomial was $P(z)=2^{-100}i+2^{100}z^{20}$, then choosing $c=2^{-10}$ and $d=2^{100}$, for instance, would yield the scaled polynomial $i+z^{20}$, which is well-behaved relative to overflow and underflow and has zeros which are 2^{10} times those of P(z).

If the routine fails with IFAIL = 2 or 3, then the real and imaginary parts of any roots obtained before the failure occurred are stored in Z in the reverse order in which they were found. Let n_R denote the number of roots found before the failure

```
          occurred. Then Z(1,n) and Z(2,n) contain the real and imaginary
          parts of the 1st root found, Z(1,n-1) and Z(2,n-1) contain the
          real and imaginary parts of the 2nd root found, ..., Z(1,n ) and
                                                                    R
          Z(2,n ) contain the real and imaginary parts of the n th root
               R                                               R
          found. After the failure has occurred, the remaining 2*(n-n )
                                                                     R
          elements of Z contain a large negative number (equal to

          -1/(X02AMF().\/2)).

          9. Example

                                                5    4    3    2
          To find the roots of the polynomial a z +a z +a z +a z +a z+a =0,
                                              0    1    2    3    4   5
          where a =(5.0+6.0i), a =(30.0+20.0i), a =-(0.2+6.0i),
                 0              1                2
          a =(50.0+100000.0i), a =-(2.0-40.0i) and a =(10.0+1.0i).
           3                    4                   5

C02AGF -- NAG Foundation Library Routine Document

Note: Before using this routine, please read the Users' Note for your implementation to check implementation-dependent details. The symbol (*) after a NAG routine name denotes a routine that is not included in the Foundation Library.

1. Purpose

C02AGF finds all the roots of a real polynomial equation, using a variant of Laguerre's Method.

2. Specification

```
      SUBROUTINE C02AGF (A, N, SCALE, Z, W, IFAIL)
      INTEGER          N, IFAIL
      DOUBLE PRECISION A(N+1), Z(2,N), W(2*(N+1))
      LOGICAL          SCALE
```

3. Description

The routine attempts to find all the roots of the nth degree real polynomial equation

$$P(z)=a_0 z^n +a_1 z^{n-1} +a_2 z^{n-2} +...+a_{n-1} z+a_n =0.$$

The roots are located using a modified form of Laguerre's Method, originally proposed by Smith [2].

The method of Laguerre [3] can be described by the iterative scheme

$$L(z_k)=z_{k+1} -z_k = \frac{-n*P(z_k)}{P'(z_k)+- \sqrt{H(z_k)}},$$

where $H(z_k)=(n-1)*[(n-1)*(P'(z_k))^2 -n*P(z_k)P''(z_k)]$, and z_0 is specified.

The sign in the denominator is chosen so that the modulus of the Laguerre step at z_k, viz. $|L(z_k)|$, is as small as possible. The method can be shown to be cubically convergent for isolated roots (real or complex) and linearly convergent for multiple roots. The routine generates a sequence of iterates $z_1, z_2, z_3, \ldots$, such that $|P(z_k+1)|<|P(z_k)|$ and ensures that $z_{k+1}+L(z_{k+1})$ 'roughly' lies inside a circular region of radius $|F|$ about z_k known to contain a zero of $P(z)$; that is, $|L(z_{k+1})|<=|F|$, where F denotes the Fejer bound (see Marden [1]) at the point z_k. Following Smith [2], F is taken to be min(B,1.445*n*R), where B is an upper bound for the magnitude of the smallest zero given by

$$B=1.0001*\min(\sqrt{n}*L(z_k),|r_1|,|a_n/a_0|^{1/n}),$$

r_1 is the zero X of smaller magnitude of the quadratic equation

$$2(P''(z_k)/(2*n*(n-1)))X^2+2(P'(z_k)/n)X+P(z_k)=0$$

and the Cauchy lower bound R for the smallest zero is computed (using Newton's Method) as the positive root of the polynomial equation

$$|a_0|z^n+|a_1|z^{n-1}+|a_2|z^{n-2}+\ldots+|a_{n-1}|z-|a_n|=0.$$

Starting from the origin, successive iterates are generated according to the rule $z_{k+1}=z_k+L(z_k)$ for k=1,2,3,... and $L(z_k)$ is iterative procedure terminates if $P(z_{k+1})$ is smaller in absolute value than the bound on the rounding error in $P(z_{k+1})$ and the current iterate $z_p=z_{k-1}$ is taken to be a zero of P(z) (as is its

conjugate $\bar{z}_p$ if z_p is complex). The deflated polynomial

$\tilde{P}(z)=P(z)/(z-z_p)$ of degree n-1 if z_p is real

$(\tilde{P}(z)=P(z)^{p}/((z-z_p)(z-z_p)^{p})$ of degree n-2 if z_p is complex) is then formed, and the above procedure is repeated on the deflated polynomial until n<3, whereupon the remaining roots are obtained via the 'standard' closed formulae for a linear (n = 1) or quadratic (n = 2) equation.

To obtain the roots of a quadratic polynomial, C02AJF(*) can be used.

5. Parameters

1: A(N+1) -- DOUBLE PRECISION array Input
On entry: if A is declared with bounds (0:N), then A(i) must contain a_i (i.e., the coefficient of z^{n-i}), for i=0,1,...,n. Constraint: A(0) /= 0.0.

2: N -- INTEGER Input
On entry: the degree of the polynomial, n. Constraint: N >= 1.

3: SCALE -- LOGICAL Input
On entry: indicates whether or not the polynomial is to be scaled. See Section 8 for advice on when it may be preferable to set SCALE = .FALSE. and for a description of the scaling strategy. Suggested value: SCALE = .TRUE..

4: Z(2,N) -- DOUBLE PRECISION array Output
On exit: the real and imaginary parts of the roots are stored in Z(1,i) and Z(2,i) respectively, for i=1,2,...,n. Complex conjugate pairs of roots are stored in consecutive pairs of elements of Z; that is, Z(1,i+1) = Z(1,i) and Z(2,i+1)=-Z(2,i).

5: W(2*(N+1)) -- DOUBLE PRECISION array   Workspace

6: IFAIL -- INTEGER   Input/Output
   On entry: IFAIL must be set to 0, -1 or 1. For users not familiar with this parameter (described in the Essential Introduction) the recommended value is 0.
   On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

6. Error Indicators and Warnings

Errors detected by the routine:

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

IFAIL= 1
   On entry A(0) = 0.0,

   or   N < 1.

IFAIL= 2
   The iterative procedure has failed to converge. This error is very unlikely to occur. If it does, please contact NAG immediately, as some basic assumption for the arithmetic has been violated. See also Section 8.

IFAIL= 3
   Either overflow or underflow prevents the evaluation of P(z) near some of its zeros. This error is very unlikely to occur. If it does, please contact NAG immediately. See also Section 8.

7. Accuracy

All roots are evaluated as accurately as possible, but because of the inherent nature of the problem complete accuracy cannot be guaranteed.

8. Further Comments

If SCALE = .TRUE., then a scaling factor for the coefficients is chosen as a power of the base B of the machine so that the largest coefficient in magnitude approaches THRESH = B^{EMAX-P}. Users should note that no scaling is performed if the largest coefficient in magnitude exceeds THRESH, even if SCALE = .TRUE.. (For definition of B, EMAX and P see the Chapter Introduction X02.)

However, with SCALE = .TRUE., overflow may be encountered when the input coefficients $a_0,a_1,a_2,...,a_n$ vary widely in magnitude, particularly on those machines for which $B^{(4*P)}$ overflows. In such cases, SCALE should be set to .FALSE. and the coefficients scaled so that the largest coefficient in magnitude does not exceed $B^{(EMAX-2*P)}$.

Even so, the scaling strategy used in C02AGF is sometimes insufficient to avoid overflow and/or underflow conditions. In such cases, the user is recommended to scale the independent variable (z) so that the disparity between the largest and smallest coefficient in magnitude is reduced. That is, use the routine to locate the zeros of the polynomial d*P(cz) for some suitable values of c and d. For example, if the original polynomial was $P(z)=2^{-100}+2^{100}z^{20}$, then choosing $c=2^{-10}$ and $d=2^{100}$, for instance, would yield the scaled polynomial $1+z^{20}$, which is well-behaved relative to overflow and underflow and has zeros which are 2^{10} times those of P(z).

If the routine fails with IFAIL = 2 or 3, then the real and imaginary parts of any roots obtained before the failure occurred are stored in Z in the reverse order in which they were found. Let n_R denote the number of roots found before the failure occurred. Then Z(1,n) and Z(2,n) contain the real and imaginary parts of the 1st root found, Z(1,n-1) and Z(2,n-1) contain the real and imaginary parts of the 2nd root found, ..., $Z(1,n_R)$ and $Z(2,n_R)$ contain the real and imaginary parts of the n_Rth root found. After the failure has occurred, the remaining $2*(n-n_R)$ elements of Z contain a large negative number (equal to

-1/(X02AMF().\/2)).

9. Example

To find the roots of the 5th degree polynomial
$z^5+2z^4+3z^3+4z^2+5z+6=0$.

16.2.4 Roots of One or More Transcendental Equations

— nagc.ht —

```
\begin{page}{manpageXXc05}{NAG Documentation: c05}
\beginscroll
\begin{verbatim}

     C05(3NAG)         Foundation Library (12/10/92)         C05(3NAG)

          C05 -- Roots of One or More Transcendental Equations
                                                             Introduction -- C05
                                    Chapter C05
                   Roots of One or More Transcendental Equations

          1. Scope of the Chapter

          This chapter is concerned with the calculation of real zeros of
          continuous real functions of one or more variables. (Complex
          equations must be expressed in terms of the equivalent larger
          system of real equations.)

          2. Background to the Problems

          The chapter divides naturally into two parts.

          2.1. A Single Equation

          The first deals with the real zeros of a real function of a
          single variable f(x).

          At present, there is only one routine with a simple calling
          sequence. This routine assumes that the user can determine an
```

initial interval [a,b] within which the desired zero lies, that is $f(a)*f(b)<0$, and outside which all other zeros lie. The routine then systematically subdivides the interval to produce a final interval containing the zero. This final interval has a length bounded by the user's specified error requirements; the end of the interval where the function has smallest magnitude is returned as the zero. This routine is guaranteed to converge to a simple zero of the function. (Here we define a simple zero as a zero corresponding to a sign-change of the function.) The algorithm used is due to Bus and Dekker.

2.2. Systems of Equations

The routines in the second part of this chapter are designed to solve a set of nonlinear equations in n unknowns

$$f_i(x)=0, \quad i=1,2,...,n, \quad x=(x_1,x_2,...,x_n)^T \qquad (1)$$

where T stands for transpose.

It is assumed that the functions are continuous and differentiable so that the matrix of first partial derivatives of the functions, the Jacobian matrix $J_{ij}(x)=ddf_i/ddx_j$ evaluated at the point x, exists, though it may not be possible to calculate it directly.

The functions f_i must be independent, otherwise there will be an infinity of solutions and the methods will fail. However, even when the functions are independent the solutions may not be unique. Since the methods are iterative, an initial guess at the solution has to be supplied, and the solution located will usually be the one closest to this initial guess.

[4] Rabinowitz P (1970) Numerical Methods for Nonlinear Algebraic Equations. Gordon and Breach.

3. Recommendations on Choice and Use of Routines

3.1. Zeros of Functions of One Variable

There is only one routine (C05ADF) for solving a single nonlinear equation. This routine is designed for solving problems where the function f(x) whose zero is to be calculated, can be coded as a user-supplied routine.

C05ADF may only be used when the user can supply an interval [a,b] containing the zero, that is f(a)*f(b)<0.

3.2. Solution of Sets of Nonlinear Equations

The solution of a set of nonlinear equations

$$f_i(x_1,x_2,\ldots,x_n)=0, \quad i=1,2,\ldots,n \qquad (2)$$

can be regarded as a special case of the problem of finding a minimum of a sum of squares

$$s(x)=\sum_{i=1}^{m}[f_i(x_1,x_2,\ldots,x_n)]^2 \quad (m>=n). \qquad (3)$$

So the routines in Chapter E04 of the Library are relevant as well as the special nonlinear equations routines.

There are two routines (C05NBF and C05PBF) for solving a set of nonlinear equations. These routines require the f_i (and possibly their derivatives) to be calculated in user-supplied routines. These should be set up carefully so the Library routines can work as efficiently as possible.

The main decision which has to be made by the user is whether to supply the derivatives $\frac{ddf_i}{ddx_j}$. It is advisable to do so if possible, since the results obtained by algorithms which use derivatives are generally more reliable than those obtained by algorithms which do not use derivatives.

C05PBF requires the user to provide the derivatives, whilst C05NBF does not. C05NBF and C05PBF are easy-to-use routines. A routine, C05ZAF, is provided for use in conjunction with C05PBF to check the user-provided derivatives for consistency with the functions themselves. The user is strongly advised to make use of this routine whenever C05PBF is used.

Firstly, the calculation of the functions and their derivatives should be ordered so that cancellation errors are avoided. This is particularly important in a routine that uses these quantities to build up estimates of higher derivatives.

Secondly, scaling of the variables has a considerable effect on the efficiency of a routine. The problem should be designed so that the elements of x are of similar magnitude. The same comment applies to the functions, all the f_i should be of comparable size.

The accuracy is usually determined by the accuracy parameters of the routines, but the following points may be useful:

(i) Greater accuracy in the solution may be requested by choosing smaller input values for the accuracy parameters. However, if unreasonable accuracy is demanded, rounding errors may become important and cause a failure.

(ii) Some idea of the accuracies of the x_i may be obtained by monitoring the progress of the routine to see how many figures remain unchanged during the last few iterations.

(iii) An approximation to the error in the solution x, given by e where e is the solution to the set of linear equations

$J(x)e=-f(x)$

where $f(x)=(f_1(x),f_2(x),...,f_n(x))^T$ (see Chapter F04).

(iv) If the functions $f_i(x)$ are changed by small amounts $(epsilon)_i$, for i=1,2,...,n, then the corresponding change in the solution x is given approximately by (sigma), where (sigma) is the solution of the set of linear equations

J(x)(sigma)=-(epsilon), (see Chapter F04).

```
                Thus one can estimate the sensitivity of x to any
                uncertainties in the specification of f (x), for
                                                       i
                i=1,2,...,n.

          3.3. Index

C05ADF(3NAG)      Foundation Library (12/10/92)      C05ADF(3NAG)

     C05 -- Roots of One or More Transcendental Equations       C05ADF
             C05ADF -- NAG Foundation Library Routine Document

     Note: Before using this routine, please read the Users' Note for
     your implementation to check implementation-dependent details.
     The symbol (*) after a NAG routine name denotes a routine that is
     not included in the Foundation Library.

     1. Purpose

     C05ADF locates a zero of a continuous function in a given
     interval by a combination of the methods of linear interpolation,
     extrapolation and bisection.

     2. Specification

            SUBROUTINE C05ADF (A, B, EPS, ETA, F, X, IFAIL)
            INTEGER          IFAIL
            DOUBLE PRECISION A, B, EPS, ETA, F, X
            EXTERNAL         F

     3. Description

     The routine attempts to obtain an approximation to a simple zero
     of the function f(x) given an initial interval [a,b] such that
     f(a)*f(b)<=0. The zero is found by calls to C05AZF(*) whose
     specification should be consulted for details of the method used.

     The approximation x to the zero (alpha) is determined so that one
     or both of the following criteria are satisfied:

          (i) |x-(alpha)|<EPS,

          (ii) |f(x)|<ETA.

     4. References

     None.

     5. Parameters

      1:  A -- DOUBLE PRECISION                                  Input
          On entry: the lower bound of the interval, a.
```

```
 2:  B -- DOUBLE PRECISION                                Input
     On entry: the upper bound of the interval, b. Constraint: B
     /= A.

 3:  EPS -- DOUBLE PRECISION                              Input
     On entry: the absolute tolerance to which the zero is
     required (see Section 3). Constraint: EPS > 0.0.

 4:  ETA -- DOUBLE PRECISION                              Input
     On entry: a value such that if |f(x)|<ETA, x is accepted as
     the zero. ETA may be specified as 0.0 (see Section 7).

 5:  F -- DOUBLE PRECISION FUNCTION, supplied by the user.
                                               External Procedure
     F must evaluate the function f whose zero is to be
     determined.

     Its specification is:

            DOUBLE PRECISION FUNCTION F (XX)
            DOUBLE PRECISION XX

      1:  XX -- DOUBLE PRECISION                          Input
          On entry: the point at which the function must be
          evaluated.
     F must be declared as EXTERNAL in the (sub)program from
     which C05ADF is called. Parameters denoted as Input
     must not be changed by this procedure.

 6:  X -- DOUBLE PRECISION                               Output
     On exit: the approximation to the zero.

 7:  IFAIL -- INTEGER                              Input/Output
     Before entry, IFAIL must be assigned a value. For users not
     familiar with this parameter (described in the Essential
     Introduction) the recommended value is 0.

     Unless the routine detects an error (see Section 6), IFAIL
     contains 0 on exit.

6. Error Indicators and Warnings

Errors detected by the routine:

IFAIL= 1
     On entry EPS <= 0.0,

     or       A = B,
     or       F(A)*F(B)>0.0.

IFAIL= 2
     Too much accuracy has been requested in the computation,
     that is, EPS is too small for the computer being used. The
     final value of X is an accurate approximation to the zero.

IFAIL= 3
     A change in sign of f(x) has been determined as occurring
     near the point defined by the final value of X. However,
     there is some evidence that this sign-change corresponds to
     a pole of f(x).

IFAIL= 4
     Indicates that a serious error has occurred in C05AZF(*).
     Check all routine calls. Seek expert help.

7. Accuracy

This depends on the value of EPS and ETA. If full machine
accuracy is required, they may be set very small, resulting in an
error exit with IFAIL = 2, although this may involve more
iterations than a lesser accuracy. The user is recommended to set
ETA = 0.0 and to use EPS to control the accuracy, unless he has
considerable knowledge of the size of f(x) for values of x near
the zero.

8. Further Comments

The time taken by the routine depends primarily on the time spent
evaluating F (see Section 5).

If it is important to determine an interval of length less than
EPS containing the zero, or if the function F is expensive to
evaluate and the number of calls to F is to be restricted, then
use of C05AZF(*) is recommended. Use of C05AZF(*) is also
recommended when the structure of the problem to be solved does
not permit a simple function F to be written: the reverse
communication facilities of C05AZF(*) are more flexible than the
direct communication of F required by C05ADF.

9. Example

                                                -x
The example program below calculates the zero of e  -x within the
interval [0,1] to approximately 5 decimal places.

The example program is not reproduced here. The source code for
all example programs is distributed with the NAG Foundation
Library software and should be available on-line.

          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          C05NBF is an easy-to-use routine to find a solution of a system
          of nonlinear equations by a modification of the Powell hybrid
          method.

          2. Specification

                 SUBROUTINE C05NBF (FCN, N, X, FVEC, XTOL, WA, LWA, IFAIL)
                 INTEGER          N, LWA, IFAIL
                 DOUBLE PRECISION X(N), FVEC(N), XTOL, WA(LWA)
                 EXTERNAL         FCN

          3. Description

          The system of equations is defined as:

                       f (x ,x ,...,x )=0, for i=1,2,...,n.
```

```
              i  1  2      n

C05NBF is based upon the MINPACK routine HYBRD1 (More et al [1]).
It chooses the correction at each step as a convex combination of
the Newton and scaled gradient directions. Under reasonable
conditions this guarantees global convergence for starting points
far from the solution and a fast rate of convergence. The
Jacobian is updated by the rank-1 method of Broyden. At the
starting point the Jacobian is approximated by forward
differences, but these are not used again until the rank-1 method
fails to produce satisfactory progress. For more details see
Powell [2].

      Equations. Numerical Methods for Nonlinear Algebraic
      Equations. (ed P Rabinowitz) Gordon and Breach.

5. Parameters

 1:  FCN -- SUBROUTINE, supplied by the user.
                                          External Procedure
     FCN must return the values of the functions f  at a point x.
                                                  i

     Its specification is:

            SUBROUTINE FCN (N, X, FVEC, IFLAG)
            INTEGER          N, IFLAG
            DOUBLE PRECISION X(N), FVEC(N)

      1:  N -- INTEGER                                     Input
          On entry: the number of equations, n.

      2:  X(N) -- DOUBLE PRECISION array                   Input
          On entry: the components of the point x at which the
          functions must be evaluated.

      3:  FVEC(N) -- DOUBLE PRECISION array               Output
          On exit: the function values f (x) (unless IFLAG is
                                        i
          set to a negative value by FCN).

      4:  IFLAG -- INTEGER                          Input/Output
          On entry: IFLAG > 0. On exit: in general, IFLAG should
```

```
              not be reset by FCN. If, however, the user wishes to
              terminate execution (perhaps because some illegal point
              X has been reached), then IFLAG should be set to a
              negative integer. This value will be returned through
              IFAIL.
         FCN must be declared as EXTERNAL in the (sub)program
         from which C05NBF is called. Parameters denoted as
         Input must not be changed by this procedure.

     2:  N -- INTEGER                                         Input
         On entry: the number of equations, n. Constraint: N > 0.

     3:  X(N) -- DOUBLE PRECISION array                Input/Output
         On entry: an initial guess at the solution vector. On
         exit: the final estimate of the solution vector.

     4:  FVEC(N) -- DOUBLE PRECISION array                   Output
         On exit: the function values at the final point, X.

     5:  XTOL -- DOUBLE PRECISION                             Input
         On entry: the accuracy in X to which the solution is
         required. Suggested value: the square root of the machine
         precision. Constraint: XTOL >= 0.0.

     6:  WA(LWA) -- DOUBLE PRECISION array                Workspace

     7:  LWA -- INTEGER                                       Input
         On entry: the dimension of the array WA. Constraint:
         LWA>=N*(3*N+13)/2.

     8:  IFAIL -- INTEGER                              Input/Output
         On entry: IFAIL must be set to 0, -1 or 1. For users not
         familiar with this parameter (described in the Essential
         Introduction) the recommended value is 0.

         On exit: IFAIL = 0 unless the routine detects an error (see
         Section 6).

     6. Error Indicators and Warnings

     Errors detected by the routine:

     If on entry IFAIL = 0 or -1, explanatory error messages are
     output on the current error message unit (as defined by X04AAF).

     IFAIL< 0
          The user has set IFLAG negative in FCN. The value of IFAIL
          will be the same as the user's setting of IFLAG.

     IFAIL= 1
         On entry N <= 0,

         or       XTOL < 0.0,

         or       LWA<N*(3*N+13)/2.

     IFAIL= 2
         There have been at least 200*(N+1) evaluations of FCN.
         Consider restarting the calculation from the final point
         held in X.

     IFAIL= 3
         No further improvement in the approximate solution X is
         possible; XTOL is too small.

     IFAIL= 4
         The iteration is not making good progress. This failure exit
         may indicate that the system does not have a zero, or that
         the solution is very close to the origin (see Section 7).
         Otherwise, rerunning C05NBF from a different starting point
         may avoid the region of difficulty.

     7. Accuracy

        ^
     If x is the true solution, C05NBF tries to ensure that

                              ^             ^
                         ||x-x||<=XTOL*||x||.

                                                       -k
     If this condition is satisfied with XTOL=10   , then the larger
     components of x have k significant decimal digits. There is a
     danger that the smaller components of x may have large relative
     errors, but the fast rate of convergence of C05NBF usually avoids
     this possibility.

     If XTOL is less than machine precision, and the above test is
     satisfied with the machine precision in place of XTOL, then the
     routine exits with IFAIL = 3.

     Note: this convergence test is based purely on relative error,
     and may not indicate convergence if the solution is very close to
     the origin.

     The test assumes that the functions are reasonably well behaved.
     If this condition is not satisfied, then C05NBF may incorrectly
     indicate convergence. The validity of the answer can be checked,
     for example, by rerunning C05NBF with a tighter tolerance.
```

```
          8. Further Comments

          The time required by C05NBF to solve a given problem depends on n
          , the behaviour of the functions, the accuracy requested and the
          starting point. The number of arithmetic operations executed by
                                                                2
          C05NBF to process each call of FCN is about 11.5*n . Unless FCN
          can be evaluated quickly, the timing of C05NBF will be strongly
          influenced by the time spent in FCN.

          Ideally the problem should be scaled so that at the solution the
          function values are of comparable magnitude.

          9. Example

          To determine the values x ,..., x  which satisfy the tridiagonal
                                   1       9
          equations:

                                   (3-2x )x -2x =-1
                                        1  1   2

                       -x -1+(3-2x )x -2x   =-1,  i=2,3,...,8
                         i        i  i   i+1

                                   -x +(3-2x )x =-1.
                                     8      9  9

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

C05 -- Roots of One or More Transcendental Equations   C05PBF
C05PBF -- NAG Foundation Library Routine Document

Note: Before using this routine, please read the Users' Note for your implementation to check implementation-dependent details. The symbol (*) after a NAG routine name denotes a routine that is not included in the Foundation Library.

1. Purpose

C05PBF is an easy-to-use routine to find a solution of a system of nonlinear equations by a modification of the Powell hybrid method. The user must provide the Jacobian.

2. Specification

```
       SUBROUTINE C05PBF (FCN, N, X, FVEC, FJAC, LDFJAC, XTOL,
      1                   WA, LWA, IFAIL)
       INTEGER          N, LDFJAC, LWA, IFAIL
       DOUBLE PRECISION X(N), FVEC(N), FJAC(LDFJAC,N), XTOL, WA
      1                 (LWA)
       EXTERNAL         FCN
```

3. Description

The system of equations is defined as:

$$f_i(x_1,x_2,...,x_n)=0, \quad i=1,2,...,n.$$

C05PBF is based upon the MINPACK routine HYBRJ1 (More et al [1]). It chooses the correction at each step as a convex combination of the Newton and scaled gradient directions. Under reasonable conditions this guarantees global convergence for starting points far from the solution and a fast rate of convergence. The Jacobian is updated by the rank-1 method of Broyden. At the starting point the Jacobian is calculated, but it is not recalculated until the rank-1 method fails to produce satisfactory progress. For more details see Powell [2].

[2] Powell M J D (1970) A Hybrid Method for Nonlinear Algebraic Equations. Numerical Methods for Nonlinear Algebraic Equations. (ed P Rabinowitz) Gordon and Breach.

5. Parameters

1: FCN -- SUBROUTINE, supplied by the user. External Procedure

Depending upon the value of IFLAG, FCN must either return the values of the functions f_i at a point x or return the Jacobian at x.

Its specification is:

```
      SUBROUTINE FCN (N, X, FVEC, FJAC, LDFJAC, IFLAG)
      INTEGER          N, LDFJAC, IFLAG
      DOUBLE PRECISION X(N), FVEC(N), FJAC(LDFJAC,N)
```

1: N -- INTEGER Input

On entry: the number of equations, n.

2: X(N) -- DOUBLE PRECISION array Input

On entry: the components of the point x at which the functions or the Jacobian must be evaluated.

3: FVEC(N) -- DOUBLE PRECISION array Output

On exit: if IFLAG = 1 on entry, FVEC must contain the function values $f_i(x)$ (unless IFLAG is set to a negative value by FCN). If IFLAG = 2 on entry, FVEC must not be changed.

4: FJAC(LDFJAC,N) -- DOUBLE PRECISION array Output

On exit: if IFLAG = 2 on entry, FJAC(i,j) must contain the value of $\frac{ddf_i}{ddx_j}$ at the point x, for i,j=1,2,...,n (unless IFLAG is set to a negative value by FCN).

If IFLAG = 1 on entry, FJAC must not be changed.

5: LDFJAC -- INTEGER Input

On entry: the first dimension of FJAC.

6: IFLAG -- INTEGER Input/Output

On entry: IFLAG = 1 or 2:

```
                 if IFLAG = 1, FVEC is to be updated;

                 if IFLAG = 2, FJAC is to be updated.
            On exit: in general, IFLAG should not be reset by FCN.
            If, however, the user wishes to terminate execution
            (perhaps because some illegal point x has been reached)
            then IFLAG should be set to a negative integer. This
            value will be returned through IFAIL.
       FCN must be declared as EXTERNAL in the (sub)program
       from which C05PBF is called. Parameters denoted as
       Input must not be changed by this procedure.

  2:   N -- INTEGER                                          Input
       On entry: the number of equations, n. Constraint: N > 0.

  3:   X(N) -- DOUBLE PRECISION array                 Input/Output
       On entry: an initial guess at the solution vector. On
       exit: the final estimate of the solution vector.

  4:   FVEC(N) -- DOUBLE PRECISION array                    Output
       On exit: the function values at the final point, X.

  5:   FJAC(LDFJAC,N) -- DOUBLE PRECISION array             Output
       On exit: the orthogonal matrix Q produced by the QR
       factorization of the final approximate Jacobian.

  6:   LDFJAC -- INTEGER                                     Input
       On entry:
       the first dimension of the array FJAC as declared in the
       (sub)program from which C05PBF is called.
       Constraint: LDFJAC >= N.

  7:   XTOL -- DOUBLE PRECISION                              Input
       On entry: the accuracy in X to which the solution is
       required. Suggested value: the square root of the machine
       precision. Constraint: XTOL >= 0.0.

  8:   WA(LWA) -- DOUBLE PRECISION array                 Workspace

  9:   LWA -- INTEGER                                        Input
       On entry: the dimension of the array WA. Constraint:
       LWA>=N*(N+13)/2.

 10:   IFAIL -- INTEGER                               Input/Output
       On entry: IFAIL must be set to 0, -1 or 1. For users not
       familiar with this parameter (described in the Essential
       Introduction) the recommended value is 0.

       On exit: IFAIL = 0 unless the routine detects an error (see
       Section 6).
```

6. Error Indicators and Warnings

Errors detected by the routine:

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

IFAIL< 0
A negative value of IFAIL indicates an exit from C05PBF because the user has set IFLAG negative in FCN. The value of IFAIL will be the same as the user's setting of IFLAG.

IFAIL= 1
On entry N <= 0,

or LDFJAC < N,

or XTOL < 0.0,

or LWA<N*(N+13)/2.

IFAIL= 2
There have been 100*(N+1) evaluations of the functions. Consider restarting the calculation from the final point held in X.

IFAIL= 3
No further improvement in the approximate solution X is possible; XTOL is too small.

IFAIL= 4
The iteration is not making good progress. This failure exit may indicate that the system does not have a zero or that the solution is very close to the origin (see Section 7). Otherwise, rerunning C05PBF from a different starting point may avoid the region of difficulty.

7. Accuracy

If $\hat{x}$ is the true solution, C05PBF tries to ensure that

$$||x-\hat{x}||_2 <= XTOL*||\hat{x}||_2 .$$

If this condition is satisfied with $XTOL=10^{-k}$, then the larger components of x have k significant decimal digits. There is a danger that the smaller components of x may have large relative errors, but the fast rate of convergence of C05PBF usually avoids the possibility.

If XTOL is less than machine precision and the above test is satisfied with the machine precision in place of XTOL, then the routine exits with IFAIL = 3.

Note: this convergence test is based purely on relative error, and may not indicate convergence if the solution is very close to the origin.

The test assumes that the functions and Jacobian are coded consistently and that the functions are reasonably well behaved. If these conditions are not satisfied then C05PBF may incorrectly indicate convergence. The coding of the Jacobian can be checked using C05ZAF. If the Jacobian is coded correctly, then the validity of the answer can be checked by rerunning C05PBF with a tighter tolerance.

8. Further Comments

The time required by C05PBF to solve a given problem depends on n , the behaviour of the functions, the accuracy requested and the starting point. The number of arithmetic operations executed by C05PBF is about $11.5*n^2$ to process each evaluation of the functions and about $1.3*n^3$ to process each evaluation of the Jacobian. Unless FCN can be evaluated quickly, the timing of C05PBF will be strongly influenced by the time spent in FCN.

Ideally the problem should be scaled so that, at the solution, the function values are of comparable magnitude.

9. Example

To determine the values $x_1,..., x_9$ which satisfy the tridiagonal equations:

$$(3-2x_1)x_1-2x_2=-1$$

$$-x_{i-1}+(3-2x_i)x_i-2x_{i+1}=-1, \quad i=2,3,...,8.$$

$$-x_8+(3-2x_9)x_9=-1.$$

```

16.2.8 Checks the gradients of a set of non-linear functions

— **nagc.ht** —

```
\begin{page}{manpageXXc05zaf}{NAG Documentation: c05zaf}
\beginscroll
\begin{verbatim}

     C05ZAF(3NAG)      Foundation Library (12/10/92)      C05ZAF(3NAG)

          C05 -- Roots of One or More Transcendental Equations       C05ZAF
                  C05ZAF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          C05ZAF checks the user-provided gradients of a set of non-linear
          functions in several variables, for consistency with the
          functions themselves. The routine must be called twice.

          2. Specification

                 SUBROUTINE C05ZAF (M, N, X, FVEC, FJAC, LDFJAC, XP, FVECP,
                1                   MODE, ERR)
                 INTEGER          M, N, LDFJAC, MODE
                 DOUBLE PRECISION X(N), FVEC(M), FJAC(LDFJAC,N), XP(N),
                1                 FVECP(M), ERR(M)

          3. Description
```

```
C05ZAF is based upon the MINPACK routine CHKDER (More et al [1]).
It checks the ith gradient for consistency with the ith function
by computing a forward-difference approximation along a suitably
chosen direction and comparing this approximation with the user-
supplied gradient along the same direction. The principal
characteristic of C05ZAF is its invariance under changes in scale
of the variables or functions.

4. References

      MINPACK-1. Technical Report ANL-80-74. Argonne National
      Laboratory.

5. Parameters

 1:  M -- INTEGER                                          Input
     On entry: the number of functions.

 2:  N -- INTEGER                                          Input
     On entry: the number of variables. For use with C05PBF and
     C05PCF(*), M = N.

 3:  X(N) -- DOUBLE PRECISION array                        Input
     On entry: the components of a point x, at which the
     consistency check is to be made. (See Section 8.)

 4:  FVEC(M) -- DOUBLE PRECISION array                     Input
     On entry: when MODE = 2, FVEC must contain the functions
     evaluated at x.

 5:  FJAC(LDFJAC,N) -- DOUBLE PRECISION array              Input
     On entry: when MODE = 2, FJAC must contain the user-
     supplied gradients. (The ith row of FJAC must contain the
     gradient of the ith function evaluated at the point x.)

 6:  LDFJAC -- INTEGER                                     Input
     On entry:
     the first dimension of the array FJAC as declared in the
     (sub)program from which C05ZAF is called.
     Constraint: LDFJAC >= M.

 7:  XP(N) -- DOUBLE PRECISION array                      Output
     On exit: when MODE = 1, XP is set to a neighbouring point
     to X.

 8:  FVECP(M) -- DOUBLE PRECISION array                    Input
     On entry: when MODE = 2, FVECP must contain the functions
     evaluated at XP.
```

```
         9:  MODE -- INTEGER                                        Input
             On entry: the value 1 on the first call and the value 2 on
             the second call of C05ZAF.

        10:  ERR(M) -- DOUBLE PRECISION array                      Output
             On exit: when MODE = 2, ERR contains measures of
             correctness of the respective gradients. If there is no loss
             of significance (see Section 8), then if ERR(i) is 1.0 the i
             th user-supplied gradient is correct, whilst if ERR(i) is 0.
             0 the ith gradient is incorrect. For values of ERR(i)
             between 0.0 and 1.0 the categorisation is less certain. In
             general, a value of ERR(i)>0.5 indicates that the ith
             gradient is probably correct.

        6. Error Indicators and Warnings

        None.

        7. Accuracy

        See below.

        8. Further Comments

        The time required by C05ZAF increases with M and N.

        C05ZAF does not perform reliably if cancellation or rounding
        errors cause a severe loss of significance in the evaluation of a
        function. Therefore, none of the components of x should be
        unusually small (in particular, zero) or any other value which
        may cause loss of significance. The relative differences between
        corresponding elements of FVECP and FVEC should be at least two
        orders of magnitude greater than the machine precision.

        9. Example

        This example checks the Jacobian matrix for a problem with 15
        functions of 3 variables. The results indicate that the first 7
        gradients are probably incorrect (this is caused by a deliberate
        error in the code to calculate the Jacobian).

        The example program is not reproduced here. The source code for
        all example programs is distributed with the NAG Foundation
        Library software and should be available on-line.

     C06(3NAG)         Foundation Library (12/10/92)         C06(3NAG)

          C06 -- Summation of Series                    Introduction -- C06
                                    Chapter C06
                                Summation of Series

          1. Scope of the Chapter

          This chapter is concerned with calculating the discrete Fourier
          transform of a sequence of real or complex data values, and
          applying it to calculate convolutions and correlations.

          2. Background to the Problems

          2.1. Discrete Fourier Transforms

          2.1.1.  Complex transforms

          Most of the routines in this chapter calculate the finite
          discrete Fourier transform  (DFT) of a sequence of n complex
          numbers z , for j=0,1,...,n-1. The transform is defined by:
                   j

                                  n-1
                          ^    1  --      (   2(pi)jk)
                          z = --- >  z exp(-i -------)                (1)
                           k      --  j   (      n   )
                             \/n j=0

          for k=0,1,...,n-1. Note that equation (1) makes sense for all
                                                 ^
          integral k and with this extension z  is periodic with period n,
                                              k
```

i.e. $z_k = z_{k\pm n}$, and in particular $z_{-k} = z_{n-k}$.

If we write $z_j = x_j + iy_j$ and $\hat{z}_k = a_k + ib_k$, then the definition of $\hat{z}_k$ may be written in terms of sines and cosines as:

$$a_k = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} \left(x_j \cos\left(\frac{2\pi jk}{n}\right) + y_j \sin\left(\frac{2\pi jk}{n}\right) \right)$$

$$b_k = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} \left(y_j \cos\left(\frac{2\pi jk}{n}\right) - x_j \sin\left(\frac{2\pi jk}{n}\right) \right).$$

The original data values z_j may conversely be recovered from the transform $\hat{z}_k$ by an inverse discrete Fourier transform:

$$z_j = \frac{1}{\sqrt{n}} \sum_{k=0}^{n-1} \hat{z}_k \exp\left(+i \frac{2\pi jk}{n}\right) \qquad (2)$$

for j=0,1,...,n-1. If we take the complex conjugate of (2), we find that the sequence $\bar{z}_j$ is the DFT of the sequence $\bar{\hat{z}}_k$. Hence the inverse DFT of the sequence $\hat{z}_k$ may be obtained by: taking the complex conjugates of the $\hat{z}_k$; performing a DFT; and taking the complex conjugates of the result.

Notes: definitions of the discrete Fourier transform vary. Sometimes (2) is used as the definition of the DFT, and (1) as the definition of the inverse. Also the scale-factor of $1/\sqrt{n}$ may be omitted in the definition of the DFT, and replaced by $1/n$ in the definition of the inverse.

2.1.2. Real transforms

If the original sequence is purely real valued, i.e. $z_j=x_j$, then

$$\hat{z}_k=a_k+ib_k=\frac{1}{\sqrt{n}}\sum_{j=0}^{n-1}x_j\exp\left(-i\frac{2(pi)jk}{n}\right)$$

and $\hat{z}_{n-k}$ is the complex conjugate of $\hat{z}_k$. Thus the DFT of a real sequence is a particular type of complex sequence, called a Hermitian sequence, or half-complex or conjugate symmetric with the properties:

$a_{n-k}=a_k$ $b_{n-k}=-b_k$ $b_0=0$ and, if n is even, $b_{n/2}=0$.

Thus a Hermitian sequence of n complex data values can be represented by only n, rather than 2n, independent real values. This can obviously lead to economies in storage, the following scheme being used in this chapter: the real parts a_k for $0<=k<=n/2$ are stored in normal order in the first $n/2+1$ locations of an array X of length n; the corresponding non-zero imaginary parts are stored in reverse order in the remaining locations of X. In other words, if X is declared with bounds (0:n-1) in the user's (sub)program, the real and imaginary parts of $\hat{z}_k$ are stored as follows:

	if n=2s	if n=2s-1
X(0)	a_0	a_0
X(1)	a_1	a_1
X(2)	a_2	a_2

```
.          .          .

.          .          .

.          .          .

X(s-1)     a          a
            s-1        s-1

X(s)       a          b
            s          s-1

X(s+1)     b          b
            s-1        s-2

.          .          .

.          .          .

.          .          .

X(n-2)     b          b
            2          2

X(n-1)     b          b
            1          1
```

$$\text{Hence}\quad x_j = \frac{1}{\sqrt{n}}\left(a_0 + 2\sum_{k=0}^{n/2-1}\left(a_k\cos\left(\frac{2\pi jk}{n}\right) - b_k\sin\left(\frac{2\pi jk}{n}\right)\right) + a_{n/2}\right)$$

where $a_{n/2} = 0$ if n is odd.

2.1.3. Fourier integral transforms

The usual application of the discrete Fourier transform is that of obtaining an approximation of the Fourier integral transform

$$F(s)= \int_{-\infty}^{+\infty} f(t)\exp(-i2\pi st)dt$$

when f(t) is negligible outside some region (0,c). Dividing the region into n equal intervals we have

$$F(s) \tilde{=} \frac{c}{n} \sum_{j=0}^{n-1} f_j \exp(-i2(pi)sjc/n)$$

and so

$$F_k \tilde{=} \frac{c}{n} \sum_{j=0}^{n-1} f_j \exp(-i2(pi)jk/n)$$

for k=0,1,...,n-1, where $f_j=f(jc/n)$ and $F_k=F(k/c)$.

Hence the discrete Fourier transform gives an approximation to the Fourier integral transform in the region s=0 to s=n/c.

If the function f(t) is defined over some more general interval (a,b), then the integral transform can still be approximated by the discrete transform provided a shift is applied to move the point a to the origin.

2.1.4. Convolutions and correlations

One of the most important applications of the discrete Fourier transform is to the computation of the discrete convolution or correlation of two vectors x and y defined (as in Brigham [1]) by:

$$\text{convolution: } z_k = \sum_{j=0}^{n-1} x_j y_{k-j}$$

$$\text{correlation: } w_k = \sum_{j=0}^{n-1} x_j y_{k+j}$$

(Here x and y are assumed to be periodic with period n.)

Under certain circumstances (see Brigham [1]) these can be used as approximations to the convolution or correlation integrals defined by:

$$z(s)=\int_{-\infty}^{+\infty} x(t)y(s-t)dt$$

and

$$w(s)=\int_{-\infty}^{+\infty} x(t)y(s+t)dt, \quad -\infty<s<+\infty.$$

For more general advice on the use of Fourier transforms, see Hamming [2]; more detailed information on the fast Fourier transform algorithm can be found in Van Loan [3] and Brigham [1].

3. Recommendations on Choice and Use of Routines

3.1. One-dimensional Fourier Transforms

The choice of routine is determined first of all by whether the data values constitute a real, Hermitian or general complex sequence. It is wasteful of time and storage to use an inappropriate routine.

Two groups, each of three routines, are provided

	Group 1	Group 2
Real sequences	C06EAF	C06FPF
Hermitian sequences	C06EBF	C06FQF
General complex sequences	C06ECF	C06FRF

Group 1 routines each compute a single transform of length n, without requiring any extra working storage. The Group 1 routines impose some restrictions on the value of n, namely that no prime factor of n may exceed 19 and the total number of prime factors (including repetitions) may not exceed 20 (though the latter restriction only becomes relevant when $n>10^6$).

Group 2 routines are designed to perform several transforms in a single call, all with the same value of n. They do however require more working storage. Even on scalar processors, they may be somewhat faster than repeated calls to Group 1 routines because of reduced overheads and because they pre-compute and store the required values of trigonometric functions. Group 2 routines impose no practical restrictions on the value of n; however the fast Fourier transform algorithm ceases to be 'fast' if applied to values of n which cannot be expressed as a product of small prime factors. All the above routines are particularly efficient if the only prime factors of n are 2, 3 or 5.

If extensive use is to be made of these routines, users who are concerned about efficiency are advised to conduct their own timing tests.

To compute inverse discrete Fourier transforms the above routines should be used in conjunction with the utility routines C06GBF, C06GCF and C06GQF which form the complex conjugate of a Hermitian or general sequence of complex data values.

3.2. Multi-dimensional Fourier Transforms

C06FUF computes a 2-dimensional discrete Fourier transform of a 2-dimensional sequence of complex data values. This is defined by

$$\hat{z}_{k_1 k_2} = \frac{1}{\sqrt{n_1 n_2}} \sum_{j_1=0}^{n_1-1} \sum_{j_2=0}^{n_2-1} z_{j_1 j_2} \exp\left(-i\frac{2(pi)j_1 k_1}{n_1}\right)\exp\left(-i\frac{2(pi)j_2 k_2}{n_2}\right).$$

3.3. Convolution and Correlation

C06EKF computes either the discrete convolution or the discrete correlation of two real vectors.

     C06EAF(3NAG)      Foundation Library (12/10/92)      C06EAF(3NAG)

          C06 -- Summation of Series                                 C06EAF
                  C06EAF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          C06EAF calculates the discrete Fourier transform of a sequence of
          n real data values. (No extra workspace required.)

          2. Specification

                 SUBROUTINE C06EAF (X, N, IFAIL)
                 INTEGER          N, IFAIL
                 DOUBLE PRECISION X(N)

          3. Description

          Given a sequence of n real data values x , for j=0,1,...,n-1,
                                                  j
```

this routine calculates their discrete Fourier transform defined by:

$$\hat{z}_k = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} x_j * \exp\left(-i \frac{2(pi)jk}{n}\right), k=0,1,...,n-1.$$

(Note the scale factor of $\frac{1}{\sqrt{n}}$ in this definition.) The

transformed values $\hat{z}_k$ are complex, but they form a Hermitian sequence (i.e., $\hat{z}_{n-k}$ is the complex conjugate of $\hat{z}_k$), so they are completely determined by n real numbers (see also the Chapter Introduction).

To compute the inverse discrete Fourier transform defined by:

$$\hat{w}_k = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} x_j * \exp\left(+i \frac{2(pi)jk}{n}\right),$$

this routine should be followed by a call of C06GBF to form the complex conjugates of the $\hat{z}_k$.

The routine uses the fast Fourier transform (FFT) algorithm (Brigham [1]). There are some restrictions on the value of n (see Section 5).

4. References

[1] Brigham E O (1973) The Fast Fourier Transform. Prentice-Hall.

5. Parameters

1: X(N) -- DOUBLE PRECISION array Input/Output
On entry: if X is declared with bounds (0:N-1) in the (sub) program from which C06EAF is called, then X(j) must contain

x_j, for j=0,1,...,n-1. On exit: the discrete Fourier transform stored in Hermitian form. If the components of the transform $\hat{z}_k$ are written as a_k+ib_k, and if X is declared with bounds (0:N-1) in the (sub)program from which C06EAF is called, then for 0<=k<=n/2, a_k is contained in X(k), and for 1<=k<=(n-1)/2, b_k is contained in X(n-k). (See also Section 2.1.2 of the Chapter Introduction, and the Example Program.)

2: N -- INTEGER Input
On entry: the number of data values, n. The largest prime factor of N must not exceed 19, and the total number of prime factors of N, counting repetitions, must not exceed 20. Constraint: N > 1.

3: IFAIL -- INTEGER Input/Output
On entry: IFAIL must be set to 0, -1 or 1. For users not familiar with this parameter (described in the Essential Introduction) the recommended value is 0.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

6. Error Indicators and Warnings

Errors detected by the routine:

IFAIL= 1
At least one of the prime factors of N is greater than 19.

IFAIL= 2
N has more than 20 prime factors.

IFAIL= 3
N <= 1.

7. Accuracy

Some indication of accuracy can be obtained by performing a subsequent inverse transform and comparing the results with the original sequence (in exact arithmetic they would be identical).

8. Further Comments

The time taken by the routine is approximately proportional to n*logn, but also depends on the factorization of n. The routine

```
          is somewhat faster than average if the only prime factors of n
          are 2, 3 or 5; and fastest of all if n is a power of 2.

          On the other hand, the routine is particularly slow if n has
          several unpaired prime factors, i.e., if the 'square-free' part
          of n has several factors. For such values of n, routine C06FAF(*)
          (which requires an additional n elements of workspace) is
          considerably faster.

          9. Example

          This program reads in a sequence of real data values, and prints
          their discrete Fourier transform (as computed by C06EAF), after
          expanding it from Hermitian form into a full complex sequence.

          It then performs an inverse transform using C06GBF and C06EBF,
          and prints the sequence so obtained alongside the original data
          values.

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

\end{verbatim}

                  C06EBF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
```

your implementation to check implementation-dependent details.
The symbol (*) after a NAG routine name denotes a routine that is
not included in the Foundation Library.

1. Purpose

C06EBF calculates the discrete Fourier transform of a Hermitian
sequence of n complex data values. (No extra workspace required.)

2. Specification

```
       SUBROUTINE C06EBF (X, N, IFAIL)
       INTEGER          N, IFAIL
       DOUBLE PRECISION X(N)
```

3. Description

Given a Hermitian sequence of n complex data values z_j (i.e., a
sequence such that z_0 is real and z_{n-j} is the complex conjugate
of z_j, for j=1,2,...,n-1) this routine calculates their discrete
Fourier transform defined by:

$$\hat{x}_k = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} z_j \exp\left(-i \frac{2(pi)jk}{n}\right), \quad k=0,1,...,n-1.$$

(Note the scale factor of $\frac{1}{\sqrt{n}}$ in this definition.) The

transformed values $\hat{x}_k$ are purely real (see also the the Chapter
Introduction).

To compute the inverse discrete Fourier transform defined by:

$$\hat{y}_k = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} z_j \exp\left(+i \frac{2(pi)jk}{n}\right),$$

this routine should be preceded by a call of C06GBF to form the complex conjugates of the z_j.

The routine uses the fast Fourier transform (FFT) algorithm (Brigham [1]). There are some restrictions on the value of n (see Section 5).

4. References

[1] Brigham E O (1973) The Fast Fourier Transform. Prentice-Hall.

5. Parameters

1: X(N) -- DOUBLE PRECISION array Input/Output
On entry: the sequence to be transformed stored in Hermitian form. If the data values z_j are written as x_j+iy_j, and if X is declared with bounds (0:N-1) in the subroutine from which C06EBF is called, then for 0<=j<=n/2, x_j is contained in X(j), and for 1<=j<=(n-1)/2, y_j is contained in X(n-j). (See also Section 2.1.2 of the Chapter Introduction and the Example Program.) On exit: the components of the discrete Fourier transform $\hat{x}_k$. If X is declared with bounds (0:N-1) in the (sub)program from which C06EBF is called, then $\hat{x}_k$ is stored in X(k), for k=0,1,...,n-1.

2: N -- INTEGER Input
On entry: the number of data values, n. The largest prime factor of N must not exceed 19, and the total number of prime factors of N, counting repetitions, must not exceed 20. Constraint: N > 1.

3: IFAIL -- INTEGER Input/Output
On entry: IFAIL must be set to 0, -1 or 1. For users not familiar with this parameter (described in the Essential Introduction) the recommended value is 0.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

6. Error Indicators and Warnings

Errors detected by the routine:

```
          IFAIL= 1
               At least one of the prime factors of N is greater than 19.

          IFAIL= 2
               N has more than 20 prime factors.

          IFAIL= 3
               N <= 1.

          7. Accuracy

          Some indication of accuracy can be obtained by performing a
          subsequent inverse transform and comparing the results with the
          original sequence (in exact arithmetic they would be identical).

          8. Further Comments

          The time taken by the routine is approximately proportional to
          n*logn, but also depends on the factorization of n. The routine
          is somewhat faster than average if the only prime factors of n
          are 2, 3 or 5; and fastest of all if n is a power of 2.

          On the other hand, the routine is particularly slow if n has
          several unpaired prime factors, i.e., if the 'square-free' part
          of n has several factors. For such values of n, routine C06FBF(*)
          (which requires an additional n elements of workspace) is
          considerably faster.

          9. Example

          This program reads in a sequence of real data values which is
          assumed to be a Hermitian sequence of complex data values stored
          in Hermitian form. The input sequence is expanded into a full
          complex sequence and printed alongside the original sequence. The
          discrete Fourier transform (as computed by C06EBF) is printed
          out.

          The program then performs an inverse transform using C06EAF and
          C06GBF, and prints the sequence so obtained alongside the
          original data values.

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

16.2.12 Discrete Fourier transform of n complex data values

— nagc.ht —

```
\begin{page}{manpageXXc06ecf}{NAG Documentation: c06ecf}
\beginscroll
\begin{verbatim}

     C06ECF(3NAG)      Foundation Library (12/10/92)      C06ECF(3NAG)

          C06 -- Summation of Series                                 C06ECF
                  C06ECF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          C06ECF calculates the discrete Fourier transform of a sequence of
          n complex data values. (No extra workspace required.)

          2. Specification

                 SUBROUTINE C06ECF (X, Y, N, IFAIL)
                 INTEGER          N, IFAIL
                 DOUBLE PRECISION X(N), Y(N)

          3. Description

          Given a sequence of n complex data values z , for j=0,1,...,n-1,
                                                     j
          this routine calculates their discrete Fourier transform defined
          by:

                           n-1
                    ^    1  --       (   2(pi)jk)
                    z = --- >  z *exp(-i -------), k=0,1,...,n-1.
                     k      --  j    (      n   )
                        \/n j=0
```

(Note the scale factor of $\frac{1}{\sqrt{n}}$ in this definition.)

To compute the inverse discrete Fourier transform defined by:

$$\hat{w}_k = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} z_j * \exp\left(+i \frac{2(pi)jk}{n}\right),$$

this routine should be preceded and followed by calls of C06GCF to form the complex conjugates of the z_j and the $\hat{z}_k$.

The routine uses the fast Fourier transform (FFT) algorithm (Brigham [1]). There are some restrictions on the value of n (see Section 5).

4. References

[1] Brigham E O (1973) The Fast Fourier Transform. Prentice-Hall.

5. Parameters

1: X(N) -- DOUBLE PRECISION array Input/Output
On entry: if X is declared with bounds (0:N-1) in the (sub) program from which C06ECF is called, then X(j) must contain x_j, the real part of z_j, for j=0,1,...,n-1. On exit: the real parts a_k of the components of the discrete Fourier transform. If X is declared with bounds (0:N-1) in the (sub) program from which C06ECF is called, then a_k is contained in X(k), for k=0,1,...,n-1.

2: Y(N) -- DOUBLE PRECISION array Input/Output
On entry: if Y is declared with bounds (0:N-1) in the (sub) program from which C06ECF is called, then Y(j) must contain y_j, the imaginary part of z_j, for j=0,1,...,n-1. On exit: the imaginary parts b_k of the components of the discrete Fourier transform. If Y is declared with bounds (0:N-1) in

```
     the (sub)program from which C06ECF is called, then b  is
                                                         k
     contained in Y(k), for k=0,1,...,n-1.

 3:  N -- INTEGER                                       Input
     On entry: the number of data values, n. The largest prime
     factor of N must not exceed 19, and the total number of
     prime factors of N, counting repetitions, must not exceed
     20. Constraint: N > 1.

 4:  IFAIL -- INTEGER                            Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. For users not
     familiar with this parameter (described in the Essential
     Introduction) the recommended value is 0.

     On exit: IFAIL = 0 unless the routine detects an error (see
     Section 6).

6. Error Indicators and Warnings

Errors detected by the routine:

IFAIL= 1
     At least one of the prime factors of N is greater than 19.

IFAIL= 2
     N has more than 20 prime factors.

IFAIL= 3
     N <= 1.

7. Accuracy

Some indication of accuracy can be obtained by performing a
subsequent inverse transform and comparing the results with the
original sequence (in exact arithmetic they would be identical).

8. Further Comments

The time taken by the routine is approximately proportional to
n*logn, but also depends on the factorization of n. The routine
is somewhat faster than average if the only prime factors of n
are 2, 3 or 5; and fastest of all if n is a power of 2.

On the other hand, the routine is particularly slow if n has
several unpaired prime factors, i.e., if the 'square-free' part
of n has several factors. For such values of n, routine C06FCF(*)
(which requires an additional n real elements of workspace) is
considerably faster.
```

```
          9. Example

          This program reads in a sequence of complex data values and
          prints their discrete Fourier transform.

          It then performs an inverse transform using C06GCF and C06ECF,
          and prints the sequence so obtained alongside the original data
          values.

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

16.2.13 Circular convolution or correlation of two real vectors

— nagc.ht —

```
\begin{page}{manpageXXc06ekf}{NAG Documentation: c06ekf}
\beginscroll
\begin{verbatim}

     C06EKF(3NAG)      Foundation Library (12/10/92)      C06EKF(3NAG)

          C06 -- Summation of Series                                C06EKF
                  C06EKF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          C06EKF calculates the circular convolution or correlation of two
          real vectors of period n. No extra workspace is required.

          2. Specification
```

```
      SUBROUTINE C06EKF (JOB, X, Y, N, IFAIL)
      INTEGER          JOB, N, IFAIL
      DOUBLE PRECISION X(N), Y(N)
```

3. Description

This routine computes:

if JOB =1, the discrete convolution of x and y, defined by:

$$z_k = \sum_{j=0}^{n-1} x_j y_{k-j} = \sum_{j=0}^{n-1} x_{k-j} y_j ;$$

if JOB =2, the discrete correlation of x and y defined by:

$$w_k = \sum_{j=0}^{n-1} x_j y_{k+j} .$$

Here x and y are real vectors, assumed to be periodic, with period n, i.e., $x_j = x_{j+-n} = x_{j+-2n} = \ldots$; z and w are then also periodic with period n.

Note: this usage of the terms 'convolution' and 'correlation' is taken from Brigham [1]. The term 'convolution' is sometimes used to denote both these computations.

If $\hat{x}$, $\hat{y}$, $\hat{z}$ and $\hat{w}$ are the discrete Fourier transforms of these sequences,

$$\text{i.e., } \hat{x}_k = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} x_j * \exp\left(-i \frac{2(pi)jk}{n}\right), \text{ etc,}$$

then $\hat{z}_k = \sqrt{n}.\hat{x}_k \hat{y}_k$

```
        ^       ^ ^
and    w =\/n.x y
        k       k k
```

(the bar denoting complex conjugate).

This routine calls the same auxiliary routines as C06EAF and C06EBF to compute discrete Fourier transforms, and there are some restrictions on the value of n.

4. References

[1] Brigham E O (1973) The Fast Fourier Transform. Prentice-Hall.

5. Parameters

```
 1:  JOB -- INTEGER                                         Input
     On entry: the computation to be performed:
                         n-1
                         --
          if JOB = 1, z = >  x y    (convolution);
                      k  --  j k-j
                         j=0

                         n-1
                         --
          if JOB = 2, w = >  x y    (correlation).
                      k  --  j k+j
                         j=0
     Constraint: JOB = 1 or 2.

 2:  X(N) -- DOUBLE PRECISION array                  Input/Output
     On entry: the elements of one period of the vector x. If X
     is declared with bounds (0:N-1) in the (sub)program from
     which C06EKF is called, then X(j) must contain x , for
                                                      j
     j=0,1,...,n-1. On exit: the corresponding elements of the
     discrete convolution or correlation.

 3:  Y(N) -- DOUBLE PRECISION array                  Input/Output
     On entry: the elements of one period of the vector y. If Y
     is declared with bounds (0:N-1) in the (sub)program from
     which C06EKF is called, then Y(j) must contain y , for
                                                      j
     j=0,1,...,n-1. On exit: the discrete Fourier transform of
     the convolution or correlation returned in the array X; the
     transform is stored in Hermitian form, exactly as described
     in the document  C06EAF.
 4:  N -- INTEGER                                          Input
     On entry: the number of values, n, in one period of the
     vectors X and Y. The largest prime factor of N must not
     exceed 19, and the total number of prime factors of N,
     counting repetitions, must not exceed 20. Constraint: N > 1.

 5:  IFAIL -- INTEGER                               Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. For users not
     familiar with this parameter (described in the Essential
     Introduction) the recommended value is 0.

     On exit: IFAIL = 0 unless the routine detects an error (see
     Section 6).
```

6. Error Indicators and Warnings

Errors detected by the routine:

```
IFAIL= 1
     At least one of the prime factors of N is greater than 19.

IFAIL= 2
     N has more than 20 prime factors.

IFAIL= 3
     N <= 1.

IFAIL= 4
     JOB /= 1 or 2.
```

7. Accuracy

The results should be accurate to within a small multiple of the machine precision.

8. Further Comments

The time taken by the routine is approximately proportional to n*logn, but also depends on the factorization of n. The routine is faster than average if the only prime factors are 2, 3 or 5; and fastest of all if n is a power of 2.

The routine is particularly slow if n has several unpaired prime factors, i.e., if the 'square free' part of n has several factors. For such values of n, routine C06FKF(*) is considerably faster (but requires an additional workspace of n elements).

9. Example

This program reads in the elements of one period of two real

```
          vectors x and y and prints their discrete convolution and
          correlation (as computed by C06EKF). In realistic computations
          the number of data values would be much larger.

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

          C06 -- Summation of Series                                C06FPF
                  C06FPF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          C06FPF computes the discrete Fourier transforms of m sequences,
          each containing n real data values. This routine is designed to
          be particularly efficient on vector processors.

          2. Specification

                 SUBROUTINE C06FPF (M, N, X, INIT, TRIG, WORK, IFAIL)
                 INTEGER          M, N, IFAIL
                 DOUBLE PRECISION X(M*N), TRIG(2*N), WORK(M*N)
```

```
      CHARACTER*1      INIT
```

3. Description

Given m sequences of n real data values x_j^p, for j=0,1,...,n-1; p=1,2,...,m, this routine simultaneously calculates the Fourier transforms of all the sequences defined by:

$$\hat{z}_k^p = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} x_j^p \exp\left(-i \frac{2(pi)jk}{n}\right), \; k=0,1,...,n-1; \; p=1,2,...,m.$$

(Note the scale factor $\frac{1}{\sqrt{n}}$ in this definition.)

The transformed values $\hat{z}_k^p$ are complex, but for each value of p the $\hat{z}_k^p$ form a Hermitian sequence (i.e.,$\hat{z}_{n-k}^p$ is the complex conjugate of $\hat{z}_k^p$), so they are completely determined by mn real numbers (see also the Chapter Introduction).

The discrete Fourier transform is sometimes defined using a positive sign in the exponential term:

$$\hat{z}_k^p = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} x_j^p \exp\left(+i \frac{2(pi)jk}{n}\right).$$

To compute this form, this routine should be followed by a call to C06GQF to form the complex conjugates of the $\hat{z}_k^p$.

The routine uses a variant of the fast Fourier transform (FFT) algorithm (Brigham [1]) known as the Stockham self-sorting algorithm, which is described in Temperton [2]. Special coding is provided for the factors 2, 3, 4, 5 and 6. This routine is designed to be particularly efficient on vector processors, and it becomes especially fast as M, the number of transforms to be computed in parallel, increases.

4. References

[1] Brigham E O (1973) The Fast Fourier Transform. Prentice-Hall.

[2] Temperton C (1983) Fast Mixed-Radix Real Fourier Transforms. J. Comput. Phys. 52 340--350.

5. Parameters

1: M -- INTEGER Input
On entry: the number of sequences to be transformed, m.
Constraint: M >= 1.

2: N -- INTEGER Input
On entry: the number of real values in each sequence, n.
Constraint: N >= 1.

3: X(M,N) -- DOUBLE PRECISION array Input/Output
On entry: the data must be stored in X as if in a two-dimensional array of dimension (1:M,0:N-1); each of the m sequences is stored in a row of the array. In other words, if the data values of the pth sequence to be transformed are denoted by x_j^p, for j=0,1,...,n-1, then the mn elements of the array X must contain the values

$$x_0^1, x_0^2, \ldots, x_0^m,\ x_1^1, x_1^2, \ldots,\ x_1^m, \ldots, x_{n-1}^1, x_{n-1}^2, \ldots, x_{n-1}^m .$$

On exit: the m discrete Fourier transforms stored as if in a two-dimensional array of dimension (1:M,0:N-1). Each of the m transforms is stored in a row of the array in Hermitian form, overwriting the corresponding original sequence. If the n components of the discrete Fourier transform $\hat{z}_k^p$ are written as $a_k^p + ib_k^p$, then for 0<=k<=n/2, a_k^p is contained in X(p,k), and for 1<=k<=(n-1)/2, b_k^p is contained in X(p,n-k). (See also Section 2.1.2 of the Chapter Introduction.)

4: INIT -- CHARACTER*1 Input

```
          On entry: if the trigonometric coefficients required to
          compute the transforms are to be calculated by the routine
          and stored in the array TRIG, then INIT must be set equal to
          'I' (Initial call).

          If INIT contains 'S' (Subsequent call), then the routine
          assumes that trigonometric coefficients for the specified
          value of n are supplied in the array TRIG, having been
          calculated in a previous call to one of C06FPF, C06FQF or
          C06FRF.

          If INIT contains 'R' (Restart then the routine assumes that
          trigonometric coefficients for the particular value of n are
          supplied in the array TRIG, but does not check that C06FPF,
          C06FQF or C06FRF have previously been called. This option
          allows the TRIG array to be stored in an external file, read
          in and re-used without the need for a call with INIT equal
          to 'I'. The routine carries out a simple test to check that
          the current value of n is consistent with the array TRIG.
          Constraint: INIT = 'I', 'S' or 'R'.

      5:  TRIG(2*N) -- DOUBLE PRECISION array             Input/Output
          On entry: if INIT = 'S' or 'R', TRIG must contain the
          required coefficients calculated in a previous call of the
          routine. Otherwise TRIG need not be set. On exit: TRIG
          contains the required coefficients (computed by the routine
          if INIT = 'I').

      6:  WORK(M*N) -- DOUBLE PRECISION array                Workspace

      7:  IFAIL -- INTEGER                                Input/Output
          On entry: IFAIL must be set to 0, -1 or 1. For users not
          familiar with this parameter (described in the Essential
          Introduction) the recommended value is 0.

          On exit: IFAIL = 0 unless the routine detects an error (see
          Section 6).

     6. Error Indicators and Warnings

     Errors detected by the routine:

     If on entry IFAIL = 0 or -1, explanatory error messages are
     output on the current error message unit (as defined by X04AAF).

     IFAIL= 1
          On entry M < 1.

     IFAIL= 2
```

```
          N < 1.

     IFAIL= 3
          INIT is not one of 'I', 'S' or 'R'.

     IFAIL= 4
          INIT = 'S', but none of C06FPF, C06FQF or C06FRF has
          previously been called.

     IFAIL= 5
          INIT = 'S' or 'R', but the array TRIG and the current value
          of N are inconsistent.

     7. Accuracy

     Some indication of accuracy can be obtained by performing a
     subsequent inverse transform and comparing the results with the
     original sequence (in exact arithmetic they would be identical).

     8. Further Comments

     The time taken by the routine is approximately proportional to
     nm*logn, but also depends on the factors of n. The routine is
     fastest if the only prime factors of n are 2, 3 and 5, and is
     particularly slow if n is a large prime, or has large prime
     factors.

     9. Example

     This program reads in sequences of real data values and prints
     their discrete Fourier transforms (as computed by C06FPF). The
     Fourier transforms are expanded into full complex form using
     C06GSF and printed. Inverse transforms are then calculated by
     calling C06GQF followed by C06FQF showing that the original
     sequences are restored.

     The example program is not reproduced here. The source code for
     all example programs is distributed with the NAG Foundation
     Library software and should be available on-line.

    C06FQF(3NAG)      Foundation Library (12/10/92)      C06FQF(3NAG)

          C06 -- Summation of Series                                C06FQF
                 C06FQF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          C06FQF computes the discrete Fourier transforms of m Hermitian
          sequences, each containing n complex data values. This routine is
          designed to be particularly efficient on vector processors.

          2. Specification

                 SUBROUTINE C06FQF (M, N, X, INIT, TRIG, WORK, IFAIL)
                 INTEGER          M, N, IFAIL
                 DOUBLE PRECISION X(M*N), TRIG(2*N), WORK(M*N)
                 CHARACTER*1      INIT

          3. Description

                                                                 p
          Given m Hermitian sequences of n complex data values z , for
                                                                 j
          j=0,1,...,n-1; p=1,2,...,m, this routine simultaneously
          calculates the Fourier transforms of all the sequences defined
          by:

                     n-1
             ^p   1  --  p    (   2(pi)jk)
             x = --- >  z *exp(-i -------), k=0,1,...,n-1; p=1,2,...,m.
              k      --  j    (      n   )
                 \/n j=0
```

(Note the scale factor $\frac{1}{\sqrt{n}}$ in this definition.)

The transformed values are purely real (see also the Chapter Introduction).

The discrete Fourier transform is sometimes defined using a positive sign in the exponential term

$$\hat{x}_k^p = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} z_j^p * \exp\left(+i \frac{2(\pi)jk}{n}\right).$$

To compute this form, this routine should be preceded by a call to C06GQF to form the complex conjugates of the $\hat{z}_j^p$.

The routine uses a variant of the fast Fourier transform (FFT) algorithm (Brigham [1]) known as the Stockham self-sorting algorithm, which is described in Temperton [2]. Special code is included for the factors 2, 3, 4, 5 and 6. This routine is designed to be particularly efficient on vector processors, and it becomes especially fast as m, the number of transforms to be computed in parallel, increases.

[2] Temperton C (1983) Fast Mixed-Radix Real Fourier Transforms. J. Comput. Phys. 52 340--350.

5. Parameters

1: M -- INTEGER Input
On entry: the number of sequences to be transformed, m.
Constraint: M >= 1.

2: N -- INTEGER Input
On entry: the number of data values in each sequence, n.
Constraint: N >= 1.

3: X(M,N) -- DOUBLE PRECISION array Input/Output
On entry: the data must be stored in X as if in a two-dimensional array of dimension (1:M,0:N-1); each of the m sequences is stored in a row of the array in Hermitian form. If the n data values z_j^p are written as $x_j^p+iy_j^p$, then for $0<=j<=n/2$, x_j^p is contained in X(p,j), and for $1<=j<=(n-1)/2$, y_j^p is contained in X(p,n-j). (See also Section 2.1.2 of the Chapter Introduction.) On exit: the components of the m discrete Fourier transforms, stored as if in a two-dimensional array of dimension (1:M,0:N-1). Each of the m transforms is stored as a row of the array, overwriting the corresponding original sequence. If the n components of the discrete Fourier transform are denoted by $\hat{x}_k^p$, for k=0,1,...,n-1, then the mn elements of the array X contain the values

$$\hat{x}_0^1,\hat{x}_0^2,...,\hat{x}_0^m, \hat{x}_1^1,\hat{x}_1^2,..., \hat{x}_1^m,...,\hat{x}_{n-1}^1,\hat{x}_{n-1}^2,...,\hat{x}_{n-1}^m.$$

4: INIT -- CHARACTER*1 Input
On entry: if the trigonometric coefficients required to compute the transforms are to be calculated by the routine and stored in the array TRIG, then INIT must be set equal to 'I' (Initial call).

If INIT contains 'S' (Subsequent call), then the routine assumes that trigonometric coefficients for the specified value of n are supplied in the array TRIG, having been calculated in a previous call to one of C06FPF, C06FQF or C06FRF.

If INIT contains 'R' (Restart), then the routine assumes that trigonometric coefficients for the particular value of N are supplied in the array TRIG, but does not check that C06FPF, C06FQF or C06FRF have previously been called. This option allows the TRIG array to be stored in an external file, read in and re-used without the need for a call with INIT equal to 'I'. The routine carries out a simple test to check that the current value of n is compatible with the array TRIG. Constraint: INIT = 'I', 'S' or 'R'.

5: TRIG(2*N) -- DOUBLE PRECISION array Input/Output

```
     On entry: if INIT = 'S' or 'R', TRIG must contain the
     required coefficients calculated in a previous call of the
     routine. Otherwise TRIG need not be set. On exit: TRIG
     contains the required coefficients (computed by the routine
     if INIT = 'I').

 6:  WORK(M*N) -- DOUBLE PRECISION array                Workspace

 7:  IFAIL -- INTEGER                                Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. For users not
     familiar with this parameter (described in the Essential
     Introduction) the recommended value is 0.

     On exit: IFAIL = 0 unless the routine detects an error (see
     Section 6).

6. Error Indicators and Warnings

Errors detected by the routine:

If on entry IFAIL = 0 or -1, explanatory error messages are
output on the current error message unit (as defined by X04AAF).

IFAIL= 1
     On entry M < 1.

IFAIL= 2
     On entry N < 1.

IFAIL= 3
     On entry INIT is not one of 'I', 'S' or 'R'.

IFAIL= 4
     On entry INIT = 'S', but none of C06FPF, C06FQF and C06FRF
     has previously been called.

IFAIL= 5
     On entry INIT = 'S' or 'R', but the array TRIG and the
     current value of n are inconsistent.

7. Accuracy

Some indication of accuracy can be obtained by performing a
subsequent inverse transform and comparing the results with the
original sequence (in exact arithmetic they would be identical).

8. Further Comments

The time taken by the routine is approximately proportional to
nm*logn, but also depends on the factors of n. The routine is
```

```
          fastest if the only prime factors of n are 2, 3 and 5, and is
          particularly slow if n is a large prime, or has large prime
          factors.

          9. Example

          This program reads in sequences of real data values which are
          assumed to be Hermitian sequences of complex data stored in
          Hermitian form. The sequences are expanded into full complex form
          using C06GSF and printed. The discrete Fourier transforms are
          then computed (using C06FQF) and printed out. Inverse transforms
          are then calculated by calling C06FPF followed by C06GQF showing
          that the original sequences are restored.

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

```
      SUBROUTINE C06FRF (M, N, X, Y, INIT, TRIG, WORK, IFAIL)
      INTEGER          M, N, IFAIL
      DOUBLE PRECISION X(M*N), Y(M*N), TRIG(2*N), WORK(2*M*N)
      CHARACTER*1      INIT
```

3. Description

Given m sequences of n complex data values z_j^p, for $j=0,1,...,n-1$; $p=1,2,...,m$, this routine simultaneously calculates the Fourier transforms of all the sequences defined by:

$$\hat{z}_k^p = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} z_j^p * \exp\left(-i \frac{2(pi)jk}{n}\right), \quad k=0,1,...,n-1; \; p=1,2,...,m.$$

(Note the scale factor $\frac{1}{\sqrt{n}}$ in this definition.)

The discrete Fourier transform is sometimes defined using a positive sign in the exponential term

$$\hat{z}_k^p = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} z_j^p * \exp\left(+i \frac{2(pi)jk}{n}\right).$$

To compute this form, this routine should be preceded and followed by a call of C06GCF to form the complex conjugates of the z_j^p and the $\hat{z}_k^p$.

The routine uses a variant of the fast Fourier transform (FFT) algorithm (Brigham [1]) known as the Stockham self-sorting algorithm, which is described in Temperton [2]. Special code is provided for the factors 2, 3, 4, 5 and 6. This routine is designed to be particularly efficient on vector processors, and it becomes especially fast as m, the number of transforms to be computed in parallel, increases.

5. Parameters

1: M -- INTEGER Input
On entry: the number of sequences to be transformed, m.
Constraint: M >= 1.

2: N -- INTEGER Input
On entry: the number of complex values in each sequence, n.
Constraint: N >= 1.

3: X(M,N) -- DOUBLE PRECISION array Input/Output

4: Y(M,N) -- DOUBLE PRECISION array Input/Output
On entry: the real and imaginary parts of the complex data must be stored in X and Y respectively as if in a two-dimensional array of dimension (1:M,0:N-1); each of the m sequences is stored in a row of each array. In other words, if the real parts of the pth sequence to be transformed are denoted by x_j^p, for j=0,1,...,n-1, then the mn elements of the array X must contain the values

$$x_0^1,x_0^2,...,x_0^m, x_1^1,x_1^2,...,x_1^m,..., x_{n-1}^1,x_{n-1}^2,...,x_{n-1}^m .$$

On exit: X and Y are overwritten by the real and imaginary parts of the complex transforms.

5: INIT -- CHARACTER*1 Input
On entry: if the trigonometric coefficients required to compute the transforms are to be calculated by the routine and stored in the array TRIG, then INIT must be set equal to 'I' (Initial call).

If INIT contains 'S' (Subsequent call), then the routine assumes that trigonometric coefficients for the specified value of n are supplied in the array TRIG, having been

```
         calculated in a previous call to one of C06FPF, C06FQF or
         C06FRF.

         If INIT contains 'R' (Restart) then the routine assumes that
         trigonometric coefficients for the particular value of n are
         supplied in the array TRIG, but does not check that C06FPF,
         C06FQF or C06FRF have previously been called. This option
         allows the TRIG array to be stored in an external file, read
         in and re-used without the need for a call with INIT equal
         to 'I'. The routine carries out a simple test to check that
         the current value of n is compatible with the array TRIG.
         Constraint: INIT = 'I', 'S' or 'R'.

     6:  TRIG(2*N) -- DOUBLE PRECISION array             Input/Output
         On entry: if INIT = 'S' or 'R', TRIG must contain the
         required coefficients calculated in a previous call of the
         routine. Otherwise TRIG need not be set. On exit: TRIG
         contains the required coefficients (computed by the routine
         if INIT = 'I').

     7:  WORK(2*M*N) -- DOUBLE PRECISION array              Workspace

     8:  IFAIL -- INTEGER                                Input/Output
         On entry: IFAIL must be set to 0, -1 or 1. For users not
         familiar with this parameter (described in the Essential
         Introduction) the recommended value is 0.

         On exit: IFAIL = 0 unless the routine detects an error (see
         Section 6).

    6. Error Indicators and Warnings

    Errors detected by the routine:

    If on entry IFAIL = 0 or -1, explanatory error messages are
    output on the current error message unit (as defined by X04AAF).

    IFAIL= 1
         On entry M < 1.

    IFAIL= 2
         On entry N < 1.

    IFAIL= 3
         On entry INIT is not one of 'I', 'S' or 'R'.

    IFAIL= 4
         On entry INIT = 'S', but none of C06FPF, C06FQF and C06FRF
         has previously been called.
     IFAIL= 5
          On entry INIT = 'S' or 'R', but the array TRIG and the
          current value of n are inconsistent.

     7. Accuracy

     Some indication of accuracy can be obtained by performing a
     subsequent inverse transform and comparing the results with the
     original sequence (in exact arithmetic they would be identical).

     8. Further Comments

     The time taken by the routine is approximately proportional to
     nm*logn, but also depends on the factors of n. The routine is
     fastest if the only prime factors of n are 2, 3 and 5, and is
     particularly slow if n is a large prime, or has large prime
     factors.

     9. Example

     This program reads in sequences of complex data values and prints
     their discrete Fourier transforms (as computed by C06FRF).
     Inverse transforms are then calculated using C06GCF and C06FRF
     and printed out, showing that the original sequences are
     restored.

     The example program is not reproduced here. The source code for
     all example programs is distributed with the NAG Foundation
     Library software and should be available on-line.

```

```
C06 -- Summation of Series                                  C06FUF
        C06FUF -- NAG Foundation Library Routine Document

Note: Before using this routine, please read the Users' Note for
your implementation to check implementation-dependent details.
The symbol (*) after a NAG routine name denotes a routine that is
not included in the Foundation Library.

1. Purpose

C06FUF computes the two-dimensional discrete Fourier transform of
a bivariate sequence of complex data values. This routine is
designed to be particularly efficient on vector processors.

2. Specification

       SUBROUTINE C06FUF (M, N, X, Y, INIT, TRIGM, TRIGN, WORK,
      1                   IFAIL)
       INTEGER          M, N, IFAIL
       DOUBLE PRECISION X(M*N), Y(M*N), TRIGM(2*M), TRIGN(2*N),
      1                 WORK(2*M*N)
       CHARACTER*1      INIT

3. Description

This routine computes the two-dimensional discrete Fourier
transform of a bivariate sequence of complex data values z    ,
                                                          j j
                                                           1 2
where j =0,1,...,m-1, j =0,1,...,n-1.
       1              2

The discrete Fourier transform is here defined by:

                 m-1  n-1          (       ( j k   j k ))
      ^       1   --   --          (       (  1 1   2 2))
      z    = ---- >    >   z    *exp(-2(pi)i( ----+ ----)),
                  --   --   j j    (       (  m     n  ))
       k k   \/mn j =0 j =0  1 2
        1 2        1    2

where k =0,1,...,m-1, k =0,1,...,n-1.
       1              2

                            1
(Note the scale factor of  ---- in this definition.)
```

```
                      \/mn
```

To compute the inverse discrete Fourier transform, defined with exp(+2(pi)i(...)) in the above formula instead of exp(-2(pi)i(...)), this routine should be preceded and followed by calls of C06GCF to form the complex conjugates of the data values and the transform.

This routine calls C06FRF to perform multiple one-dimensional discrete Fourier transforms by the fast Fourier transform (FFT) algorithm in Brigham [1]. It is designed to be particularly efficient on vector processors.

4. References

[1] Brigham E O (1973) The Fast Fourier Transform. Prentice-Hall.

[2] Temperton C (1983) Self-sorting Mixed-radix Fast Fourier Transforms. J. Comput. Phys. 52 1--23.

5. Parameters

```
 1:  M -- INTEGER                                        Input
     On entry: the number of rows, m, of the arrays X and Y.
     Constraint: M >= 1.

 2:  N -- INTEGER                                        Input
     On entry: the number of columns, n, of the arrays X and Y.
     Constraint: N >= 1.

 3:  X(M,N) -- DOUBLE PRECISION array             Input/Output

 4:  Y(M,N) -- DOUBLE PRECISION array             Input/Output
     On entry: the real and imaginary parts of the complex data
     values must be stored in arrays X and Y respectively. If X
     and Y are regarded as two-dimensional arrays of dimension
     (0:M-1,0:N-1), then X(j ,j ) and Y(j ,j ) must contain the
                             1  2        1  2
     real and imaginary parts of z    . On exit: the real and
                                  j j
                                   1 2
     imaginary parts respectively of the corresponding elements
     of the computed transform.

 5:  INIT -- CHARACTER*1                                 Input
     On entry: if the trigonometric coefficients required to
     compute the transforms are to be calculated by the routine
     and stored in the arrays TRIGM and TRIGN, then INIT must be
```

```
         set equal to 'I', (Initial call).

         If INIT contains 'S', (Subsequent call), then the routine
         assumes that trigonometric coefficients for the specified
         values of m and n are supplied in the arrays TRIGM and
         TRIGN, having been calculated in a previous call to the
         routine.

         If INIT contains 'R', (Restart), then the routine assumes
         that trigonometric coefficients for the particular values of
         m and n are supplied in the arrays TRIGM and TRIGN, but does
         not check that the routine has previously been called. This
         option allows the TRIGM and TRIGN arrays to be stored in an
         external file, read in and re-used without the need for a
         call with INIT equal to 'I'. The routine carries out a
         simple test to check that the current values of m and n are
         compatible with the arrays TRIGM and TRIGN. Constraint: INIT
         = 'I', 'S' or 'R'.

     6:  TRIGM(2*M) -- DOUBLE PRECISION array            Input/Output

     7:  TRIGN(2*N) -- DOUBLE PRECISION array            Input/Output
         On entry: if INIT = 'S' or 'R',TRIGM and TRIGN must contain
         the required coefficients calculated in a previous call of
         the routine. Otherwise TRIGM and TRIGN need not be set.

         If m=n the same array may be supplied for TRIGM and TRIGN.
         On exit: TRIGM and TRIGN contain the required coefficients
         (computed by the routine if INIT = 'I').

     8:  WORK(2*M*N) -- DOUBLE PRECISION array              Workspace

     9:  IFAIL -- INTEGER                                Input/Output
         On entry: IFAIL must be set to 0, -1 or 1. For users not
         familiar with this parameter (described in the Essential
         Introduction) the recommended value is 0.

         On exit: IFAIL = 0 unless the routine detects an error (see
         Section 6).

    6. Error Indicators and Warnings

    Errors detected by the routine:

    If on entry IFAIL = 0 or -1, explanatory error messages are
    output on the current error message unit (as defined by X04AAF).

    IFAIL= 1
         On entry M < 1.
```

```
          IFAIL= 2
               On entry N < 1.

          IFAIL= 3
               On entry INIT is not one of 'I', 'S' or 'R'.

          IFAIL= 4
               On entry INIT = 'S', but C06FUF has not previously been
               called.

          IFAIL= 5
               On entry INIT = 'S' or 'R', but at least one of the arrays
               TRIGM and TRIGN is inconsistent with the current value of M
               or N.

          7. Accuracy

          Some indication of accuracy can be obtained by performing a
          subsequent inverse transform and comparing the results with the
          original sequence (in exact arithmetic they would be identical).

          8. Further Comments

          The time taken by the routine is approximately proportional to
          mn*log(mn), but also depends on the factorization of the
          individual dimensions m and n. The routine is somewhat faster
          than average if their only prime factors are 2, 3 or 5; and
          fastest of all if they are powers of 2.

          9. Example

          This program reads in a bivariate sequence of complex data values
          and prints the two-dimensional Fourier transform. It then
          performs an inverse transform and prints the sequence so
          obtained, which may be compared to the original data values.

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

16.2.18 Summation of Series

— **nagc.ht** —

```
\begin{page}{manpageXXc06gbf}{NAG Documentation: c06gbf}
\beginscroll
\begin{verbatim}

     C06GBF(3NAG)      Foundation Library (12/10/92)      C06GBF(3NAG)

          C06 -- Summation of Series                                 C06GBF
                  C06GBF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          C06GBF forms the complex conjugate of a Hermitian sequence of n
          data values.

          2. Specification

                 SUBROUTINE C06GBF (X, N, IFAIL)
                 INTEGER          N, IFAIL
                 DOUBLE PRECISION X(N)

          3. Description

          This is a utility routine for use in conjunction with C06EAF,
          C06EBF, C06FAF(*) or C06FBF(*) to calculate inverse discrete
          Fourier transforms (see the Chapter Introduction).

          4. References

          None.

          5. Parameters

           1:  X(N) -- DOUBLE PRECISION array                  Input/Output
               On entry: if the data values z  are written as x +iy  and
                                             j                 j   j
               if X is declared with bounds (0:N-1) in the (sub)program
               from which C06GBF is called, then for 0<=j<=n/2, X(j) must
               contain x (=x   ), while for n/2<j<=n-1, X(j) must contain
                        j   n-j
               -y (=y   ). In other words, X must contain the Hermitian
                 j   n-j
               sequence in Hermitian form. (See also Section 2.1.2 of the
               Chapter Introduction). On exit: the imaginary parts y  are
                                                                    j
               negated. The real parts x  are not referenced.
                                         j

           2:  N -- INTEGER                                           Input
               On entry: the number of data values, n. Constraint: N >= 1.

           3:  IFAIL -- INTEGER                                Input/Output
               On entry: IFAIL must be set to 0, -1 or 1. For users not
               familiar with this parameter (described in the Essential
               Introduction) the recommended value is 0.

               On exit: IFAIL = 0 unless the routine detects an error (see
               Section 6).

          6. Error Indicators and Warnings

          Errors detected by the routine:

          IFAIL= 1
               N < 1.

          7. Accuracy

          Exact.

          8. Further Comments

          The time taken by the routine is negligible.

          9. Example

          This program reads in a sequence of real data values, calls
          C06EAF followed by C06GBF to compute their inverse discrete
          Fourier transform, and prints this after expanding it from
          Hermitian form into a full complex sequence.

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

                  C06GQF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          C06GQF forms the complex conjugates of m Hermitian sequences,
          each containing n data values.

          2. Specification

                 SUBROUTINE C06GQF (M, N, X, IFAIL)
                 INTEGER          M, N, IFAIL
                 DOUBLE PRECISION X(M*N)

          3. Description

          This is a utility routine for use in conjunction with C06FPF and
          C06FQF to calculate inverse discrete Fourier transforms (see the
          Chapter Introduction).

          4. References

          None.

          5. Parameters

           1:  M -- INTEGER                                            Input
               On entry: the number of Hermitian sequences to be
               conjugated, m. Constraint: M >= 1.
```

2: N -- INTEGER Input
On entry: the number of data values in each Hermitian sequence, n. Constraint: N >= 1.

3: X(M,N) -- DOUBLE PRECISION array Input/Output
On entry: the data must be stored in array X as if in a two-dimensional array of dimension (1:M,0:N-1); each of the m sequences is stored in a row of the array in Hermitian form. If the n data values z_j^p are written as $x_j^p+iy_j^p$, then for 0<=j<=n/2, x_j^p is contained in X(p,j), and for 1<=j<=(n-1)/2, y_j^p is contained in X(p,n-j). (See also Section 2.1.2 of the Chapter Introduction.) On exit: the imaginary parts y_j^p are negated. The real parts x_j^p are not referenced.

4: IFAIL -- INTEGER Input/Output
On entry: IFAIL must be set to 0, -1 or 1. For users not familiar with this parameter (described in the Essential Introduction) the recommended value is 0.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

6. Error Indicators and Warnings

Errors detected by the routine:

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

IFAIL= 1
On entry M < 1.

IFAIL= 2
On entry N < 1.

7. Accuracy

Exact.

8. Further Comments

None.

```
          9. Example

          This program reads in sequences of real data values which are
          assumed to be Hermitian sequences of complex data stored in
          Hermitian form. The sequences are expanded into full complex form
          using C06GSF and printed. The sequences are then conjugated
          (using C06GQF) and the conjugated sequences are expanded into
          complex form using C06GSF and printed out.

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

16.3.1 Quadrature

— nagd.ht —

```
\begin{page}{manpageXXd01}{NAG Documentation: d01}
\beginscroll
\begin{verbatim}

     D01(3NAG)        Foundation Library (12/10/92)        D01(3NAG)

          D01 -- Quadrature                            Introduction -- D01
                                     Chapter D01
                                     Quadrature

          1. Scope of the Chapter

          This chapter provides routines for the numerical evaluation of
          definite integrals in one or more dimensions and for evaluating
          weights and abscissae of integration rules.

          2. Background to the Problems

          The routines in this chapter are designed to estimate:

          (a)   the value of a one-dimensional definite integral of the
                form:
                                   b
                                   /
                                   |f(x)dx                        (1)
                                   /
                                   a
                where f(x) is defined by the user, either at a set of
                points (x ,f(x )), for i=1,2,...,n where a=x <x <...<x =b,
                         i    i                          1  2     n
                or in the form of a function; and the limits of integration
                a,b may be finite or infinite.
```

Some methods are specially designed for integrands of the form

$$f(x)=w(x)g(x) \qquad (2)$$

which contain a factor $w(x)$, called the weight-function, of a specific form. These methods take full account of any peculiar behaviour attributable to the $w(x)$ factor.

(b) the value of a multi-dimensional definite integral of the form:

$$\int_{R_n} f(x_1,x_2,\ldots,x_n)dx_n\ldots dx_2\,dx_1 \qquad (3)$$

where $f(x_1,x_2,\ldots,x_n)$ is a function defined by the user and R_n is some region of n-dimensional space.

The simplest form of R_n is the n-rectangle defined by:

$$a_i<=x_i<=b_i\ ,\quad i=1,2,\ldots,n \qquad (4)$$

where a_i and b_i are constants. When a_i and b_i are functions of x_j $(j<i)$, the region can easily be transformed to the rectangular form (see Davis and Rabinowitz [1] page 266). Some of the methods described incorporate the transformation procedure.

2.1. One-dimensional Integrals

To estimate the value of a one-dimensional integral, a quadrature rule uses an approximation in the form of a weighted sum of integrand values, i.e.,

$$\int_a^b f(x)dx\simeq\sum_{i=1}^{N} w_i f(x_i). \qquad (5)$$

The points x_i within the interval [a,b] are known as the abscissae, and the w_i are known as the weights.

More generally, if the integrand has the form (2), the corresponding formula is

$$\int_a^b w(x)g(x)dx \simeq \sum_{i=1}^{N} w_i g(x_i). \qquad (6)$$

If the integrand is known only at a fixed set of points, these points must be used as the abscissae, and the weighted sum is calculated using finite-difference methods. However, if the functional form of the integrand is known, so that its value at any abscissa is easily obtained, then a wide variety of quadrature rules are available, each characterised by its choice of abscissae and the corresponding weights.

The appropriate rule to use will depend on the interval [a,b] - whether finite or otherwise - and on the form of any w(x) factor in the integrand. A suitable value of N depends on the general behaviour of f(x); or of g(x), if there is a w(x) factor present.

Among possible rules, we mention particularly the Gaussian formulae, which employ a distribution of abscissae which is optimal for f(x) or g(x) of polynomial form.

The choice of basic rules constitutes one of the principles on which methods for one-dimensional integrals may be classified. The other major basis of classification is the implementation strategy, of which some types are now presented.

(a) Single rule evaluation procedures

A fixed number of abscissae, N, is used. This number and the particular rule chosen uniquely determine the weights and abscissae. No estimate is made of the accuracy of the result.

(b) Automatic procedures

The number of abscissae, N, within [a,b] is gradually increased until consistency is achieved to within a level of accuracy (absolute or relative) requested by the user. There are essentially two ways of doing this; hybrid forms of these two methods are also possible:

(i) whole interval procedures (non-adaptive)

A series of rules using increasing values of N are successively applied over the whole interval [a,b]. It is clearly more economical if abscissae already used for a lower value of N can be used again as part of a higher-order formula. This principle is known as optimal extension. There is no overlap between the abscissae used in Gaussian formulae of different orders. However, the Kronrod formulae are designed to give an optimal (2N+1)-point formula by adding (N+1) points to an N-point Gauss formula. Further extensions have been developed by Patterson.

(ii) adaptive procedures

The interval [a,b] is repeatedly divided into a number of sub-intervals, and integration rules are applied separately to each sub-interval. Typically, the subdivision process will be carried further in the neighbourhood of a sharp peak in the integrand, than where the curve is smooth. Thus, the distribution of abscissae is adapted to the shape of the integrand.

Subdivision raises the problem of what constitutes an acceptable accuracy in each sub-interval. The usual global acceptability criterion demands that the sum of the absolute values of the error estimates in the sub-intervals should meet the conditions required of the error over the whole interval. Automatic extrapolation over several levels of subdivision may eliminate the effects of some types of singularities.

An ideal general-purpose method would be an automatic method which could be used for a wide variety of integrands, was efficient (i.e., required the use of as few abscissae as possible), and was reliable (i.e., always gave results within the requested accuracy). Complete reliability is unobtainable, and generally higher reliability is obtained at the expense of efficiency, and vice versa. It must therefore be emphasised that the automatic routines in this chapter cannot be assumed to be 100% reliable. In general, however, the reliability is very high.

2.2. Multi-dimensional Integrals

A distinction must be made between cases of moderately low dimensionality (say, up to 4 or 5 dimensions), and those of higher dimensionality. Where the number of dimensions is limited, a one-dimensional method may be applied to each dimension, according to some suitable strategy, and high accuracy may be obtainable (using product rules). However, the number of integrand evaluations rises very rapidly with the number of dimensions, so that the accuracy obtainable with an acceptable amount of computational labour is limited; for example a product of 3-point rules in 20 dimensions would require more than 10^{9}

integrand evaluations. Special techniques such as the Monte Carlo methods can be used to deal with high dimensions.

(a) Products of one-dimensional rules

Using a two-dimensional integral as an example, we have

$$\int_{a_1}^{b_1}\int_{a_2}^{b_2} f(x,y)dydx \simeq \sum_{i=1}^{N} w_i \left[\int_{a_2}^{b_2} f(x_i,y)dy\right] \qquad (7)$$

$$\int_{a_1}^{b_1}\int_{a_2}^{b_2} f(x,y)dydx \simeq \sum_{i=1}^{N}\sum_{j=1}^{N} w_i v_j f(x_i,y_j) \qquad (8)$$

where (w_i,x_i) and (v_i,y_i) are the weights and abscissae of the rules used in the respective dimensions.

A different one-dimensional rule may be used for each dimension, as appropriate to the range and any weight function present, and a different strategy may be used, as appropriate to the integrand behaviour as a function of each independent variable.

For a rule-evaluation strategy in all dimensions, the formula (8) is applied in a straightforward manner. For automatic strategies (i.e., attempting to attain a requested accuracy), there is a problem in deciding what accuracy must be requested in the inner integral(s). Reference to formula (7) shows that the presence of a limited but random error in the y-integration for different values of x_i can produce a 'jagged' function of x, which may be difficult to integrate to the desired accuracy and for this reason products of automatic one-dimensional routines should be used with caution (see also Lyness [3]).

(b) Monte Carlo methods

These are based on estimating the mean value of the integrand sampled at points chosen from an appropriate statistical distribution function. Usually a variance reducing procedure is incorporated to combat the fundamentally slow rate of convergence of the rudimentary form of the technique. These methods can be effective by comparison with alternative methods when the integrand contains singularities or is erratic in some way, but they are of quite limited accuracy.

(c) Number theoretic methods

These are based on the work of Korobov and Conroy and operate by exploiting implicitly the properties of the Fourier expansion of the integrand. Special rules, constructed from so-called optimal coefficients, give a particularly uniform distribution of the points throughout n-dimensional space and from their number theoretic properties minimize the error on a prescribed class of integrals. The method can be combined with the Monte Carlo procedure.

(d) Sag-Szekeres method

By transformation this method seeks to induce properties into the integrand which make it accurately integrable by the trapezoidal rule. The transformation also allows effective control over the number of integrand evaluations.

(e) Automatic adaptive procedures

An automatic adaptive strategy in several dimensions normally involves division of the region into subregions, concentrating the divisions in those parts of the region where the integrand is worst behaved. It is difficult to arrange with any generality for variable limits in the inner integral(s). For this reason, some methods use a region where all the limits are constants; this is called a hyper-rectangle. Integrals over regions defined by variable or infinite limits may be handled by transformation to a hyper-rectangle. Integrals over regions so irregular that such a transformation is not feasible may be handled by surrounding the region by an appropriate hyper-rectangle and defining the integrand to be zero outside the desired region. Such a technique should always be followed by a Monte Carlo method for integration.

The method used locally in each subregion produced by the adaptive subdivision process is usually one of three types: Monte Carlo, number theoretic or deterministic. Deterministic methods are usually the most rapidly convergent but are often expensive to use for high dimensionality and not as robust as the other techniques.

3. Recommendations on Choice and Use of Routines

The following three sub-sections consider in turn routines for: one-dimensional integrals over a finite interval, and over a semi-infinite or an infinite interval; and multi-dimensional integrals. Within each sub-section, routines are classified by the type of method, which ranges from simple rule evaluation to automatic adaptive algorithms. The recommendations apply particularly when the primary objective is simply to compute the value of one or more integrals, and in these cases the automatic adaptive routines are generally the most convenient and reliable, although also the most expensive in computing time.

Note however that in some circumstances it may be counter-productive to use an automatic routine. If the results of the quadrature are to be used in turn as input to a further computation (e.g. an 'outer' quadrature or an optimization problem), then this further computation may be adversely affected by the 'jagged performance profile' of an automatic routine; a simple rule-evaluation routine may provide much better overall performance. For further guidance, the article Lyness [3] is recommended.

3.1. One-dimensional Integrals over a Finite Interval

```
(a)    Integrand defined as a set of points

       If f(x) is defined numerically at four or more points, then
       the Gill-Miller finite difference method (D01GAF) should be
       used. The interval of integration is taken to coincide with
       the range of x-values of the points supplied. It is in the
       nature of this problem that any routine may be unreliable.
       In order to check results independently and so as to
       provide an alternative technique the user may fit the
       integrand by Chebyshev series using E02ADF and then use
       routines E02AJF and E02AKF to evaluate its integral (which
       need not be restricted to the range of the integration
       points, as is the case for D01GAF). A further alternative
       is to fit a cubic spline to the data using E02BAF and then
       to evaluate its integral using E02BDF.

(b)    Integrand defined as a function

       If the functional form of f(x) is known, then one of the
       following approaches should be taken. They are arranged in
       the order from most specific to most general, hence the
       first applicable procedure in the list will be the most
       efficient.  However, if the user does not wish to make any
       assumptions about the integrand, the most reliable routine
       to use will be D01AJF, although this will in general be
       less efficient for simple integrals.
       (i)    Rule-evaluation routines

              If f(x) is known to be sufficiently well-behaved
              (more precisely, can be closely approximated by a
              polynomial of moderate degree), a Gaussian routine
              with a suitable number of abscissae may be used.

              D01BBF may be used if it is required to examine the
              weights and abscissae. In this case, the user should
              write the code for the evaluation of quadrature
              summation (6).

       (ii)   Automatic adaptive routines

              Firstly, several routines are available for
              integrands of the form w(x)g(x) where g(x) is a '
              smooth' function (i.e., has no singularities, sharp
              peaks or violent oscillations in the interval of
              integration) and w(x) is a weight function of one of
              the following forms:

                             (alpha)     (beta)          k          l
              if w(x)=(b-x)       (x-a)      (log(b-x)) (log(x-a))
```

```
          where k,l=0 or 1, (alpha),(beta)>-1: use D01APF;

          if w(x)=1/(x-c): use D01AQF (this integral is called
          the Hilbert transform of g);

          if w(x)=cos((omega)x) or sin((omega)x): use D01ANF
          (this routine can also handle certain types of
          singularities in g(x)).

          Secondly, there are some routines for general f(x).
          If f(x) is known to be free of singularities, though
          it may be oscillatory, D01AKF may be used.

          The most powerful of the finite interval integration
          routine is D01AJF (which can cope with singularities
          of several types). It may be used if none of the more
          specific situations described above applies. D01AJF
          is very reliable, particularly where the integrand
          has singularities other than at an end-point, or has
          discontinuities or cusps, and is therefore
          recommended where the integrand is known to be badly-
          behaved, or where its nature is completely unknown.

          Most of the routines in this chapter require the user
          to supply a function or subroutine to evaluate the
          integrand at a single point.

          If f(x) has singularities of certain types,
          discontinuities or sharp peaks  occurring at known
          points, the integral should be evaluated separately
          over each of the subranges or D01ALF may be used.

3.2. One-dimensional Integrals over a Semi-infinite or Infinite
     Interval

(a)   Integrand defined as a set of points

      If f(x) is defined numerically at four or more points, and
      the portion of the integral lying outside the range of the
      points supplied may be neglected, then the Gill-Miller
      finite difference method, D01GAF, should be used.

(b)   Integrand defined as a function
      (i)   Rule evaluation routines

            If f(x) behaves approximately like a polynomial in x,
            apart from a weight function of the form
             -(beta)x
            e                    (beta)>0 (semi-infinite interval,
                                          lower limit finite);
```

or $e^{-(\text{beta})x}$ (beta)<0 (semi-infinite interval, upper limit finite);

or $e^{-(\text{beta})(x-(\text{alpha}))^2}$ (beta)>0 (infinite interval);

or if f(x) behaves approximately like a polynomial in $(x+B)^{-1}$ (semi-infinite range); then the Gaussian routines may be used.

D01BBF may be used if it is required to examine the weights and abscissae. In this case, the user should write the code for the evaluation of quadrature summation (6).

(ii) Automatic adaptive routines

D01AMF may be used, except for integrands which decay slowly towards an infinite end-point, and oscillate in sign over the entire range. For this class, it may be possible to calculate the integral by integrating between the zeros and invoking some extrapolation process.

D01ASF may be used for integrals involving weight functions of the form cos((omega)x) and sin((omega)x) over a semi-infinite interval (lower limit finite).

The following alternative procedures are mentioned for completeness, though their use will rarely be necessary:

(1) If the integrand decays rapidly towards an infinite end-point, a finite cut-off may be chosen, and the finite range methods applied.

(2) If the only irregularities occur in the finite part (apart from a singularity at the finite limit, with which D01AMF can cope), the range may be divided, with D01AMF used on the infinite part.

(3) A transformation to finite range may be employed, e.g.

$$x=\frac{1-t}{t} \quad \text{or} \quad x=-\log_e t$$

will transform (0,infty) to (1,0) while for infinite ranges we have

$$\int_{-\infty}^{+\infty} f(x)dx = \int_{0}^{\infty} [f(x)+f(-x)]dx.$$

If the integrand behaves badly on (-infty,0) and well on (0,infty) or vice versa it is better to compute it as

$$\int_{-\infty}^{0} f(x)dx + \int_{0}^{\infty} f(x)dx.$$

This saves computing unnecessary function values in the semi-infinite range where the function is well behaved.

3.3. Multi-dimensional Integrals

A number of techniques are available in this area and the choice depends to a large extent on the dimension and the required accuracy. It can be advantageous to use more than one technique as a confirmation of accuracy particularly for high dimensional integrations. Many of the routines incorporate the transformation procedure REGION which allows general product regions to be easily dealt with in terms of conversion to the standard n-cube region.

(a) Products of one-dimensional rules (suitable for up to about 5 dimensions)

If $f(x_1,x_2,...,x_n)$ is known to be a sufficiently well-behaved function of each variable x_i, apart possibly from weight functions of the types provided, a product of Gaussian rules may be used. These are provided by D01BBF. In this case, the user should write the code for the evaluation of quadrature summation (6). Rules for finite, semi-infinite and infinite ranges are included.

The one-dimensional routines may also be used recursively. For example, the two-dimensional integral

$$I=\int^{b_1}\int^{b_2} f(x,y)dydx$$

$$a_1 \quad a_2$$

may be expressed as

$$I=\int_{a_1}^{b_1} F(x)dx,$$

where

$$F(x)=\int_{a_2}^{b_2} f(x,y)dy.$$

The user segment to evaluate F(x) will call the integration routine for the y-integration, which will call another user segment for f(x,y) as a function of y (x being effectively a constant). Note that, as Fortran is not a recursive language, a different library integration routine must be used for each dimension. Apart from this restriction, the full range of one-dimensional routines are available, for finite/infinite intervals, constant/variable limits, rule evaluation/automatic strategies etc.

(b) Automatic routines (D01GBF and D01FCF)

Both routines are for integrals of the form

$$\int_{a_1}^{b_1}\int_{a_2}^{b_2} \ldots \int_{a_n}^{b_n} f(x_1,x_2,\ldots,x_n)dx_n dx_{n-1} \ldots dx_1 .$$

D01GBF is an adaptive Monte Carlo routine. This routine is usually slow and not recommended for high accuracy work. It is a robust routine that can often be used for low accuracy results with highly irregular integrands or when n is large.

D01FCF is an adaptive deterministic routine. Convergence is fast for well-behaved integrands. Highly accurate results can often be obtained for n between 2 and 5, using significantly fewer integrand evaluations than would be required by D01GBF. The routine will usually work when the integrand is mildly singular and for n<=10 should be used before D01GBF. If it is known in advance that the integrand is highly irregular, it is best to compare results from at least two different routines.

There are many problems for which one or both of the routines will require large amounts of computing time to obtain even moderately accurate results. The amount of computing time is controlled by the number of integrand evaluations allowed by the user, and users should set this parameter carefully, with reference to the time available and the accuracy desired.

3.4. Decision Trees

(i) One-dimensional integrals over a finite interval. (If in doubt, follow the downward branch.)

                 D01AJF -- NAG Foundation Library Routine Document
```

Note: Before using this routine, please read the Users' Note for your implementation to check implementation-dependent details. The symbol (*) after a NAG routine name denotes a routine that is not included in the Foundation Library.

1. Purpose

D01AJF is a general-purpose integrator which calculates an approximation to the integral of a function f(x) over a finite interval [a,b]:

```
               b
               /
            I= |f(x)dx.
               /
               a
```

2. Specification

```
       SUBROUTINE D01AJF (F, A, B, EPSABS, EPSREL, RESULT,
      1                   ABSERR, W, LW, IW, LIW, IFAIL)
       INTEGER          LW, IW(LIW), LIW, IFAIL
       DOUBLE PRECISION F, A, B, EPSABS, EPSREL, RESULT, ABSERR, W
      1                 (LW)
       EXTERNAL         F
```

3. Description

D01AJF is based upon the QUADPACK routine QAGS (Piessens et al [3]). It is an adaptive routine, using the Gauss 10-point and Kronrod 21-point rules. The algorithm, described by de Doncker [1], incorporates a global acceptance criterion (as defined by Malcolm and Simpson [2]) together with the (epsilon)-algorithm (Wynn [4]) to perform extrapolation. The local error estimation is described by Piessens et al [3].

The routine is suitable as a general purpose integrator, and can be used when the integrand has singularities, especially when these are of algebraic or logarithmic type.

D01AJF requires the user to supply a function to evaluate the integrand at a single point.

The routine D01ATF(*) uses an identical algorithm but requires the user to supply a subroutine to evaluate the integrand at an array of points. Therefore D01ATF(*) will be more efficient if the evaluation can be performed in vector mode on a vector-processing machine.

5. Parameters

1: F -- DOUBLE PRECISION FUNCTION, supplied by the user. External Procedure

F must return the value of the integrand f at a given point.

Its specification is:

```
      DOUBLE PRECISION FUNCTION F (X)
      DOUBLE PRECISION X
```

 1: X -- DOUBLE PRECISION Input
 On entry: the point at which the integrand f must be evaluated.

F must be declared as EXTERNAL in the (sub)program from which D01AJF is called. Parameters denoted as Input must not be changed by this procedure.

2: A -- DOUBLE PRECISION Input

On entry: the lower limit of integration, a.

3: B -- DOUBLE PRECISION Input

On entry: the upper limit of integration, b. It is not necessary that a<b.

4: EPSABS -- DOUBLE PRECISION Input

On entry: the absolute accuracy required. If EPSABS is negative, the absolute value is used. See Section 7.

5: EPSREL -- DOUBLE PRECISION Input

On entry: the relative accuracy required. If EPSREL is negative, the absolute value is used. See Section 7.

6: RESULT -- DOUBLE PRECISION Output

```
     On exit: the approximation to the integral I.

 7:  ABSERR -- DOUBLE PRECISION                          Output
     On exit: an estimate of the modulus of the absolute error,
     which should be an upper bound for |I-RESULT|.

 8:  W(LW) -- DOUBLE PRECISION array                     Output
     On exit: details of the computation, as described in
     Section 8.

 9:  LW -- INTEGER                                        Input
     On entry:
     the dimension of the array W as declared in the (sub)program
     from which D01AJF is called.
     The value of LW (together with that of LIW below) imposes a
     bound on the number of sub-intervals into which the interval
     of integration may be divided by the routine. The number of
     sub-intervals cannot exceed LW/4. The more difficult the
     integrand, the larger LW should be. Suggested value: a value
     in the range 800 to 2000 is adequate for most problems.
     Constraint: LW >= 4.

10:  IW(LIW) -- INTEGER array                            Output
     On exit: IW(1) contains the actual number of sub-intervals
     used. The rest of the array is used as workspace.

11:  LIW -- INTEGER                                       Input
     On entry:
     the dimension of the array IW as declared in the
     (sub)program from which D01AJF is called.
     The number of sub-intervals into which the interval of
     integration may be divided cannot exceed LIW. Suggested
     value: LIW = LW/4. Constraint: LIW >= 1.

12:  IFAIL -- INTEGER                              Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. Users who are
     unfamiliar with this parameter should refer to the Essential
     Introduction for details.

     On exit: IFAIL = 0 unless the routine detects an error or
     gives a warning (see Section 6).

     For this routine, because the values of output parameters
     may be useful even if IFAIL /=0 on exit, users are
     recommended to set IFAIL to -1 before entry. It is then
     essential to test the value of IFAIL on exit.

6. Error Indicators and Warnings

Errors or warnings specified by the routine:
```

```
If on entry IFAIL = 0 or -1, explanatory error messages are
output on the current error message unit (as defined by X04AAF).

IFAIL= 1
     The maximum number of subdivisions allowed with the given
     workspace has been reached without the accuracy requirements
     being achieved. Look at the integrand in order to determine
     the integration difficulties. If the position of a local
     difficulty within the interval can be determined (e.g. a
     singularity of the integrand or its derivative, a peak, a
     discontinuity, etc) you will probably gain from splitting up
     the interval at this point and calling the integrator on the
     subranges. If necessary, another integrator, which is
     designed for handling the type of difficulty involved, must
     be used. Alternatively, consider relaxing the accuracy
     requirements specified by EPSABS and EPSREL, or increasing
     the amount of workspace.

IFAIL= 2
     Round-off error prevents the requested tolerance from being
     achieved. The error may be under-estimated. Consider
     requesting less accuracy.

IFAIL= 3
     Extremely bad local integrand behaviour causes a very strong
     subdivision around one (or more) points of the interval.

IFAIL= 4
     The requested tolerance cannot be achieved, because the
     extrapolation does not increase the accuracy satisfactorily;
     the returned result is the best which can be obtained. The
     same advice applies as in the case of IFAIL = 1.

IFAIL= 5
     The integral is probably divergent, or slowly convergent.
     Please note that divergence can occur with any non-zero
     value of IFAIL.

IFAIL= 6
     On entry LW < 4,

     or       LIW < 1.

7. Accuracy

The routine cannot guarantee, but in practice usually achieves,
the following accuracy:

                        |I-RESULT|<=tol,
```

where

tol=max{|EPSABS|,|EPSREL|*|I|},

and EPSABS and EPSREL are user-specified absolute and relative error tolerance. Moreover it returns the quantity ABSERR which, in normal circumstances, satisfies

|I-RESULT|<=ABSERR<=tol.

8. Further Comments

The time taken by the routine depends on the integrand and the accuracy required.

If IFAIL /= 0 on exit, then the user may wish to examine the contents of the array W, which contains the end-points of the sub-intervals used by D01AJF along with the integral contributions and error estimates over the sub-intervals.

Specifically, for i=1,2,...,n, let r_i denote the approximation to the value of the integral over the sub-interval $[a_i,b_i]$ in the partition of [a,b] and e_i be the corresponding absolute error estimate.

Then, $\int_{a_i}^{b_i} f(x)dx \simeq r_i$ and RESULT= $\sum_{i=1}^{n} r_i$, unless D01AJF terminates while testing for divergence of the integral (see Piessens et al [3], Section 3.4.3). In this case, RESULT (and ABSERR) are taken to be the values returned from the extrapolation process. The value of n is returned in IW(1), and the values a_i, b_i, e_i and r_i are stored consecutively in the array W, that is:

a_i=W(i),

b_i=W(n+i),

e_i=W(2n+i) and

```
                i

               r =W(3n+i).
                i

          9. Example

          To compute
                            2(pi)
                            /         x sin(30x)
                            |     ----------------dx.
                            /
                            0        /(  (  x  )2)
                                    / (1-(-----) )
                                  \/  (  (2(pi)) )

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

16.3.3 Adaptive integration over a finite integral

— nagd.ht —

```
\begin{page}{manpageXXd01akf}{NAG Documentation: d01akf}
\beginscroll
\begin{verbatim}

     D01AKF(3NAG)      Foundation Library (12/10/92)      D01AKF(3NAG)

          D01 -- Quadrature                                      D01AKF
                  D01AKF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.
```

1. Purpose

D01AKF is an adaptive integrator, especially suited to oscillating, non-singular integrands, which calculates an approximation to the integral of a function f(x) over a finite interval [a,b]:

```
          b
          /
       I= |f(x)dx.
          /
          a
```

2. Specification

```
       SUBROUTINE D01AKF (F, A, B, EPSABS, EPSREL, RESULT,
      1                   ABSERR, W, LW, IW, LIW, IFAIL)
       INTEGER          LW, IW(LIW), LIW, IFAIL
       DOUBLE PRECISION F, A, B, EPSABS, EPSREL, RESULT, ABSERR, W
      1                 (LW)
       EXTERNAL         F
```

3. Description

D01AKF is based upon the QUADPACK routine QAG (Piessens et al [3]). It is an adaptive routine, using the Gauss 30-point and Kronrod 61-point rules. A 'global' acceptance criterion (as defined by Malcolm and Simpson [1]) is used. The local error estimation is described in Piessens et al [3].

Because this routine is based on integration rules of high order, it is especially suitable for non-singular oscillating integrands.

D01AKF requires the user to supply a function to evaluate the integrand at a single point.

The routine D01AUF(*) uses an identical algorithm but requires the user to supply a subroutine to evaluate the integrand at an array of points. Therefore D01AUF(*) will be more efficient if the evaluation can be performed in vector mode on a vector-processing machine.

D01AUF(*) also has an additional parameter KEY which allows the user to select from six different Gauss-Kronrod rules.

          Integration. Springer-Verlag.

     5. Parameters

      1:  F -- DOUBLE PRECISION FUNCTION, supplied by the user.
                                                   External Procedure
          F must return the value of the integrand f at a given point.

          Its specification is:

                 DOUBLE PRECISION FUNCTION F (X)
                 DOUBLE PRECISION X

           1:  X -- DOUBLE PRECISION                             Input
               On entry: the point at which the integrand f must be
               evaluated.
          F must be declared as EXTERNAL in the (sub)program from
          which D01AKF is called. Parameters denoted as Input
          must not be changed by this procedure.

      2:  A -- DOUBLE PRECISION                                  Input
          On entry: the lower limit of integration, a.

      3:  B -- DOUBLE PRECISION                                  Input
          On entry: the upper limit of integration, b. It is not
          necessary that a<b.

      4:  EPSABS -- DOUBLE PRECISION                             Input
          On entry: the absolute accuracy required. If EPSABS is
          negative, the absolute value is used. See Section 7.

      5:  EPSREL -- DOUBLE PRECISION                             Input
          On entry: the relative accuracy required. If EPSREL is
          negative, the absolute value is used. See Section 7.

      6:  RESULT -- DOUBLE PRECISION                            Output
          On exit: the approximation to the integral I.

      7:  ABSERR -- DOUBLE PRECISION                            Output
          On exit: an estimate of the modulus of the absolute error,
          which should be an upper bound |I-RESULT|.
```

```
 8:  W(LW) -- DOUBLE PRECISION array                        Output
     On exit: details of the computation, as described in
     Section 8.

 9:  LW -- INTEGER                                           Input
     On entry: the dimension of W, as declared in the (sub)
     program from which D01AKF is called. The value of LW
     (together with that of LIW below) imposes a bound on the
     number of sub-intervals into which the interval of
     integration may be divided by the routine. The number of
     sub-intervals cannot exceed LW/4. The more difficult the
     integrand, the larger LW should be. Suggested value: a value
     in the range 800 to 2000 is adequate for most problems.
     Constraint: LW >= 4. See IW below.

10:  IW(LIW) -- INTEGER array                               Output
     On exit: IW(1) contains the actual number of sub-intervals
     used. The rest of the array is used as workspace.

11:  LIW -- INTEGER                                          Input
     On entry:
     the dimension of the array IW as declared in the
     (sub)program from which D01AKF is called.
     The number of sub-intervals into which the interval of
     integration may be divided cannot exceed LIW. Suggested
     value: LIW = LW/4. Constraint: LIW >= 1.

12:  IFAIL -- INTEGER                                 Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. Users who are
     unfamiliar with this parameter should refer to the Essential
     Introduction for details.

     On exit: IFAIL = 0 unless the routine detects an error or
     gives a warning (see Section 6).

     For this routine, because the values of output parameters
     may be useful even if IFAIL /=0 on exit, users are
     recommended to set IFAIL to -1 before entry. It is then
     essential to test the value of IFAIL on exit.

6. Error Indicators and Warnings

Errors or warnings specified by the routine:

If on entry IFAIL = 0 or -1, explanatory error messages are
output on the current error message unit (as defined by X04AAF).

IFAIL= 1
     The maximum number of subdivisions allowed with the given
     workspace has been reached without the accuracy requirements
     being achieved. Look at the integrand in order to determine
     the integration difficulties. Probably another integrator
     which is designed for handling the type of difficulty
     involved must be used. Alternatively, consider relaxing the
     accuracy requirements specified by EPSABS and EPSREL, or
     increasing the amount of workspace.

IFAIL= 2
     Round-off error prevents the requested tolerance from being
     achieved. Consider  requesting less accuracy.

IFAIL= 3
     Extremely bad local integrand behaviour causes a very strong
     subdivision around one (or more) points of the interval.
     The same advice applies as in the case of IFAIL = 1.

IFAIL= 4
     On entry LW < 4,

     or       LIW < 1.

7. Accuracy

The routine cannot guarantee, but in practice usually achieves,
the following accuracy:

                        |I-RESULT|<=tol,

where

                 tol=max{|EPSABS|,|EPSREL|*|I|},

and EPSABS and EPSREL are user-specified absolute and relative
error tolerances. Moreover it returns the quantity ABSERR which,
in normal circumstances satisfies

                    |I-RESULT|<=ABSERR<=tol.

8. Further Comments

The time taken by the routine depends on the integrand and the
accuracy required.

If IFAIL /= 0 on exit, then the user may wish to examine the
contents of the array W, which contains the end-points of the
sub-intervals used by D01AKF along with the integral
contributions and error estimates over these sub-intervals.

Specifically, for i=1,2,...,n, let r  denote the approximation to
                                    i
```

```
          the value of the integral over the sub-interval [a ,b ] in the
                                                             i  i
          partition of [a,b] and e  be the corresponding absolute error
                                  i
                           b
                            i                       n
                           /                        --
          estimate. Then,  | f(x)dx~=r  and RESULT= >  r . The value of n
                           /         i              --  i
                           a                        i=1
                            i
          is returned in IW(1), and the values a , b , e  and r  are stored
                                                i   i   i      i
          consecutively in the array W, that is:

               a =W(i),
                i

               b =W(n+i),
                i

               e =W(2n+i) and
                i

               r =W(3n+i).
                i

          9. Example

          To compute

                                2(pi)
                                /
                                |    x sin(30x) cosx dx.
                                /
                                0

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

16.3.4 Approximate integration with local singular points

— nagd.ht —

```
\begin{page}{manpageXXd01alf}{NAG Documentation: d01alf}
\beginscroll
\begin{verbatim}

     D01ALF(3NAG)      Foundation Library (12/10/92)      D01ALF(3NAG)

          D01 -- Quadrature                                        D01ALF
                  D01ALF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          D01ALF is a general purpose integrator which calculates an
          approximation to the integral of a function f(x) over a finite
          interval [a,b]:

                                       b
                                       /
                                    I= |f(x)dx
                                       /
                                       a

          where the integrand may have local singular behaviour at a finite
          number of points within the integration interval.

          2. Specification

                 SUBROUTINE D01ALF (F, A, B, NPTS, POINTS, EPSABS, EPSREL,
                1                   RESULT, ABSERR, W, LW, IW, LIW, IFAIL)
                 INTEGER          NPTS, LW, IW(LIW), LIW, IFAIL
                 DOUBLE PRECISION F, A, B, POINTS(*), EPSABS, EPSREL,
                1                 RESULT, ABSERR, W(LW)
                 EXTERNAL         F

          3. Description

          D01ALF is based upon the QUADPACK routine QAGP (Piessens et al
```

[3]). It is very similar to D01AJF, but allows the user to supply difficult. It is an adaptive routine, using the Gauss 10-point and Kronrod 21-point rules. The algorithm described by de Doncker [1], incorporates a global acceptance criterion (as defined by Malcolm and Simpson [2]) together with the (epsilon)-algorithm (Wynn [4]) to perform extrapolation. The user-supplied 'break-points'always occur as the end-points of some sub-interval during the adaptive process. The local error estimation is described by Piessens et al [3].

5. Parameters

1: F -- DOUBLE PRECISION FUNCTION, supplied by the user.
External Procedure
F must return the value of the integrand f at a given point.

Its specification is:

```
       DOUBLE PRECISION FUNCTION F (X)
       DOUBLE PRECISION X
```

1: X -- DOUBLE PRECISION Input
On entry: the point at which the integrand f must be evaluated.

F must be declared as EXTERNAL in the (sub)program from which D01ALF is called. Parameters denoted as Input must not be changed by this procedure.

2: A -- DOUBLE PRECISION Input
On entry: the lower limit of integration, a.

3: B -- DOUBLE PRECISION Input
On entry: the upper limit of integration, b. It is not

```
    necessary that a<b.

 4: NPTS -- INTEGER                                         Input
    On entry: the number of user-supplied break-points within
    the integration interval. Constraint: NPTS >= 0.

 5: POINTS(NPTS) -- DOUBLE PRECISION array                  Input
    On entry: the user-specified break-points. Constraint: the
    break-points must all lie within the interval of integration
    (but may be supplied in any order).

 6: EPSABS -- DOUBLE PRECISION                              Input
    On entry: the absolute accuracy required. If EPSABS is
    negative, the absolute value is used. See Section 7.

 7: EPSREL -- DOUBLE PRECISION                              Input
    On entry: the relative accuracy required. If EPSREL is
    negative, the absolute value is used. See Section 7.

 8: RESULT -- DOUBLE PRECISION                              Input
    On entry: the approximation to the integral I.

 9: ABSERR -- DOUBLE PRECISION                             Output
    On exit: an estimate of the modulus of the absolute error,
    which should be an upper bound for |I-RESULT|.

10: W(LW) -- DOUBLE PRECISION array                        Output
    On exit: details of the computation, as described in
    Section 8.

11: LW -- INTEGER                                           Input
    On entry:
    the dimension of the array W as declared in the (sub)program
    from which D01ALF is called.
    The value of LW (together with that of LIW below) imposes a
    bound on the number of sub-intervals into which the interval
    of integration may be divided by the routine. The number of
    sub-intervals cannot exceed (LW-2*NPTS-4)/4. The more
    difficult the integrand, the larger LW should be. Suggested
    value: a value in the range 800 to 2000 is adequate for most
    problems. Constraint: LW>=2*NPTS+8.

12: IW(LIW) -- INTEGER array                               Output
    On exit: IW(1) contains the actual number of sub-intervals
    used. The rest of the array is used as workspace.

13: LIW -- INTEGER                                          Input
    On entry:
    the dimension of the array IW as declared in the
    (sub)program from which D01ALF is called.
```

```
     The number of sub-intervals into which the interval of
     integration may be divided cannot exceed (LIW-NPTS-2)/2.
     Suggested value: LIW = LW/2. Constraint: LIW >= NPTS + 4.

14:  IFAIL -- INTEGER                                Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. Users who are
     unfamiliar with this parameter should refer to the Essential
     Introduction for details.

     On exit: IFAIL = 0 unless the routine detects an error or
     gives a warning (see Section 6).

     For this routine, because the values of output parameters
     may be useful even if IFAIL /=0 on exit, users are
     recommended to set IFAIL to -1 before entry. It is then
     essential to test the value of IFAIL on exit.

6. Error Indicators and Warnings

Errors or warnings specified by the routine:

If on entry IFAIL = 0 or -1, explanatory error messages are
output on the current error message unit (as defined by X04AAF).

IFAIL= 1
     The maximum number of subdivisions allowed with the given
     workspace has been reached, without the accuracy
     requirements being achieved. Look at the integrand in order
     to determine the integration difficulties. If the position
     of a local difficulty within the interval can be determined
     (e.g. a singularity of the integrand or its derivative, a
     peak, a discontinuity, etc) it should be supplied to the
     routine as an element of the vector POINTS. If necessary,
     another integrator should be used, which is designed for
     handling the type of difficulty involved. Alternatively,
     consider relaxing the accuracy requirements specified by
     EPSABS and EPSREL, or increasing the amount of workspace.

IFAIL= 2
     Round-off error prevents the requested tolerance from being
     achieved. The error may be under-estimated. Consider
     requesting less accuracy.

IFAIL= 3
     Extremely bad local integrand behaviour causes a very strong
     subdivision around one (or more) points of the interval.
     The same advice applies as in the case of IFAIL = 1.

IFAIL= 4
     The requested tolerance cannot be achieved, because the
     extrapolation does not increase the accuracy satisfactorily;
     the result returned is the best which can be obtained.  The
     same advice applies as in the case IFAIL = 1.

IFAIL= 5
     The integral is probably divergent, or slowly convergent.
     Please note that divergence can also occur with any other
     non-zero value of IFAIL.

IFAIL= 6
     The input is invalid: break-points are specified outside the
     integration range, NPTS > LIMIT or NPTS < 0. RESULT and
     ABSERR are set to zero.

IFAIL= 7
     On entry LW<2*NPTS+8,

     or       LIW<NPTS+4.

7. Accuracy

The routine cannot guarantee, but in practice usually achieves,
the following accuracy:
                        |I-RESULT|<=tol,

where

                tol=max{|EPSABS|,|EPSREL|*|I|},

and EPSABS and EPSREL are user-specified absolute and relative
error tolerances. Moreover it returns the quantity ABSERR which,
in normal circumstances, satisfies

                    |I-RESULT|<=ABSERR<=tol.

8. Further Comments

The time taken by the routine depends on the integrand and on the
accuracy required.

If IFAIL /= 0 on exit, then the user may wish to examine the
contents of the array W, which contains the end-points of the
sub-intervals used by D01ALF along with the integral
contributions and error estimates over these sub-intervals.

Specifically, for i=1,2,...,n, let r  denote the approximation to
                                   i
the value of the integral over the sub-interval [a ,b ] in the
                                                  i  i
partition of [a,b] and e  be the corresponding absolute error
```

estimate. Then, $\int_{a_i}^{b_i} f(x)dx\simeq r_i$ and RESULT$=\sum_{i=1}^{n} r_i$ unless D01ALF terminates while testing for divergence of the integral (see Piessens et al [3] Section 3.4.3). In this case, RESULT (and ABSERR) are taken to be the values returned from the extrapolation process. The value of n is returned in IW(1), and the values a_i, b_i, e_i and r_i are stored consecutively in the array W, that is:

a_i=W(i),

b_i=W(n+i),

e_i=W(2n+i) and

r_i=W(3n+i).

9. Example

To compute

$$\int_0^1 \frac{1}{\sqrt{|x-1/7|}}dx.$$

A break-point is specified at x=1/7, at which point the integrand is infinite. (For definiteness the function FST returns the value 0.0 at this point.)

The example program is not reproduced here. The source code for all example programs is distributed with the NAG Foundation Library software and should be available on-line.

16.3.5 Approximate integration over a (semi-)infinite interval

— **nagd.ht** —

```
\begin{page}{manpageXXd01amf}{NAG Documentation: d01amf}
\beginscroll
\begin{verbatim}

     D01AMF(3NAG)      Foundation Library (12/10/92)      D01AMF(3NAG)

          D01 -- Quadrature                                      D01AMF
                  D01AMF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          D01AMF calculates an approximation to the integral of a function
          f(x) over an infinite or semi-infinite interval [a,b]:

                                       b
                                       /
                                     I= |f(x)dx
                                       /
                                       a

          2. Specification

                 SUBROUTINE D01AMF (F, BOUND, INF, EPSABS, EPSREL, RESULT,
                1                   ABSERR, W, LW, IW, LIW, IFAIL)
                 INTEGER          INF, LW, IW(LIW), LIW, IFAIL
                 DOUBLE PRECISION F, BOUND, EPSABS, EPSREL, RESULT, ABSERR,
                1                 W(LW)
                 EXTERNAL         F

          3. Description

          D01AMF is based on the QUADPACK routine QAGI (Piessens et al [3])
          [0,1] using one of the identities:
```

$$\int_{-\infty}^{a} f(x)dx = \int_{0}^{1} f\left(a-\frac{1-t}{t}\right)\frac{1}{t^2}dt$$

$$\int_{a}^{\infty} f(x)dx = \int_{0}^{1} f\left(a+\frac{1-t}{t}\right)\frac{1}{t^2}dt$$

$$\int_{-\infty}^{\infty} f(x)dx = \int_{0}^{\infty} (f(x)+f(-x))dx = \int_{0}^{1}\left[f\left(\frac{1-t}{t}\right)+f\left(\frac{-1+t}{t}\right)\right]\frac{1}{t^2}dt$$

where a represents a finite integration limit. An adaptive procedure, based on the Gauss seven-point and Kronrod 15-point rules, is then employed on the transformed integral. The algorithm, described by de Doncker [1], incorporates a global acceptance criterion (as defined by Malcolm and Simpson [2]) together with the (epsilon)-algorithm (Wynn [4]) to perform extrapolation. The local error estimation is described by Piessens et al [3].

5. Parameters

1: F -- DOUBLE PRECISION FUNCTION, supplied by the user.
External Procedure
On entry: the point at which the integrand f must be

```
        evaluated.

        Its specification is:

               DOUBLE PRECISION FUNCTION F (X)
               DOUBLE PRECISION X

         1:  X -- DOUBLE PRECISION                            Input
             On entry: the point at which the integrand f must be
             evaluated.
        F must be declared as EXTERNAL in the (sub)program from
        which D01AMF is called. Parameters denoted as Input
        must not be changed by this procedure.

    2:  BOUND -- DOUBLE PRECISION                             Input
        On entry: the finite limit of the integration range (if
        present). BOUND is not used if the interval is doubly
        infinite.

    3:  INF -- INTEGER                                        Input
        On entry: indicates the kind of integration range:
             if INF =1, the range is [BOUND, +infty)

             if INF =-1, the range is (-infty, BOUND]

             if INF =+2, the range is (-infty, +infty).
         Constraint: INF =-1, 1 or 2.

    4:  EPSABS -- DOUBLE PRECISION                            Input
        On entry: the absolute accuracy required. If EPSABS is
        negative, the absolute value is used. See Section 7.

    5:  EPSREL -- DOUBLE PRECISION                            Input
        On entry: the relative accuracy required. If EPSREL is
        negative, the absolute value is used. See Section 7.

    6:  RESULT -- DOUBLE PRECISION                           Output
        On exit: the approximation to the integral I.

    7:  ABSERR -- DOUBLE PRECISION                           Output
        On exit: an estimate of the modulus of the absolute error,
        which should be an upper bound for |I-RESULT|.

    8:  W(LW) -- DOUBLE PRECISION array                      Output
        On exit: details of the computation, as described in
        Section 8.

    9:  LW -- INTEGER                                         Input
        On entry:
        the dimension of the array W as declared in the (sub)program
```

```
     from which D01AMF is called.
     The value of LW (together with that of LIW below) imposes a
     bound on the number of sub-intervals into which the interval
     of integration may be divided by the routine. The number of
     sub-intervals cannot exceed LW/4. The more difficult the
     integrand, the larger LW should be. Suggested value: a value
     in the range 800 to 2000 is adequate for most problems.
     Constraint: LW >= 4.

10:  IW(LIW) -- INTEGER array                              Output
     On exit: IW(1) contains the actual number of sub-intervals
     used. The rest of the array is used as workspace.

11:  LIW -- INTEGER                                         Input
     On entry:
     the dimension of the array IW as declared in the
     (sub)program from which D01AMF is called.
     The number of sub-intervals into which the interval of
     integration may be divided cannot exceed LIW. Suggested
     value: LIW = LW/4. Constraint: LIW >= 1.

12:  IFAIL -- INTEGER                                Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. Users who are
     unfamiliar with this parameter should refer to the Essential
     Introduction for details.
     On exit: IFAIL = 0 unless the routine detects an error or
     gives a warning (see Section 6).

     For this routine, because the values of output parameters
     may be useful even if IFAIL /=0 on exit, users are
     recommended to set IFAIL to -1 before entry. It is then
     essential to test the value of IFAIL on exit.

6. Error Indicators and Warnings

Errors or warnings specified by the routine:

If on entry IFAIL = 0 or -1, explanatory error messages are
output on the current error message unit (as defined by X04AAF).

IFAIL= 1
     The maximum number of subdivisions allowed with the given
     workspace has been reached without the requested accuracy
     requirements being achieved. Look at the integrand in order
     to determine the integration difficulties. If the position
     of a local difficulty within the interval can be determined
     (e.g. a singularity of the integrand or its derivative, a
     peak, a discontinuity, etc) you will probably gain from
     splitting up the interval at this point and calling D01AMF
     on the infinite subrange and an appropriate integrator on
     the finite subrange. Alternatively, consider relaxing the
     accuracy requirements specified by EPSABS and EPSREL, or
     increasing the amount of workspace.

IFAIL= 2
     Round-off error prevents the requested tolerance from being
     achieved. The error may be underestimated. Consider
     requesting less accuracy.

IFAIL= 3
     Extremely bad local integrand behaviour causes a very strong
     subdivision around one (or more) points of the interval.
     The same advice applies as in the case of IFAIL = 1.

IFAIL= 4
     The requested tolerance cannot be achieved, because the
     extrapolation does not increase the accuracy satisfactorily;
     the returned result is the best which can be obtained.  The
     same advice applies as in the case of IFAIL = 1.

IFAIL= 5
     The integral is probably divergent, or slowly convergent. It
     must be noted that divergence can also occur with any other
     non-zero value of IFAIL.

IFAIL= 6
     On entry LW < 4,

     or       LIW < 1,

     or       INF /= -1, 1 or 2.
     Please note that divergence can occur with any non-zero
     value of IFAIL.

7. Accuracy

The routine cannot guarantee, but in practice usually achieves,
the following accuracy:

                        |I-RESULT|<=tol,

where

                 tol=max{|EPSABS|,|EPSREL|*|I|},

and EPSABS and EPSREL are user-specified absolute and relative
error tolerances. Moreover it returns the quantity ABSERR, which,
in normal circumstances, satisfies

                    |I-RESULT|<=ABSERR<=tol.
```

8. Further Comments

The time taken by the routine depends on the integrand and the accuracy required.

If IFAIL /= 0 on exit, then the user may wish to examine the contents of the array W, which contains the end-points of the sub-intervals used by D01AMF along with the integral contributions and error estimates over these sub-intervals.

Specifically, for $i=1,2,...,n$, let r_i denote the approximation to the value of the integral over the sub-interval $[a_i,b_i]$ in the partition of $[a,b]$ and e_i be the corresponding absolute error estimate. Then, $\int_{a_i}^{b_i} f(x)dx \simeq r_i$ and RESULT$= \sum_{i=1}^{n} r_i$ unless D01AMF terminates while testing for divergence of the integral (see Piessens et al [3] Section 3.4.3). In this case, RESULT (and ABSERR) are taken to be the values returned from the extrapolation process. The value of n is returned in IW(1), and the values a_i, b_i, e_i and r_i are stored consecutively in the array W, that is:

$$a_i=W(i), b_i=W(n+i), e_i=W(2n+i) \text{ and } r_i=W(3n+i).$$

Note: that this information applies to the integral transformed to (0,1) as described in Section 3, not to the original integral.

9. Example

To compute

$$\int_0^{\infty} \frac{1}{(x+1)\sqrt{x}} dx.$$

The exact answer is π.

```
         The example program is not reproduced here. The source code for
         all example programs is distributed with the NAG Foundation
         Library software and should be available on-line.

         D01 -- Quadrature                                         D01ANF
                 D01ANF -- NAG Foundation Library Routine Document

         Note: Before using this routine, please read the Users' Note for
         your implementation to check implementation-dependent details.
         The symbol (*) after a NAG routine name denotes a routine that is
         not included in the Foundation Library.

         1. Purpose

         D01ANF calculates an approximation to the sine or the cosine
         transform of a function g over [a,b]:

            b                                 b
            /                                 /
         I= |g(x)||,sin((omega)x)||,dx  or  I= |g(x)||,cos((omega)x)||,dx
            /                                 /
            a                                 a

         (for a user-specified value of (omega)).

         2. Specification
```

```
      SUBROUTINE D01ANF (G, A, B, OMEGA, KEY, EPSABS, EPSREL,
     1                   RESULT, ABSERR, W, LW, IW, LIW, IFAIL)
      INTEGER          KEY, LW, IW(LIW), LIW, IFAIL
      DOUBLE PRECISION G, A, B, OMEGA, EPSABS, EPSREL, RESULT,
     1                 ABSERR, W(LW)
      EXTERNAL         G
```

3. Description

D01ANF is based upon the QUADPACK routine QFOUR (Piessens et al [3]). It is an adaptive routine, designed to integrate a function of the form g(x)w(x), where w(x) is either sin((omega)x) or cos((omega)x). If a sub-interval has length

$$L=|b-a|2^{-l}$$

then the integration over this sub-interval is performed by means of a modified Clenshaw-Curtis procedure (Piessens and Branders [2]) if L(omega)>4 and l<=20. In this case a Chebyshev-series approximation of degree 24 is used to approximate g(x), while an error estimate is computed from this approximation together with that obtained using Chebyshev-series of degree 12. If the above conditions do not hold then Gauss 7-point and Kronrod 15-point rules are used. The algorithm, described in [3], incorporates a global acceptance criterion (as defined in Malcolm and Simpson [1]) together with the (epsilon)-algorithm Wynn [4] to perform extrapolation. The local error estimation is described in [3].

5. Parameters

1: G -- DOUBLE PRECISION FUNCTION, supplied by the user.
External Procedure

```
    G must return the value of the function g at a given point.

    Its specification is:

           DOUBLE PRECISION FUNCTION G (X)
           DOUBLE PRECISION X

     1:  X -- DOUBLE PRECISION                             Input
         On entry: the point at which the function g must be
         evaluated.
    G must be declared as EXTERNAL in the (sub)program from
    which D01ANF is called. Parameters denoted as Input
    must not be changed by this procedure.

 2: A -- DOUBLE PRECISION                                  Input
    On entry: the lower limit of integration, a.

 3: B -- DOUBLE PRECISION                                  Input
    On entry: the upper limit of integration, b. It is not
    necessary that a<b.

 4: OMEGA -- DOUBLE PRECISION                              Input
    On entry: the parameter (omega) in the weight function of
    the transform.

 5: KEY -- INTEGER                                         Input
    On entry: indicates which integral is to be computed:
         if KEY = 1, w(x)=cos((omega)x);

         if KEY = 2, w(x)=sin((omega)x).
     Constraint: KEY = 1 or 2.

 6: EPSABS -- DOUBLE PRECISION                             Input
    On entry: the absolute accuracy required. If EPSABS is
    negative, the absolute value is used. See Section 7.

 7: EPSREL -- DOUBLE PRECISION                             Input
    On entry: the relative accuracy required. If EPSREL is
    negative, the absolute value is used. See Section 7.

 8: RESULT -- DOUBLE PRECISION                            Output
    On exit: the approximation to the integral I.

 9: ABSERR -- DOUBLE PRECISION                            Output
    On exit: an estimate of the modulus of the absolute error,
    which should be an upper bound for |I-RESULT|.

10: W(LW) -- DOUBLE PRECISION array                       Output
    On exit: details of the computation, as described in
    Section 8.
```

```
11:  LW -- INTEGER                                        Input
     On entry:
     the dimension of the array W as declared in the (sub)program
     from which D01ANF is called.
     The value of LW (together with that of LIW below) imposes a
     bound on the number of sub-intervals into which the interval
     of integration may be divided by the routine. The number of
     sub-intervals cannot exceed LW/4. The more difficult the
     integrand, the larger LW should be. Suggested value: a value
     in the range 800 to 2000 is adequate for most problems.
     Constraint: LW >= 4.

12:  IW(LIW) -- INTEGER array                            Output
     On exit: IW(1) contains the actual number of sub-intervals
     used. The rest of the array is used as workspace.

13:  LIW -- INTEGER                                       Input
     On entry:
     the dimension of the array IW as declared in the
     (sub)program from which D01ANF is called.
     The number of sub-intervals into which the interval of
     integration may be divided cannot exceed LIW/2. Suggested
     value: LIW = LW/2. Constraint: LIW >= 2.

14:  IFAIL -- INTEGER                              Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. Users who are
     unfamiliar with this parameter should refer to the Essential
     Introduction for details.

     On exit: IFAIL = 0 unless the routine detects an error or
     gives a warning (see Section 6).

     For this routine, because the values of output parameters
     may be useful even if IFAIL /=0 on exit, users are
     recommended to set IFAIL to -1 before entry. It is then
     essential to test the value of IFAIL on exit.

6. Error Indicators and Warnings

Errors or warnings specified by the routine:

If on entry IFAIL = 0 or -1, explanatory error messages are
output on the current error message unit (as defined by X04AAF).

IFAIL= 1
     The maximum number of subdivisions allowed with the given
     workspace has been reached without the accuracy requested
     being achieved. Look at the integrand in order to determine
     the integration difficulties. If the position of a local
     difficulty within the interval can be determined (e.g. a
     singularity of the integrand or its derivative, a peak, a
     discontinuity, etc) you will probably gain from splitting up
     the interval at this point and calling the integrator on the
     subranges. If necessary, another integrator, which is
     designed for handling the type of difficulty involved, must
     be used. Alternatively consider relaxing the accuracy
     requirements specified by EPSABS and EPSREL, or increasing
     amount of workspace.

IFAIL= 2
     Round-off error prevents the requested tolerance from being
     achieved. The error may be underestimated. Consider
     requesting less accuracy.

IFAIL= 3
     Extremely bad local behaviour of g(x) causes a very strong
     subdivision around one (or more) points of the interval.
     The same advice applies as in the case of IFAIL = 1.

IFAIL= 4
     The requested tolerance cannot be achieved because the
     extrapolation does not increase the accuracy satisfactorily;
     the returned result is the best which can be obtained.  The
     same advice applies as in the case of IFAIL = 1.

IFAIL= 5
     The integral is probably divergent, or slowly convergent. It
     must be noted that divergence can occur with any non-zero
     value of IFAIL.

IFAIL= 6
     On entry KEY < 1,

     or       KEY > 2.

IFAIL= 7
     On entry LW < 4,

     or       LIW < 2.

7. Accuracy

The routine cannot guarantee, but in practice usually achieves,
the following accuracy:

                        |I-RESULT|<=tol,

where
```

$$tol=\max\{|EPSABS|,|EPSREL|*|I|\},$$

and EPSABS and EPSREL are user-specified absolute and relative tolerances. Moreover it returns the quantity ABSERR, which, in normal circumstances, satisfies

$$|I-RESULT|<=ABSERR<=tol.$$

8. Further Comments

The time taken by the routine depends on the integrand and on the accuracy required.

If IFAIL /= 0 on exit, then the user may wish to examine the contents of the array W, which contains the end-points of the sub-intervals used by D01ANF along with the integral contributions and error estimates over these sub-intervals.

Specifically, for i=1,2,...,n, let r_i denote the approximation to the value of the integral over the sub-interval $[a_i,b_i]$ in the partition of [a,b] and e_i be the corresponding absolute error estimate. Then, $\int_{a_i}^{b_i} g(x)w(x)dx \simeq r_i$ and RESULT= $\sum_{i=1}^{n} r_i$ unless D01ANF terminates while testing for divergence of the integral (see Piessens et al [3] Section 3.4.3). In this case, RESULT (and ABSERR) are taken to be the values returned from the extrapolation process. The value of n is returned in IW(1), and the values a_i, b_i, e_i and r_i are stored consecutively in the array W, that is:

a_i=W(i),

b_i=W(n+i),

e_i=W(2n+i) and

r_i=W(3n+i).

```
          9. Example

          To compute

                                 1
                                 /
                                 |ln(x)sin(10(pi)x)dx.
                                 /
                                 0

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

\begin{page}{manpageXXd01apf}{NAG Documentation: d01apf}
\beginscroll
\begin{verbatim}

     D01APF(3NAG)      Foundation Library (12/10/92)      D01APF(3NAG)

          D01 -- Quadrature                                          D01APF
                  D01APF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          D01APF is an adaptive integrator which calculates an
          approximation to the integral of a function g(x)w(x) over a
```

finite interval [a,b]:

```
                          b
                          /
                       I= |g(x)w(x)dx
                          /
                          a
```

where the weight function w has end-point singularities of
algebraico-logarithmic type.

2. Specification

```
       SUBROUTINE D01APF (G, A, B, ALFA, BETA, KEY, EPSABS,
      1                   EPSREL, RESULT, ABSERR, W, LW, IW, LIW,
      2                   IFAIL)
       INTEGER          KEY, LW, IW(LIW), LIW, IFAIL
       DOUBLE PRECISION G, A, B, ALFA, BETA, EPSABS, EPSREL,
      1                 RESULT, ABSERR, W(LW)
       EXTERNAL         G
```

3. Description

D01APF is based upon the QUADPACK routine QAWSE (Piessens et al
[3]) and integrates a function of the form g(x)w(x), where the
weight function w(x) may have algebraico-logarithmic
singularities at the end-points a and/or b. The strategy is a
modification of that in D01AKF. We start by bisecting the
original interval and applying modified Clenshaw-Curtis
integration of orders 12 and 24 to both halves. Clenshaw-Curtis
integration is then used on all sub-intervals which have a or b
as one of their end-points (Piessens et al [2]). On the other
sub-intervals Gauss-Kronrod (7-15 point) integration is carried
out.

A 'global' acceptance criterion (as defined by Malcolm and
Simpson [1]) is used. The local error estimation control is
described by Piessens et al [3].

      Integration. Springer-Verlag.

 5. Parameters

  1:  G -- DOUBLE PRECISION FUNCTION, supplied by the user.
                                          External Procedure
      G must return the value of the function g at a given point
      X.

      Its specification is:

             DOUBLE PRECISION FUNCTION G (X)
             DOUBLE PRECISION X

       1:  X -- DOUBLE PRECISION                             Input
           On entry: the point at which the function g must be
           evaluated.
      G must be declared as EXTERNAL in the (sub)program from
      which D01APF is called. Parameters denoted as Input
      must not be changed by this procedure.

  2:  A -- DOUBLE PRECISION                                  Input
      On entry: the lower limit of integration, a.

  3:  B -- DOUBLE PRECISION                                  Input
      On entry: the upper limit of integration, b. Constraint: B
      > A.

  4:  ALFA -- DOUBLE PRECISION                               Input
      On entry: the parameter (alpha) in the weight function.
      Constraint: ALFA>-1.

  5:  BETA -- DOUBLE PRECISION                               Input
      On entry: the parameter (beta) in the weight function.
      Constraint: BETA>-1.

  6:  KEY -- INTEGER                                         Input
      On entry: indicates which weight function is to be used:
                                (alpha)     (beta)
           if KEY = 1, w(x)=(x-a)       (b-x)

                                (alpha)     (beta)
           if KEY = 2, w(x)=(x-a)       (b-x)      ln(x-a)

                                (alpha)     (beta)
           if KEY = 3, w(x)=(x-a)       (b-x)      ln(b-x)

                                (alpha)     (beta)
           if KEY = 4, w(x)=(x-a)       (b-x)     ln(x-a)ln(b-x)
```

```
     Constraint: KEY = 1, 2, 3 or 4

 7:  EPSABS -- DOUBLE PRECISION                          Input
     On entry: the absolute accuracy required. If EPSABS is
     negative, the absolute value is used. See Section 7.

 8:  EPSREL -- DOUBLE PRECISION                          Input
     On entry: the relative accuracy required. If EPSREL is
     negative, the absolute value is used. See Section 7.

 9:  RESULT -- DOUBLE PRECISION                         Output
     On exit: the approximation to the integral I.

10:  ABSERR -- DOUBLE PRECISION                         Output
     On exit: an estimate of the modulus of the absolute error,
     which should be an upper bound for |I-RESULT|.

11:  W(LW) -- DOUBLE PRECISION array                    Output
     On exit: details of the computation, as described in
     Section 8.

12:  LW -- INTEGER                                       Input
     On entry:
     the dimension of the array W as declared in the (sub)program
     from which D01APF is called.
     The value of LW (together with that of LIW below) imposes a
     bound on the number of sub-intervals into which the interval
     of integration may be divided by the routine. The number of
     sub-intervals cannot exceed LW/4. The more difficult the
     integrand, the larger LW should be. Suggested value: LW =
     800 to 2000 is adequate for most problems. Constraint: LW >=
     8.

13:  IW(LIW) -- INTEGER array                           Output
     On exit: IW(1) contains the actual number of sub-intervals
     used. The rest of the array is used as workspace.

14:  LIW -- INTEGER                                      Input
     On entry:
     the dimension of the array IW as declared in the
     (sub)program from which D01APF is called.
     The number of sub-intervals into which the interval of
     integration may be divided cannot exceed LIW. Suggested
     value: LIW = LW/4. Constraint: LIW >= 2.

15:  IFAIL -- INTEGER                             Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. Users who are
     unfamiliar with this parameter should refer to the Essential
     Introduction for details.
     On exit: IFAIL = 0 unless the routine detects an error or
     gives a warning (see Section 6).

     For this routine, because the values of output parameters
     may be useful even if IFAIL /=0 on exit, users are
     recommended to set IFAIL to -1 before entry. It is then
     essential to test the value of IFAIL on exit.

6. Error Indicators and Warnings

Errors or warnings specified by the routine:

If on entry IFAIL = 0 or -1, explanatory error messages are
output on the current error message unit (as defined by X04AAF).

IFAIL= 1
     The maximum number of subdivisions allowed with the given
     workspace has been reached without the accuracy requirements
     being achieved. Look at the integrand in order to determine
     the integration difficulties. If the position of a
     discontinuity or a singularity of algebraico-logarithmic
     type within the interval can be determined, the interval
     must be split up at this point and the integrator called on
     the subranges. If necessary, another integrator, which is
     designed for handling the difficulty involved, must be used.
     Alternatively consider relaxing the accuracy requirements
     specified by EPSABS and EPSREL, or increasing the amount of
     workspace.

IFAIL= 2
     Round-off error prevents the requested tolerance from being
     achieved. Consider  requesting less accuracy.

IFAIL= 3
     Extremely bad local integrand behaviour causes a very strong
     subdivision around one (or more) points of the interval.
     The same advice applies as in the case of IFAIL = 1.

IFAIL= 4
     On entry B <= A,

     or       ALFA <= -1,

     or       BETA <= -1,

     or       KEY < 1,

     or       KEY > 4.
```

IFAIL= 5
On entry LW < 8,

or LIW < 2.

7. Accuracy

The routine cannot guarantee, but in practice usually achieves, the following accuracy:

$$|I-RESULT|<=tol,$$

where

$$tol=max\{|EPSABS|,|EPSREL|*|I|\},$$

and EPSABS and EPSREL are user-specified absolute and relative error tolerances.

Moreover it returns the quantity ABSERR which, in normal circumstances, satisfies:

$$|I-RESULT|<=ABSERR<=tol.$$

8. Further Comments

The time taken by the routine depends on the integrand and on the accuracy required.

If IFAIL /= 0 on exit, then the user may wish to examine the contents of the array W, which contains the end-points of the sub-intervals used by D01APF along with the integral contributions and error estimates over these sub-intervals.

Specifically, for i=1,2,...,n, let r_i denote the approximation to the value of the integral over the sub-interval $[a_i,b_i]$ in the partition of [a,b] and e_i be the corresponding absolute error estimate. Then, $\int_{a_i}^{b_i} f(x)w(x)dx\simeq r_i$ and RESULT= $\sum_{i=1}^{n} r_i$. The value of n is returned in IW(1), and the values a_i, b_i, e_i and r_i are stored consecutively in the array W, that is:

```
                 a =W(i),
                  i

                 b =W(n+i),
                  i

                 e =W(2n+i),
                  i

                 r =W(3n+i).
                  i

          9. Example

          To compute:

                                    1
                                    /
                                    |ln(x)cos(10(pi)x)dx  and
                                    /
                                    0

                                         1
                                         / sin(10x)
                                         | --------dx.
                                         /
                                         0 \/x(1-x)

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

D01AQF(3NAG)      Foundation Library (12/10/92)      D01AQF(3NAG)

     D01 -- Quadrature                                       D01AQF
             D01AQF -- NAG Foundation Library Routine Document

     Note: Before using this routine, please read the Users' Note for
     your implementation to check implementation-dependent details.
     The symbol (*) after a NAG routine name denotes a routine that is
     not included in the Foundation Library.

     1. Purpose

     D01AQF calculates an approximation to the Hilbert transform of a
     function g(x) over [a,b]:

                                  b
                                  / g(x)
                               I= | ----dx
                                  / x-c
                                  a

     for user-specified values of a, b and c.

     2. Specification

            SUBROUTINE D01AQF (G, A, B, C, EPSABS, EPSREL, RESULT,
           1                   ABSERR, W, LW, IW, LIW, IFAIL)
            INTEGER          LW, IW(LIW), LIW, IFAIL
            DOUBLE PRECISION G, A, B, C, EPSABS, EPSREL, RESULT,
           1                 ABSERR, W(LW)
            EXTERNAL         G

     3. Description

     D01AQF is based upon the QUADPACK routine QAWC (Piessens et al
     [3]) and integrates a function of the form g(x)w(x), where the
     weight function

                                        1
                                w(x)= ---
                                      x-c

     is that of the Hilbert transform. (If a<c<b the integral has to
     be interpreted in the sense of a Cauchy principal value.) It is
     an adaptive routine which employs a 'global' acceptance criterion
     (as defined by Malcolm and Simpson [1]). Special care is taken to
```

ensure that c is never the end-point of a sub-interval (Piessens et al[2]). On each sub-interval (c_1,c_2) modified Clenshaw-Curtis integration of orders 12 and 24 is performed if $c_1-d<=c<=c_2+d$ where $d=(c_2-c_1)/20$. Otherwise the Gauss 7-point and Kronrod 15-point rules are used. The local error estimation is described by Piessens et al [3].

5. Parameters

1: G -- DOUBLE PRECISION FUNCTION, supplied by the user. External Procedure
G must return the value of the function g at a given point.

Its specification is:

```
      DOUBLE PRECISION FUNCTION G (X)
      DOUBLE PRECISION X
```

1: X -- DOUBLE PRECISION Input
On entry: the point at which the function g must be evaluated.

G must be declared as EXTERNAL in the (sub)program from which D01AQF is called. Parameters denoted as Input must not be changed by this procedure.

2: A -- DOUBLE PRECISION Input
On entry: the lower limit of integration, a.

3: B -- DOUBLE PRECISION Input
On entry: the upper limit of integration, b. It is not necessary that a<b.

4: C -- DOUBLE PRECISION Input

```
     On entry: the parameter c in the weight function.
     Constraint: C must not equal A or B.

 5:  EPSABS -- DOUBLE PRECISION                         Input
     On entry: the absolute accuracy required. If EPSABS is
     negative, the absolute value is used. See Section 7.

 6:  EPSREL -- DOUBLE PRECISION                         Input
     On entry: the relative accuracy required. If EPSREL is
     negative, the absolute value is used. See Section 7.

 7:  RESULT -- DOUBLE PRECISION                        Output
     On exit: the approximation to the integral I.

 8:  ABSERR -- DOUBLE PRECISION                        Output
     On exit: an estimate of the modulus of the absolute error,
     which should be an upper bound for |I-RESULT|.

 9:  W(LW) -- DOUBLE PRECISION array                   Output
     On exit: details of the computation, as described in
     Section 8.

10:  LW -- INTEGER                                      Input
     On entry:
     the dimension of the array W as declared in the (sub)program
     from which D01AQF is called.
     The value of LW (together with that of LIW below) imposes a
     bound on the number of sub-intervals into which the interval
     of integration may be divided by the routine. The number of
     sub-intervals cannot exceed LW/4. The more difficult the
     integrand, the larger LW should be. Suggested value: LW =
     800 to 2000 is adequate for most problems. Constraint: LW >=
     4.

11:  IW(LIW) -- INTEGER array                          Output
     On exit: IW(1) contains the actual number of sub-intervals
     used. The rest of the array is used as workspace.

12:  LIW -- INTEGER                                     Input
     On entry:
     the dimension of the array IW as declared in the
     (sub)program from which D01AQF is called.
     The number of sub-intervals into which the interval of
     integration may be divided cannot exceed LIW. Suggested
     value: LIW = LW/4. Constraint: LIW >= 1.

13:  IFAIL -- INTEGER                            Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. Users who are
     unfamiliar with this parameter should refer to the Essential
     Introduction for details.
     On exit: IFAIL = 0 unless the routine detects an error or
     gives a warning (see Section 6).

     For this routine, because the values of output parameters
     may be useful even if IFAIL /=0 on exit, users are
     recommended to set IFAIL to -1 before entry. It is then
     essential to test the value of IFAIL on exit.

6. Error Indicators and Warnings

Errors or warnings specified by the routine:

If on entry IFAIL = 0 or -1, explanatory error messages are
output on the current error message unit (as defined by X04AAF).

IFAIL= 1
     The maximum number of subdivisions allowed with the given
     workspace has been reached without the accuracy requirements
     being achieved. Look at the integrand in order to determine
     the integration difficulties. Another integrator which is
     designed for handling the type of difficulty involved, must
     be used. Alternatively consider relaxing the accuracy
     requirements specified by EPSABS and EPSREL, or increasing
     the workspace.

IFAIL= 2
     Round-off error prevents the requested tolerance from being
     achieved. Consider  requesting less accuracy.

IFAIL= 3
     Extremely bad local behaviour of g(x) causes a very strong
     subdivision around one (or more) points of the interval. The
     same advice applies as in the case of IFAIL = 1.

IFAIL= 4
     On entry C = A or C = B.

IFAIL= 5
     On entry LW < 4,

     or       LIW < 1.

7. Accuracy

The routine cannot guarantee, but in practice usually achieves,
the following accuracy:

                        |I-RESULT|<=tol,
```

where

$$tol=\max\{|EPSABS|,|EPSREL|*|I|\},$$

and EPSABS and EPSREL are user-specified absolute and relative error tolerances. Moreover it returns the quantity ABSERR which, in normal circumstances satisfies:

$$|I-RESULT|<=ABSERR<=tol.$$

8. Further Comments

The time taken by the routine depends on the integrand and on the accuracy required.

If IFAIL /= 0 on exit, then the user may wish to examine the contents of the array W, which contains the end-points of the sub-intervals used by D01AQF along with the integral contributions and error estimates over these sub-intervals.

Specifically, for i=1,2,...,n, let r_i denote the approximation to the value of the integral over the sub-interval $[a_i,b_i]$ in the partition of [a,b] and e_i be the corresponding absolute error estimate. Then, $\int_{a_i}^{b_i} g(x)w(x)dx\simeq r_i$ and $RESULT=\sum_{i=1}^{n} r_i$. The value of n is returned in IW(1), and the values a_i, b_i, e_i and r_i are stored consecutively in the array W, that is:

a_i=W(i),

b_i=W(n+i),

e_i=W(2n+i) and

r_i=W(3n+i).

9. Example

```
          To compute the Cauchy principal value of

                                 1
                                 /        dx
                                 |  ----------------.
                                 /    2     2     1
                                 -1 (x +0.01 )(x- -)
                                                  2

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

     D01ASF(3NAG)      Foundation Library (12/10/92)      D01ASF(3NAG)

          D01 -- Quadrature                                          D01ASF
                  D01ASF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          D01ASF calculates an approximation to the sine or the cosine
          transform of a function g over [a,infty):
```

```
   infty
   /
I= |    g(x)||,sin((omega)x)dx  or  I=
   /
   a
 infty
 /
 |    g(x)||,cos((omega)x)dx
 /
 a
```

(for a user-specified value of (omega)).

2. Specification

```
       SUBROUTINE D01ASF (G, A, OMEGA, KEY, EPSABS, RESULT,
      1                   ABSERR, LIMLST, LST, ERLST, RSLST,
      2                   IERLST, W, LW, IW, LIW, IFAIL)
       INTEGER          KEY, LIMLST, LST, IERLST(LIMLST), LW, IW
      1                 (LIW), LIW, IFAIL
       DOUBLE PRECISION G, A, OMEGA, EPSABS, RESULT, ABSERR, ERLST
      1                 (LIMLST), RSLST(LIMLST), W(LW)
       EXTERNAL         G
```

3. Description

D01ASF is based upon the QUADPACK routine QAWFE (Piessens et al [2]). It is an adaptive routine, designed to integrate a function of the form g(x)w(x) over a semi-infinite interval, where w(x) is either sin((omega)x) or cos((omega)x). Over successive intervals

```
                C =[a+(k-1)c,a+kc],   k=1,2,...,LST
                 k
```

integration is performed by the same algorithm as is used by D01ANF. The intervals C are of constant length

```
                      k
```

```
          c={2[|(omega)|]+1}(pi)/|(omega)|,  (omega)/=0
```

where [|(omega)|] represents the largest integer less than or equal to |(omega)|. Since c equals an odd number of half periods, the integral contributions over succeeding intervals will alternate in sign when the function g is positive and monotonically decreasing over [a,infty). The algorithm, described by [2], incorporates a global acceptance criterion (as defined by Malcolm and Simpson [1]) together with the (epsilon)-algorithm (Wynn [3]) to perform extrapolation. The local error estimation is described by Piessens et al [2].

If (omega)=0 and KEY = 1, the routine uses the same algorithm as D01AMF (with EPSREL = 0.0).

In contrast to the other routines in Chapter D01, D01ASF works only with a user-specified absolute error tolerance (EPSABS). Over the interval C_k it attempts to satisfy the absolute accuracy requirement

$$EPSA_k=U_k*EPSABS$$

where $U_k=(1-p)p^{k-1}$, for k=1,2,... and p=0.9.

However, when difficulties occur during the integration over the kth sub-interval C_k such that the error flag IERLST(k) is non-zero, the accuracy requirement over subsequent intervals is relaxed. See Piessens et al [2] for more details.

5. Parameters

1: G -- DOUBLE PRECISION FUNCTION, supplied by the user. External Procedure
G must return the value of the function g at a given point.

Its specification is:

```
      DOUBLE PRECISION FUNCTION G (X)
      DOUBLE PRECISION X
```

1: X -- DOUBLE PRECISION Input
On entry: the point at which the function g must be evaluated.

G must be declared as EXTERNAL in the (sub)program from

```
     which D01ASF is called. Parameters denoted as Input
     must not be changed by this procedure.

 2:  A -- DOUBLE PRECISION                                  Input
     On entry: the lower limit of integration, a.

 3:  OMEGA -- DOUBLE PRECISION                              Input
     On entry: the parameter (omega) in the weight function of
     the transform.

 4:  KEY -- INTEGER                                         Input
     On entry: indicates which integral is to be computed:
          if KEY = 1, w(x)=cos((omega)x);

          if KEY = 2, w(x)=sin((omega)x).
      Constraint: KEY = 1 or 2.

 5:  EPSABS -- DOUBLE PRECISION                             Input
     On entry: the absolute accuracy requirement. If EPSABS is
     negative, the absolute value is used. See Section 7.

 6:  RESULT -- DOUBLE PRECISION                            Output
     On exit: the approximation to the integral I.

 7:  ABSERR -- DOUBLE PRECISION                            Output
     On exit: an estimate of the modulus of the absolute error,
     which should be an upper bound for |I-RESULT|.

 8:  LIMLST -- INTEGER                                      Input
     On entry: an upper bound on the number of intervals C
                                                          k
     needed for the integration. Suggested value: LIMLST = 50 is
     adequate for most problems. Constraint: LIMLST >= 3.

 9:  LST -- INTEGER                                        Output
     On exit: the number of intervals C  actually used for the
                                       k
     integration.

10:  ERLST(LIMLST) -- DOUBLE PRECISION array               Output
     On exit: ERLST(k) contains the error estimate corresponding
     to the integral contribution over the interval C , for
                                                    k
     k=1,2,...,LST.

11:  RSLST(LIMLST) -- DOUBLE PRECISION array               Output
     On exit: RSLST(k) contains the integral contribution over
     the interval C  for k=1,2,...,LST.
                   k
```

12: IERLST(LIMLST) -- INTEGER array Output
On exit: IERLST(k) contains the error flag corresponding to
RSLST(k), for k=1,2,...,LST. See Section 6.

13: W(LW) -- DOUBLE PRECISION array Workspace

14: LW -- INTEGER Input
On entry:
the dimension of the array W as declared in the (sub)program
from which D01ASF is called.
The value of LW (together with that of LIW below) imposes a
bound on the number of sub-intervals into which each
interval C_k may be divided by the routine. The number of
sub-intervals cannot exceed LW/4. The more difficult the
integrand, the larger LW should be. Suggested value: a value
in the range 800 to 2000 is adequate for most problems.
Constraint: LW >= 4.

15: IW(LIW) -- INTEGER array Output
On exit: IW(1) contains the maximum number of sub-intervals
actually used for integrating over any of the intervals C_k.
The rest of the array is used as workspace.

16: LIW -- INTEGER Input
On entry:
the dimension of the array IW as declared in the
(sub)program from which D01ASF is called.
The number of sub-intervals into which each interval C_k may
be divided cannot exceed LIW/2. Suggested value: LIW = LW/2.
Constraint: LIW >= 2.

17: IFAIL -- INTEGER Input/Output
On entry: IFAIL must be set to 0, -1 or 1. Users who are
unfamiliar with this parameter should refer to the Essential
Introduction for details.

On exit: IFAIL = 0 unless the routine detects an error or
gives a warning (see Section 6).

For this routine, because the values of output parameters
may be useful even if IFAIL /=0 on exit, users are
recommended to set IFAIL to -1 before entry. It is then
essential to test the value of IFAIL on exit.

6. Error Indicators and Warnings

Errors or warnings specified by the routine:

```
If on entry IFAIL = 0 or -1, explanatory error messages are
output on the current error message unit (as defined by X04AAF).

IFAIL= 1
     The maximum number of subdivisions allowed with the given
     workspace has been reached without the accuracy requirements
     being achieved. Look at the integrand in order to determine
     the integration difficulties. If the position of a local
     difficulty within the interval can be determined (e.g. a
     singularity of the integrand or its derivative, a peak, a
     discontinuity, etc) you will probably gain from splitting up
     the interval at this point and calling D01ASF on the
     infinite subrange and an appropriate integrator on the
     finite subrange. Alternatively, consider relaxing the
     accuracy requirements specified by EPSABS or increasing the
     amount of workspace.

IFAIL= 2
     Round-off error prevents the requested tolerance from being
     achieved. The error may be underestimated. Consider
     requesting less accuracy.

IFAIL= 3
     Extremely bad local integrand behaviour causes a very strong
     subdivision around one (or more) points of the interval.
     The same advice applies as in the case of IFAIL = 1.

IFAIL= 4
     The requested tolerance cannot be achieved, because the
     extrapolation does not increase the accuracy satisfactorily;
     the returned result is the best which can be obtained.  The
     same advice applies as in the case of IFAIL = 1.

IFAIL= 5
     The integral is probably divergent, or slowly convergent.
     Please note that divergence can occur with any non-zero
     value of IFAIL.

IFAIL= 6
     On entry KEY < 1,

     or       KEY > 2,

     or       LIMLST < 3.

IFAIL= 7
     Bad integration behaviour occurs within one or more of the
     intervals C . Location and type of the difficulty involved
                k
```

can be determined from the vector IERLST (see below).

IFAIL= 8
Maximum number of intervals C_k (= LIMLST) allowed has been achieved. Increase the value of LIMLST to allow more cycles.

IFAIL= 9
The extrapolation table constructed for convergence acceleration of the series formed by the integral contribution over the intervals C_k, does not converge to the required accuracy.

IFAIL= 10
On entry LW < 4,

or LIW < 2.

In the cases IFAIL = 7, 8 or 9, additional information about the cause of the error can be obtained from the array IERLST, as follows:

IERLST(k)=1
The maximum number of subdivisions = min(LW/4,LIW/2) has been achieved on the kth interval.

IERLST(k)=2
Occurrence of round-off error is detected and prevents the tolerance imposed on the kth interval from being achieved.

IERLST(k)=3
Extremely bad integrand behaviour occurs at some points of the kth interval.

IERLST(k)=4
The integration procedure over the kth interval does not converge (to within the required accuracy) due to round-off in the extrapolation procedure invoked on this interval. It is assumed that the result on this interval is the best which can be obtained.

IERLST(k)=5
The integral over the kth interval is probably divergent or slowly convergent. It must be noted that divergence can occur with any other value of IERLST(k).

7. Accuracy

The routine cannot guarantee, but in practice usually achieves,

```
        the following accuracy:

                             |I-RESULT|<=|EPSABS|,

        where EPSABS is the user-specified absolute error tolerance.
        Moreover, it returns the quantity ABSERR, which, in normal
        circumstances, satisfies

                        |I-RESULT|<=ABSERR<=|EPSABS|.

        8. Further Comments

        None.

        9. Example

        To compute

                                infty
                                /      1
                                |     ---cos((pi)x/2)dx.
                                /
                                0     \/x

        The example program is not reproduced here. The source code for
        all example programs is distributed with the NAG Foundation
        Library software and should be available on-line.

     D01BBF(3NAG)                  D01BBF                  D01BBF(3NAG)
```

```
D01 -- Quadrature                                          D01BBF
        D01BBF -- NAG Foundation Library Routine Document

Note: Before using this routine, please read the Users' Note for
your implementation to check implementation-dependent details.
The symbol (*) after a NAG routine name denotes a routine that is
not included in the Foundation Library.

Note for users via the Axiom system: the interface to this routine
has been enhanced for use with Axiom and is slightly different to
that offered in the standard version of the Foundation Library.

1. Purpose

D01BBF returns the weights and abscissae appropriate to a
Gaussian quadrature formula with a specified number of abscissae.
The formulae provided are Gauss-Legendre, Gauss-Rational, Gauss-
Laguerre and Gauss-Hermite.

2. Specification

       SUBROUTINE D01BBF (A, B, ITYPE, N, WEIGHT, ABSCIS, GTYPE,
      1                   IFAIL)
       INTEGER          ITYPE, N, GTYPE, IFAIL
       DOUBLE PRECISION A, B, WEIGHT(N), ABSCIS(N)

3. Description

This routine returns the weights and abscissae for use in the
Gaussian quadrature of a function f(x). The quadrature takes the
form

                           n
                           --
                        S= >  w f(x )
                           --  i   i
                           i=1

where w  are the weights and x  are the abscissae (see Davis and
       i                      i
Rabinowitz [1], Froberg [2], Ralston [3] or Stroud and Secrest
[4]).

Weights and abscissae are available for Gauss-Legendre, Gauss-
Rational, Gauss-Laguerre and Gauss-Hermite quadrature, and for a
selection of values of n (see Section 5).

(a)   Gauss-Legendre Quadrature:
                                 b
```

```
                         /
                     S~= |f(x)dx
                         /

                         a
where a and b are finite and it will be exact for any
function of the form
                         2n-1
                         --     i
                   f(x)= >   c x
                         --   i
                         i=0
```

```
(b)   Gauss-Rational quadrature:
           infty                          a
           /                              /
       S~= |    f(x)dx  (a+b>0)   or   S~= |     f(x)dx  (a+b<0)
           /                              /
           a                              -infty
      and will be exact for any function of the form
                                 2n-1
                                 --              i
                                 >   c      (x+b)
                      2n+1   c      --   2n+1-i
                      --      i     i=0
               f(x)= >    ------= -----------------
                      --        i           2n+1
                      i=2  (x+b)       (x+b)
```

```
(c)   Gauss-Laguerre quadrature, adjusted weights option:
            infty                         a
            /                             /
        S~= |    f(x)dx  (b>0<)   or   S~= |     f(x)dx  (b<0)
            /                             /
            a                             -infty
      and will be exact for any function of the form
                                2n-1
                            -bx --     i
                      f(x)=e    >   c x
                                --   i
                                i=0
```

```
(d)   Gauss-Hermite quadrature, adjusted weights option:
                           +infty
                           /
                       S~= |     f(x)dx
                           /
                           -infty
      and will be exact for any function of the form
```

```
                          2 2n-1
                   -b(x-a)  --     i
             f(x)=e         >   c x   (b>0)
                            --   i
                            i=0
```

(e) Gauss-Laguerre quadrature, normal weights option:

```
      infty                             a
      /     -bx                         /      -bx
  S~= |     e   f(x)dx  (b>0)   or  S~= |      e   f(x)dx
      /                                 /
      a                                 -infty

   (b<0)
```

and will be exact for any function of the form

```
                           2n-1
                           --     i
                     f(x)= >   c x
                           --   i
                           i=0
```

(f) Gauss-Hermite quadrature, normal weights option:

```
                     +infty        2
                     /      -b(x-a)
                 S~= |     e        f(x)dx
                     /
                     -infty
```

and will be exact for any function of the form:

```
                           2n-1
                           --     i
                     f(x)= >   c x
                           --   i
                           i=0
```

Note: that the Gauss-Legendre abscissae, with a=-1, b=+1, are the zeros of the Legendre polynomials; the Gauss-Laguerre abscissae, with a=0, b=1, are the zeros of the Laguerre polynomials; and the Gauss-Hermite abscissae, with a=0, b=1, are the zeros of the Hermite polynomials.

5. Parameters

```
 1:  A -- DOUBLE PRECISION                                  Input

 2:  B -- DOUBLE PRECISION                                  Input
     On entry: the quantities a and b as described in the
     appropriate subsection of Section 3.

 3:  ITYPE -- INTEGER                                       Input
     On entry: indicates the type of weights for Gauss-Laguerre
     or Gauss-Hermite quadrature (see Section 3):

     if ITYPE = 1, adjusted weights will be returned;

     if ITYPE = 0, normal weights will be returned.

     Constraint: ITYPE = 0 or 1.

     For Gauss-Legendre or Gauss-Rational quadrature, this
     parameter is not used.

 4:  N -- INTEGER                                           Input
     On entry: the number of weights and abscissae to be
     returned, n. Constraint: N =
     1,2,3,4,5,6,8,10,12,14,16,20,24,32,48 or 64.

 5:  WEIGHT(N) -- DOUBLE PRECISION array                   Output
     On exit: the N weights. For Gauss-Laguerre and Gauss-
     Hermite quadrature, these will be the adjusted weights if
     ITYPE = 1, and the normal weights if ITYPE = 0.

 6:  ABSCIS(N) -- DOUBLE PRECISION array                   Output
     On exit: the N abscissae.

 7:  GTYPE -- INTEGER                                       Input
     On entry: The value of GTYPE indicates which quadrature
     formula are to be used:
          GTYPE = 0 for Gauss-Legendre weights and abscissae;

          GTYPE = 1 for Gauss-Rational weights and abscissae;
          GTYPE = 2 for Gauss-Laguerre weights and abscissae;

          GTYPE = 3 for Gauss-Hermite weights and abscissae.

 8:  IFAIL -- INTEGER                                Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. For users not
     familiar with this parameter (described in the Essential
     Introduction) the recommended value is 0.

     On exit: IFAIL = 0 unless the routine detects an error (see
     Section 6).

6. Error Indicators and Warnings

Errors detected by the routine:

IFAIL= 1
     The N-point rule is not among those stored. If the soft fail
     option is used, the weights and abscissae returned will be
     those for the largest valid value of N less than the
     requested value, and the excess elements of WEIGHT and
     ABSCIS (i.e., up to the requested N) will be filled with
     zeros.

IFAIL= 2
     The value of A and/or B is invalid.
          Gauss-Rational: A + B = 0

          Gauss-Laguerre: B = 0

          Gauss-Hermite: B <= 0
     If the soft fail option is used the weights and abscissae
     are returned as zero.

IFAIL= 3
     Laguerre and Hermite normal weights only: underflow is
     occurring in evaluating one or more of the normal weights.
     If the soft fail option is used, the underflowing weights
     are returned as zero. A smaller value of N must be used; or
     adjusted weights should be used (ITYPE = 1). In the latter
     case, take care that underflow does not occur when
     evaluating the integrand appropriate for adjusted weights.

IFAIL=4
    GTYPE < 0 or GTYPE > 3

7. Accuracy

The weights and abscissae are stored for standard values of A and
B to full machine accuracy.
```

```
     8. Further Comments

     Timing is negligible.

     9. Example

     This example program returns the abscissae and (adjusted) weights
     for the six-point Gauss-Laguerre formula.

     The example program is not reproduced here. The source code for
     all example programs is distributed with the NAG Foundation
     Library software and should be available on-line.

16.3.11 Multidimensional integrals with finite limits

— nagd.ht —

```
\begin{page}{manpageXXd01fcf}{NAG Documentation: d01fcf}
\beginscroll
\begin{verbatim}

     D01FCF(3NAG)      Foundation Library (12/10/92)      D01FCF(3NAG)

          D01 -- Quadrature                                        D01FCF
                  D01FCF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          D01FCF attempts to evaluate a multi-dimensional integral (up to
          15 dimensions), with constant and finite limits, to a specified
          relative accuracy, using an adaptive subdivision strategy.
```

2. Specification

```
       SUBROUTINE D01FCF (NDIM, A, B, MINPTS, MAXPTS, FUNCTN,
      1                   EPS, ACC, LENWRK, WRKSTR, FINVAL, IFAIL)
       INTEGER          NDIM, MINPTS, MAXPTS, LENWRK, IFAIL
       DOUBLE PRECISION A(NDIM), B(NDIM), FUNCTN, EPS, ACC, WRKSTR
      1                 (LENWRK), FINVAL
       EXTERNAL         FUNCTN
```

3. Description

The routine returns an estimate of a multi-dimensional integral over a hyper-rectangle (i.e., with constant limits), and also an estimate of the relative error. The user sets the relative accuracy required, supplies the integrand as a function subprogram (FUNCTN), and also sets the minimum and maximum acceptable number of calls to FUNCTN (in MINPTS and MAXPTS).

The routine operates by repeated subdivision of the hyper-rectangular region into smaller hyper-rectangles. In each subregion, the integral is estimated using a seventh-degree rule, and an error estimate is obtained by comparison with a fifth-degree rule which uses a subset of the same points. The fourth differences of the integrand along each co-ordinate axis are evaluated, and the subregion is marked for possible future subdivision in half along that co-ordinate axis which has the largest absolute fourth difference.

If the estimated errors, totalled over the subregions, exceed the requested relative error (or if fewer than MINPTS calls to FUNCTN have been made), further subdivision is necessary, and is performed on the subregion with the largest estimated error, that subregion being halved along the appropriate co-ordinate axis.

The routine will fail if the requested relative error level has not been attained by the time MAXPTS calls to FUNCTN have been made; or, if the amount LENWRK of working storage is insufficient. A formula for the recommended value of LENWRK is given in Section 5. If a smaller value is used, and is exhausted in the course of execution, the routine switches to a less efficient mode of operation; only if this mode also breaks down is insufficient storage reported.

D01FCF is based on the HALF subroutine developed by van Dooren and de Ridder [1]. It uses a different basic rule, described by Genz and Malik [2].

for Numerical Integration over an N-dimensional Cube. J. Comput. Appl. Math. 2 207--217.

[2] Genz A C and Malik A A (1980) An Adaptive Algorithm for Numerical Integration over an N-dimensional Rectangular Region. J. Comput. Appl. Math. 6 295--302.

5. Parameters

1: NDIM -- INTEGER Input
On entry: the number of dimensions of the integral, n.
Constraint: 2 <= NDIM <= 15.

2: A(NDIM) -- DOUBLE PRECISION array Input
On entry: the lower limits of integration, a_i, for i=1,2,...,n.

3: B(NDIM) -- DOUBLE PRECISION array Input
On entry: the upper limits of integration, b_i, for i=1,2,...,n.

4: MINPTS -- INTEGER Input/Output
On entry: MINPTS must be set to the minimum number of integrand evaluations to be allowed. On exit: MINPTS contains the actual number of integrand evaluations used by D01FCF.

5: MAXPTS -- INTEGER Input
On entry: the maximum number of integrand evaluations to be allowed.
Constraints:

MAXPTS >= MINPTS

MAXPTS >= (alpha),

where $(alpha)=2^{NDIM}+2*NDIM^2+2*NDIM+1$.

6: FUNCTN -- DOUBLE PRECISION FUNCTION, supplied by the user.
External Procedure
FUNCTN must return the value of the integrand f at a given point.

Its specification is:

```
DOUBLE PRECISION FUNCTION FUNCTN (NDIM,Z)
INTEGER          NDIM
```

```
                DOUBLE PRECISION Z(NDIM)

           1:  NDIM -- INTEGER                                  Input
               On entry: the number of dimensions of the integral, n.

           2:  Z(NDIM) -- DOUBLE PRECISION array                Input
               On entry: the co-ordinates of the point at which the
               integrand must be evaluated.
          FUNCTN must be declared as EXTERNAL in the (sub)program
          from which D01FCF is called. Parameters denoted as
          Input must not be changed by this procedure.

      7:  EPS -- DOUBLE PRECISION                               Input
          On entry: the relative error acceptable to the user. When
          the solution is zero or very small relative accuracy may not
          be achievable but the user may still set EPS to a reasonable
          value and check for the error exit IFAIL = 2. Constraint:
          EPS > 0.0.

      8:  ACC -- DOUBLE PRECISION                              Output
          On exit: the estimated relative error in FINVAL.

      9:  LENWRK -- INTEGER                                     Input
          On entry:
          the dimension of the array WRKSTR as declared in the
          (sub)program from which D01FCF is called.
          Suggested value: for maximum efficiency, LENWRK >=
          (NDIM+2)*(1+MAXPTS/(alpha)) (see parameter MAXPTS for
          (alpha)).

          If LENWRK is less than this, the routine will usually run
          less efficiently and may fail. Constraint: LENWRK>=2*NDIM+4.

     10:  WRKSTR(LENWRK) -- DOUBLE PRECISION array          Workspace

     11:  FINVAL -- DOUBLE PRECISION                           Output
          On exit: the best estimate obtained for the integral.

     12:  IFAIL -- INTEGER                               Input/Output
          On entry: IFAIL must be set to 0, -1 or 1. Users who are
          unfamiliar with this parameter should refer to the Essential
          Introduction for details.
          On exit: IFAIL = 0 unless the routine detects an error or
          gives a warning (see Section 6).

          For this routine, because the values of output parameters
          may be useful even if IFAIL /=0 on exit, users are
          recommended to set IFAIL to -1 before entry. It is then
          essential to test the value of IFAIL on exit. To suppress
          the output of an error message when soft failure occurs, set
```

IFAIL to 1.

6. Error Indicators and Warnings

Errors or warnings specified by the routine:

IFAIL= 1

On entry NDIM < 2,

or NDIM > 15,

or MAXPTS is too small,

or LENWRK<2*NDIM+4,

or EPS <= 0.0.

IFAIL= 2

MAXPTS was too small to obtain the required relative accuracy EPS. On soft failure, FINVAL and ACC contain estimates of the integral and the relative error, but ACC will be greater than EPS.

IFAIL= 3

LENWRK was too small. On soft failure, FINVAL and ACC contain estimates of the integral and the relative error, but ACC will be greater than EPS.

7. Accuracy

A relative error estimate is output through the parameter ACC.

8. Further Comments

Execution time will usually be dominated by the time taken to evaluate the integrand FUNCTN, and hence the maximum time that could be taken will be proportional to MAXPTS.

9. Example

This example program estimates the integral

$$\int_0^1\int_0^1\int_0^1\int_0^1 \frac{4z_1z_3^2\exp(2z_1z_3)}{(1+z_2+z_4)^2}\,dz_4\,dz_3\,dz_2\,dz_1=0.575364.$$

```
          The accuracy requested is one part in 10,000.

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

\end{verbatim}

\end{page}
```

———

16.3.12 Third-order finite-difference integration

— nagd.ht —

```
\begin{page}{manpageXXd01gaf}{NAG Documentation: d01gaf}
\beginscroll
\begin{verbatim}

     D01GAF(3NAG)      Foundation Library (12/10/92)      D01GAF(3NAG)

          D01 -- Quadrature                                      D01GAF
                  D01GAF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          D01GAF integrates a function which is specified numerically at
          four or more points, over the whole of its specified range, using
          third-order finite-difference formulae with error estimates,
          according to a method due to Gill and Miller.

          2. Specification

                 SUBROUTINE D01GAF (X, Y, N, ANS, ER, IFAIL)
                 INTEGER          N, IFAIL
                 DOUBLE PRECISION X(N), Y(N), ANS, ER
```

3. Description

This routine evaluates the definite integral

$$I=\int_{x_1}^{x_n} y(x)dx,$$

where the function y is specified at the n-points $x_1,x_2,...,x_n$, which should be all distinct, and in either ascending or descending order. The integral between successive points is calculated by a four-point finite-difference formula centred on the interval concerned, except in the case of the first and last intervals, where four-point forward and backward difference formulae respectively are employed. If n is less than 4, the routine fails. An approximation to the truncation error is integrated and added to the result. It is also returned separately to give an estimate of the uncertainty in the result. The method is due to Gill and Miller.

4. References

[1] Gill P E and Miller G F (1972) An Algorithm for the Integration of Unequally Spaced Data. Comput. J. 15 80--83.

5. Parameters

1: X(N) -- DOUBLE PRECISION array Input
On entry: the values of the independent variable, i.e., the $x_1,x_2,...,x_n$. Constraint: either X(1) < X(2) <... < X(N) or X(1) > X(2) >... > X(N).

2: Y(N) -- DOUBLE PRECISION array Input
On entry: the values of the dependent variable y_i at the points x_i, for i=1,2,...,n.

3: N -- INTEGER Input
On entry: the number of points, n. Constraint: N >= 4.

4: ANS -- DOUBLE PRECISION Output
On exit: the estimate of the integral.

```
 5:  ER -- DOUBLE PRECISION                                Output
     On exit: an estimate of the uncertainty in ANS.

 6:  IFAIL -- INTEGER                                Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. For users not
     familiar with this parameter (described in the Essential
     Introduction) the recommended value is 0.

     On exit: IFAIL = 0 unless the routine detects an error (see
     Section 6).
```

6. Error Indicators and Warnings

Errors detected by the routine:

IFAIL= 1
     Indicates that fewer than four-points have been supplied to
     the routine.

IFAIL= 2
     Values of X are neither strictly increasing nor strictly
     decreasing.

IFAIL= 3
     Two points have the same X-value.

No error is reported arising from the relative magnitudes of ANS and ER on return, due to the difficulty when the true answer is zero.

7. Accuracy

No accuracy level is specified by the user before calling the routine but on return ABS(ER) is an approximation to, but not necessarily a bound for, |I-ANS|. If on exit IFAIL > 0, both ANS and ER are returned as zero.

8. Further Comments

The time taken by the routine depends on the number of points supplied, n.

In their paper, Gill and Miller [1] do not add the quantity ER to ANS before return. However, extensive tests have shown that a dramatic reduction in the error often results from such addition. In other cases, it does not make an improvement, but these tend to be cases of low accuracy in which the modified answer is not significantly inferior to the unmodified one. The user has the option of recovering the Gill-Miller answer by subtracting ER from ANS on return from the routine.

```
          9. Example

          The example program evaluates the integral

                                    1
                                    /  4
                                    | ----dx=(pi)
                                    /    2
                                    0 1+x

          reading in the function values at 21 unequally-spaced points.

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

          1. Purpose
```

D01GBF returns an approximation to the integral of a function over a hyper-rectangular region, using a Monte Carlo method. An approximate relative error estimate is also returned. This routine is suitable for low accuracy work.

2. Specification

```
       SUBROUTINE D01GBF (NDIM, A, B, MINCLS, MAXCLS, FUNCTN,
      1                   EPS, ACC, LENWRK, WRKSTR, FINEST, IFAIL)
       INTEGER          NDIM, MINCLS, MAXCLS, LENWRK, IFAIL
       DOUBLE PRECISION A(NDIM), B(NDIM), FUNCTN, EPS, ACC, WRKSTR
      1                 (LENWRK), FINEST
       EXTERNAL         FUNCTN
```

3. Description

D01GBF uses an adaptive Monte Carlo method based on the algorithm described by Lautrup [1]. It is implemented for integrals of the form:

$$\int_{a_1}^{b_1}\int_{a_2}^{b_2}\dots\int_{a_n}^{b_n} f(x_1,x_2,\dots,x_n)dx_n\dots dx_2\,dx_1 .$$

Upon entry, unless LENWRK has been set to the minimum value 10*NDIM, the routine subdivides the integration region into a number of equal volume subregions. Inside each subregion the integral and the variance are estimated by means of pseudo-random sampling. All contributions are added together to produce an estimate for the whole integral and total variance. The variance along each co-ordinate axis is determined and the routine uses this information to increase the density and change the widths of the sub-intervals along each axis, so as to reduce the total variance. The total number of subregions is then increased by a factor of two and the program recycles for another iteration. The program stops when a desired accuracy has been reached or too many integral evaluations are needed for the next cycle.

4. References

[1] Lautrup B (1971) An Adaptive Multi-dimensional Integration Procedure. Proc. 2nd Coll. on Advanced Methods in Theoretical Physics, Marseille.

5. Parameters

```
1:  NDIM -- INTEGER                                         Input
    On entry: the number of dimensions of the integral, n.
    Constraint: NDIM >= 1.

2:  A(NDIM) -- DOUBLE PRECISION array                       Input
    On entry: the lower limits of integration, a , for
                                                i
    i=1,2,...,n.

3:  B(NDIM) -- DOUBLE PRECISION array                       Input
    On entry: the upper limits of integration, b , for
                                                i
    i=1,2,...,n.

4:  MINCLS -- INTEGER                                Input/Output
    On entry: MINCLS must be set:

    either to the minimum number of integrand evaluations to be
    allowed, in which case MINCLS >= 0;

    or to a negative value. In this case the routine assumes
    that a previous call had been made with the same parameters
    NDIM, A and B and with either the same integrand (in which
    case D01GBF continues calculation) or a similar integrand
    (in which case D01GBF begins the calculation with the
    subdivision used in the last iteration of the previous call)
    . See also WRKSTR. On exit: MINCLS contains the number of
    integrand evaluations actually used by D01GBF.

5:  MAXCLS -- INTEGER                                       Input
    On entry: the maximum number of integrand evaluations to be
    allowed. In the continuation case this is the number of new
    integrand evaluations to be allowed. These counts do not
    include zero integrand values.
    Constraints:
             MAXCLS > MINCLS,

             MAXCLS >= 4*(NDIM+1).

6:  FUNCTN -- DOUBLE PRECISION FUNCTION, supplied by the user.
                                                External Procedure
    FUNCTN must return the value of the integrand f at a given
    point.

    Its specification is:

           DOUBLE PRECISION FUNCTION FUNCTN (NDIM, X)
           INTEGER          NDIM
           DOUBLE PRECISION X(NDIM)
```

```
         1:  NDIM -- INTEGER                                   Input
             On entry: the number of dimensions of the integral, n.

         2:  X(NDIM) -- DOUBLE PRECISION array                 Input
             On entry: the co-ordinates of the point at which the
             integrand must be evaluated.
        FUNCTN must be declared as EXTERNAL in the (sub)program
        from which D01GBF is called. Parameters denoted as
        Input must not be changed by this procedure.

   7:   EPS -- DOUBLE PRECISION                                Input
        On entry: the relative accuracy required. Constraint: EPS
        >= 0.0.

   8:   ACC -- DOUBLE PRECISION                               Output
        On exit: the estimated relative accuracy of FINEST.

   9:   LENWRK -- INTEGER                                      Input
        On entry:
        the dimension of the array WRKSTR as declared in the
        (sub)program from which D01GBF is called.
        For maximum efficiency, LENWRK should be about
                                   1/NDIM
                     3*NDIM*(MAXCLS/4)      +7*NDIM.
        If LENWRK is given the value 10*NDIM then the subroutine
        uses only one iteration of a crude Monte Carlo method with
        MAXCLS sample points. Constraint: LENWRK >= 10*NDIM.

  10:   WRKSTR(LENWRK) -- DOUBLE PRECISION array        Input/Output
        On entry: if MINCLS<0, WRKSTR must be unchanged from the
        previous call of D01GBF - except that for a new integrand
        WRKSTR(LENWRK) must be set to 0.0. See also MINCLS. On
        exit: WRKSTR contains information about the current sub-
        interval structure which could be used in later calls of
        D01GBF. In particular, WRKSTR(j) gives the number of sub-
        intervals used along the jth co-ordinate axis.

  11:   FINEST -- DOUBLE PRECISION                            Output
        On exit: the best estimate obtained for the integral.

  12:   IFAIL -- INTEGER                                Input/Output
        On entry: IFAIL must be set to 0, -1 or 1. Users who are
        unfamiliar with this parameter should refer to the Essential
        Introduction for details.

        On exit: IFAIL = 0 unless the routine detects an error or
        gives a warning (see Section 6).

        For this routine, because the values of output parameters
        may be useful even if IFAIL /=0 on exit, users are
```

```
     recommended to set IFAIL to -1 before entry. It is then
     essential to test the value of IFAIL on exit. To suppress
     the output of an error message when soft failure occurs, set
     IFAIL to 1.

6. Error Indicators and Warnings

Errors or warnings specified by the routine:

IFAIL= 1
     On entry NDIM < 1,

     or       MINCLS >= MAXCLS,

     or       LENWRK < 10*NDIM,

     or       MAXCLS < 4*(NDIM+1),

     or       EPS < 0.0.

IFAIL= 2
     MAXCLS was too small for D01GBF to obtain the required
     relative accuracy EPS. In this case D01GBF returns a value
     of FINEST with estimated relative error ACC, but ACC will be
     greater than EPS. This error exit may be taken before MAXCLS
     non-zero integrand evaluations have actually occurred, if
     the routine calculates that the current estimates could not
     be improved before MAXCLS was exceeded.

7. Accuracy

A relative error estimate is output through the parameter ACC.
The confidence factor is set so that the actual error should be
less than ACC 90% of the time. If a user desires a higher
confidence level then a smaller value of EPS should be used.

8. Further Comments

The running time for D01GBF will usually be dominated by the time
used to evaluate the integrand FUNCTN, so the maximum time that
could be used is approximately proportional to MAXCLS.

For some integrands, particularly those that are poorly behaved
in a small part of the integration region, D01GBF may terminate
with a value of ACC which is significantly smaller than the
actual relative error. This should be suspected if the returned
value of MINCLS is small relative to the expected difficulty of
the integral. Where this occurs, D01GBF should be called again,
but with a higher entry value of MINCLS (e.g. twice the returned
value) and the results compared with those from the previous
```

```
          call.

          The exact values of FINEST and ACC on return will depend (within
          statistical limits) on the sequence of random numbers generated
          within D01GBF by calls to G05CAF. Separate runs will produce
          identical answers unless the part of the program executed prior
          to calling D01GBF also calls (directly or indirectly) routines
          from Chapter G05, and the series of such calls differs between
          runs. If desired, the user may ensure the identity or difference
          between runs of the results returned by D01GBF, by calling G05CBF
          or G05CCF respectively, immediately before calling D01GBF.

          9. Example

          This example program calculates the integral

                  1  1  1  1  4x x exp(2x x )
                  /  /  /  /    1 3      1 3
                  |  |  |  |  ---------------dx dx dx dx =0.575364.
                  /  /  /  /            2     1  2  3  4
                  0  0  0  0    (1+x +x )
                                    2  4

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

D02 -- Ordinary Differential Equations   Introduction -- D02

Chapter D02
Ordinary Differential Equations

1. Scope of the Chapter

This chapter is concerned with the numerical solution of ordinary differential equations. There are two main types of problem, those in which all boundary conditions are specified at one point (initial-value problems), and those in which the boundary conditions are distributed between two or more points (boundary-value problems and eigenvalue problems). Routines are available for initial-value problems, two-point boundary-value problems and Sturm-Liouville eigenvalue problems.

2. Background to the Problems

For most of the routines in this chapter a system of ordinary differential equations must be written in the form

$$y'_1 = f_1(x,y_1,y_2,...,y_n),$$

$$y'_2 = f_2(x,y_1,y_2,...,y_n),$$

$$.. ...$$

$$y'_n = f_n(x,y_1,y_2,...y_n),$$

that is the system must be given in first-order form. The n dependent variables (also, the solution) $y_1,y_2,...,y_n$ are functions of the independent variable x, and the differential equations give expressions for the first derivatives $y'_i=dy_i/dx$ in terms of x and $y_1,y_2,...,y_n$. For a system of n first-order equations, n associated boundary conditions are usually required to define the solution.

A more general system may contain derivatives of higher order, but such systems can almost always be reduced to the first-order form by introducing new variables. For example, suppose we have the third-order equation

$$z'''+zz''+k(l-z'^2)=0.$$

We write y_1=z, y_2=z', y_3=z'', and the third order equation may then be written as the system of first-order equations

$$y'_1 = y_2$$

$$y'_2 = y_3$$

$$y'_3 = -y_1 y_3 - k(1-y_2^2).$$

For this system n = 3 and we require 3 boundary conditions in order to define the solution. These conditions must specify values of the dependent variables at certain points. For example, we have an initial-value problem if the conditions are:

$y_1 = 0$ at x=0

$y_2 = 0$ at x=0

$y_3 = 0.1$ at x=0.

These conditions would enable us to integrate the equations numerically from the point x=0 to some specified end-point. We have a boundary-value problem if the conditions are:

$y_1 = 0$ at x=0

$y_2 = 0$ at x=0

$y_2 = 1$ at x=10.

These conditions would be sufficient to define a solution in the range 0<=x<=10, but the problem could not be solved by direct integration (see Section 2.2). More general boundary conditions are permitted in the boundary-value case.

2.1. Initial-value Problems

To solve first-order systems, initial values of the dependent variables y_i, for i=1,2,...,n must be supplied at a given point, i

a. Also a point, b, at which the values of the dependent variables are required, must be specified. The numerical solution is then obtained by a step-by-step calculation which approximates values of the variables y_i, for i=1,2,...,n at finite intervals over the required range [a,b]. The routines in this chapter adjust the step length automatically to meet specified accuracy tolerances. Although the accuracy tests used are reliable over each step individually, in general an accuracy requirement cannot be guaranteed over a long range. For many problems there may be no serious accumulation of error, but for unstable systems small perturbations of the solution will often lead to rapid divergence of the calculated values from the true values. A simple check for stability is to carry out trial calculations with different tolerances; if the results differ appreciably the system is probably unstable. Over a short range, the difficulty may possibly be overcome by taking sufficiently small tolerances, but over a long range it may be better to try to reformulate the problem.

A special class of initial-value problems are those for which the solutions contain rapidly decaying transient terms. Such problems are called stiff; an alternative way of describing them is to say that certain eigenvalues of the Jacobian matrix (ddf_i/ddy_j) have large negative real parts when compared to others. These problems require special methods for efficient numerical solution; the methods designed for non-stiff problems when applied to stiff problems tend to be very slow, because they need small step lengths to avoid numerical instability. A full discussion is given in Hall and Watt [6] and a discussion of the methods for stiff problems is given in Berzins, Brankin and Gladwell [1].

2.2. Boundary-value Problems

A full discussion of the design of the methods and codes for boundary-value problems is given in Gladwell [4]. In general, a system of nonlinear differential equations with boundary conditions given at two or more points cannot be guaranteed to have a solution. The solution has to be determined iteratively (if it exists). Finite-difference equations are set up on a mesh of points and estimated values for the solution at the grid points are chosen. Using these estimated values as starting values a Newton iteration is used to solve the finite-difference equations. The accuracy of the solution is then improved by deferred corrections or the addition of points to the mesh or a combination of both. Good initial estimates of the solution may be required in some cases but results may be difficult to compute when the solution varies very rapidly over short ranges. A discussion is given in Chapters 9 and 11 of Gladwell and Sayers [5] and Chapter 4 of Childs et al [2].

2.3. Eigenvalue Problems

Sturm-Liouville problems of the form

```
(p(x)y')'+q(x,(lambda))y=0
```

with appropriate boundary conditions given at two points, can be solved by a Scaled Pruefer method. In this method the differential equation is transformed to another which can be solved for a specified eigenvalue by a shooting method. A discussion is given in Chapter 11 of Gladwell and Sayers [5] and a complete description is given in Pryce [7].

3. Recommendations on Choice and Use of Routines

There are no routines which deal directly with COMPLEX equations. These may however be transformed to larger systems of real equations of the required form. Split each equation into its real and imaginary parts and solve for the real and imaginary parts of each component of the solution. Whilst this process doubles the size of the system and may not always be appropriate it does make available for use the full range of routines provided presently.

3.1. Initial-value Problems

For simple first-order problems with low accuracy requirements, that is problems on a short range of integration, with derivative functions f_i which are inexpensive to calculate and where only a few correct figures are required, the best routines to use are likely to be the Runge-Kutta-Merson (RK) routines, D02BBF and D02BHF. For larger problems, over long ranges or with high accuracy requirements the variable-order, variable-step Adams routine D02CJF should usually be preferred. For stiff equations, that is those with rapidly decaying transient solutions, the Backward Differentiation Formula (BDF) variable-order, variable-step routine D02EJF should be used.

There are four routines for initial-value problems, two of which use the Runge-Kutta-Merson method:

D02BBF	integrates a system of first order ordinary differential equations over a range with intermediate output and a choice of error control
D02BHF	integrates a system of first order ordinary differential equations with a choice of error control until a position is determined where a function of the solution is zero.

one uses an Adams method:

D02CJF	combines the functionality of D02BBF and D02BHF

and one uses a BDF method:

D02EJF	combines the functionality of D02BBF and D02BHF.

3.2. Boundary-value Problems

D02GAF may be used for simple boundary-value problems with assigned boundary values. The user may find that convergence is difficult to achieve using D02GAF since only specifying the unknown boundary values and the position of the finite-difference mesh is permitted. In such cases the user may use D02RAF which permits specification of an initial estimate for the solution at all mesh points and allows the calculation to be influenced in other ways too. D02RAF is designed to solve a general nonlinear two-point boundary value problem with nonlinear boundary conditions.

```
          A routine, D02GBF, is also supplied specifically for the general
          linear two-point boundary-value problem written in a standard

          The user is advised to use interpolation routines from the E01
          Chapter to obtain solution values at points not on the final
          mesh.

          3.3. Eigenvalue Problems

          There is one general purpose routine for eigenvalue problems,
          D02KEF. It may be used to solve regular or singular second-order
          Sturm-Liouville problems on a finite or infinite range.
          Discontinous coefficient functions can be treated and
          eigenfunctions can be computed.

     D02 -- Ordinary Differential Equations                    D02BBF
             D02BBF -- NAG Foundation Library Routine Document

     Note: Before using this routine, please read the Users' Note for
     your implementation to check implementation-dependent details.
     The symbol (*) after a NAG routine name denotes a routine that is
     not included in the Foundation Library.

     Note for users via the Axiom system: the interface to this routine
     has been enhanced for use with Axiom and is slightly different to
     that offered in the standard version of the Foundation Library.

     1. Purpose

     D02BBF integrates a system of first-order ordinary differential
     equations over an interval with suitable initial conditions,
     using a Runge-Kutta-Merson method, and returns the solution at
     points specified by the user.

     2. Specification

            SUBROUTINE D02BBF (X, XEND, M, N, Y, TOL, IRELAB, RESULT,
           1                   FCN, OUTPUT, W, IFAIL)
            INTEGER          M, N, IRELAB, IFAIL
            DOUBLE PRECISION X, XEND, Y(N), TOL, W(N,7), RESULT(M,N)
            EXTERNAL         FCN, OUTPUT

     3. Description
```

The routine integrates a system of ordinary differential equations

$$y'_i = f_i(x, y_1, y_2, ..., y_n) \quad i=1,2,...,n$$

from x = X to x = XEND using a Merson form of the Runge-Kutta method. The system is defined by a subroutine FCN supplied by the user, which evaluates f_i in terms of x and $y_1, y_2, ..., y_n$, and the values of $y_1, y_2, ..., y_n$ must be given at x = X.

The solution is returned via the user-supplied routine OUTPUT at a set of points specified by the user. This solution is obtained by quintic Hermite interpolation on solution values produced by the Runge-Kutta method.

The accuracy of the integration and, indirectly, the interpolation is controlled by the parameters TOL and IRELAB.

For a description of Runge-Kutta methods and their practical implementation see Hall and Watt [1].

5. Parameters

1: X -- DOUBLE PRECISION Input/Output
On entry: X must be set to the initial value of the independent variable x. On exit: XEND, unless an error has occurred, when it contains the value of x at the error.

2: XEND -- DOUBLE PRECISION Input
On entry: the final value of the independent variable. If XEND < X on entry, integration will proceed in a negative direction.

3: M -- INTEGER Input
On entry: the first dimension of the array RESULT. This will usually be equal to the number of points at which the solution is required.
Constraint: M > 0.

4: N -- INTEGER Input
On entry: the number of differential equations.
Constraint: N > 0.

5: Y(N) -- DOUBLE PRECISION array Input/Output
On entry: the initial values of the solution $y_1,y_2,...,y_n$.
On exit: the computed values of the solution at the final value of X.

6: TOL -- DOUBLE PRECISION Input/Output
On entry: TOL must be set to a positive tolerance for controlling the error in the integration.

D02BBF has been designed so that, for most problems, a reduction in TOL leads to an approximately proportional reduction in the error in the solution at XEND. The relation between changes in TOL and the error at intermediate output points is less clear, but for TOL small enough the error at intermediate output points should also be approximately proportional to TOL. However, the actual relation between TOL and the accuracy achieved cannot be guaranteed. The user is strongly recommended to call D02BBF with more than one value for TOL and to compare the results obtained to estimate their accuracy. In the absence of any prior knowledge, the user might compare the results obtained by calling D02BBF with $TOL=10.0^{-p}$ and $TOL=10.0^{-p-1}$ if p correct decimal digits in the solution are required. Constraint: TOL > 0.0. On exit: normally unchanged. However if the range X to XEND is so short that a small change in TOL is unlikely to make any change in the computed solution then, on return, TOL has its sign changed. This should be treated as a warning that the computed solution is likely to be more accurate than would be produced by using the same value of TOL on a longer range of integration.

7: IRELAB -- INTEGER Input
On entry: IRELAB determines the type of error control. At each step in the numerical solution an estimate of the local error, EST, is made. For the current step to be accepted the following condition must be satisfied:
IRELAB = 0
    $EST=10.0<=TOL*max\{1.0,|y_1|,|y_2|,...,|y_n|\}$;

IRELAB = 1
    EST <= TOL;

IRELAB = 2
    $EST<=TOL*max\{(epsilon),|y_1|,|y_2|,...,|y_n|\}$, where
    (epsilon) is machine precision.

```
     If the appropriate condition is not satisfied, the step size
     is reduced and the solution is recomputed on the current
     step.

     If the user wishes to measure the error in the computed
     solution in terms of the number of correct decimal places,
     then IRELAB should be given the value 1 on entry, whereas if
     the error requirement is in terms of the number of correct
     significant digits, then IRELAB should be given the value 2.
     Where there is no preference in the choice of error test
     IRELAB = 0 will result in a mixed error test. Constraint: 0
     <= IRELAB <= 2.

  8: RESULT(M,N) -- DOUBLE PRECISION array                 Output
     On exit: the computed values of the solution at the points
     given by OUTPUT.

  9: FCN -- SUBROUTINE, supplied by the user.
                                           External Procedure
     FCN must evaluate the functions f  (i.e., the derivatives
                                      i
     y' ) for given values of its arguments x,y ,...,y .
       i                                       1      n

     Its specification is:

            SUBROUTINE FCN (X, Y, F)
            DOUBLE PRECISION X, Y(n), F(n)

     where n is the actual value of N in the call of D02BBF.

      1:  X -- DOUBLE PRECISION                              Input
          On entry: the value of the argument x.

      2:  Y(*) -- DOUBLE PRECISION array                     Input
          On entry: the value of the argument y , for
                                               i
          i=1,2,...,n.

      3:  F(*) -- DOUBLE PRECISION array                    Output
          On exit: the value of f , for i=1,2,...,n.
                                 i
     FCN must be declared as EXTERNAL in the (sub)program
     from which D02BBF is called. Parameters denoted as
     Input must not be changed by this procedure.

 10: OUTPUT -- SUBROUTINE, supplied by the user.
                                           External Procedure
     OUTPUT allows the user to have access to intermediate values
     of the computed solution at successive points specified by the
```

```
user. These solution values may be returned to the user via
the array RESULT if desired (this is a non-standard feature
added for use with the Axiom system).  OUTPUT is initially
called by D02BBF with XSOL = X (the initial value of x). The
user must reset XSOL to the next point where OUTPUT is to be
called, and so on at each call to OUTPUT. If, after a call
to OUTPUT, the reset point XSOL is beyond XEND, D02BBF will
integrate to XEND with no further calls to OUTPUT; if a call
to OUTPUT is required at the point XSOL = XEND, then XSOL
must be given precisely the value XEND.

Its specification is:

     SUBROUTINE OUTPUT(XSOL,Y,COUNT,M,N,RESULT)
     DOUBLE PRECISION Y(N),RESULT(M,N),XSOL
     INTEGER M,N,COUNT

 1:  XSOL -- DOUBLE PRECISION                   Input/Output
     On entry: the current value of the independent
     variable x. On exit: the next value of x at which
     OUTPUT is to be called.

 2:  Y(N) -- DOUBLE PRECISION array                    Input
     On entry: the computed solution at the point XSOL.

 3:  COUNT -- INTEGER                           Input/Output
     On entry: Zero if OUTPUT has not been called before, or
     the previous value of COUNT.
     On exit: A new value of COUNT: this can be used to keep
     track of the number of times OUTPUT has been called.

 4:  M -- INTEGER                                      Input
     On entry: The first dimension of RESULT.

 5:  N -- INTEGER                                      Input
     On entry: The dimension of Y.

 6:  RESULT(M,N) -- DOUBLE PRECISION array      Input/Output
     On entry: the previous contents of RESULT.
     On exit: RESULT may be used to return the values of the
     intermediate solutions to the user.

OUTPUT must be declared as EXTERNAL in the (sub)program
from which D02BBF is called. Parameters denoted as
Input must not be changed by this procedure.

11:  W(N,7) -- DOUBLE PRECISION array                Workspace

12:  IFAIL -- INTEGER                             Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. For users not
familiar with this parameter (described in the Essential
Introduction) the recommended value is 0.

On exit: IFAIL = 0 unless the routine detects an error (see
Section 6).

6. Error Indicators and Warnings

Errors detected by the routine:

IFAIL= 1
On entry TOL <= 0,

or       N <= 0,

or       IRELAB /= 0, 1 or 2.

IFAIL= 2
With the given value of TOL, no further progress can be made
across the integration range from the current point x = X,
or the dependence of the error on TOL would be lost if
further progress across the integration range were attempted
(see Section 8 for a discussion of this error exit). The
components Y(1),Y(2),...,Y(n) contain the computed values of
the solution at the current point x = X.

IFAIL= 3
TOL is too small for the routine to take an initial step
(see Section 8). X and Y(1),Y(2),...,Y(n) retain their
initial values.

IFAIL= 4
X = XEND and XSOL /= X after the initial call to OUTPUT.

IFAIL= 5
A value of XSOL returned by OUTPUT lies behind the previous
value of XSOL in the direction of integration.

IFAIL= 6
A serious error has occurred in an internal call to
D02PAF(*). Check all subroutine calls and array dimensions.
Seek expert help.

IFAIL= 7
A serious error has occurred in an internal call to
D02XAF(*). Check all subroutine calls and array dimensions.
Seek expert help.

7. Accuracy
```

The accuracy depends on TOL, on the mathematical properties of the differential system, on the length of the range of integration and on the method. It can be controlled by varying TOL but the approximate proportionality of the error to TOL holds only for a restricted range of values of TOL. For TOL too large, the underlying theory may break down and the result of varying TOL may be unpredictable. For TOL too small, rounding errors may affect the solution significantly and an error exit with IFAIL = 2 or IFAIL = 3 is possible.

At the intermediate output points the same remarks apply. For large values of TOL it is possible that the errors at some intermediate output points may be much larger than at XEND. In any case, it must not be expected that the error will have the same size at all output points. At any point, it is a combination of the errors arising from the integration of the differential equation and the interpolation. The effect of combining these errors will vary, though in most cases the integration error will dominate.

The user who requires a more reliable estimate of the accuracy achieved than can be obtained by varying TOL, is recommended to call D02BDF(*) where both the solution and a global error estimate are computed.

8. Further Comments

The time taken by the routine depends on the complexity and mathematical properties of the system of differential equations defined by FCN, on the range, the tolerance and the number of calls to OUTPUT. There is also an overhead of the form a+b*n where a and b are machine-dependent computing times.

If the routine fails with IFAIL = 3, then it can be called again with a larger value of TOL (if this has not already been tried). If the accuracy requested is really needed and cannot be obtained with this routine, the system may be very stiff (see below) or so badly scaled that it cannot be solved to the required accuracy.

If the routine fails with IFAIL = 2, it is probable that it has been called with a value of TOL which is so small that the solution cannot be obtained on the range X to XEND. This can happen for well-behaved systems and very small values of TOL. The user should, however, consider whether there is a more fundamental difficulty. For example:

(a) in the region of a singularity (infinite value) of the solution, the routine will usually stop with IFAIL = 2, unless overflow occurs first. If overflow occurs using D02BBF, D02PAF(*) can be used instead to trap the increasing solution before overflow occurs. In any case, numerical integration cannot be continued through a singularity, and analytic treatment should be considered;

(b) for 'stiff' equations, where the solution contains rapidly decaying components, the routine will use very small steps in x (internally to D02BBF) to preserve stability. This will usually exhibit itself by making the computing time excessively long, or occasionally by an exit with IFAIL = 2. Merson's method is not efficient in such cases, and the user should try using D02EBF(*) (Backward Differentiation Formula). To determine whether a problem is stiff, D02BDF(*) may be used.

For well-behaved systems with no difficulties such as stiffness or singularities, the Merson method should work well for low accuracy calculations (three or four figures). For higher accuracy calculations or where FCN is costly to evaluate, Merson's method may not be appropriate and a computationally less expensive method may be D02CBF(*) which uses an Adams method.

Users with problems for which D02BBF is not sufficiently general should consider using D02PAF(*) with D02XAF(*). D02PAF(*) is a more general Merson routine with many facilities including more general error control options and several criteria for interrupting the calculations. D02XAF(*) interpolates on values produced by D02PAF(*).

9. Example

To integrate the following equations (for a projectile)

```
                     y'=tan(phi)

                 -0.032tan(phi)   0.02v
             v'= --------------- --------
                       v         cos(phi)

                          -0.032
                   (phi)'= ------
                             2
                            v
```

over an interval X = 0.0 to XEND = 8.0, starting with values y=0.0, v=0.5 and (phi)=(pi)/5 and printing the solution at steps of 1.0. We write y=Y(1), v=Y(2) and (phi)=Y(3), and we set TOL=1.0E-4 and TOL=1.0E-5 in turn so that we may compare the solutions. The value of (pi) is obtained by using X01AAF(*).

```
     Note the careful construction of routine OUT to ensure that the
     value of XEND is printed.

     The example program is not reproduced here. The source code for
     all example programs is distributed with the NAG Foundation
     Library software and should be available on-line.

     D02BHF(3NAG)      Foundation Library (12/10/92)      D02BHF(3NAG)

          D02 -- Ordinary Differential Equations                     D02BHF
                  D02BHF -- NAG Foundation Library Routine Document

          Note: Before using this routine, please read the Users' Note for
          your implementation to check implementation-dependent details.
          The symbol (*) after a NAG routine name denotes a routine that is
          not included in the Foundation Library.

          1. Purpose

          D02BHF integrates a system of first-order ordinary differential
          equations over an interval with suitable initial conditions,
          using a Runge-Kutta-Merson method, until a user-specified
          function of the solution is zero.

          2. Specification

                 SUBROUTINE D02BHF (X, XEND, N, Y, TOL, IRELAB, HMAX, FCN,
                1                   G, W, IFAIL)
                 INTEGER          N, IRELAB, IFAIL
                 DOUBLE PRECISION X, XEND, Y(N), TOL, HMAX, G, W(N,7)
```

```
      EXTERNAL        FCN, G
```

3. Description

The routine advances the solution of a system of ordinary differential equations

$$y_i' = f_i(x,y_1,y_2,\dots,y_n), \quad i=1,2,\dots,n,$$

from x = X towards x = XEND using a Merson form of the Runge-Kutta method. The system is defined by a subroutine FCN supplied by the user, which evaluates f_i in terms of x and $y_1,y_2,\dots,y_n$ (see Section 5), and the values of $y_1,y_2,\dots,y_n$ must be given at x = X.

As the integration proceeds, a check is made on the function g(x,y) specified by the user, to determine an interval where it changes sign. The position of this sign change is then determined accurately by interpolating for the solution and its derivative. It is assumed that g(x,y) is a continuous function of the variables, so that a solution of g(x,y) = 0 can be determined by searching for a change in sign in g(x,y).

The accuracy of the integration and, indirectly, of the determination of the position where g(x,y) = 0, is controlled by the parameter TOL.

For a description of Runge-Kutta methods and their practical implementation see Hall and Watt [1].

5. Parameters

1: X -- DOUBLE PRECISION Input/Output
On entry: X must be set to the initial value of the independent variable x. On exit: the point where g(x,y) = 0. 0 unless an error has occurred, when it contains the value of x at the error. In particular, if g(x,y)/=0.0 anywhere on the range X to XEND, it will contain XEND on exit.

2: XEND -- DOUBLE PRECISION Input
On entry: the final value of the independent variable x.

If XEND < X on entry, integration proceeds in a negative direction.

3: N -- INTEGER Input

On entry: the number of differential equations, n.
Constraint: N > 0.

4: Y(N) -- DOUBLE PRECISION array Input/Output

On entry: the initial values of the solution $y_1, y_2, ..., y_n$.

On exit: the computed values of the solution at the final point x = X.

5: TOL -- DOUBLE PRECISION Input/Output

On entry: TOL must be set to a positive tolerance for controlling the error in the integration and in the determination of the position where g(x,y) = 0.0.

D02BHF has been designed so that, for most problems, a reduction in TOL leads to an approximately proportional reduction in the error in the solution obtained in the integration. The relation between changes in TOL and the error in the determination of the position where g(x,y) = 0. 0 is less clear, but for TOL small enough the error should be approximately proportional to TOL. However, the actual relation between TOL and the accuracy cannot be guaranteed. The user is strongly recommended to call D02BHF with more than one value for TOL and to compare the results obtained to estimate their accuracy. In the absence of any prior knowledge the user might compare results obtained by calling D02BHF with $TOL=10.0^{-p}$ and $TOL=10.0^{-p-1}$ if p correct decimal digits in the solution are required. Constraint: TOL > 0.0.

On exit: normally unchanged. However if the range from x = X to the position where g(x,y) = 0.0 (or to the final value of x if an error occurs) is so short that a small change in TOL is unlikely to make any change in the computed solution, then TOL is returned with its sign changed. To check results returned with TOL < 0.0, D02BHF should be called again with a positive value of TOL whose magnitude is considerably smaller than that of the previous call.

6: IRELAB -- INTEGER Input

On entry: IRELAB determines the type of error control. At each step in the numerical solution an estimate of the local error, EST, is made. For the current step to be accepted the following condition must be satisfied:
IRELAB = 0

    EST<=TOL*max{1.0,|y |,|y |,...,|y |};

```
                              1    2        n

     IRELAB = 1
           EST <= TOL;

     IRELAB = 2
           EST<=TOL*max{(epsilon),|y |,|y |,...,|y |},
                                    1    2        n

           where (epsilon) is machine precision.
     If the appropriate condition is not satisfied, the step size
     is reduced and the solution recomputed on the current step.

     If the user wishes to measure the error in the computed
     solution in terms of the number of correct decimal places,
     then IRELAB should be given the value 1 on entry, whereas if
     the error requirement is in terms of the number of correct
     significant digits, then IRELAB should be given the value 2.
     Where there is no preference in the choice of error test,
     IRELAB = 0 will result in a mixed error test. It should be
     borne in mind that the computed solution will be used in
     evaluating g(x,y). Constraint: 0 <= IRELAB <= 2.

 7:  HMAX -- DOUBLE PRECISION                               Input
     On entry: if HMAX = 0.0, no special action is taken.

     If HMAX /= 0.0, a check is made for a change in sign of
     g(x,y) at steps not greater than |HMAX|. This facility
     should be used if there is any chance of 'missing' the
     change in sign by checking too infrequently. For example, if
     two changes of sign of g(x,y) are expected within a distance
     h, say, of each other, then a suitable value for HMAX might
     be HMAX = h/2. If only one change of sign in g(x,y) is
     expected on the range X to XEND, then the choice HMAX = 0.0
     is most appropriate.

 8:  FCN -- SUBROUTINE, supplied by the user.
                                                  External Procedure
     FCN must evaluate the functions f  (i.e., the derivatives
                                      i
     y' ) for given values of its arguments x,y ,...,y .
      i                                        1      n

     Its specification is:

            SUBROUTINE FCN (X, Y, F)
            DOUBLE PRECISION X, Y(n), F(n)

      1:  X -- DOUBLE PRECISION                             Input
          On entry: the value of the argument x.
      2:  Y(*) -- DOUBLE PRECISION array                    Input
          On entry: the value of the argument y , for
                                               i
          i=1,2,...,n.

      3:  F(*) -- DOUBLE PRECISION array                   Output
          On exit: the value of f , for i=1,2,...,n.
                                 i
     FCN must be declared as EXTERNAL in the (sub)program
     from which D02BHF is called. Parameters denoted as
     Input must not be changed by this procedure.

 9:   G -- DOUBLE PRECISION FUNCTION, supplied by the user.
                                          External Procedure
     G must evaluate the function g(x,y) at a specified point.

     Its specification is:

            DOUBLE PRECISION FUNCTION G (X, Y)
            DOUBLE PRECISION X, Y(n)
     where n is the actual value of N in the call of D02BHF.

      1:  X -- DOUBLE PRECISION                         Input
          On entry: the value of the independent variable x.

      2:  Y(*) -- DOUBLE PRECISION array                Input
          On entry: the value of y , for i=1,2,...,n.
                                   i
     G must be declared as EXTERNAL in the (sub)program from
     which D02BHF is called. Parameters denoted as Input
     must not be changed by this procedure.

10:  W(N,7) -- DOUBLE PRECISION array               Workspace

11:  IFAIL -- INTEGER                            Input/Output
     On entry: IFAIL must be set to 0, -1 or 1. For users not
     familiar with this parameter (described in the Essential
     Introduction) the recommended value is 0.

     On exit: IFAIL = 0 unless the routine detects an error (see
     Section 6).

6. Error Indicators and Warnings

Errors detected by the routine:

IFAIL= 1
     On entry TOL <= 0.0,
     or       N <= 0,

     or       IRELAB /= 0, 1 or 2.

IFAIL= 2
     With the given value of TOL, no further progress can be made
     across the integration range from the current point x = X,
     or dependence of the error on TOL would be lost if further
     progress across the integration range were attempted (see
     Section 8 for a discussion of this error exit). The
     components Y(1),Y(2),...,Y(n) contain the computed values of
     the solution at the current point x = X. No point at which
     g(x,y) changes sign has been located up to the point x = X.

IFAIL= 3
     TOL is too small for the routine to take an initial step
     (see Section 8). X and Y(1),Y(2),...,Y(n) retain their
     initial values.

IFAIL= 4
     At no point in the range X to XEND did the function g(x,y)
     change sign. It is assumed that g(x,y) = 0.0 has no
     solution.

IFAIL= 5
     A serious error has occurred in an internal call to
     C05AZF(*). Check all subroutine calls and array dimensions.
     Seek expert help.

IFAIL= 6
     A serious error has occurred in an internal call to
     D02PAF(*). Check all subroutine calls and array dimensions.
     Seek expert help.

IFAIL= 7
     A serious error has occurred in an internal call to
     D02XAF(*). Check all subroutine calls and array dimensions.
     Seek expert help.

7. Accuracy

The accuracy depends on TOL, on the mathematical properties of
the differential system, on the position where g(x,y) = 0.0 and
on the method. It can be controlled by varying TOL but the
approximate proportionality of the error to TOL holds only for a
restricted range of values of TOL. For TOL too large, the
underlying theory may break down and the result of varying TOL
may be unpredictable. For TOL too small, rounding error may
affect the solution significantly and an error exit with IFAIL =
2 or IFAIL = 3 is possible.
```

The accuracy may also be restricted by the properties of g(x,y). The user should try to code G without introducing any unnecessary cancellation errors.

8. Further Comments

The time taken by the routine depends on the complexity and mathematical properties of the system of differential equations defined by FCN, the complexity of G, on the range, the position of the solution and the tolerance. There is also an overhead of the form a+b*n where a and b are machine-dependent computing times.

For some problems it is possible that D02BHF will return IFAIL = 4 because of inaccuracy of the computed values Y, leading to inaccuracy in the computed values of g(x,y) used in the search for the solution of g(x,y) = 0.0. This difficulty can be overcome by reducing TOL sufficiently, and if necessary, by choosing HMAX sufficiently small. If possible, the user should choose XEND well beyond the expected point where g(x,y) = 0.0; for example make |XEND-X| about 50 larger than the expected range. As a simple check, if, with XEND fixed, a change in TOL does not lead to a significant change in Y at XEND, then inaccuracy is not a likely source of error.

If the routine fails with IFAIL = 3, then it could be called again with a larger value of TOL if this has not already been tried. If the accuracy requested is really needed and cannot be obtained with this routine, the system may be very stiff (see below) or so badly scaled that it cannot be solved to the required accuracy.

If the routine fails with IFAIL = 2, it is likely that it has been called with a value of TOL which is so small that a solution cannot be obtained on the range X to XEND. This can happen for well-behaved systems and very small values of TOL. The user should, however, consider whether there is a more fundamental difficulty. For example:

(a) in the region of a singularity (infinite value) of the solution, the routine will usually stop with IFAIL = 2, unless overflow occurs first. If overflow occurs using D02BHF, D02PAF(*) can be used instead to trap the increasing solution, before overflow occurs. In any case, numerical integration cannot be continued through a singularity, and analytical treatment should be considered;

(b) for 'stiff' equations, where the solution contains rapidly decaying components, the routine will compute in very small steps in x (internally to D02BHF) to preserve stability. This will usually exhibit itself by making the computing time excessively long, or occasionally by an exit with IFAIL = 2. Merson's method is not efficient in such cases, and the user should try D02EHF(*) which uses a Backward Differentiation Formula method. To determine whether a problem is stiff, D02BDF(*) may be used.

For well-behaved systems with no difficulties such as stiffness or singularities, the Merson method should work well for low accuracy calculations (three or four figures). For high accuracy calculations or where FCN is costly to evaluate, Merson's method may not be appropriate and a computationally less expensive method may be D02CHF(*) which uses an Adams method.

For problems for which D02BHF is not sufficiently general, the user should consider D02PAF(*). D02PAF(*) is a more general Merson routine with many facilities including more general error control options and several criteria for interrupting the calculations. D02PAF(*) can be combined with the rootfinder C05AZF(*) and the interpolation routine D02XAF(*) to solve equations involving $y_1, y_2, ..., y_n$ and their derivatives.

D02BHF can also be used to solve an equation involving x, $y_1, y_2, ..., y_n$ and the derivatives of $y_1, y_2, ..., y_n$. For example in Section 9, D02BHF is used to find a value of X > 0.0 where Y(1) = 0.0. It could instead be used to find a turning-point of y_1 by replacing the function g(x,y) in the program by:

```
      DOUBLE PRECISION FUNCTION G(X,Y)
      DOUBLE PRECISION X,Y(3),F(3)
      CALL FCN(X,Y,F)
      G = F(1)
      RETURN
      END
```

This routine is only intended to locate the first zero of g(x,y). If later zeros are required, users are strongly advised to construct their own more general root finding routines as discussed above.

9. Example

To find the value X > 0.0 at which y=0.0, where y, v, (phi) are defined by

y'=tan(phi)

```
                                     -0.032tan(phi)   0.02v
                                 v'= -------------- --------
                                           v        cos(phi)

                                                0.032
                                        (phi)'=- -----
                                                   2
                                                  v

          and where at X = 0.0 we are given y=0.5, v=0.5 and (phi)=(pi)/5.
          We write y=Y(1), v=Y(2) and (phi)=Y(3) and we set TOL=1.0E-4 and
          TOL=1.0E-5 in turn so that we can compare the solutions. We
          expect the solution X ~= 7.3 and so we set XEND = 10.0 to avoid
          determining the solution of y=0.0 too near the end of the range
          of integration. The value of (pi) is obtained by using X01AAF(*).

          The example program is not reproduced here. The source code for
          all example programs is distributed with the NAG Foundation
          Library software and should be available on-line.

     D02 -- Ordinary Differential Equations                      D02CJF
             D02CJF -- NAG Foundation Library Routine Document

     Note: Before using this routine, please read the Users' Note for
     your implementation to check implementation-dependent details.
```

The symbol (*) after a NAG routine name denotes a routine that is not included in the Foundation Library.

Note for users via the Axiom system: the interface to this routine has been enhanced for use with Axiom and is slightly different to that offered in the standard version of the Foundation Library.

1. Purpose

D02CJF integrates a system of first-order ordinary differential equations over a range with suitable initial conditions, using a variable-order, variable-step Adams method until a user-specified function, if supplied, of the solution is zero, and returns the solution at points specified by the user, if desired.

2. Specification

```
       SUBROUTINE D02CJF (X, XEND, M, N, Y, FCN, TOL, RELABS,
      1                   RESULT, OUTPUT, G, W, IFAIL)
       INTEGER          M, N, IFAIL
       DOUBLE PRECISION X, XEND, Y(N), TOL, G, W(28+21*N), RESULT(M,N)
       CHARACTER*1      RELABS
       EXTERNAL         FCN, OUTPUT, G
```

3. Description

The routine advances the solution of a system of ordinary differential equations

$$y'_i=f_i(x,y_1,y_2,...,y_n),\quad i=1,2,...,n,$$

from x = X to x = XEND using a variable-order, variable-step Adams method. The system is defined by a subroutine FCN supplied by the user, which evaluates f_i in terms of x and $y_1,y_2,...,y_n$. The initial values of $y_1,y_2,...,y_n$ must be given at x = X.

The solution is returned via the user-supplied routine OUTPUT at points specified by the user, if desired: this solution is obtained by C^1 interpolation on solution values produced by the method. As the integration proceeds a check can be made on the user-specified function g(x,y) to determine an interval where it changes sign. The position of this sign change is then determined accurately by C^1 interpolation to the solution. It is assumed that g(x,y) is a continuous function of the variables, so that a solution of g(x,y)=0.0 can be determined by searching for a change in sign in g(x,y). The accuracy of the integration, the interpolation and, indirectly, of the determination of the position where g(x,y)=0.0, is controlled by the parameters TOL and RELABS.

For a description of Adams methods and their practical implementation see Hall and Watt [1].
