The 30 Year Horizon

Manuel Bronstein *William Burge* *Timothy Daly*
James Davenport *Michael Dewar* *Martin Dunstan*
Albrecht Fortenbacher *Patrizia Gianni* *Johannes Grabmeier*
Jocelyn Guidry *Richard Jenks* *Larry Lambe*
Michael Monagan *Scott Morrison* *William Sit*
Jonathan Steinbach *Robert Sutor* *Barry Trager*
Stephen Watt *Jim Wen* *Clifton Williamson*

Volume 7.1: Axiom Hyperdoc Pages

Inclusion of names in the list of credits is based on historical information and is as accurate as possible. Inclusion of names does not in any way imply an endorsement but represents historical influence on Axiom development.

Cyril Alberga	Roy Adler	Richard Anderson
George Andrews	Henry Baker	Stephen Balzac
Yurij Baransky	David R. Barton	Gerald Baumgartner
Gilbert Baumslag	Fred Blair	Vladimir Bondarenko
Mark Botch	Alexandre Bouyer	Peter A. Broadbery
Martin Brock	Manuel Bronstein	Florian Bundschuh
William Burge	Quentin Carpent	Bob Caviness
Bruce Char	Cheekai Chin	David V. Chudnovsky
Gregory V. Chudnovsky	Josh Cohen	Christophe Conil
Don Coppersmith	George Corliss	Robert Corless
Gary Cornell	Meino Cramer	Claire Di Crescenzo
Timothy Daly Sr.	Timothy Daly Jr.	James H. Davenport
Jean Della Dora	Gabriel Dos Reis	Michael Dewar
Claire DiCrescendo	Sam Dooley	Lionel Ducos
Martin Dunstan	Brian Dupee	Dominique Duval
Robert Edwards	Heow Eide-Goodman	Lars Erickson
Richard Fateman	Bertfried Fauser	Stuart Feldman
Brian Ford	Albrecht Fortenbacher	George Frances
Constantine Frangos	Timothy Freeman	Korrinn Fu
Marc Gaetano	Rudiger Gebauer	Kathy Gerber
Patricia Gianni	Holger Gollan	Teresa Gomez-Diaz
Laureano Gonzalez-Vega	Stephen Gortler	Johannes Grabmeier
Matt Grayson	James Griesmer	Vladimir Grinberg
Oswald Gschnitzer	Jocelyn Guidry	Steve Hague
Vilya Harvey	Satoshi Hamaguchi	Martin Hassner
Ralf Hemmecke	Henderson	Antoine Hersen
Pietro Iglio	Richard Jenks	Kai Kaminski
Grant Keady	Tony Kennedy	Paul Kosinski
Klaus Kusche	Bernhard Kutzler	Larry Lambe
Frederic Lehobey	Michel Levaud	Howard Levy
Rudiger Loos	Michael Lucks	Richard Luczak
Camm Maguire	Bob McElrath	Michael McGettrick
Ian Meikle	David Mentre	Victor S. Miller
Gerard Milmeister	Mohammed Mobarak	H. Michael Moeller
Michael Monagan	Marc Moreno-Maza	Scott Morrison
Mark Murray	William Naylor	C. Andrew Neff
John Nelder	Godfrey Nolan	Arthur Norman
Jinzhong Niu	Michael O'Connor	Kostas Oikonomou
Julian A. Padget	Bill Page	Jaap Weel
Susan Pelzel	Michel Petitot	Didier Pinchon
Claude Quitte	Norman Ramsey	Michael Richardson
Renaud Rioboo	Jean Rivlin	Nicolas Robidoux
Simon Robinson	Michael Rothstein	Martin Rubey
Philip Santas	Alfred Scheerhorn	William Schelter
Gerhard Schneider	Martin Schoenert	Marshall Schor
Fritz Schwarz	Nick Simicich	William Sit
Elena Smirnova	Jonathan Steinbach	Christine Sundaresan
Robert Sutor	Moss E. Sweedler	Eugene Surowitz
James Thatcher	Baldir Thomas	Mike Thomas
Dylan Thurston	Barry Trager	Themos T. Tsikas
Gregory Vanuxem	Bernhard Wall	Stephen Watt
Juergen Weiss	M. Weller	Mark Wegman
James Wen	Thorsten Werther	Michael Wester
John M. Wiley	Berhard Will	Clifton J. Williamson
Stephen Wilson	Shmuel Winograd	Robert Wisbauer
Sandra Wityak	Waldemar Wiwianka	Knut Wolf
Clifford Yapp	David Yun	Richard Zippel
Evelyn Zoernack	Bruno Zuercher	Dan Zwillinger

2 Special hyperdoc pages 89
2.1 util.ht . . . 89
2.1.1 Names of software and facilities . . . 89
2.1.2 Special hooks to Unix . . . 89
2.1.3 HyperDoc menu macros . . . 90
2.1.4 Bitmaps and bitmap manipulation macros . . . 91
2.1.5 HyperDoc button objects . . . 92
2.1.6 Standard HyperDoc button configurations . . . 92
2.1.7 HyperDoc graphics macros . . . 92
2.1.8 TeX and LaTeX compatibility macros . . . 93
2.1.9 Book and .ht page macros . . . 95
2.1.10 Browse macros . . . 98
2.1.11 Support for output and graph paste-ins . . . 99
2.1.12 Hook for including a local menu item on the rootpage . . . 99
2.1.13 Not Connected to Axiom . . . 100
2.1.14 Do You Really Want to Exit? . . . 100
2.1.15 Missing Page . . . 100
2.1.16 Something is Wrong . . . 101
2.1.17 Sorry! . . . 101

3 Hyperdoc pages 103
3.1 rootpage.ht . . . 103
3.1.1 Axiom HyperDoc Top Level . . . 103
3.1.2 Axiom – The Scientific Computation System . . . 105
3.1.3 System Commands . . . 106
3.1.4 Axiom Examples . . . 107
3.1.5 Axiom Reference . . . 109
3.1.6 NAG Documentation . . . 111

3.4.1 OneDimensionalArray . . . 124
3.5 array2.ht . . . 129
3.5.1 TwoDimensionalArray . . . 129
3.6 basic.ht . . . 141
3.6.1 Basic Commands . . . 141
3.6.2 Calculus . . . 142
3.7 bbtree.ht . . . 143
3.7.1 BalancedBinaryTree . . . 143
3.8 binary.ht . . . 149
3.8.1 BinaryExpansion . . . 149
3.9 bmcat.ht . . . 154
3.9.1 Bit Map Catalog . . . 154

3.10 bop.ht 155
3.10.1 BasicOperator 155
3.11 bstree.ht 164
3.11.1 BinarySearchTree 164
3.12 card.ht 171
3.12.1 CardinalNumber 171
3.13 carten.ht 181
3.13.1 CartesianTensor 181
3.14 cclass.ht 207
3.14.1 CharacterClass 207
3.15 char.ht 214
3.15.1 Character 214
3.15.2 CliffordAlgebra 220
3.15.3 The Complex Numbers as a Clifford Algebra 221
3.15.4 The Quaternion Numbers as a Clifford Algebra 225
3.15.5 The Exterior Algebra on a Three Space 230
3.15.6 The Dirac Spin Algebra 236
3.16 complex.ht 240
3.16.1 Complex 240
3.17 contfrac.ht 248
3.17.1 ContinuedFraction 248
3.18 cphelp.ht 265
3.18.1 Control Panel Bits 265
3.19 cycles.ht 265
3.19.1 CycleIndicators 265
3.20 coverex.ht 290
3.20.1 Examples Of Axiom Commands 290
3.20.2 Differentiation 291
3.20.3 Integration 296
3.20.4 Laplace Transforms 303
3.20.5 Limits 306
3.20.6 Matrices 311
3.20.7 2-D Graphics 319
3.20.8 3-D Graphics 321
3.20.9 Series 323
3.20.10 Summations 328
3.21 decimal.ht 334
3.21.1 Decimal Expansion 334
3.22 derham.ht 338
3.22.1 DeRhamComplex 338
3.23 dfloat.ht 355
3.23.1 DoubleFloat 355
3.24 dmp.ht 361
3.24.1 DistributedMultivariatePoly 361
3.25 eq.ht 366
3.25.1 Equation 366

3.26 eqtbl.ht . . . 372
3.26.1 EqTable . . . 372
3.27 evalex.ht . . . 375
3.27.1 Example of Standard Evaluation . . . 375
3.27.2 Example of Standard Evaluation . . . 376
3.28 exdiff.ht . . . 377
3.28.1 Computing Derivatives . . . 377
3.28.2 Derivatives of Functions of Several Variables . . . 378
3.28.3 Derivatives of Higher Order . . . 379
3.28.4 Multiple Derivatives I . . . 380
3.28.5 Multiple Derivatives II . . . 382
3.28.6 Derivatives of Functions Involving Formal Integrals . . . 382
3.28.7 Exit . . . 384
3.29 exlap.ht . . . 388
3.29.1 Laplace transform with a single pole . . . 388
3.29.2 Laplace transform of a trigonometric function . . . 388
3.29.3 Laplace transform requiring a definite integration . . . 389
3.29.4 Laplace transform of exponentials . . . 390
3.29.5 Laplace transform of an exponential integral . . . 391
3.29.6 Laplace transform of special functions . . . 392
3.30 exint.ht . . . 392
3.30.1 Integral of a Rational Function . . . 392
3.30.2 Integral of a Rational Function with a Real Parameter . . . 395
3.30.3 Integral of a Rational Function with a Complex Parameter . . . 396
3.30.4 Two Similar Integrands Producing Very Different Results . . . 396
3.30.5 An Integral Which Does Not Exist . . . 398
3.30.6 A Trigonometric Function of a Quadratic . . . 399
3.30.7 Integrating a Function with a Hidden Algebraic Relation . . . 400
3.30.8 Details for integrating a function with a Hidden Algebraic Relation . . 401
3.30.9 An Integral Involving a Root of a Transcendental Function . . . 402
3.30.10 An Integral of a Non-elementary Function . . . 403
3.31 exlimit.ht . . . 403
3.31.1 Computing Limits . . . 403
3.31.2 Limits of Functions with Parameters . . . 404
3.31.3 One-sided Limits . . . 405
3.31.4 Two-sided Limits . . . 406
3.31.5 Limits at Infinity . . . 408
3.31.6 Real Limits vs. Complex Limits . . . 409
3.31.7 Complex Limits at Infinity . . . 410
3.32 exmatrix.ht . . . 412
3.32.1 Basic Arithmetic Operations on Matrices . . . 412
3.32.2 Constructing new Matrices . . . 415
3.32.3 Trace of a Matrix . . . 419
3.32.4 Determinant of a Matrix . . . 419
3.32.5 Inverse of a Matrix . . . 420
3.32.6 Rank of a Matrix . . . 421

3.33 expr.ht . . . 422
3.33.1 Expression . . . 422
3.34 explot2d.ht . . . 435
3.34.1 Plotting Functions of One Variable . . . 435
3.34.2 Plotting Parametric Curves . . . 435
3.34.3 Plotting Using Polar Coordinates . . . 436
3.34.4 Plotting Plane Algebraic Curves . . . 437
3.35 explot3d.ht . . . 437
3.35.1 Plotting Functions of Two Variables . . . 437
3.35.2 Plotting Parametric Surfaces . . . 438
3.35.3 Plotting Parametric Curves . . . 439
3.36 expose.ht . . . 440
3.36.1 Exposure . . . 440
3.36.2 System Defined Exposure Groups . . . 441
3.36.3 What is an Exposure Group? . . . 442
3.36.4 Details on Exposure . . . 443
3.37 exseries.ht . . . 443
3.37.1 Converting Expressions to Series . . . 443
3.37.2 Manipulating Power Series . . . 445
3.37.3 Functions on Power Series . . . 447
3.37.4 Substituting Numerical Values in Power Series . . . 448
3.38 exsum.ht . . . 450
3.38.1 Summing the Entries of a List I . . . 450
3.38.2 Summing the Entries of a List II . . . 451
3.38.3 Approximating e . . . 452
3.38.4 Closed Form Summations . . . 453
3.38.5 Sums of Cubes . . . 454
3.38.6 Sums of Polynomials . . . 456
3.38.7 Sums of General Functions . . . 457
3.38.8 Infinite Sums . . . 458
3.39 farray.ht . . . 458
3.39.1 FlexibleArray . . . 458
3.40 file.ht . . . 466
3.40.1 File . . . 466
3.41 float.ht . . . 473
3.41.1 Float . . . 473
3.41.2 Introduction to Float . . . 474
3.41.3 Conversion Functions . . . 476
3.41.4 Output Functions . . . 484
3.41.5 An Example: Determinant of a Hilbert Matrix . . . 488
3.41.6 Expanding Factored Objects . . . 507
3.41.7 Arithmetic with Factored Objects . . . 509
3.41.8 Creating New Factored Objects . . . 516

16.2.2 Roots of a complex polynomial equation 2807
16.2.3 Roots of a real polynomial equation 2812
16.2.4 Roots of One or More Transcendental Equations 2818
16.2.5 Zero of a continuous function in a given interval 2822
16.2.6 Solution of a system of nonlinear equations 2826

16.2.7 Solution of a system of nonlinear equations 2830
16.2.8 Checks the gradients of a set of non-linear functions 2836
16.2.9 Discrete Fourier transform of real or complex data values 2839
16.2.10 Discrete Fourier transform of n real data values 2847
16.2.11 Discrete Fourier transform of a Hermitian sequence 2850
16.2.12 Discrete Fourier transform of n complex data values 2854
16.2.13 Circular convolution or correlation of two real vectors 2857
16.2.14 Discrete Fourier transforms of m sequences 2861
16.2.15 Discrete Fourier transforms of m Hermitian sequences 2866
16.2.16 Discrete Fourier transforms of m complex sequences 2870
16.2.17 Discrete Fourier transform of bivariate complex data 2874
16.2.18 Summation of Series 2879
16.2.19 Complex conjugate of a sequence of n data values 2881
16.2.20 Complex conjugates of m Hermitian sequences 2883
16.2.21 Form real and imaginary parts of m Hermitian sequences 2885
16.3 nagd.ht 2888
16.3.1 Quadrature 2888
16.3.2 Approximation of the integral over a finite interval 2901
16.3.3 Adaptive integration over a finite integral 2907
16.3.4 Approximate integration with local singular points 2913
16.3.5 Approximate integration over a (semi-)infinite interval 2919
16.3.6 Approximate sine or cosine transform over finite interval 2925
16.3.7 Adaptive integration of weighted function over an interval 2931
16.3.8 Hilbert transform over finite interval 2937
16.3.9 Approximate Sine or Cosine over $[a,\infty]$ 2943
16.3.10 Weights and abscissae for Gaussian quadrature formula 2950
16.3.11 Multidimensional integrals with finite limits 2956
16.3.12 Third-order finite-difference integration 2961
16.3.13 Monte Carlo integration over hyper-rectangular regions 2964
16.3.14 Ordinary Differential Equations 2969
16.3.15 First-order ODE over an interval with initial conditions 2976
16.3.16 First-order ODE with initial conditions and user function 2984
16.3.17 First-order ODE with variable-order, variable-step 2992
16.3.18 Stiff First-order ODE with variable order and step 3001
16.3.19 Two-point boundary-value ODE 3010
16.3.20 Two-point boundary value ODE with deferred correction 3017
16.3.21 Eignevalue of regular singular 2nd-order Sturm-Liouville 3025
16.3.22 Two-point boundary-value ODE equation systems 3048
16.3.23 Partial differential equations 3062
16.3.24 Discrete elliptic PDE on rectangular region 3069
16.3.25 Discrete 2nd-order elliptic PDE on rectangular regions 3077
16.3.26 Helmholtz equation in 3 dimensions 3090
16.4 nage.ht 3100
16.4.1 Interpolation 3100
16.4.2 Cubic spline interpolant 3105
16.4.3 Monoticity-preserving piecewise cubic Hermite interpolant 3110

16.4.4 Piecewise cubic Hermite interpolant 3113
16.4.5 Piecewise cubic Hermite interpolant and 1st deriv 3116
16.4.6 Definite integral of piecewise cubic Hermite interpolant 3119
16.4.7 Bicubic spline interpolated surface 3121
16.4.8 Two-D surface interpolating a set of scattered data points 3128
16.4.9 Evaluate 2D interpolant function from E01SAF 3131
16.4.10 Generate 2D surface interpolating a scattered data points 3134
16.4.11 Evaluate 2D interpolating function from E01SEF 3140
16.4.12 Curve and Surface Fitting 3143
16.4.13 Least-squares polynomial approximations 3168
16.4.14 Evaluate polynomial from Chebyshev-series representation 3174
16.4.15 Constrained weighted least-squares polynomial 3178
16.4.16 Coefficients of polynomial derivative 3186
16.4.17 Find coefficients of indefinite integral of polynomial 3191
16.4.18 Evaluate polynomial in Chebyshev-series representation 3196
16.4.19 Weighted least-squares aprrox to data points 3201
16.4.20 Evaluates a cubic spline from its B-spline representation 3208
16.4.21 Evaluate cubic spline and 3 derivatives from B-spline 3212
16.4.22 Definite integral of cubic spline from B-spline 3217
16.4.23 Cubic spline approximation to an arbitrary set points 3221
16.4.24 Minimal, weighted least-squares bicubic spline fit 3230
16.4.25 Bicubic spline approximation to a set of data values 3239
16.4.26 Bicubic spline approximation to a set of scattered data 3250
16.4.27 Calculates values of a bicubic spline from B-spline 3262
16.4.28 Calculates values of a bicubic spline from B-spline 3266
16.4.29 Calculates l_1 solution to over-determined system equations 3270
16.4.30 Sorts two-dimensional data into rectangular panels 3276
16.4.31 Minimizing or Maximizing a Function 3280
16.4.32 Minimizes a nonlinear function of several variable 3305
16.4.33 Supply optional parameters to E04DGF from file 3320
16.4.34 Supply individual optional params to E04DGF 3323
16.4.35 Finding an unconstrained minimum of a sum of squares 3325
16.4.36 Finding an unconstrained minimum of a sum of squares 3331
16.4.37 Finding a minimum of a function 3338
16.4.38 Solving linear programming problems 3344
16.4.39 Solving linear or quadratic problems 3353
16.4.40 Minimize an arbitrary smooth constrainted function 3373
16.4.41 Supply optional parameters to E04UCF from file 3424
16.4.42 Supply individual optional params to E04UCF 3427
16.4.43 Estimates of elements of the variance-covariance matrix 3430
16.5 nagf.ht 3436
16.5.1 Linear Algebra 3436
16.5.2 Matrix Factorization 3440
16.5.3 Factorizes a real sparse matrix 3443
16.5.4 Factorizes a real sparse matrix 3453
16.5.5 Incomplete Cholesky factorization 3459

16.5.6 Cholesky factor of a symmetric positive-definite matrix 3466
16.5.7 QR factorization of the real m by n matrix A 3471
16.5.8 $B := QB$ or $B := Q^T B$ 3476
16.5.9 First ncolq columns of the real m by m orthogonal matrix 3481
16.5.10 QR factorization of the complex m by n matrix A 3485
16.5.11 $B := QB$ or $B := Q^H B$ 3490
16.5.12 First ncolq columns of the complex m by m unitary matrix 3496
16.5.13 Eigenvalues and Eigenvectors 3501
16.5.14 Calculates all the eigenvalues of a real symmetric matrix 3507
16.5.15 Eigenvalues and eigenvectors of a real symmetric matrix 3509
16.5.16 Calculates all the eigenvalues of $Ax = \lambda Bx$ 3512
16.5.17 Eigenvalues and eigenvectors of $Ax = \lambda Bx$ 3515
16.5.18 Calculates all the eigenvalues of a real unsymmetric matrix 3519
16.5.19 Eigenvalues and eigenvectors of a real unsymmetric matrix 3521
16.5.20 Calculates all the eigenvalues of a complex matrix 3524
16.5.21 Eigenvalues and eigenvectors of a complex matrix 3527
16.5.22 Eigenvalues of a complex Hermitian matrix 3530
16.5.23 Eigenvalues/eigenvectors complex Hermitian matrix 3533
16.5.24 Eigenvalues and eigenvectors of a real symmetric matrix 3536
16.5.25 Eigenvalues of generalized eigenproblem $Ax = \lambda Bx$ 3540
16.5.26 Eigenvalues and eigenvectors of real sparse symmetric problem 3545
16.5.27 Singular value decomposition of a general real matrix 3558
16.5.28 Singular value decomposition of a general complex matrix 3566
16.5.29 Simultaneous Linear Equations 3573
16.5.30 Approximate solution of a set of complex linear equations 3579
16.5.31 Approximate solution of a set of real linear equations 3582
16.5.32 Real symmetric positive-definite linear equations 3585
16.5.33 Set of real linear equations with a single right-hand side 3589
16.5.34 Solution of a set of real sparse linear equations 3592
16.5.35 Real symmetric positive-definite tridiagonal linear equations 3595
16.5.36 Solution of a linear least-squares problem, $Ax = b$ 3601
16.5.37 Sparse symmetric positive-definite system linear equations 3607
16.5.38 Solves a system of real sparse symmetric linear equations 3613
16.5.39 Solution of a system of real linear equations 3624
16.5.40 Solves sparse unsymmetric equations 3629
16.5.41 Linear Algebra Support Routines 3643
16.5.42 Linear Equations (LAPACK) 3676
16.5.43 Computes the LU factorization of a real m by n matrix 3677
16.5.44 Solves a real system of linear equations 3681
16.5.45 Factorization of a real symmetric positive-definite matrix 3685
16.5.46 Real symmetric positive-definite system of linear equations 3688
16.5.47 Sort vector of double precision numbers 3695
16.5.48 Ranks a vector of double precision numbers 3698
16.5.49 Ranks the rows of a matrix of double precision numbers 3701
16.5.50 Ranks the columns of a matrix of double precision numbers 3704
16.5.51 Rearranges a vector of double precision numbers 3707

16.5.52 Inverts a permutation . . . 3709
16.6 nags.ht . . . 3712
16.6.1 Approximations of Special Functions . . . 3712
16.6.2 Exponential function e^z , for complex z . . . 3725
16.6.3 Returns the value of the exponential integral $E(x)$ . . . 3728
16.6.4 Returns the value of the cosine integral . . . 3731
16.6.5 Returns the value of the sine integral . . . 3734
16.6.6 Returns the value of the Gamma function . . . 3737
16.6.7 Returns a value for the logarithm of the Gamma function . . . 3740
16.6.8 Incomplete gamma functions P(a,x) and Q(a,x) . . . 3744
16.6.9 Returns the value of the complementary error function . . . 3747
16.6.10 Returns the value of the error function erfx . . . 3751
16.6.11 Returns the value of the Bessel Function $Y_0(x)$ . . . 3753
16.6.12 Returns the value of the Bessel Function $Y_1(x)$ . . . 3757
16.6.13 Returns the value of the Bessel Function $J_0(x)$ . . . 3762
16.6.14 Returns the value of the Bessel Function $J_1(x)$ . . . 3766
16.6.15 Returns a value for the Airy function, $Ai(x)$ . . . 3769
16.6.16 Returns a value of the Airy function, $Bi(x)$ . . . 3774
16.6.17 Value of the derivative of the Airy function $Ai(x)$ . . . 3778
16.6.18 Value for the derivative of the Airy function $Bi(x)$ . . . 3782
16.6.19 Values for the Bessel functions $Y_{\nu+n}(z)$ . . . 3786
16.6.20 Values for the Bessel functions $J_{\nu+n}(z)$ . . . 3791
16.6.21 Value of the Airy function $Ai(z)$ or derivative $Ai'(z)$ . . . 3796
16.6.22 Value of the Airy function $Bi(z)$ or derivative $Bi'(z)$ . . . 3800
16.6.23 Returns a sequence of values for the Hankel functions . . . 3804
16.6.24 Returns the value of the modified Bessel Function $K_0(x)$ . . . 3810
16.6.25 Returns the value of the modified Bessel Function $K_1(x)$ . . . 3813
16.6.26 Returns the value of the modified Bessel Function $I_0(x)$ . . . 3817
16.6.27 Returns a value for the modified Bessel Function $I_1(x)$ . . . 3821
16.6.28 Sequence of values for the modified Bessel $K_{\nu_n}(z)$ . . . 3824
16.6.29 Sequence of values for the modified Bessel $I_{\nu+n}$ . . . 3829
16.6.30 Returns a value for the Kelvin function ber x . . . 3833
16.6.31 Returns a value for the Kelvin function bei x . . . 3837
16.6.32 Returns a value for the Kelvin function ker x . . . 3840
16.6.33 Returns a value for the Kelvin function keix . . . 3844
16.6.34 Returns a value for the Fresnel Integral $S(x)$ . . . 3848
16.6.35 Returns a value for the Fresnel Integral $C(x)$ . . . 3852
16.6.36 Returns a value of an elementary integral . . . 3857
16.6.37 Value of the symmetrised elliptic integral of first kind . . . 3860
16.6.38 Value of the symmetrised elliptic integral of second kind . . . 3864
16.6.39 Value of the symmetrised elliptic integral of third kind . . . 3869
16.7 nagx.ht . . . 3874
16.7.1 Mathematical Constants . . . 3874
16.7.2 Machine Constants . . . 3875
16.7.3 Input/Output Utilities . . . 3882
16.7.4 Value of the current error message unit number . . . 3884

16.7.5 Value of the current advisory message unit number 3887
16.7.6 Print a real matrix stored in a two-dimensional array 3889
16.7.7 Print a complex matrix stored in a 2D array 3892
16.7.8 Date and Time Utilities 3896
16.7.9 Returns the current date and time 3898
16.7.10 From seven-integer format time and date to character string 3899
16.7.11 Compares two date/time character strings 3902
16.7.12 Amount of processor time used 3905

New Foreword

On October 1, 2001 Axiom was withdrawn from the market and ended life as a commercial product. On September 3, 2002 Axiom was released under the Modified BSD license, including this document. On August 27, 2003 Axiom was released as free and open source software available for download from the Free Software Foundation's website, Savannah.

Work on Axiom has had the generous support of the Center for Algorithms and Interactive Scientific Computation (CAISS) at City College of New York. Special thanks go to Dr. Gilbert Baumslag for his support of the long term goal.

The online version of this documentation is roughly 1000 pages. In order to make printed versions we've broken it up into three volumes. The first volume is tutorial in nature. The second volume is for programmers. The third volume is reference material. We've also added a fourth volume for developers. All of these changes represent an experiment in print-on-demand delivery of documentation. Time will tell whether the experiment succeeded.

Axiom has been in existence for over thirty years. It is estimated to contain about three hundred man-years of research and has, as of September 3, 2003, 143 people listed in the credits. All of these people have contributed directly or indirectly to making Axiom available. Axiom is being passed to the next generation. I'm looking forward to future milestones.

With that in mind I've introduced the theme of the "30 year horizon". We must invent the tools that support the Computational Mathematician working 30 years from now. How will research be done when every bit of mathematical knowledge is online and instantly available? What happens when we scale Axiom by a factor of 100, giving us 1.1 million domains? How can we integrate theory with code? How will we integrate theorems and proofs of the mathematics with space-time complexity proofs and running code? What visualization tools are needed? How do we support the conceptual structures and semantics of mathematics in effective ways? How do we support results from the sciences? How do we teach the next generation to be effective Computational Mathematicians?

The "30 year horizon" is much nearer than it appears.

Tim Daly
CAISS, City College of New York

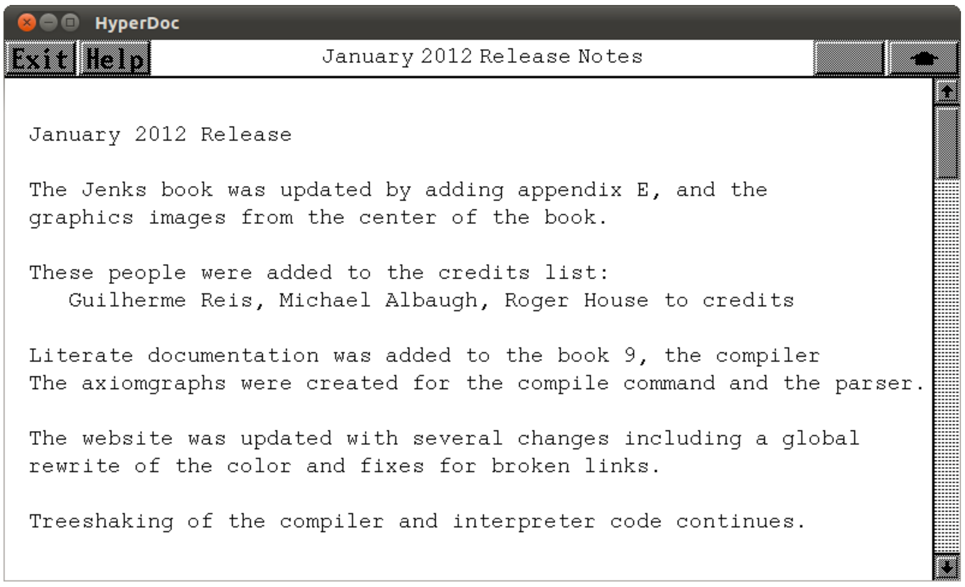
1.1.3 January 2012 Release Notes



```
January 2012 Release

The Jenks book was updated by adding appendix E, and the
graphics images from the center of the book.

These people were added to the credits list:
   Guilherme Reis, Michael Albaugh, Roger House to credits

Literate documentation was added to the book 9, the compiler
The axiomgraphs were created for the compile command and the parser.

The website was updated with several changes including a global
rewrite of the color and fixes for broken links.

Treeshaking of the compiler and interpreter code continues.

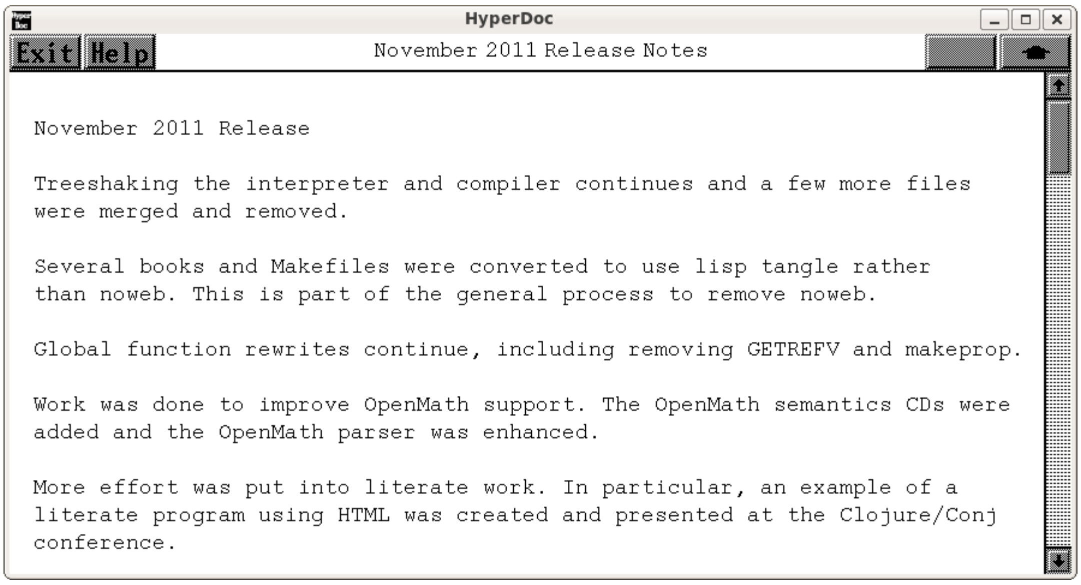
1.1.4 November 2011 Release Notes



```
November 2011 Release

Treeshaking the interpreter and compiler continues and a few more files
were merged and removed.

Several books and Makefiles were converted to use lisp tangle rather
than noweb. This is part of the general process to remove noweb.

Global function rewrites continue, including removing GETREFV and makeprop.

Work was done to improve OpenMath support. The OpenMath semantics CDs were
added and the OpenMath parser was enhanced.

More effort was put into literate work. In particular, an example of a
literate program using HTML was created and presented at the Clojure/Conj
conference.

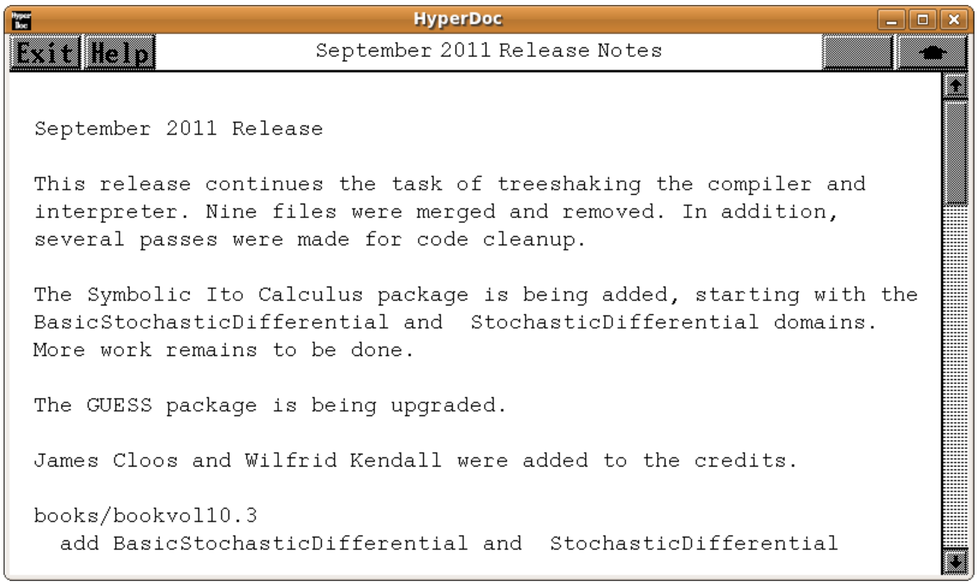
1.1.5 September 2011 Release Notes



```
September 2011 Release

This release continues the task of treeshaking the compiler and
interpreter. Nine files were merged and removed. In addition,
several passes were made for code cleanup.

The Symbolic Ito Calculus package is being added, starting with the
BasicStochasticDifferential and  StochasticDifferential domains.
More work remains to be done.

The GUESS package is being upgraded.

James Cloos and Wilfrid Kendall were added to the credits.

\begin{verbatim}
May 2011 Release
```

```
This release involved more work treeshaking of the compiler and
interpreter. Argument naming conventions were normalized to improve
the documentation and clarity.

Time was spent proofreading the books and reducing or eliminating
latex warnings. Missing index files were fixed and errors in the Jenks
book were fixed.

The website has been updated to make Arthur Ralf's book available
from every page. The website is being rewritten to be IPv6 enabled.

Doug Telford was added to the credits.

Book Volume 0 (Jenks book)
  proofread to chapter 1 (pdf page 86)
  replace "operator over" by "operate over"
  set textlength 400
  port changes to Arthur Ralfs HTML version

Book Volume 1 (Tutorial)
  proofread and copyedit
  set textlength 400
  update HTML image

Book Volume 2
  set textlength 400

Book Volume 3
  set textlength 400

Book Volume 4
  set textlength 400

Book Volume 5 (Interpreter)
  add Doug Telford to credits
  set textlength 400
  treeshake interpreter

Book Volume 6
  set textlength 400

Book Volume 7 (Hyperdoc)
  set textlength 400

Book Volume 7.1 (Hyperdoc pages)
  set textlength 400
  update What's New Page

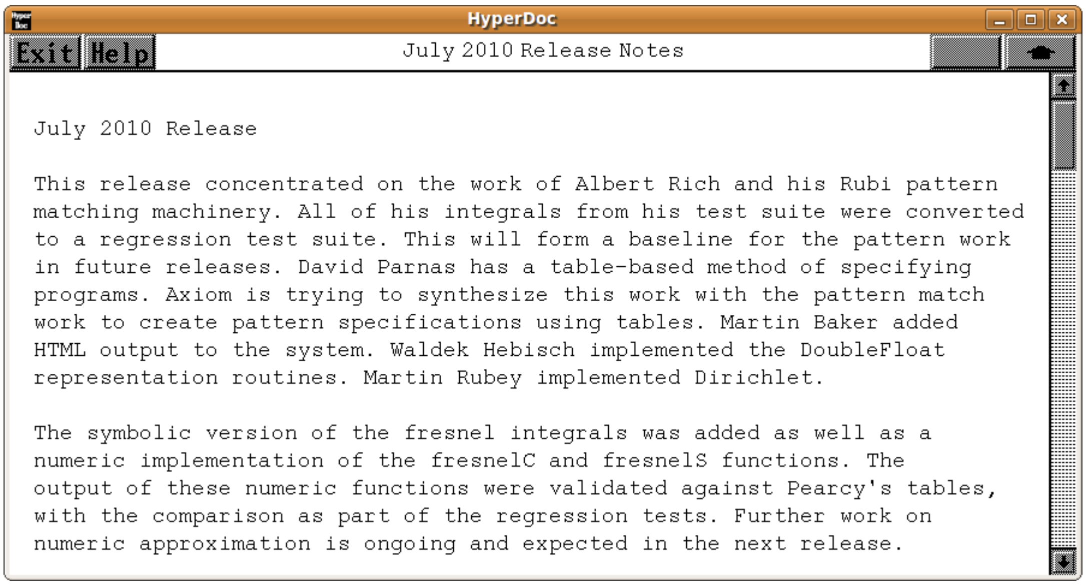
1.1.12 July 2010 Release Notes



```
July 2010 Release

This release concentrated on the work of Albert Rich and his Rubi pattern
matching machinery. All of his integrals from his test suite were converted
to a regression test suite. This will form a baseline for the pattern work
in future releases. David Parnas has a table-based method of specifying
programs. Axiom is trying to synthesize this work with the pattern match
work to create pattern specifications using tables. Martin Baker added
HTML output to the system. Waldek Hebisch implemented the DoubleFloat
representation routines. Martin Rubey implemented Dirichlet.

The symbolic version of the fresnel integrals was added as well as a
numeric implementation of the fresnelC and fresnelS functions. The
output of these numeric functions were validated against Pearcy's tables,
with the comparison as part of the regression tests. Further work on
numeric approximation is ongoing and expected in the next release.

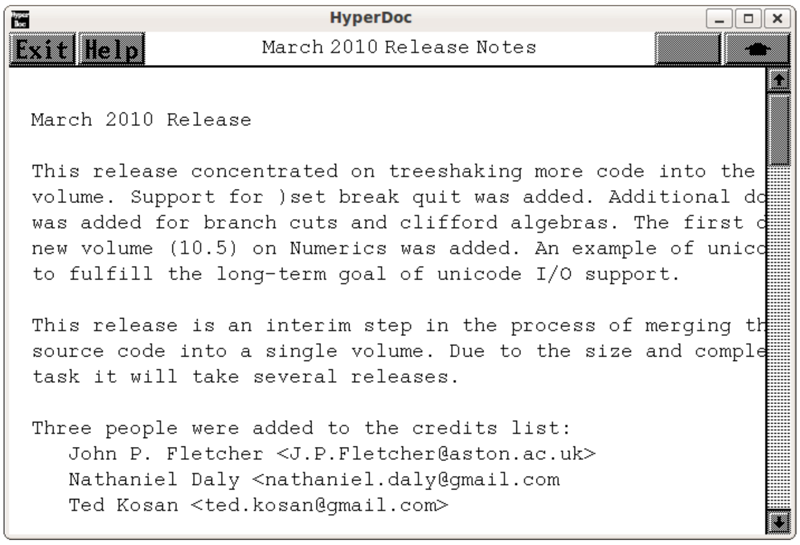
1.1.14 March 2010 Release Notes



```
March 2010 Release

This release concentrated on treeshaking more code into the
volume. Support for )set break quit was added. Additional do
was added for branch cuts and clifford algebras. The first c
new volume (10.5) on Numerics was added. An example of unicc
to fulfill the long-term goal of unicode I/O support.

This release is an interim step in the process of merging th
source code into a single volume. Due to the size and comple
task it will take several releases.

Three people were added to the credits list:
   John P. Fletcher <J.P.Fletcher@aston.ac.uk>
   Nathaniel Daly <nathaniel.daly@gmail.com
   Ted Kosan <ted.kosan@gmail.com>
```

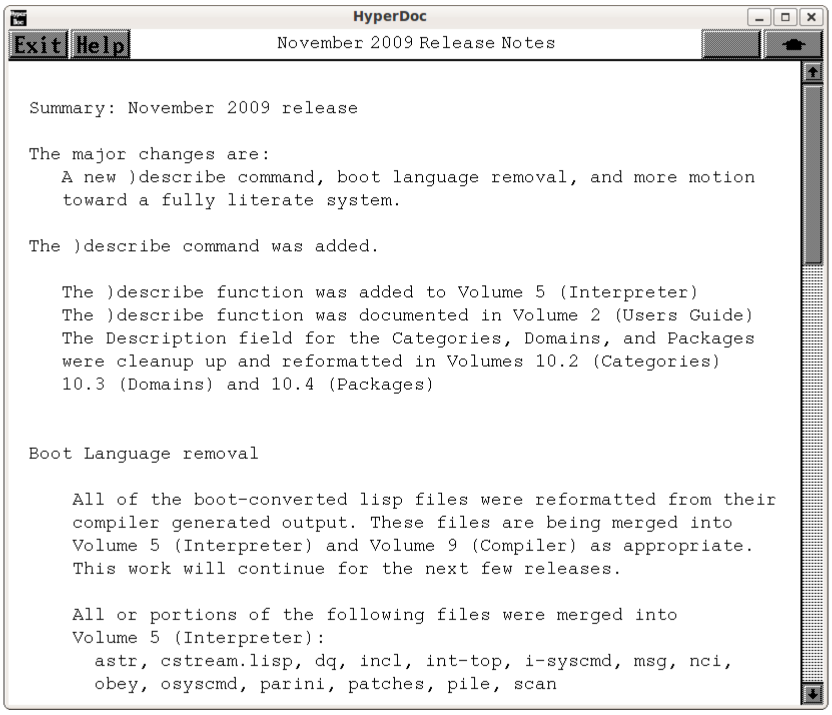
1.1.16 November 2009 Release Notes



```
Summary: November 2009 release

The major changes are:
   A new )describe command, boot language removal, and more motion
   toward a fully literate system.

The )describe command was added.

   The )describe function was added to Volume 5 (Interpreter)
   The )describe function was documented in Volume 2 (Users Guide)
   The Description field for the Categories, Domains, and Packages
   were cleanup up and reformatted in Volumes 10.2 (Categories)
   10.3 (Domains) and 10.4 (Packages)

Boot Language removal

    All of the boot-converted lisp files were reformatted from their
    compiler generated output. These files are being merged into
    Volume 5 (Interpreter) and Volume 9 (Compiler) as appropriate.
    This work will continue for the next few releases.

    All or portions of the following files were merged into
    Volume 5 (Interpreter):
      astr, cstream.lisp, dq, incl, int-top, i-syscmd, msg, nci,
      obey, osyscmd, parini, patches, pile, scan

    All of the boot-converted lisp files were reformatted from their
    compiler generated output. These files are being merged into
    Volume 5 (Interpreter) and Volume 9 (Compiler) as appropriate.
    This work will continue for the next few releases.

    All or portions of the following files were merged into
    Volume 5 (Interpreter):
      astr, cstream.lisp, dq, incl, int-top, i-syscmd, msg, nci,
      obey, osyscmd, parini, patches, pile, scan

    The src/boot subdirectory is gone, including the files:
      Makefile, boot-proclaims, boothdr, bootload, btincl2, btpile2,
      btscan2, ccl-bootsys, ccl-depsys.lsp, exports.lisp, npextras, ptyout,
      tyextra, typars, typrops, tytree1, sys-pkg, vmlisp, ptrees, wi2

    The bootsys image is no longer part of the build process

Patch ports from Fricas and Open-Axiom

    The Tuples patch was picked up and applied.

    The SXHASH function is the hash default in SetCategory

    The function ListOfTerms was renamed to listOfTerms

Input file changes

    New input files have been added to show how to compute
    results using Axiom or to create regression tests for fixes:
      complexfactor, rubey, zimmbron, branchcut, cachedf, finitegraph,
      newtonlisp, nonlinhomodiffeq, distexpr, numericgamma, donsimple
      solveperf, tuplebug, unit-macro, testprob, unittest2

    lexp was removed and moved to the LEXP algebra file
    dop and gstbl had minor fixes

New Help files and Function examples were added

    There are new help files:
      describe, AlgebraicallyClosedField, RationalFunctionSum,
      RadicalSolvePackage, PartialFractionPackage, Product,
      OrderedFreeMonoid

Website update:

  The developer.html page was rewritten. An old Scratchpad group
  photo was added to the site.

  Work continues on re-hosting the axiom-developer.org domain.

  We now own axiom-developer.com and axiom-developer.net which will
  be retargetted to the new host as soon as it is available

Interpreter changes:

    Axiom will sit in a single package in the near future.
    The VMLISP package was partially removed from the system.
    Work continues on this path.

    The util.ht file is created earlier in the parallel build
    so there are fewer compiler messages about documentation.

Research:

    A Cohen algebra domain is being developed to enable symbolic
    manipulation of expressions with explanations and controlled
    simplification.

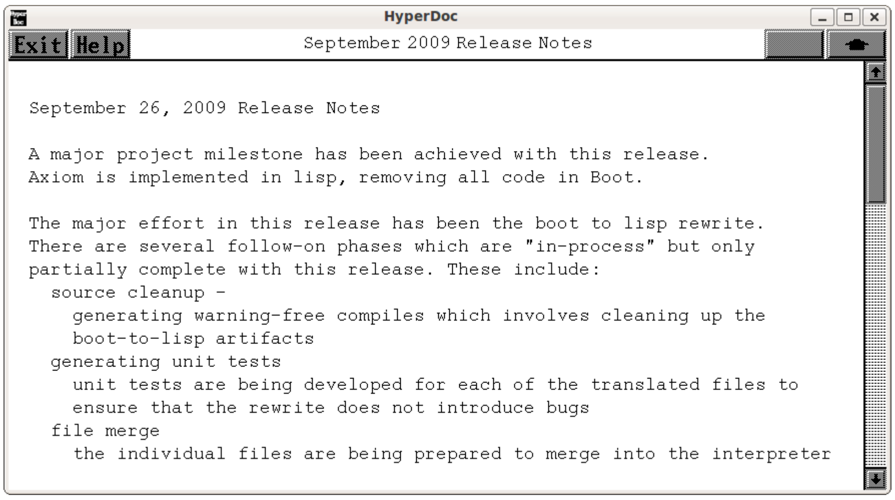
1.1.17 September 2009 Release Notes



```
September 26, 2009 Release Notes

A major project milestone has been achieved with this release.
Axiom is implemented in lisp, removing all code in Boot.

The major effort in this release has been the boot to lisp rewrite.
There are several follow-on phases which are "in-process" but only
partially complete with this release. These include:
  source cleanup -
    generating warning-free compiles which involves cleaning up the
    boot-to-lisp artifacts
  generating unit tests
    unit tests are being developed for each of the translated files to
    ensure that the rewrite does not introduce bugs
  file merge
    the individual files are being prepared to merge into the interpreter
```

⇐ "What's New in Axiom" (releaseNotes) 1.1.1 on page 1

— **releasenotes.ht** —

```

Axiom is implemented in lisp, removing all code in Boot.

The major effort in this release has been the boot to lisp rewrite.
There are several follow-on phases which are "in-process" but only
partially complete with this release. These include:
  source cleanup -
    generating warning-free compiles which involves cleaning up the
    boot-to-lisp artifacts
  generating unit tests
    unit tests are being developed for each of the translated files to
    ensure that the rewrite does not introduce bugs
  file merge
    the individual files are being prepared to merge into the interpreter
    and compiler volumes.
  global variable handling
    the system uses many globals which are being either explained or
    rewritten to reduce coupling
  data structure extraction
    the various data structures used by the compiler and interpreter
    are being identified and explained
  API vs implementation
```

```
    the functions used externally vs the functions used internally are
    being identified
  code refactoring
    the generated lisp code is being rewritten into human form without
    changing the behavior

The target goal is to have the code cleanly merged into the interpreter
and compiler volumes in a logical way that form chapters related to function.

Additional changes in this release include:

  Add Steven Segletes to credits. He was the author of the paper that
  supplied the coefficients for computing E1. He has contributed a later,
  unpublished paper which has more accurate coefficients. This is in-plan
  to implement.

  Barry Trager contributed an example of computing Shannon Matrices.
  This has been added to the input/regression suite.

  The .dvi files for the interpreter are no longer being built. The
  individual pamphlets will shortly disappear.

  Debugsys is no longer built. I am the only user of it and I can build
  it when needed.

  Bootsys is no longer built. It is no longer needed.

  The Makefiles now use the := rather than = assignment limiting re-evals

  Parallel Make is now the default since the documentation build is now
  independent of the interpreter build

\end{verbatim}

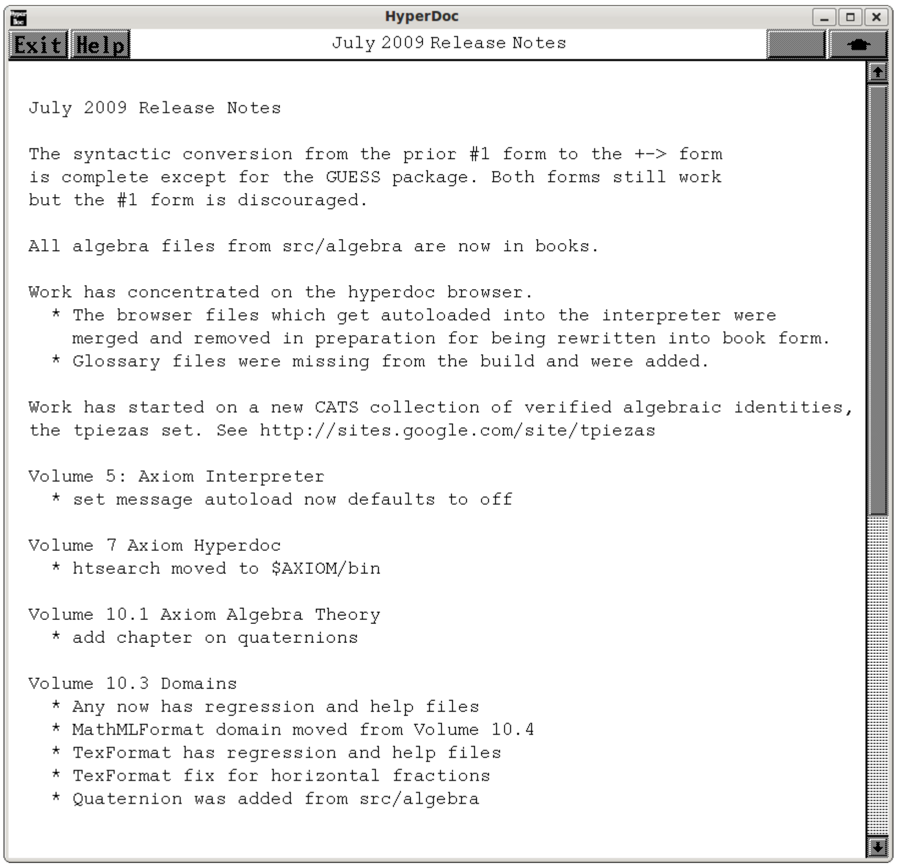
\autobuttons
\end{page}
```

1.1.18 July 2009 Release Notes



```
July 2009 Release Notes

The syntactic conversion from the prior #1 form to the +-> form
is complete except for the GUESS package. Both forms still work
but the #1 form is discouraged.

All algebra files from src/algebra are now in books.

Work has concentrated on the hyperdoc browser.
  * The browser files which get autoloaded into the interpreter were
    merged and removed in preparation for being rewritten into book form.
  * Glossary files were missing from the build and were added.

Work has started on a new CATS collection of verified algebraic identities,
the tpiezas set. See http://sites.google.com/site/tpiezas

Volume 5: Axiom Interpreter
  * set message autoload now defaults to off

Volume 7 Axiom Hyperdoc
  * htsearch moved to $AXIOM/bin

Volume 10.1 Axiom Algebra Theory
  * add chapter on quaternions

Volume 10.3 Domains
  * Any now has regression and help files
  * MathMLFormat domain moved from Volume 10.4
  * TexFormat has regression and help files
  * TexFormat fix for horizontal fractions
  * Quaternion was added from src/algebra
```

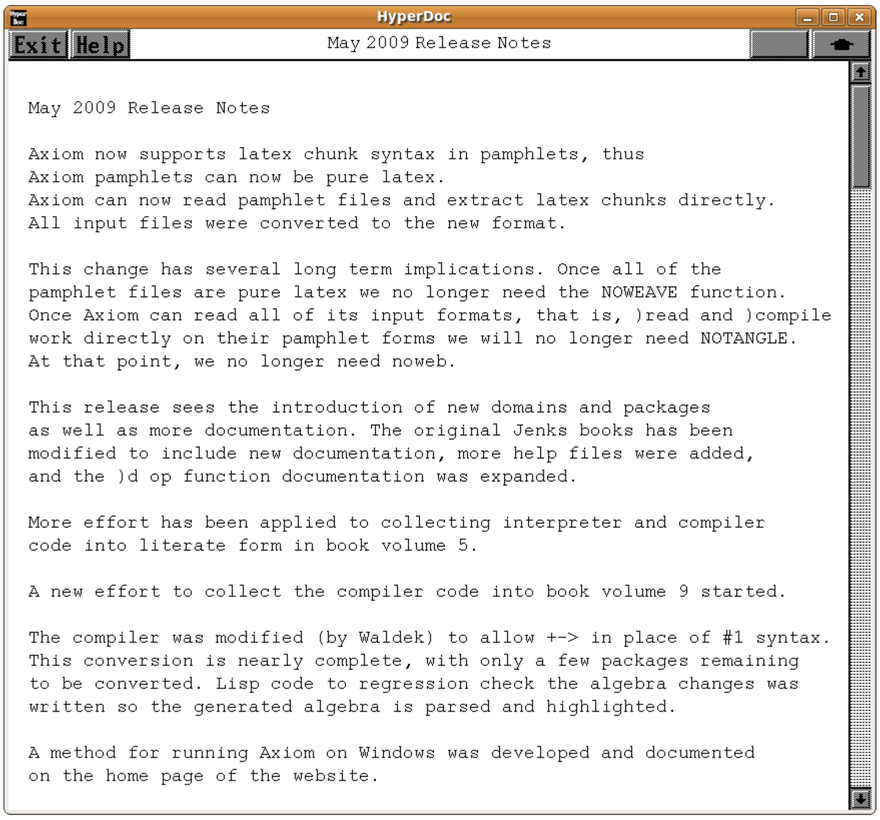
———-

1.1.19 May 2009 Release Notes



```
May 2009 Release Notes

Axiom now supports latex chunk syntax in pamphlets, thus
Axiom pamphlets can now be pure latex.
Axiom can now read pamphlet files and extract latex chunks directly.
All input files were converted to the new format.

This change has several long term implications. Once all of the
pamphlet files are pure latex we no longer need the NOWEAVE function.
Once Axiom can read all of its input formats, that is, )read and )compile
work directly on their pamphlet forms we will no longer need NOTANGLE.
At that point, we no longer need noweb.

This release sees the introduction of new domains and packages
as well as more documentation. The original Jenks books has been
modified to include new documentation, more help files were added,
and the )d op function documentation was expanded.

More effort has been applied to collecting interpreter and compiler
code into literate form in book volume 5.

A new effort to collect the compiler code into book volume 9 started.

The compiler was modified (by Waldek) to allow +-> in place of #1 syntax.
This conversion is nearly complete, with only a few packages remaining
to be converted. Lisp code to regression check the algebra changes was
written so the generated algebra is parsed and highlighted.

A method for running Axiom on Windows was developed and documented
on the home page of the website.

A new effort to collect the compiler code into book volume 9 started.

The compiler was modified (by Waldek) to allow +-> in place of #1 syntax.
This conversion is nearly complete, with only a few packages remaining
to be converted. Lisp code to regression check the algebra changes was
written so the generated algebra is parsed and highlighted.

A method for running Axiom on Windows was developed and documented
on the home page of the website.

Unit testing of interpreter and compiler changes was added to the
regression testing. This will expand in future versions as changes
are made so ensure that things continue to function.

Volume 0: Axiom Jenks and Sutor
  Richard Jenks bio was added

  Section 9: Examples of Domains and Packages expanded
     ApplicationProgramInterface (API)
     Dequeue (DEQUEUE)
     EuclideanGroebnerBasisPackage
     GeneralDistributedMultivariatePolynomial
     GroebnerPackage
     HomogeneousDistributedMultivariatePolynomial
     NottinghamGroup
     Permutation
     RealSolvePackage
     TwoDimensionalViewport

  Cross references were fixed

  More spelling typo fixes

Volume 4: Axiom Developers Guide
  A section was added explaining how to find anonymous function signatures

Volume 5: Axiom Interpreter
  Michael Becker was added to the credit list
  )set debug is now a new top level command to collect all of
  the developer-level commands to enable/disable internal messages
  and tracing functions.

  \defunsec macro was added to handle section titles with docstrings

  More interpreter code was moved from other files into this book

  All regression test numbering was fixed to conform to the new,
  stronger regression test. Thus --S requires the "of NN" phrase
  or a FAILED message will be raised.

  The compiler root was moved to volume 9: Axiom Compiler

Volume 7: Axiom Hyperdoc
  Fixup verbatim breakage

Volume 7.1: Axiom Hyperdoc Pages
  Update What's New for March 2009

Volume 9: Axiom Compiler
  The compiler code is being collected from other parts of the
  system into this book. In particular,
    The root functions for the compiler were added
    The top level loop code of the compiler was added
    The next layer of compiler code was added

Volume 10.2: Axiom Algebra Categories
  There was a general change to allow +-> syntax in algebra and
  this was made to all existing categories

  MatrixCategory now has regression test cases, a help page,
  and )d op function examples

  Document binomial category

Volume 10.3: Axiom Algebra Domains
  There was a general change to allow +-> syntax in algebra and
  this was made to all existing domains

  SparseMultivariateTaylorSeries now has regression test cases, a help page,
  and )d op function examples

  Permutation now has regression test cases, a help page,
  and )d op function examples

  The regression tests now conform to the new, stronger
  regression test requirements

Volume 10.4: Axiom Algebra Packages
```

```
  There was a general change to allow +-> syntax in algebra and
  this was made to some existing packages. There is more to be done.

  Bezier package was added, including regression test cases, a help page,
  and )d op function examples

  CombiniatorialFunction now has regression test cases, a help page,
  and )d op function examples

  ElementaryFunction now has regression test cases, a help page,
  and )d op function examples

  IntegerCombinatoricFunctions now has regression test cases, a help page,
  and )d op function examples

  LazardSetSolvingPackage now has regression test cases, a help page,
  and )d op function examples

  The regression tests now conform to the new, stronger
  regression test requirements

Volume 12: Axiom Crystal
  Add Gelernter's observations on Layout and Linking

Bug fixes
   7191: set *system-directory* dynamically     (20090413.03.tpd.patch)
   7192: )edit now works because SPADEDIT added (20090414.02.tpd.patch)
   7197: fix hyperdoc/graphics failure          (20090530.01.tpd.patch)

Makefile changes
  Top Level Makfile
    The BOOKS environment shell variable was added to ENV
    Makefile.slackware chunk exists
    Makefile reports regression failures after builds

  lsp/Makefile
    Build tangle into the lisp image

  src/Makefile
    Copy bookvol9, the compiler,  to src/interp at build time

  src/algebra/Makefile
    Add Bezier package
    Add LazardSetSolvingPackage.help
    Add MatrixCategory.input, .help
    Add help, regress for ElementaryFunction
    Add input, help, examples for SparseMultivariateTaylorSeries
    Fix LazardSetSolvingPackage typo
    Move egrep to grep -E since egrep might not be installed
    Move help to bookvol5
  src/doc/Makefile
    Move help to bookvol5

  src/input/Makefile
    Add FRAC regression test
    Add unittest* files for regression testing non-algebra changes
    Change input files to latex tangle
    Fix regress format to conform to the new, improved regression testing

  src/interp/Makefile
    Build bookvol9, the compiler from book sources
    The old gclweb code was rewritten into tangle.lisp, gclweb was removed
    Move help to bookvol5
    More interpreter code was moved to bookvol5, the interpreter
    Debugsys has been updated to stop loading deleted files
    Several files were merged, rewritten, and removed:
      apply.boot, bootlex.lisp, comp.lisp, compiler.boot, cstream.boot,
      def.lisp, i-util.boot, incl.boot, int-top.boot, metalex.lisp,
      nci.lisp, parse.boot, parsing.lisp, postpar.boot, preparse.lisp,
      server.boot, setq.lisp, sockio.lisp, spad.lisp, spaderror.lisp,
      util.lisp, vmlisp.lisp

faq
  faq 50: Cannot find libXpm.a

readme
  Add Michael Becker to credit list

books/
  tangle.lisp lisp version of tangle command
  ps/v71mar2009.ps hypertex march 2009 release notes pic
  ps/v71releasenotes.ps hypertex what's new page pic

src/interp
  Rewrite apply.boot to apply.lisp
  Regression tests, regress.lisp, now checks for the "of NN" phrase

src/algebra
  Add Bezier package to exposed.lsp

src/axiom-website
  Add March 2009 column
  Add slackware column
  Axiom on Windows as html instructions
  Add March release notes
  Add binaries

src/doc/
```

```
  Add chunk environment to axiom.sty
  Old book sources were removed
  The spadhelp file was removed and added to the interpreter book

src/input/
  All of the .input files were modified to use latex tangle

src/scripts/tex/
  axiom.sty contains new latex macros

zips
  Old GCL versions were removed
    gcl-2.6.8pre.tgz removed
    gcl-2.6.7.tgz removed

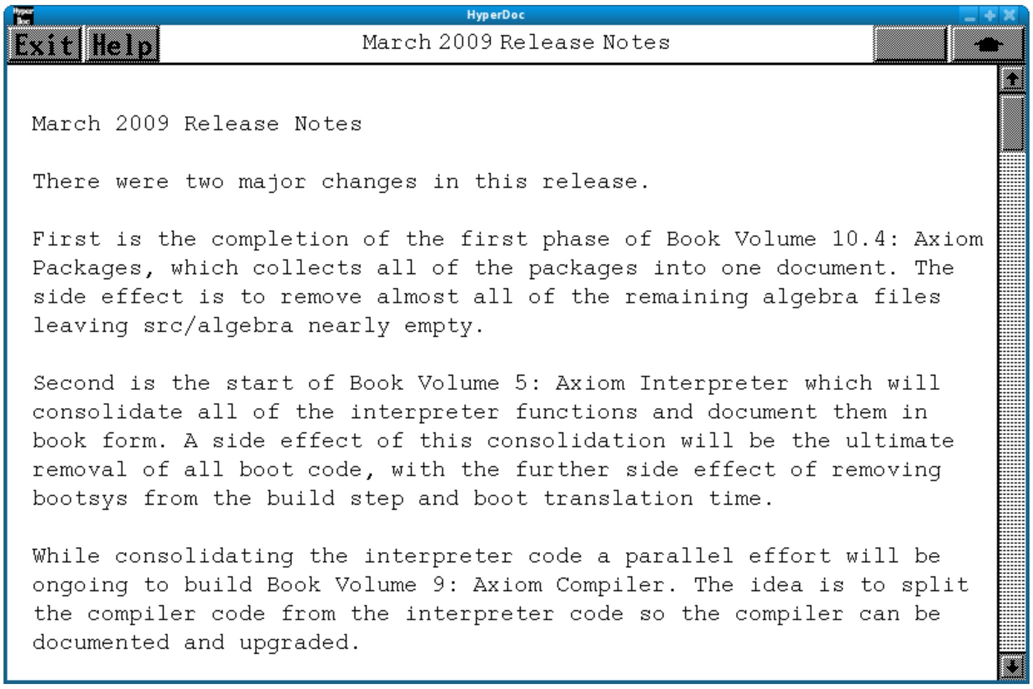
———-

1.1.20 March 2009 Release Notes



March 2009 Release Notes

There were two major changes in this release.

First is the completion of the first phase of Book Volume 10.4: Axiom Packages, which collects all of the packages into one document. The side effect is to remove almost all of the remaining algebra files leaving src/algebra nearly empty.

Second is the start of Book Volume 5: Axiom Interpreter which will consolidate all of the interpreter functions and document them in book form. A side effect of this consolidation will be the ultimate removal of all boot code, with the further side effect of removing bootsys from the build step and boot translation time.

While consolidating the interpreter code a parallel effort will be ongoing to build Book Volume 9: Axiom Compiler. The idea is to split the compiler code from the interpreter code so the compiler can be documented and upgraded.

⇐ “What’s New in Axiom” (releaseNotes) 1.1.1 on page 1

\begin{verbatim}
March 2009 Release Notes

There were two major changes in this release.

First is the completion of the first phase of Book Volume 10.4: Axiom
Packages, which collects all of the packages into one document. The
side effect is to remove almost all of the remaining algebra files
leaving src/algebra nearly empty.

Second is the start of Book Volume 5: Axiom Interpreter which will
consolidate all of the interpreter functions and document them in
book form. A side effect of this consolidation will be the ultimate
removal of all boot code, with the further side effect of removing
bootsys from the build step and boot translation time.

While consolidating the interpreter code a parallel effort will be
ongoing to build Book Volume 9: Axiom Compiler. The idea is to split
the compiler code from the interpreter code so the compiler can be
documented and upgraded.

Book Volume 0: Axiom Jenks book
  Add )include documentation

    The original book did not document the )include command. This is
    now documented.

  Add UnivariateSkewPolynomial

    This domain was added to the domain examples

Book Volume 4: Axiom Developers Guide
  Hyperdoc

    A Hyperdoc tutorial on making new pages was written

    A tutorial on spadhelp was added

Book Volume 5: Axiom Interpreter
  Command Handling

    The top level commands that start with open parenthesis are all
    kept in the $setOptions data structure. This structure was documented.
    Each command has a handler routine which was integrated with the
    structure in the proper place.

  New latex macros

    The \defun and \defmacro macros were added to ensure that
    there is a uniform handling of subsections and cross references
    for all functions and macros.

    The \defdollar macro was added to handle $foo variables in
    both index and cross reference.

    The \cmdhead macro was added to provide uniform handling of
    each of the top level commands in the $setOptions data structure

  Unit testing

    To ensure that changes did not break behavior two new regression
    test routines were added, unittest1 and setcmd. These test the
    top level command behavior.

  Trace functions added

    The trace.boot code was added.

Book Volume 7: Axiom Hyperdoc
  Documentation

    Add Scott Morrison's original hypertex plan notes

Book Volume 10.1: Axiom Algebra Theory
  Documentation

    Add tutorial chapter on Singular Value Decomposition

Book Volume 10.3 Axiom Domains
  Algebra fixes

    Johannes Grabmeier fixed the outputFixed behavior in Float.

    A regression test chunk was added to the Float domain.

    UnivariateSkewPolynomial was documented. A regression test,
    help file, and examples were added.

    Heap was documented. A regression test, help file, and
    examples were added.

    Dequeue was documented. A regression test, help file, and
    examples were added.
    Queue was documented. A regression test, help file, and
    examples were added.

    ArrayStack was documented. A regression test, help file, and
    examples were added.

    Stack was documented. A regression test, help file, and
    examples were added.

    NottinghamGroup was added, including regression and help files.
    Originally written by Martin Rubey.

  Regression tests

    The )sys rm now uses the -f flag to force deletion on all
    regression test files

Book Volume 10.4 Axiom Packages
  New Algebra

    All packages were moved into this volume. Almost all of the
    remaining algebra files were deleted.

    ApplicationProgramInterface (API) was added. It exposes the
    Axiom internal functions at the algebra level.

    UnivariateSkewPolynomial now has help, input, and examples

  Documentation

    The nag man pages were added to the related domain documentation

    Export lists were added for all packages.

  Regression tests

    The )sys rm now uses the -f flag to force deletion on all regression
    test files.

Boot to Lisp rewrite
  Deleted boot files

    setvars.boot is gone. The code has been rewritten and added to
    book volume 5. The code was rewritten and/or reformatted. All
    compile-time warnings were eliminated.

    setvart.boot is gone. The code has been rewritten and added to
    book volume 5. The code was rewritten and/or reformatted. All
    compile-time warnings were eliminated.
    trace.boot is gone. The code has been rewritten and added to
    book volume 5. The code was rewritten and/or reformatted. All
    compile-time warnings were eliminated.

Regression test
  cleanup
    )set break resume

     A subtle bug in regression testing caused by early exit of a
     test left some of the regression tests reporting success when
     there should have been failure. This was fixed by adding a
     )set break resume command to allow Axiom to continue the testing
     in the presence of an internal fault.

  new

     setcmd.input was added to regression test changes to the )set
     top level command

     unittest1.input was added to regresstion test other top level
     commands

     dop.input was added to unit test )d op example output

     frame.input was added to unit test frame handling

  removed

     bags.input was distributed among the algebra regression test
     files and bags.input was removed.

Bug fixes

  Bug 7183. The library handling code was repaired. Functions which do
  not exist were removed (e.g. input-libraries). The element values of
  the data structure are now pathnames.

  Bug 7182. )set mes auto did not indicate the current value.

  Bug 7180: )set compiler input add foo triggers a call to open-library
  which was a CCL function and no longer implemented. The elements of
  the data structure were changed.

  Bug 7179. Suprious sensitivity to )abb in documentation caused
  breakage because this was assumed to be an )abbreviation command.

  Bug 7178. Missing function inspect in ArrayStack

  Bug 7177. Missing function map! in ArrayStack
  Bug 7176. Missing function parts in ArrayStack

  Bug 7175. Missing function map in ArrayStack

  Bug 7174. Missing function map! in Stack

  Bug 7173. Missing function parts in Stack

  Bug 7172. map was missing from Stack(Integer)

  Bug 7170: )d op output failure due to X in algebra comments. The X
  symbol is now a marker for )d op examples and the use of X in comments
  is ambiguous.

  Bug 7141: )cd relative does not work

Interpreter (src/interp)
  Documentation

    document mmCost calculation

Help files
  Documentation

    The help file list is now dynamically generated from the algebra
    books.

readme
  Quote

    Add Doron Zeilberger quote about builders of CA systems.

Website
  Download

    Add fedora10 as a supported platform

    Add vector as a supported platform

Lisp
  New patch

    read-char-no-hang was changed by Camm to ignore newlines but
    Axiom's browser needs them to be recognized. A patch was added
    to back out Camm's change.

\begin{verbatim}
January 2009 Release Notes

One major theme of this release was restructuring the system
to move all domains to literate form in book volume 10.3

A second major theme was the first Axiom youtube tutorial video.

Book Volume 0: Axiom Reference

  Remove obsolete references to SmallFloat

Book Volume 1: Axiom Tutorial

  Remove obsolete references to SmallFloat

Book Volume 4: Axiom Developers Guide
```

```
  Add section on generating graphviz graphs

Book Volume 7.1: Axiom Hyperdoc

  Give a complete path to htadd

Book Volume 10.3 Axiom Domains

  All domains have been removed from the algebra subdirectory
  and are now in literate form in book volume 10.3. Some
  domains include a help file, a regression test suite, and
  --X function examples for the )display command. Future work
  will extend this set.

  Each domain has a fully indexed list of functions exported.
  This allows hyperlinked access to functions.

  Each domain includes a graph segment that shows the list of
  categories, domains, and packages that provide immediate
  support in the prior build layer.

  Each domain includes a dotabb chunk which contains the
  source code necessary to recreate the graph.

  Domains which were associated with other domains in the same
  original spad file have hyperlinks to connect them.

Book Volume 11: Axiom Browser

  Lighten Bayou theme background image

Axiom Website (src/axiom-website)

  The axiom website is now under git control.
  The source tree is in src/axiom-website in the distribution.

  The build order graph exists. It contains a graph of all the
  constraints for each level. A line in the graph connects each
  category, domain, and package to every category, domain, and
  package in the prior layer that is required for the build.
  Multilayer constraints are not shown (although the data is
  in src/algebra/Makefile chunks) because the graph would be
  too complex.
    http://axiom-developer.org/axiom-website/hp.svg

  The Computer Algebra Test Suite (CATS) has a new test suite
  for ordinary differential equations (kamke*)
    http://axiom-developer.org/axiom-website/CATS
  The Ubuntu download now advises XTerm*metaSendsEscape: true
  due to misconfiguration of the meta key in emacs.
    http://axiom-developer.org/axiom-website/documentation.html

  A new binary for vector linux was added
    http://axiom-developer.org/axiom-website/download.html

  A new binary for doyen thumbdrive was added
  (work by Jose Alfredo Portes)
    http://axiom-developer.org/axiom-website/download.html

  The screenshots were recreated so the sources would be available.
  for matrixinmatrix.jpg, heatequation.jpg, axiomfirefox.jpg
    http://axiom-developer.org/axiom-website/screenshots.html

  The Axiom Information Sources video page was added, including
  a link to the youtube video, a local copy, and the supporting PDF.
    http://axiom-developer.org/axiom-website/videos.html

  A broken link to Book Volume 0: Axiom Reference was fixed.

Algebra (src/algebra)

  All domains were removed from spad files and moved to
  Book Volume 10.3 Axiom Domains

  The Makefile now contains the information necessary to
  construct the build order graph as literate chunks.

  The layers were restructured. Files were moved to ensure
  that each file was at its lowest possible layer.

  The Guess package was added. However, due to nonstandard
  package files the guess function does not yet work properly.
  These packages are being rewritten.

  The Guess package has circular references. A new clique
  mechanism was added to the Makefile to handle this.

  Automatic regression test files associated with the algebra
  sources were reviewed for conforming to regression standards.

  integer.spad was reverted to remove an algebra change that
  causes a regression (cherry picked from Fricas in 2007)

Interpreter (src/interp)

  Tim Lahey added to )credits
  Karl Hegbloom added to )credits

  htcheck.boot moves util.ht to the mnt/doc directory

  setq.lisp no longer had redundant release data information

  nrunfast.boot Float has exp : Float -> Float now works
  This change was cherry-picked from Fricas.

Testing (src/input)

  All regression test files were reviewed and cleaned to
  conform to a standard setup.

  A parallel build race condition was fixed in the Makefile

  xpbwpoly.input was removed as it is now associated with
  its source domain and automatically generated.

  hyperbolicrules.input was added

  Tim Lahey submitted a fix for bugs in schaum17.input

  A cherry-picked patch from Fricas in 2007 was removed
  because it causes an algebra regression. The regression
  test file was corrected.

  fixed.input was converted to a regression test file

Build process

  The lsp/Makefile was updated for GCL pre3 patches

  An ubuntu64 chunk was added as a system target

  src/Makefile outputs util.ht before compiles (bug 7146)

  books/Makefile uses bash SHELL to fix echo behavior.
  The standard sh echo behaves badly.

  books/Makefile now has amssymb in preamble for toc.tex

GCL (zips)

  Axiom now includes GCL pre3, the latest snapshot of GCL.
  This can be chosen as an option for building in the top
  level Makefile.pamphlet
  The lsp/Makefile was updated for GCL pre3 patches

faq

  FAQ 49: How do I get the lastest GCL?

readme

  Tim Lahey added
  Karl Hegbloom added

  The date information for releases was removed as it is
  available elsewhere

  A John Gorka quote was added:
  "What matters the most is what you do for free" -- John Gorka

\begin{verbatim}
September 2008 Release Notes

Axiom website
   The effort here is to improve the support for offline literate
   documentation. The primary changes are the inclusion of graphs
   and additional book volumes.

* <http://axiom-developer.org/axiom-website/documentation.html>
  Contains the new algebra volumes and subvolumes.
* <http://axiom-developer.org/axiom-website/bookvol10.2abb.html>
  Contains a "clickable" graph that indexes into the algebra.

Graphviz, PDF, and HTML integration
   The effort here is to unify these three technologies in a way
   that simplifies the user interface and improves documentation
```

```
* Graphviz is used if available but not required
* Algebra graphs are automatically generated at build time
  from algebra source files
* Graphviz graphs now properly hyperlink into PDF files allowing
  any node in a graph to link to any document page

Book volume 0 (Jenks and Sutor)

* <http://axiom-developer.org/axiom-website/bookvol0.pdf>
* replace \over with \frac

Book volume 7.1 (Hyperdoc pages)
   The effort here is to create a literate document that contains
   all of the "live" pages used in hyperdoc. The PDF is being
   constructed so that a user can effectively "browse" the static
   hyperdoc pages, which are included, without a running Axiom.

* <http://axiom-developer.org/axiom-website/bookvol7.1.pdf>
* The source for all of the pages is now contained in this book.
* Hyperdoc now fetches the pages directly from the book.
* The hyper page directory and all files are gone.
* Some of the static page images are now inside the PDF
* Pages have href links allowing "in-pdf" navigation of pages

Book volume 10 (Algebra)
   The effort here is to create a way to describe and deeply
   document the algebra. This volume was split to better handle
   the structure of Axiom's information.

* Split into 5 volumes
   - 10   Implementation
   - 10.1 Theory
   - 10.2 Categories
   - 10.3 Domains
   - 10.4 Packages

Book volume 10.2 (Algebra Categories)
   The effort here is to create fully indexed, cross-referenced,
   graphical documentation for Axiom categories in a standalone
   form. This is a "live" literate document which contains the
   actual source code used to build the system.

* <http://axiom-developer.org/axiom-website/bookvol10.2.pdf>
* Contains 60 categories so far
* Has partial graphs for each category
* Has list of exported functions
* Has information about source of functions
* Has index cross reference by function and category
* Has PDF href links so that URLs work:
   <http://axiom-developer.org/axiom-website/bookvol10.2.pdf#nameddest=AGG>
* Has forward/backward links between categories
* Automatically generates "clickable" graphs:
   <http://axiom-developer.org/axiom-website/bookvol10.2abb.html>
* Graph clicking automatically opens to the proper source code

New algebra examples (Daly, Tsikas)
   The effort here is to create "real time" documentation that
   gives the end user an example of how to construct the proper
   arguments and call a function. This puts examples into the
   system so users don't need to consult other documents.

* )d op someop shows examples of function usage
* about 100 new function examples were added
* new comment syntax added to allow automatic API testing

Input Files
   There is a new effort to automatically extract the algebra
   examples in order to regression test the user API to the
   algebra. In addition there is ongoing test work.

* New input files (Hemmecke, Stumbo, Cyganski, Daly)
     bini, biquat, ifthenelse, liu, overload, sqrt3, typetower
* Changed input files (Hemmecke, Stumbo, Cyganski, Daly)
     bern, function, linalg, regset, test, tutchap2

Build changes

* graphics does not depend on compress, done at build time
* firefox html pages are now built before tests are run
```

```
Algebra changes

* FLAGG (FiniteLinearAggregate) -- removed a duplicate function

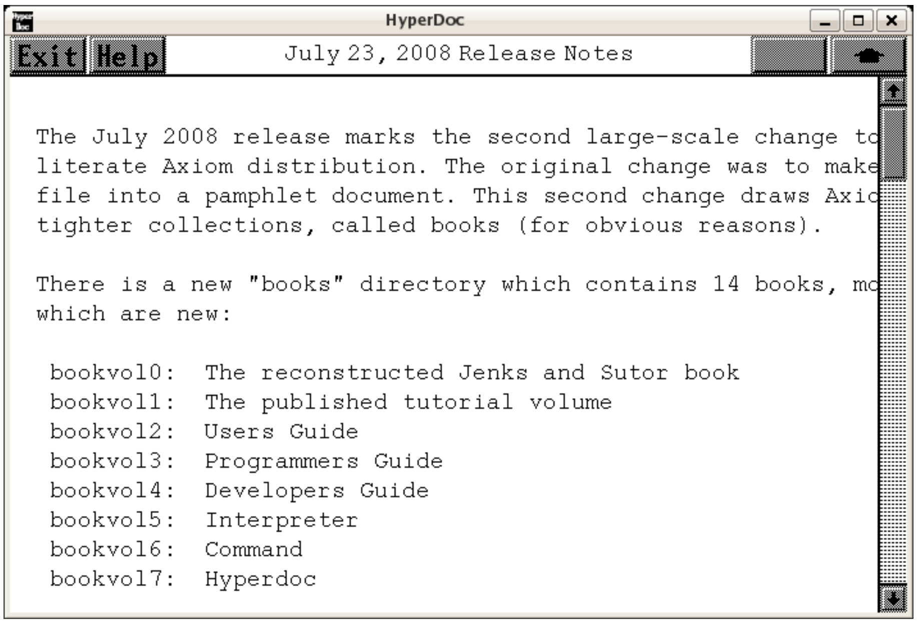
Interpreter changes (Page)

* add cost function to bottomUp output

\end{verbatim}
\endscroll
\autobuttons
\end{page}
```

———

1.1.24 July 23, 2008 Release Notes



```
The July 2008 release marks the second large-scale change to
literate Axiom distribution. The original change was to make
file into a pamphlet document. This second change draws Axic
tighter collections, called books (for obvious reasons).

There is a new "books" directory which contains 14 books, mc
which are new:

 bookvol0:  The reconstructed Jenks and Sutor book
 bookvol1:  The published tutorial volume
 bookvol2:  Users Guide
 bookvol3:  Programmers Guide
 bookvol4:  Developers Guide
 bookvol5:  Interpreter
 bookvol6:  Command
 bookvol7:  Hyperdoc
```

⇐ "What's New in Axiom" (releaseNotes) 1.1.1 on page 1

— releasenotes.ht —

```
\begin{page}{july2008}{July 23, 2008 Release Notes}
\beginscroll
\begin{verbatim}
The July 2008 release marks the second large-scale change toward a
literate Axiom distribution. The original change was to make every
file into a pamphlet document. This second change draws Axiom into
tighter collections, called books (for obvious reasons).

There is a new "books" directory which contains 14 books, most of
which are new:

 bookvol0:  The reconstructed Jenks and Sutor book
 bookvol1:  The published tutorial volume
 bookvol2:  Users Guide
 bookvol3:  Programmers Guide
 bookvol4:  Developers Guide
 bookvol5:  Interpreter
 bookvol6:  Command
 bookvol7:  Hyperdoc
 bookvol7.1 Hyperdoc Pages
 bookvol8:  Graphics
 bookvol9:  Compiler
 bookvol10: Algebra
 bookvol11: Browser
 bookvol12: Crystal

All of these books now exist. Portions of the current system have
been moved completely into book form (Graphics and Hyperdoc) so
the old files have been removed from the src tree. Both Graphics
and Hyperdoc are now built directly from their book. Work will
follow on other parts of the system.

These books are online at:
<http://axiom.axiom-developer.org/axiom-website/documentation.html>

There is an interesting side-effect of using literate technology.
Once you combine C and .h files into a single document so that each
file is a separate chunk it becomes obvious that there is no need for
local include files. The lines that read:
   #include "foo.h"
become
   begin{chunk}{foo.h}
and get expanded inline. Once you do this it also becomes obvious
that many include files get included multiple times (a clear waste
of disk I/O and preparser time). Further it becomes clear that there
```

```
is no need for creating tiny .o files since all of the source can
be combined into one C file using chunks.

These approaches were used to reduce the compile-time overhead
for both the graphics and the hyperdoc functions.

In addition to consolidating the source files for Graphics into
bookvol8 there were several other changes.

  * the functions for graphics, that is, viewman, view2d, view3d
    and viewalone are now built as single C files.
  * the graphics code was reorganized into chapters of related code
  * there is the beginnings of documentation
  * there is the beginnings of a test suite based on the
    CRC Handbook of Curves and Surfaces
  * the book is hyperlinked (Bill Page, Frederic Lehobey, Anatoly Raportirenko)
  * redundant code was eliminated
  * the code is fully indexed
  * the src/graph subdirectory is gone

In addition to consolidating the source files for Hyperdoc into
bookvol7 there were several other changes.

  * the functions for hyperdoc, that is, spadbuf, ex2ht, htadd, hthits
    and hypertex are now built as single C files
  * the hyperdoc code was reorganized into chapters of related code
  * there is the beginnngs of documentation
  * redundant code was eliminated
  * scroll wheel handling was added (Gregory Vanuxem)
  * the book is hyperlinked (Bill Page, Frederic Lehobey, Anatoly Raportirenko)
  * the code is fully indexed
  * )hd now works to start or restart Hyperdoc (Jose Alfredo Portes)
  * the src/hyper subdirectory is gone

In addition to consolidating the hyperdoc pages into bookvol7.1
there were several other changes:

  * the pages are hyperlinked
  * new latex macros were written to simplify page handling
  * images of hyperdoc pages were added
  * forward and backward hyperlinks between pages images works
    making it possible to "browse" the hyperdoc pages using only
    the single PDF file (Bill Page, Frederic Lehobey, Anatoly Raportirenko)
  * the pages are fully indexed
  * the src/hyper/pages subdirectory is gone

A combined table of contents PDF is now automatically generated
which covers all of the volumes. This makes it easier to find the
topic of interest.

In addition there were several other changes.

  * Some fixes were made for different platforms
       In particular, Fedora9 breaks the build and needs work

  * The configure script was replaced by instructions
       The standard (export AXIOM) works everywhere so the configure
       script is useless for guessing.

  * the FAQ was updated about git
       Since the May 2008 release the primary Gold source code platform
       is github. The FAQ was updated to reflect this.

  * the FAQ was updated about X11
       X11 has moved yet again so more notes are needed

  * move axbook to books
       The hyperlinked version of Jenks is now built from the books dir

  * add Ralf Hemmecke's documentation to ax.boot
  * add Monoid multiply to DirectProduct (Ralf Hemmecke)
  * add Monoid multiply regression test

\end{verbatim}

```

```
\begin{verbatim}

Summary: March 2008 release

Axiom is now available at github, a git-based code repository.
This site will have the Gold version of Axiom, that is, only
code that changes at each two-month release. To get a clone type:

   git-clone git://github.com/daly/axiom.git

USER VISIBLE CHANGES

  One primary focus of this release has been extending the Firefox
  toward being a full Axiom user interface (as opposed to a simple
  hyperdoc replacement). The Firefox console page has new, AJAX
  based, dropdown menus which are planned to be dynamically updated
  to display available functions for the last computed type. This
  should make it much easier to find the applicable functions by
  category and type. They are currently static in this release.

* Firefox Pages

 o Dropdown menus were added to the Axiom console page
 o More hyperdoc pages were translated to Firefox/html
 o Bitmaps and graphics are now properly handled in pages
 o A minor mathml fix was applied (for invisible times)

* Refcard

 o An Axiom reference card of Axiom commands was created (src/doc/refcard)

* Examples

 o It is often difficult to figure the exact arguments required to call
   any given function in Axiom. The )display operation command used to
   only show the available modemaps. This command has now been changed.
    )display operation foo
   now shows examples of function calls for foo.

* Help

 o The plot routines have new help files and documentation

PORTING

 o Axiom was ported to MAC-OSX

 o The binary download page now has binaries for
   Ubuntu, OpenSUsE, Redhat9, Redhat72, Debian, MACOSX at
```

```
    <http://axiom.axiom-developer.org/axiom-website/download.html>

 o Binaries for the this release will be available shortly.

INTERNALS

* Compiler changes
 o  hashtables were used to speed up compiles

* Algebra changes
 o  There are new special functions, Ei,En,Ei1,Ei2,Ei3,Ei4,Ei5,Ei6
 o  The prime and BasicSieve functions are faster
 o  The Brent/Pollard algorithm was documented
 o  Bad gcd reductions are checked (heugcd regression test file added)
 o  The plot routines have new help files and documentation

* Makefile changes
 o  Bi-capital SVN copies are no longer made

* Interpreter changes
 o  Book Volume 5 has new documentation on the display function
 o  The display function code has been translated and moved to book volume 5
 o  PI has a higher internal precision
 o  Mappings are now properly hashed for Aldor

CATS (Computer Algebra Test Suite)

 o The differential equations regression tests are being checked against
   Mathematica, Maple, and Maxima. This has happended for the kamke2.input
   regression test file and will happen for the other regression tests.

o  Complex Gamma, logGamma, and log(Gamma) have additional tests and
   documentation.

\end{verbatim}
\endscroll
\autobuttons
\end{page}
```

\begin{verbatim}

Summary: January 2008 release

There have been two major concentrations of effort in this release.

The first concentration is on the new Firefox Hyperdoc and the
second concentration was the verification of Axiom against
published standards.

Firefox Hyperdoc

The Firefox Hyperdoc has been integrated with the rest of the
interpreter. The new )browse command causes Axiom to listen and
serve hyperdoc pages on port 8085.

The interpreter was changed to add the )browse command. As a
```

```
side-effect new documentation was added to the interpreter
volume (bookvol5) to explain top-level command handling. In
addition, lisp and boot code was rewritten as part of the
literate change.

New sections were added to cover the beginning of the Computer
Algebra Test Suite (CATS) subsection which brings a focus on
compliance with published standards.

Arthur Ralf's mathml-enabled version of the Jenks book is fully
integrated into the Firefox Hyperdoc. Arthur also fixed some
rendering and ambiguity issues.

  axbook.tgz             fix the user/group settings
  axserver.spad          fix lastType output re: errors
  bookvol5               browse and top-level command handling
  bookvol11              add standards compliance for gamma
  gammacomplexinverse.png added
  gammacomplex.png       added
  gammareal3.png         added
  loggamma.png           added
  mathml.spad            fix ambiguity bug in mathml output
  mathml.spad            fix hex(10) mathml rendering
  mathml.spad            fix F,3 mathml rendering
  mathml.spad            remove code to eat %%
  psi.png                added

Standards Verification

The Computer Algebra Test Suite (CATS) effort checks the results
that Axiom generates against published results. Axiom has an
extensive set of regression tests (the KAMKE suite) for ordinary
differential equations, for integration (the SCHAUM suite), and
for numeric special functions (the ABRAMOWITZ suite). In addition,
results have been checked against Mathematica, Maple, and Maxima.

  asinatan.input   regression for the functions asin and atan
  asinhatanh.input regression for the functions asinh and atanh
  besselk.input    regression for the function besselK
  e1.input         regression for the function E1
  en.input         regression for the function En
  exp.input        regression for the function exp
  gamma.input      regression for the function gamma
  log.input        regression for the functions log
  pfaffian.input   regression for the function pfaffian
  seccsc.input     regression for the functions sec and csc
  sincos.input     regression for the functions sin and cos
  sinhcosh.input   regression for the functions sinh and cosh
  tancot.input     regression for the functions tan and cot
  tanhcoth.input   regression for the functions tanh and coth

New Functions Added

Axiom is missing various special functions found in other computer
algebra systems. This release adds two new ones, the Exponential
Integral E1 and the higher order Exponential Integral En.  These have
been tested against the published results.

  special.spad E1 added
  special.spad En added

Bugs Fixed

There are 15 bug fixes in this release:

  bug 7015: fix hex(10) mathml rendering
  bug 7016: remove code to eat %%
  bug 7019: fix F,3 mathml rendering
  bug 7023: discardGraph free corrected
  bug 7042: ignore regression test gensym
  bug 7045: wrong Makefile for Xpm fix
  bug 7052: spurious remake of axbook
  bug 7054: /home/silver path in bookvol11
  bug 7057: ambiguity in mathml
  bug 7089/343: FreeAbelianGroup order
  bug 7090/355 handle besselK
  bug 7093: Function name fix
  bug 7100/149: numlock in hyperdoc
  bug 7101/204: MoreSystemCommand unnecessary loading
  bug 7102/412: Equality testing in TableAggregate

Regression test fixes

As changes happen in the system the regression tests are updated
to reflect the new conditions. Changing the category of PositiveInteger
caused (a + -bi) to print as (a - bi). New builds raised gensym faults
which were fixed. And new builds change random numbers so the tests
that depend on them are marked "ok" despite failures due to randomness.
```

```
The FreeAbelianGroup bug is tested.

  acplot.spad     fix output form of negative numbers
  calculus2.input fix function names
  classtalk.input ignore gensyms
  collect.input   fix function names
  dfloat.input    handle negative number output
  easter.input    fix function names
  elemnum.input   handle negative number output
  exlap.input     fix function names
  exsum.input     fix function names
  free.input      added to test bug
  grpthry.input   mark random generation failures ok
  grpthry.input   fix function names
  ico.input       mark random generation failures ok
  intg0.input     ignore gensyms
  is.input        type declare function
  kamke3.input    mark random generation failures ok
  knot2.input     fix function names
  lodo.spad       ignore regression test gensym
  mapleok.input   ignore gensyms
  mathml.input    handle new mathml sub/sup change
  ndftip.input    fix missing blank lines
  pmint.input     rewritten
  repa6.input     fix function names
  r20bugs.input   change spacing
  sf.spad         fix output form of negative numbers
  tbagg.input     regression for equality testing in TableAggregate

Algebra file changes

The fundamental change was a supposedly transparent move of
the category for PositiveInteger. This had the effect of changing
the output form and broke several regression tests. Some mathml
issues were fixed. The new functions E1 and En were added. The
FreeAbelianGroup bug was fixed.

  axserver.spad  fix lastType output re: errors
  acplot.spad    fix output form of negative numbers
  combfunc.spad  fix bold font handling
  integer.spad   category change for PositiveInteger
  sf.spad fix    output form of negative numbers
  sf.spad        handle besselK
  op.spad        handle besselK
  combfunc.spad  handle besselK
  free.spad      fix FreeAbelianGroup bug
  special.spad   add E1
  special.spad   add En
  mathml.spad    fix ambiguity bug in mathml output
  mathml.spad    fix hex(10) mathml rendering
  mathml.spad    fix F,3 mathml rendering
  mathml.spad    remove code to eat %%

Interpreter changes

The primary changes are the addition of bookvol11 for the Firefox
Hyperdoc and the literate documentation of the top level command
handling in bookvol5 (the interpreter) along with rewrites of the
lisp/boot code.

  bootfuns.lisp move $systemCommands to bookvol5
  bookvol5      browse and top-level command handling
  bookvol11     added
  http.lisp     mathObject2String for hex(10)
  incl.boot     move incBiteOff to bookvol5
  intint.lisp   move setCurrentLine to bookvol5
  int-top.boot  move ncloopCommand, etc. to bookvol5
  i-syscmd.boot move $SYSCOMMANDS to bookvol5
  Makefile      wrong Makefile for Xpm fix
  makegraph.c   discardGraph free corrected
  nci.lisp      move ncloopInclude to bookvol5
  setq.lisp     move command initialization to bookvol5

Documentation changes

  bookvol5      explain top level input handling (lisp/boot rewrite)
  combfunc.spad fix bold font handling
  axiom.sty     add binom

PORT TO DIFFERENT SYSTEMS
```

```
  As part of the new axiom website there is a binary release page.
  The stanzas for these supported systems were added.

20071119 tpd Makefile.pamphlet add fedora6,7,8 stanzas

NEW Axiom WEBSITE: http://axiom-developer.org STARTED.
  The new Axiom website (currently at axiom.axiom-developer.org)
  has been started. It will include the binary release page.

REMOVE OLD REGRESSION SYSTEM
  The previous regression test system was removed. A new combined
  regression test and help documentation system was built to replace
  this mechanism.

20070901 tpd src/input/Makefile remove ALGEBRA variable
20070901 tpd src/algebra/perm.spad remove TEST mechanism
20070901 tpd src/algebra/view2d.spad remove TEST mechanism
20070901 tpd src/algebra/fr.spad remove TEST mechanism

FIX BOOK DOCUMENTATION
  Minor typos have been discovered in the book during documentation.

20070905 tpd src/doc/book remove duplicate upperCase, lowerCase typo
20070903 tpd src/doc/bookvol4 fix typos
20070902 tpd src/doc/book MultiSet -> Multiset
20080829 tpd src/doc/book.pamphlet correct typo

FIX BUGS
  Various bugs have been found and fixed.

20071101 tpd src/interp/i-output.boot fix bugs 7010 (209), 7011
20070920 tpd src/input/Makefile add bug101.input regression test
20070920 tpd src/input/bug101.input test laplace(log(z),z,w) bug 101
20070920 wxh src/algebra/laplace.spad fix laplace(log(z),z,w) bug 101
20070916 tpd src/input/Makefile add bug103.input regression test
20070916 tpd src/input/bug103.input test solve(z=z,z) bug fix
20070916 tpd src/algebra/polycat.spad solve(z=z,z) bug fix
20070916 tpd src/algebra/catdef.spad add zero? to exquo
20070915 tpd merge bug100 branch
20070915 tpd src/input/Makefile add bug100.input regression test
20070915 tpd src/input/bug100.input test integrate((z^a+1)^b,z) infinite loop
20070915 wxh src/algebra/intef.spad fix integrate((z^a+1)^b,z) infinite loop
20070915 tpd src/algebra/carten minor edit for regression cleanup
20070914 wxh src/hyper/hyper fix bad bracing of )hd change
20070914 tpd src/algebra/fraction.spad remove double )spool command
20070914 tpd src/algebra/kl.spad remove double )spool command
```

```
20070914 tpd src/algebra/lindep.spad remove double )spool command
20070914 tpd src/algebra/radix.spad remove double )spool command

ENABLE DYNAMIC RESTART OF HYPERDOC
  Hyperdoc can now be started dynamically or restarted if killed.

20070914 jap adapt changes for )hd restart to Axiom sources
20070914 wxh src/sman/bookvol6 enable restart of hyperdoc with )hd
20070914 wxh src/include/sman.h1 enable restart of hyperdoc with )hd
20070914 wxh src/hyper/hyper enable restart of hyperdoc with )hd

SET UP THE NEW FIREFOX BASED HYPERDOC
  Hyperdoc is going away. A new version of hyperdoc is being built
  which uses html/javascript/mathml. These files change the interpreter
  and algebra to support the new hyperdoc machinery.

20071019 acr src/interp/http.lisp use new return values
20071019 acr src/algebra/axserver.spad use new return values
20071014 acr src/algebra/axserver.spad use getContentType(pathvar)
20071013 acr license/license.ralfs license rewrite
20071013 acr src/interp/http.lisp faster page service
20071013 acr src/algebra/axserver.spad faster page service
20071001 tpd src/algebra/exposed.lisp add (|AxiomServer| . AXSERV) to basic
20071001 tpd src/algebra/Makefile add axserver.spad
20071001 acr src/algebra/axserver.spad axserver socket connection code
20071001 tpd src/interp/Makefile add http.lisp
20071001 acr src/interp/http.lisp axserver socket connection code
20071001 acr license/license.ralfs added

REGRESSION TEST CALCULUS
  A new regression test suite for calculus is being built. The first
  of these files has been added to the system.

20070913 tpd src/input/Makefile schaum1.input added
20070913 tpd src/input/schaum1.input added

REGRESSION TEST ORDINARY DIFFERENTIAL EQUATIONS
  A regression test suite for ordinary differential equations was built.

20071005 tpd src/input/Makefile kamke7.input regression test added
20071005 tpd src/input/kamke7.input ODE regression test added
20071005 tpd src/input/Makefile kamke6.input regression test added
20071005 tpd src/input/kamke6.input ODE regression test added
20071005 tpd src/input/Makefile kamke5.input regression test added
20071005 tpd src/input/kamke5.input ODE regression test added
20071005 tpd src/input/Makefile kamke4.input regression test added
```

```
20071005 tpd src/input/kamke4.input ODE regression test added
20071005 tpd src/input/Makefile kamke3.input regression test added
20071005 tpd src/input/kamke3.input ODE regression test added
20071004 tpd src/input/Makefile kamke2.input regression test added
20071004 tpd src/input/kamke2.input ODE regression test added
20071004 tpd src/input/Makefile kamke1.input regression test added
20071004 tpd src/input/kamke1.input ODE regression test added
20071004 tpd src/input/Makefile kamke0.input regression test added
20071004 tpd src/input/kamke0.input ODE regression test added

REGRESSION TEST PFAFFIAN
  Martin added the pfaffian regression test. It was added and removed
  due to documentation license issues. New documentation is being written.

20070929 tpd src/input/Makefile pfaffian regression test removed
20070929 tpd src/input/pfaffian.input regression test removed
20070927 tpd src/input/Makefile pfaffian regression test added
20070927 mxr src/input/pfaffian.input regression test added

ADD PORTIONS OF THE GUESS PACKAGE
  The newton.spad file is actually part of the fffg.spad file so it
  was removed. The very top level spad functions in GUESS still do
  not work properly.

20070909 tpd src/algebra/newton.spad included in fffg.spad
20070909 tpd src/algebra/Makefile remove newton.spad (duplicate)

FIX BUILD PROCESS
  The build process was not properly suppressing output by default.

20070907 tpd src/algebra/acplot.spad fix PlaneAlgebraicCurvePlot.help NOISE
20070907 tpd src/algebra/Makefile make regression respect NOISE variable
20070907 tpd src/input/Makefile make regression respect NOISE variable

FIX INSTALL PROCESS
  The install process had a bug.

20070906 tpd Makefile int/sman/axiom command to target command for install
20070906 tpd src/sman/Makefile copy axiom command to int

ADD ALDOR RELEASE
  The aldor release has been added to zips. It will soon be part of
  the build mechanism but separately maintained like GCL.

20070901 tpd zips/aldor.20070901.tgz add pdf documentation
```

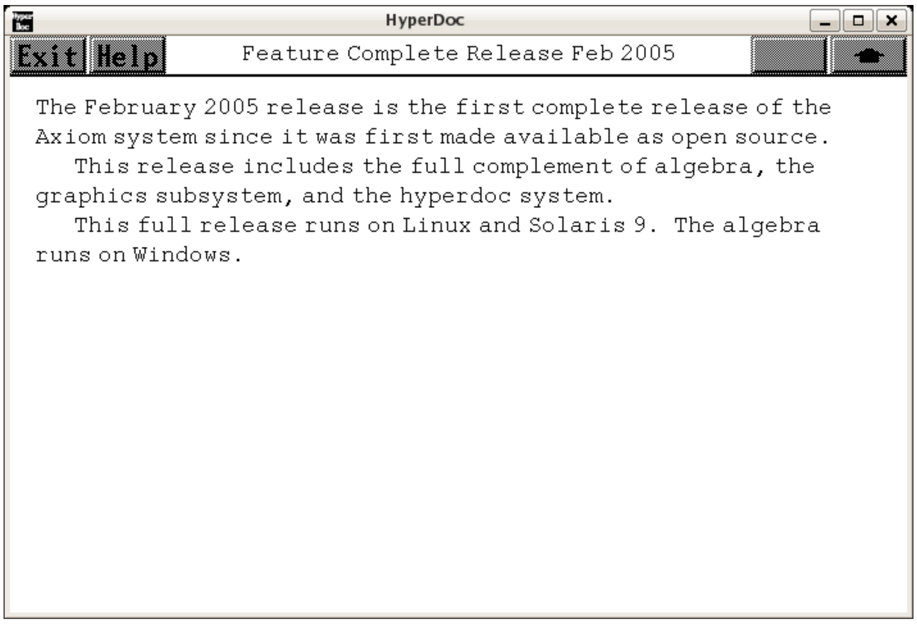
```
20070901 tpd zips/aldor.20070901.tgz added

ADD )HELP FACILITY
  The )help facility was recovered. The documentation is now integrated
  into the spad files and used both for help documentation and algebra
  regression testing.

\end{verbatim}
\endscroll
\autobuttons
\end{page}
```

———-

1.1.29 Feature Complete Release Feb 2005



The February 2005 release is the first complete release of the Axiom system since it was first made available as open source.
This release includes the full complement of algebra, the graphics subsystem, and the hyperdoc system.
This full release runs on Linux and Solaris 9. The algebra runs on Windows.

⇐ "What's New in Axiom" (releaseNotes) 1.1.1 on page 1

Chapter 2

Special hyperdoc pages

2.1 util.ht

This file contains macros for the Axiom HyperDoc hypertext facility. Most of the macros for the system are here though there may be some in individual .ht files that are of a local nature.

2.1.1 Names of software and facilities

— **util.ht** —

```
\newcommand{\Browse}{Browse}
\newcommand{\Language}{Axiom}
\newcommand{\SpadName}{\Language}
\newcommand{\LangName}{\Language}
\newcommand{\HyperName}{HyperDoc}
\newcommand{\Clef}{Clef}
\newcommand{\Lisp}{Common LISP}
\newcommand{\naglib}{NAG Foundation Library}
\newcommand{\GoBackToWork}
{\vspace{2}\newline
{Click on \  \UpButton{} \  to go back to what you were doing.}}
```

———-

2.1.2 Special hooks to Unix

All unix commands should be done as macros defined here so we don't have to go hunting when moving between Unix versions.

— util.ht —

```
\newcommand{\newspadclient}[1]
{xterm -n "#1" -e \$SPAD/bin/clef \$SPAD/bin/server/spadclient}
\newcommand{\searchwindow}[2]{\unixwindow{#1}{\$SPAD/lib/htsearch "#2"}}
\newcommand{\unixwindow}[2]{\unixlink{#1}{#2}}
\newcommand{\menuunixlink}[2]{\item\unixlink{\menuitemstyle{#1}}{#2}}
\newcommand{\menuunixcommand}[2]{\item\unixcommand{\menuitemstyle{#1}}{#2}}
\newcommand{\menuunixwindow}[2]{\item\unixwindow{\menuitemstyle{#1}}{#2}}
```

————-

2.1.3 HyperDoc menu macros

— util.ht —

```
% Example:
%
% \beginmenu
% \menulink{Thing One}{PageOne} la da di da da ...
% \menulink{Thin Two}{PageTwo}  do da day ...
% \item \ACmdMacro{\menuitemstyle{Thing Three}} la di da ...
% \endmenu

% The menu environment

\newcommand{\beginmenu}          {\beginitems[\MenuDotBitmap]}
\newcommand{\endmenu}            {\enditems}

% This is the usual format for a menu item.

\newcommand{\menuitemstyle}[1]   {{\MenuDotBitmap}#1}

% Often-used menu item forms

%   These two simply do links
\newcommand{\menudownlink}[2]    {\item\downlink{\menuitemstyle{#1}}{#2}}
\newcommand{\menulink}[2]        {\menudownlink{#1}{#2}}

%   This will cause lower level links to have a HOME button
\newcommand{\menumemolink}[2]    {\item\memolink{\menuitemstyle{#1}}{#2}}

%   This opens a new window for the linked page.
\newcommand{\menuwindowlink}[2]    {\item\windowlink{\menuitemstyle{#1}}{#2}}

%   These execute lisp commands in various flavors
\newcommand{\menulispcommand}[2]
```

```
{\item\lispcommand{\menuitemstyle{#1}}{#2}}
\newcommand{\menulispdownlink}[2]
{\item\lispdownlink{\menuitemstyle{#1}}{#2}}
\newcommand{\menulispmemolink}[2]
{\item\lispmemolink{\menuitemstyle{#1}}{#2}}
\newcommand{\menulispwindowlink}[2]
{\item\lispwindowlink{\menuitemstyle{#1}}{#2}}

%   This executes a unix command
\newcommand{\menuunixcmd}[2]{\item\unixcommand{\menuitemstyle{#1}}{#2}}
\newcommand{\searchresultentry}[3]
{\tab{3}\item#3\tab{8}\downlink{\menuitemstyle{#1}}{#2}\newline}
\newcommand{\newsearchresultentry}[3]
{\tab{3}\item#1\tab{8}\downlink{\menuitemstyle{#2}}{#3}\newline}
```

———-

2.1.4 Bitmaps and bitmap manipulation macros

— util.ht —

```
\newcommand{\htbmdir}{\env{AXIOM}/doc/bitmaps}
\newcommand{\htbmfile}[1]{\htbmdir /#1.bitmap}
\newcommand{\htbitmap}[1]{\inputbitmap{\htbmfile{#1}}}
\newcommand{\ControlBitmap}[1]{\controlbitmap{\htbmfile{#1}}}

% next group of bitmaps frequently appear in the titlebar
\newcommand{\ContinueBitmap} {\ControlBitmap{continue}}
\newcommand{\DoItBitmap}     {\ControlBitmap{doit}}
\newcommand{\ExitBitmap}     {\ControlBitmap{exit3d}}
\newcommand{\HelpBitmap}     {\ControlBitmap{help3d}}
\newcommand{\ReturnBitmap}   {\ControlBitmap{home3d}}
\newcommand{\NoopBitmap}       {\ControlBitmap{noop3d}}
\newcommand{\UpBitmap}       {\ControlBitmap{up3d}}

\newcommand{\MenuDotBitmap}{\htbitmap{menudot}}

% Including control panel pixmaps for help pages:

\newcommand{\helpbit}[1]
{\centerline{\inputpixmap{\env{AXIOM}/doc/pixmaps/{#1}}}}
```

———-

2.1.5 HyperDoc button objects

— util.ht —

```
\newcommand{\ContinueButton}[1]{\downlink{Click here}{#1} to continue.}
\newcommand{\ExitButton}[1]{\memolink{\ExitBitmap}{#1}}
\newcommand{\HelpButton}[1]{\memolink{\HelpBitmap}{#1}}
\newcommand{\StdHelpButton}{\HelpButton{ugHyperPage}}
\newcommand{\StdExitButton}{\ExitButton{ProtectedQuitPage}}
\newcommand{\UpButton}{\upbutton{\UpBitmap}{UpPage}}
\newcommand{\ReturnButton}{\returnbutton{\ReturnBitmap}{ReturnPage}}
\newcommand{\on}[1]{{\inputbox[1]{#1}{\htbmfile{pick}}
             {\htbmfile{unpick}}}}
\newcommand{\off}[1]{{\inputbox[0]{#1}{\htbmfile{pick}}
             {\htbmfile{unpick}}}}
```

———-

2.1.6 Standard HyperDoc button configurations

— util.ht —

```
\newcommand{\autobutt}[1]{\helppage{#1}}
\newcommand{\autobuttons}{}
\newcommand{\exitbuttons}{}

\newcommand{\autobuttLayout}[1]{\centerline{#1}}}
\newcommand{\autobuttMaker}[1]{\autobuttLayout{\HelpButton{#1}}}
\newcommand{\riddlebuttons}[1]{\autobuttLayout{\link{\HelpBitmap}{#1}}}

% Macro for downward compatibility (?).

\newcommand{\simplebox}[2]
{\inputbox[#1]{#2}{\htbitmap{xbox}}{\htbitmap{xopenbox}}}
```

———-

2.1.7 HyperDoc graphics macros

— util.ht —

```
% Including viewport bitmaps within \HyperName pages:
```

```
\newcommand{\viewport}[1]{\inputimage{{#1}.view/image}}
\newcommand{\axiomViewport}[1]
{\inputimage{\env{AXIOM}/doc/viewports/{#1}.view/image}}
\newcommand{\spadviewport}[1]{\axiomViewport{#1}}

% Creating a real live viewport:

\newcommand{\viewportbutton}[2]{\unixcommand{#1}{viewalone #2}}
\newcommand{\axiomViewportbutton}[2]
{\unixcommand{#1}{viewalone \$AXIOM/doc/viewports/{#2}}}
\newcommand{\spadviewportbutton}[2]{\axiomViewportbutton{#1}{#2}}

% Making active viewport buttons:

\newcommand{\viewportasbutton}[1]
{\unixcommand{\inputimage{{#1}.view/image}}{viewalone {#1}}}
\newcommand{\axiomViewportasbutton}[1]
{\unixcommand{\inputimage{\env{AXIOM}/doc/viewports/{#1}.view/image}}
{viewalone \$AXIOM/doc/viewports/{#1}}}
\newcommand{\spadviewportasbutton}[1]{\axiomViewportasbutton{#1}}
```

———-

2.1.8 TeX and LaTeX compatibility macros

— **util.ht** —

```
%% Begin macros that are needed because HD uses the wrong names

\newcommand{\center}[1]{\centerline{#1}}
\newcommand{\box}[1]{\fbox{#1}}

%% End   macros that are needed because HD uses the wrong names

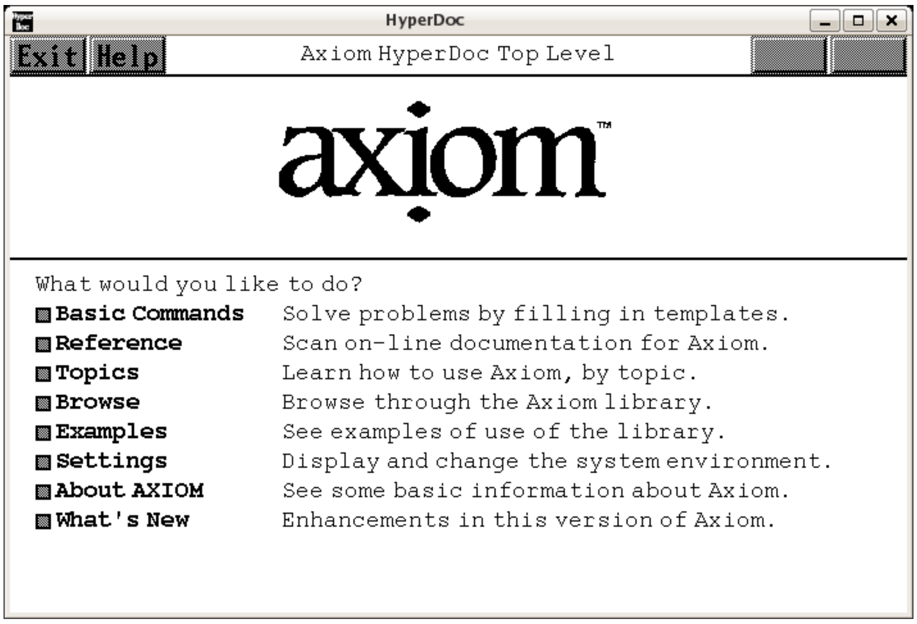
Chapter 3

Hyperdoc pages

The hyperdoc pages can be viewed as a forest of rooted pages. The main routine in hypertex will look for a page called “RootPage”.
⇐ “Root Page” (RootPage) 3.1.1 on page 103

3.1 rootpage.ht

3.1.1 Axiom HyperDoc Top Level



What would you like to do?

▨ **Basic Commands**	Solve problems by filling in templates.
▨ **Reference**	Scan on-line documentation for Axiom.
▨ **Topics**	Learn how to use Axiom, by topic.
▨ **Browse**	Browse through the Axiom library.
▨ **Examples**	See examples of use of the library.
▨ **Settings**	Display and change the system environment.
▨ **About AXIOM**	See some basic information about Axiom.
▨ **What's New**	Enhancements in this version of Axiom.

⇒ "Basic Commands" (BasicCommand) 3.6.1 on page 141
⇒ "Reference" (TopReferencePage) 3.1.5 on page 109

3.3 alist.ht

3.3.1 AssociationList

⇒ "Table" (TableXmpPage) 3.94.1 on page 1278
⇒ "List" (ListXmpPage) 3.61.1 on page 849

— **alist.ht** —

```
\begin{page}{AssociationListXmpPage}{AssociationList}
\beginscroll

The \spadtype{AssociationList} constructor provides a general
structure for associative storage.  This type provides association
lists in which data objects can be saved according to keys of any
type.  For a given association list, specific types must be chosen for
the keys and entries.  You can think of the representation of an
association list as a list of records with key and entry fields.
```

```
Association lists are a form of table and so most of the operations
available for \spadtype{Table} are also available for
\spadtype{AssociationList}.  They can also be viewed as lists and can
be manipulated accordingly.

\xtc{
This is a \pspadtype{Record} type with age and gender fields.
}{
\spadpaste{Data := Record(monthsOld : Integer, gender : String) \bound{Data}}
}
\xtc{
In this expression, \spad{al} is declared to be an association
list whose keys are strings and whose entries are the above records.
}{
\spadpaste{al : AssociationList(String,Data) \free{Data}\bound{al}}
}
\xtc{
The \spadfunFrom{table}{AssociationList} operation is used to create
an empty association list.
}{
\spadpaste{al := table() \free{al}\bound{al1}}
}
\xtc{
You can use assignment syntax to add things to the association list.
}{
\spadpaste{al."bob" := [407,"male"]\$Data \free{al1}\bound{al2}}
}
\xtc{
}{
\spadpaste{al."judith" := [366,"female"]\$Data \free{al2}\bound{al3}}
}
\xtc{
}{
\spadpaste{al."katie" := [24,"female"]\$Data \free{al3}\bound{al4}}
}
\xtc{
Perhaps we should have included a species field.
}{
\spadpaste{al."smokie" := [200,"female"]\$Data \free{al4}\bound{al5}}
}
\xtc{
Now look at what is in the association list.
Note that the last-added (key, entry) pair is at the beginning of the list.
}{
\spadpaste{al \free{al5}}
}
\xtc{
You can reset the entry for an existing key.
}{
\spadpaste{al."katie" := [23,"female"]\$Data \free{al5}\bound{al6}}
}
\xtc{
Use \spadfunFromX{delete}{AssociationList} to destructively remove
an element of the association list.
Use \spadfunFrom{delete}{AssociationList} to return a copy of the
association list with the element deleted.
The second argument is the index of the element to delete.
}{
\spadpaste{delete!(al,1) \free{al6}\bound{al7}}
}

For more information about tables,
see \downlink{`Table'}{TableXmpPage}\ignore{Table}.
For more information about lists,
see \downlink{`List'}{ListXmpPage}\ignore{List}.

3.4 array1.ht

3.4.1 OneDimensionalArray

⇒ "Vector" (VectorXmpPage) 3.102.1 on page 1331
⇒ "FlexibleArray" (FlexibleArrayXmpPage) 3.39.1 on page 458

— **array1.ht** —

```
\begin{page}{OneDimensionalArrayXmpPage}{OneDimensionalArray}
\beginscroll
The \spadtype{OneDimensionalArray} domain is used for storing data in
a one-dimensional indexed data structure.  Such an array is a
homogeneous data structure in that all the entries of the array must
belong to the same Axiom domain.  Each array has a fixed length
specified by the user and arrays are not extensible.  The indexing of
one-dimensional arrays is one-based.  This means that the ``first''
element of an array is given the index \spad{1}.
See also \downlink{`Vector'}{VectorXmpPage}\ignore{Vector} and
\downlink{`FlexibleArray'}{FlexibleArrayXmpPage}\ignore{FlexibleArray}.
\xtc{
To create a one-dimensional array, apply the
operation \spadfun{oneDimensionalArray} to a list.
}{
\spadpaste{oneDimensionalArray [i**2 for i in 1..10]}
}
\xtc{
Another approach is to first create \spad{a}, a one-dimensional
array of 10 \spad{0}'s.
\spadtype{OneDimensionalArray} has the convenient
abbreviation \spadtype{ARRAY1}.
}{
\spadpaste{a : ARRAY1 INT := new(10,0)\bound{a}}
}
\xtc{
Set each \spad{i}th element to i, then display the result.
}{
```

```
\spadpaste{for i in 1..10 repeat a.i := i; a\bound{a1}\free{a}}
}
\xtc{
Square each element by mapping the function
\texht{$i \mapsto i^2$}{i +-> i**2} onto each element.
}{
\spadpaste{map!(i +-> i ** 2,a); a\bound{a3}\free{a2}}
}
\xtc{
Reverse the elements in place.

⇒ "The Any Domain" (ugTypesAnyNonePage) **??** on page **??**
⇒ "Matrix" (MatrixXmpPage) 3.71.1 on page 966
⇒ "OneDimensionalArray" (OneDimensionalArrayXmpPage) 3.4.1 on page 124

— **array2.ht** —

```
\begin{page}{TwoDimensionalArrayXmpPage}{TwoDimensionalArray}
\beginscroll

The \spadtype{TwoDimensionalArray} domain is used for storing data in
a \twodim{} data structure indexed by row and by column.  Such an
array is a homogeneous data structure in that all the entries of the
array must belong to the same Axiom domain (although see
\downlink{``The Any Domain''}{ugTypesAnyNonePage} in Section 2.6
\ignore{ugTypesAnyNone}).  Each array has a fixed
number of rows and columns specified by the user and arrays are not
extensible.  In Axiom, the indexing of two-dimensional arrays is
one-based.  This means that both the ``first'' row of an array and the
``first'' column of an array are given the index \spad{1}.  Thus, the
entry in the upper left corner of an array is in position
\spad{(1,1)}.

The operation \spadfunFrom{new}{TwoDimensionalArray} creates an array
with a specified number of rows and columns and fills the components
of that array with a specified entry.  The arguments of this operation
specify the number of rows, the number of columns, and the entry.
\xtc{
This creates a five-by-four array of integers, all of whose entries are
zero.
}{
\spadpaste{arr : ARRAY2 INT := new(5,4,0) \bound{arr}}
}
The entries of this array can be set to other integers using
the operation \spadfunFrom{setelt}{TwoDimensionalArray}.

\xtc{
```

```
Issue this to set the element in the upper left corner of this array to
\spad{17}.
}{
\spadpaste{setelt(arr,1,1,17) \free{arr}\bound{arr1}}
}
\xtc{
Now the first element of the array is \spad{17.}
}{
\spadpaste{arr \free{arr1}}
}
\xtc{
Likewise, elements of an array are extracted using the operation
\spadfunFrom{elt}{TwoDimensionalArray}.
}{
\spadpaste{elt(arr,1,1) \free{arr1}}
}
\xtc{
Another way to use these two operations is as follows.
This sets the element in position \spad{(3,2)} of the array to \spad{15}.
}{
\spadpaste{arr(3,2) := 15 \free{arr1}\bound{arr2}}
}
\xtc{
This extracts the element in position \spad{(3,2)} of the array.
}{
\spadpaste{arr(3,2) \free{arr2}}
}
The operations \spadfunFrom{elt}{TwoDimensionalArray} and
\spadfunFrom{setelt}{TwoDimensionalArray} come equipped with an error
check which verifies that the indices are in the proper ranges.
For example, the above array has five rows and four columns, so if you ask
for the entry in position \spad{(6,2)} with \spad{arr(6,2)} Axiom
displays an error message.
If there is no need for an error check, you can call the operations
\spadfunFrom{qelt}{TwoDimensionalArray} and
\spadfunFromX{qsetelt}{TwoDimensionalArray} which provide the same
functionality but without the error check.
Typically, these operations are called in well-tested programs.

\xtc{
The operations \spadfunFrom{row}{TwoDimensionalArray} and
\spadfunFrom{column}{TwoDimensionalArray} extract rows and columns,
respectively, and return objects of \spadtype{OneDimensionalArray} with
the same underlying element type.
}{
\spadpaste{row(arr,1) \free{arr2}}
}
\xtc{
}{
\spadpaste{column(arr,1) \free{arr2}}
```

```
}

\xtc{
You can determine the dimensions of an array by calling the
operations \spadfunFrom{nrows}{TwoDimensionalArray} and
\spadfunFrom{ncols}{TwoDimensionalArray},
which return the number of rows and columns, respectively.
}{
\spadpaste{nrows(arr) \free{arr2}}
}
\xtc{
}{
\spadpaste{ncols(arr) \free{arr2}}
}
\xtc{
To apply an operation to every element of an array, use
\spadfunFrom{map}{TwoDimensionalArray}.
This creates a new array.
This expression negates every element.
}{
\spadpaste{map(-,arr) \free{arr2}}
}
\xtc{
This creates an array where all the elements are doubled.
}{
\spadpaste{map((x +-> x + x),arr) \free{arr2}}
}
\xtc{
To change the array destructively, use
\spadfunFromX{map}{TwoDimensionalArray} instead of
\spadfunFrom{map}{TwoDimensionalArray}.
If you need to make a copy of any array, use
\spadfunFrom{copy}{TwoDimensionalArray}.
}{
\spadpaste{arrc := copy(arr) \bound{arrc}\free{arr2}}
}
\xtc{
}{
\spadpaste{map!(-,arrc) \free{arrc}}
}
\xtc{
}{
\spadpaste{arrc \free{arrc}}
}
\xtc{
}{
\spadpaste{arr  \free{arr2}}
}

\xtc{
```

```
Use \spadfunFrom{member?}{TwoDimensionalArray} to see if a given element
is in an array.
}{
\spadpaste{member?(17,arr) \free{arr2}}
}
\xtc{
}{
\spadpaste{member?(10317,arr) \free{arr2}}
}
\xtc{
To see how many times an element appears in an array, use
\spadfunFrom{count}{TwoDimensionalArray}.
}{
\spadpaste{count(17,arr) \free{arr2}}
}
\xtc{
}{
\spadpaste{count(0,arr) \free{arr2}}
}

For more information about the operations available for
\spadtype{TwoDimensionalArray}, issue \spadcmd{)show
TwoDimensionalArray}.

3.7 bbtree.ht

3.7.1 BalancedBinaryTree

— **bbtree.ht** —

```
\begin{page}{BalancedBinaryTreeXmpPage}{BalancedBinaryTree}
\beginscroll
\spadtype{BalancedBinaryTrees(S)} is the domain
of balanced binary trees with elements of type \spad{S} at the nodes.
A binary tree is either \spadfun{empty} or else
consists of a \spadfun{node} having a \spadfun{value}
and two branches, each branch a binary tree.
A balanced binary tree is one that is balanced with respect its leaves.
One with \texht{$2^k$}{2**k} leaves is
perfectly ``balanced'': the tree has minimum depth, and
the \spadfun{left} and \spadfun{right}
branch of every interior node is identical in shape.

Balanced binary trees are useful in algebraic computation for
so-called ``divide-and-conquer'' algorithms.  Conceptually, the data
for a problem is initially placed at the root of the tree.  The
original data is then split into two subproblems, one for each
subtree.  And so on.  Eventually, the problem is solved at the leaves
```

```
of the tree.  A solution to the original problem is obtained by some
mechanism that can reassemble the pieces.  In fact, an implementation
of the Chinese Remainder Algorithm using balanced binary trees was
first proposed by David Y. Y.  Yun at the IBM T. J.  Watson Research
Center in Yorktown Heights, New York, in 1978.  It served as the
prototype for polymorphic algorithms in Axiom.

In what follows, rather than perform a series of computations with
a single expression, the expression is reduced modulo a number of
integer primes, a computation is done with modular arithmetic for
each prime, and the Chinese Remainder Algorithm is used to obtain
the answer to the original problem.
We illustrate this principle with the computation of
\texht{$12^2 = 144$}{12 ** 2 = 144}.

\xtc{
A list of moduli.
}{
\spadpaste{lm := [3,5,7,11]\bound{lm}}
}
\xtc{
The expression \spad{modTree(n, lm)}
creates a balanced binary tree with leaf values
\spad{n mod m} for each modulus \spad{m} in \spad{lm}.
}{
\spadpaste{modTree(12,lm)\free{lm}}
}
\xtc{
Operation \spad{modTree} does this using
operations on balanced binary trees.
We trace its steps.
Create a balanced binary tree \spad{t} of zeros with four leaves.
}{
\spadpaste{t := balancedBinaryTree(\#lm, 0)\bound{t}\free{lm}}
}
\xtc{
The leaves of the tree are set to the individual moduli.
}{
\spadpaste{setleaves!(t,lm)\bound{t1}\free{t}}
}
\xtc{
Use \spadfunX{mapUp} to do
a bottom-up traversal of \spad{t}, setting each interior node
to the product of the values at the nodes of its children.
}{
\spadpaste{mapUp!(t,_*)\bound{t2}\free{t1}}
}
\xtc{
The value at the node of every subtree is the product of the moduli
of the leaves of the subtree.
}{
\spadpaste{t \bound{t3}\free{t2}}
}
\xtc{
Operation \spadfunX{mapDown}\spad{(t,a,fn)} replaces the value
\spad{v} at each node of \spad{t} by \spad{fn(a,v)}.
}{
\spadpaste{mapDown!(t,12,_rem)\bound{t4}\free{t3}}
}
\xtc{
The operation \spadfun{leaves} returns the leaves of the resulting
tree.
In this case, it returns the list of \spad{12 mod m} for each
modulus \spad{m}.
}{
\spadpaste{leaves \%\bound{t5}\free{t4}}
}
\xtc{
Compute the square of the images of \spad{12} modulo each \spad{m}.
}{
\spadpaste{squares := [x**2 rem m for x in \% for m in lm]\bound{t6}\free{t5}}
}
\xtc{
Call the Chinese Remainder Algorithm to get the
answer for \texht{$12^2$}{12**2}.
}{
\spadpaste{chineseRemainder(\%,lm)\free{t6}}
}
\endscroll
\autobuttons

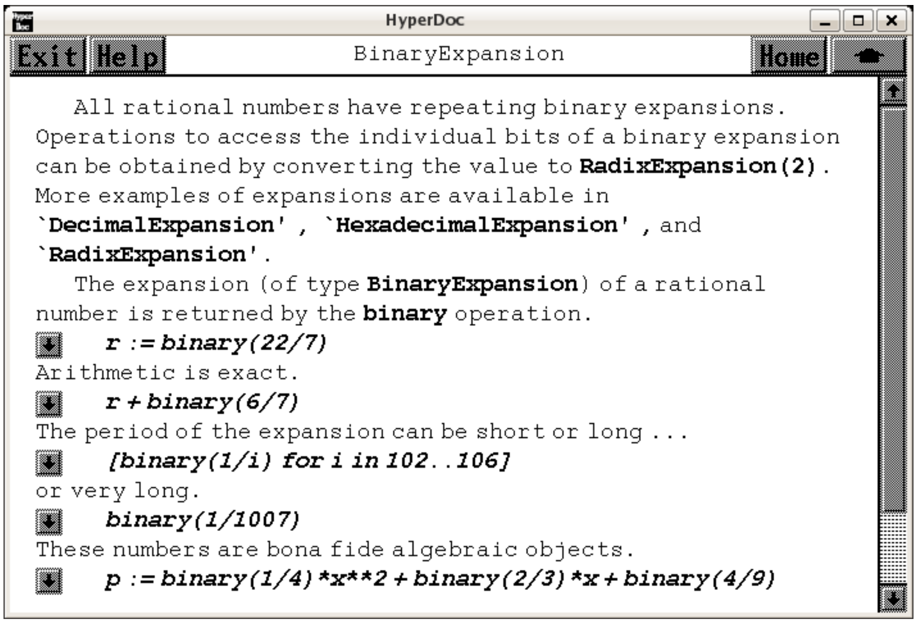
3.8 binary.ht

3.8.1 BinaryExpansion



All rational numbers have repeating binary expansions. Operations to access the individual bits of a binary expansion can be obtained by converting the value to **RadixExpansion(2)**. More examples of expansions are available in **`DecimalExpansion'**, **`HexadecimalExpansion'**, and **`RadixExpansion'**.

The expansion (of type **BinaryExpansion**) of a rational number is returned by the **binary** operation.

r := binary(22/7)

Arithmetic is exact.

r + binary(6/7)

The period of the expansion can be short or long ...

[binary(1/i) for i in 102..106]

or very long.

binary(1/1007)

These numbers are bona fide algebraic objects.

*p := binary(1/4)*x**2 + binary(2/3)*x + binary(4/9)*

\begin{page}{BinaryExpansionXmpPage}{BinaryExpansion}
\beginscroll
All rational numbers have repeating binary expansions.
Operations to access the individual bits of a binary expansion can
be obtained by converting the value to \spadtype{RadixExpansion(2)}.
More examples of expansions are available in
\downlink{‘DecimalExpansion’}{DecimalExpansionXmpPage}
\ignore{DecimalExpansion},
\downlink{‘HexadecimalExpansion’}{HexExpansionXmpPage}
\ignore{HexadecimalExpansion}, and
\downlink{‘RadixExpansion’}{RadixExpansionXmpPage}\ignore{RadixExpansion}.

\xtc{
The expansion (of type \spadtype{BinaryExpansion}) of a rational number
is returned by the \spadfunFrom{binary}{BinaryExpansion} operation.
}{
\spadpaste{r := binary(22/7) \bound{r}}
}
\xtc{
Arithmetic is exact.
}{
\spadpaste{r + binary(6/7) \free{r}}
}
\xtc{
The period of the expansion can be short or long \ldots
}{
\spadpaste{[binary(1/i) for i in 102..106] }
}
\xtc{
or very long.
}{
\spadpaste{binary(1/1007) }
}
\xtc{
These numbers are bona fide algebraic objects.
}{
\spadpaste{p := binary(1/4)*x**2 + binary(2/3)*x + binary(4/9)  \bound{p}}
}
\xtc{
}{
\spadpaste{q := D(p, x) \free{p}\bound{q}}
}

3.10 bop.ht

3.10.1 BasicOperator

— **bop.ht** —

```
\begin{page}{BasicOperatorXmpPage}{BasicOperator}
\beginscroll

A basic operator is an object that can be symbolically
applied to a list of arguments from a set, the result being
a kernel over that set or an expression.
In addition to this section, please see
\downlink{‘Expression’}{ExpressionXmpPage}\ignore{Expression}
and \downlink{‘Kernel’}{KernelXmpPage}\ignore{Kernel}
for additional information and examples.

You create an object of type \axiomType{BasicOperator} by using the
\axiomFunFrom{operator}{BasicOperator} operation.
This first form of this operation has one argument and it
must be a symbol.
The symbol should be quoted in case the
name has been used as an identifier to which a value
```

```
has been assigned.

A frequent application of \axiomType{BasicOperator} is the
creation of an operator to represent the unknown function when
solving a differential equation.
\xtc{
Let \axiom{y} be the unknown function in terms of \axiom{x}.
}{
\spadpaste{y := operator 'y \bound{y}}
}
%
\xtc{
This is how you enter
the equation \axiom{y'' + y' + y = 0}.
}{
\spadpaste{deq := D(y x, x, 2) + D(y x, x) + y x = 0\bound{e1}\free{y}}
}
%
\xtc{
To solve the above equation, enter this.
}{
\spadpaste{solve(deq, y, x) \free{e1}\free{y}}
}
See \downlink{``Solution of Differential Equations''}{ugProblemDEQPage}
in Section 8.10\ignore{ugProblemDEQ}
for this kind of use of \axiomType{BasicOperator}.

Use the single argument form of
\axiomFunFrom{operator}{BasicOperator} (as above) when you intend
to use the operator to create functional expressions with an
arbitrary number of arguments
\xtc{
{\it Nary} means an arbitrary number of arguments can be used
in the functional expressions.
}{
\spadpaste{nary? y \free{y}}
}
\xtc{
}{
\spadpaste{unary? y \free{y}}
}
Use the two-argument form when you want to restrict the number of
arguments in the functional expressions created with the operator.
\xtc{
This operator can only be used to create functional expressions
with one argument.
}{
\spadpaste{opOne := operator('opOne, 1) \bound{opOne}}
}
\xtc{
}{
\spadpaste{nary? opOne \free{opOne}}
}
\xtc{
}{
\spadpaste{unary? opOne \free{opOne}}
}
\xtc{
Use \axiomFunFrom{arity}{BasicOperator} to learn the number of
arguments that can be used.
It returns {\tt "false"} if the operator is nary.
}{
\spadpaste{arity opOne \free{opOne}}
}
\xtc{
Use \axiomFunFrom{name}{BasicOperator} to learn the name of an
operator.
}{
\spadpaste{name opOne \free{opOne}}
}
\xtc{
Use \axiomFunFrom{is?}{BasicOperator} to learn if an operator has a
particular name.
}{
\spadpaste{is?(opOne, 'z2) \free{opOne}}
}
\xtc{
You can also use a string as the name to be tested against.
}{
\spadpaste{is?(opOne, "opOne") \free{opOne}}
}

You can attached named properties to an operator.
These are rarely used at the top-level of the Axiom
interactive environment but are used with Axiom
library source code.
\xtc{
By default, an operator has no properties.
}{
\spadpaste{properties y \free{y}}
}
The interface for setting and getting properties is somewhat awkward
because the property values are stored as values of type
\axiomType{None}.
\xtc{
Attach a property by using \axiomFunFrom{setProperty}{BasicOperator}.
}{
\spadpaste{setProperty(y, "use", "unknown function" :: None )
\free{y}\bound{spy}}
}
```

```
\xtc{
}{
\spadpaste{properties y \free{y spy}}
}
\xtc{
We {\it know} the property value has type \axiomType{String}.
}{
\spadpaste{property(y, "use") :: None pretend String \free{y spy}}
}
\xtc{
Use \axiomFunFrom{deleteProperty!}{BasicOperator} to destructively
remove a property.
}{
\spadpaste{deleteProperty!(y, "use") \free{y spy}\bound{dpy}}
}
\xtc{
}{
\spadpaste{properties y \free{dpy}}
}
\endscroll
\autobuttons
\end{page}

3.11 bstree.ht

3.11.1 BinarySearchTree

— bstree.ht —

```
\begin{page}{BinarySearchTreeXmpPage}{BinarySearchTree}
\beginscroll

\spadtype{BinarySearchTree(R)} is the domain of binary trees with
elements of type \spad{R}, ordered across the nodes of the tree.  A
non-empty binary search tree has a value of type \spad{R}, and
\spadfun{right} and \spadfun{left} binary search subtrees.  If a
subtree is empty, it is displayed as a period (‘‘.’’).

\xtc{
Define a list of values to be placed across the tree.
The resulting tree has \spad{8} at the root;
all other elements are in the left subtree.
```

```
}{
\spadpaste{lv := [8,3,5,4,6,2,1,5,7]\bound{lv}}
}
\xtc{
A convenient way to create a binary search tree is to
apply the operation \spadfun{binarySearchTree} to a list of elements.
}{
\spadpaste{t := binarySearchTree lv\free{lv}\bound{t}}
}
\xtc{
Another approach is to first create an empty binary search tree of integers.
}{
\spadpaste{emptybst := empty()\$BSTREE(INT)\bound{e}}
}
\xtc{
Insert the value \spad{8}.
This establishes \spad{8} as the root of the binary search tree.
Values inserted later that are less than \spad{8} get stored in
the \spadfun{left} subtree, others in the \spadfun{right} subtree.
}{
\spadpaste{t1 := insert!(8,emptybst)\free{e}\bound{t1}}
}
\xtc{
Insert the value \spad{3}. This number becomes the root of the
\spadfun{left} subtree of \spad{t1}.
For optimal retrieval, it is thus important to insert the
middle elements first.
}{
\spadpaste{insert!(3,t1)\free{t1}}
}
\xtc{
We go back to the original tree \spad{t}.
The leaves of the binary search tree are those which have empty
\spadfun{left} and \spadfun{right} subtrees.
}{
\spadpaste{leaves t\free{t}}
}
\xtc{
The operation
\spadfun{split}\spad{(k,t)} returns a \spadgloss{record} containing
the two subtrees: one with all elements ``less'' than \spad{k},
another with elements ``greater'' than \spad{k}.
}{
\spadpaste{split(3,t)\free{t}}
}
\xtc{
Define \userfun{insertRoot} to insert new elements by
creating a new node.
}{
\spadpaste{insertRoot: (INT,BSTREE INT) -> BSTREE INT\bound{x}}
```

```
}
\xtc{
The new node puts the inserted value between its
``less'' tree and ``greater'' tree.
}{
\begin{spadsrc}[\bound{x1}\free{x}]
insertRoot(x, t) ==
    a := split(x, t)
    node(a.less, x, a.greater)
\end{spadsrc}
}
\xtc{
Function \userfun{buildFromRoot} builds
a binary search tree from a list of elements \spad{ls}
and the empty tree \spad{emptybst}.
}{
\spadpaste{buildFromRoot ls == reduce(insertRoot,ls,emptybst)
\bound{x2}\free{x1 e}}
}
\xtc{
Apply this to the reverse of the list \spad{lv}.
}{
\spadpaste{rt := buildFromRoot reverse lv\bound{rt}\free{lv x2}}
}
\xtc{
Have Axiom check that these are equal.
}{
\spadpaste{(t = rt)@Boolean\free{rt t}}
}
\endscroll

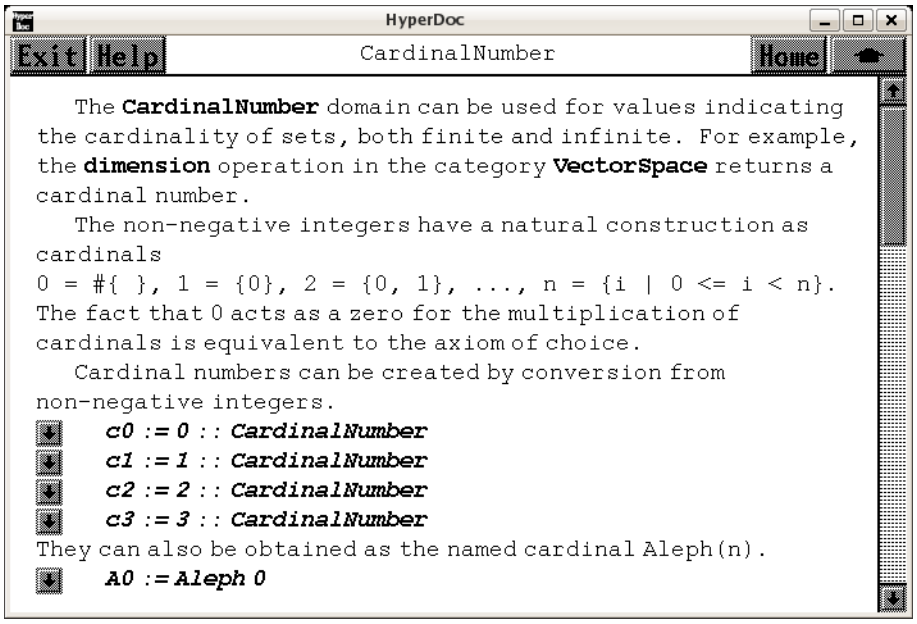
3.12 card.ht

3.12.1 CardinalNumber



The **CardinalNumber** domain can be used for values indicating the cardinality of sets, both finite and infinite. For example, the **dimension** operation in the category **VectorSpace** returns a cardinal number.

The non-negative integers have a natural construction as cardinals
0 = #{ }, 1 = {0}, 2 = {0, 1}, ..., n = {i | 0 <= i < n}.
The fact that 0 acts as a zero for the multiplication of cardinals is equivalent to the axiom of choice.

Cardinal numbers can be created by conversion from non-negative integers.

c0 := 0 : : CardinalNumber
c1 := 1 : : CardinalNumber
c2 := 2 : : CardinalNumber
c3 := 3 : : CardinalNumber

They can also be obtained as the named cardinal Aleph(n).

A0 := Aleph 0

⇐ "Axiom Number Types" (NumberPage) 3.76.1 on page 1004

— **card.ht** —

```
\begin{page}{CardinalNumberXmpPage}{CardinalNumber}
\beginscroll
The \spadtype{CardinalNumber} domain can be used for values indicating
the cardinality of sets, both finite and infinite.
For example, the \spadfunFrom{dimension}{VectorSpace} operation in the
category \spadtype{VectorSpace} returns a cardinal number.

The non-negative integers have a natural construction as cardinals
\begin{verbatim}
0 = #{ }, 1 = {0}, 2 = {0, 1}, ..., n = {i | 0 <= i < n}.
\end{verbatim}
The fact that \spad{0} acts as a zero for the multiplication of
cardinals is equivalent to the axiom of choice.

\xtc{
Cardinal numbers can be created by conversion from non-negative integers.
}{
\spadpaste{c0 := 0 :: CardinalNumber \bound{c0}}
}
\xtc{
}{
\spadpaste{c1 := 1 :: CardinalNumber \bound{c1}}
}
\xtc{
}{
\spadpaste{c2 := 2 :: CardinalNumber \bound{c2}}
}
\xtc{
}{
\spadpaste{c3 := 3 :: CardinalNumber \bound{c3}}
}
\xtc{
They can also be obtained as the named cardinal \spad{Aleph(n)}.
}{
\spadpaste{A0 := Aleph 0 \bound{A0}}
}
\xtc{
}{
\spadpaste{A1 := Aleph 1 \bound{A1}}
}
\xtc{
The \spadfunFrom{finite?}{CardinalNumber} operation tests whether a
value is a finite cardinal, that is, a non-negative integer.
}{
\spadpaste{finite? c2 \free{c2}}
}
\xtc{
}{
\spadpaste{finite? A0 \free{A0}}
}
\xtc{
Similarly, the \spadfunFrom{countable?}{CardinalNumber}
operation determines whether a value is
a countable cardinal, that is, finite or \spad{Aleph(0)}.
}{
\spadpaste{countable? c2 \free{c2}}
}
\xtc{
}{
\spadpaste{countable? A0 \free{A0}}
}
\xtc{
}{
\spadpaste{countable? A1 \free{A1}}
}
Arithmetic operations are defined on cardinal numbers as follows:
If \spad{x = \#X}  and  \spad{y = \#Y} then

\indent{0}
\spad{x+y  = \#(X+Y)}
```

```
\tab{20} cardinality of the disjoint union \newline
\spad{x-y  = \#(X-Y)}
\tab{20} cardinality of the relative complement \newline
\spad{x*y  = \#(X*Y)}
\tab{20} cardinality of the Cartesian product \newline
\spad{x**y = \#(X**Y)}
\tab{20} cardinality of the set of maps from \spad{Y} to \spad{X} \newline

\xtc{

3.13 carten.ht

3.13.1 CartesianTensor

— carten.ht —

```
\begin{page}{CartesianTensorXmpPage}{CartesianTensor}
\beginscroll

\spadtype{CartesianTensor(i0,dim,R)}
provides Cartesian tensors with
components belonging to a commutative ring \spad{R}.
Tensors can be described as a generalization of vectors and matrices.
This gives a concise {\it tensor algebra} for multilinear objects
supported by the \spadtype{CartesianTensor} domain.
You can form the inner or outer product of any two tensors and you can add
or subtract tensors with the same number of components.
Additionally, various forms of traces and transpositions are useful.

The \spadtype{CartesianTensor} constructor allows you to specify the
minimum index for subscripting.
In what follows we discuss in detail how to manipulate tensors.

\xtc{
Here we construct the domain of Cartesian tensors of dimension 2 over the
integers, with indices starting at 1.
}{
\spadpaste{CT := CARTEN(i0 := 1, 2, Integer) \bound{CT i0}}
}

\subsubsection{Forming tensors}
\labelSpace{2pc}
\xtc{
Scalars can be converted to tensors of rank zero.
}{
\spadpaste{t0: CT := 8 \free{CT}\bound{t0}}
```

```
}
\xtc{
}{
\spadpaste{rank t0 \free{t0}}
}
\xtc{
Vectors (mathematical direct products, rather than one dimensional array
structures) can be converted to tensors of rank one.
}{
\spadpaste{v: DirectProduct(2, Integer) := directProduct [3,4] \bound{v}}
}
\xtc{
}{
\spadpaste{Tv: CT := v \free{v CT}\bound{Tv}}
}
\xtc{
Matrices can be converted to tensors of rank two.
}{
\spadpaste{m: SquareMatrix(2, Integer) := matrix {\tt{}1,2],[4,5} \bound{m}}
}
\xtc{
}{
\spadpaste{Tm: CT := m \bound{Tm}\free{CT m}}
}
\xtc{
}{
\spadpaste{n: SquareMatrix(2, Integer) := matrix {\tt{}2,3],[0,1} \bound{n}}
}
\xtc{
}{
\spadpaste{Tn: CT := n \bound{Tn}\free{CT n}}
}
\xtc{
In general, a tensor of rank \spad{k} can be formed by making a
list of rank \spad{k-1} tensors or, alternatively, a \spad{k}-deep nested
list of lists.
}{
\spadpaste{t1: CT := [2, 3] \free{CT}\bound{t1}}
}
\xtc{
}{
\spadpaste{rank t1 \free{t1}}
}
\xtc{
}{
\spadpaste{t2: CT := [t1, t1] \free{CT t1}\bound{t2}}
}
\xtc{
}{
\spadpaste{t3: CT := [t2, t2] \free{CT t2}\bound{t3}}
```

```
}
\xtc{
}{
\spadpaste{tt: CT := [t3, t3]; tt := [tt, tt] \free{CT t3}\bound{tt}}
}
\xtc{
}{
\spadpaste{rank tt \free{tt}}
}

\subsubsection{Multiplication}
%\head{subsection}{Multiplication}{ugxCartenMult}

Given two tensors of rank \spad{k1} and \spad{k2}, the outer
{CartesianTensor}
\spadfunFrom{product}{CartesianTensor} forms a new tensor of rank
\spad{k1+k2}.
\xtc{
Here
\texht{$T_{mn}(i,j,k,l) = T_m(i,j) \  T_n(k,l).$}{%
\spad{Tmn(i,j,k,l) = Tm(i,j)*Tn(k,l).}}
}{
\spadpaste{Tmn := product(Tm, Tn)\free{Tm Tn}\bound{Tmn}}
}

The inner product (\spadfunFrom{contract}{CartesianTensor}) forms a tensor
{CartesianTensor}
of rank \spad{k1+k2-2}.
This product generalizes the vector dot product and matrix-vector product
by summing component products along two indices.
\xtc{
Here we sum along the second index of \texht{$T_m$}{\spad{Tm}} and the
first index of \texht{$T_v$}{\spad{Tv}}.
Here
\texht{$T_{mv} = \sum_{j=1}^{\hbox{\tiny\rm dim}} T_m(i,j) \  T_v(j)$}{%
\spad{Tmv(i) = sum Tm(i,j) * Tv(j) for j in 1..dim.}}
}{
\spadpaste{Tmv := contract(Tm,2,Tv,1)\free{Tm Tv}\bound{Tmv}}
}

The multiplication operator \spadopFrom{*}{CartesianTensor} is scalar
multiplication or an inner product depending on the ranks of the
arguments.
\xtc{
If either argument is rank zero it is treated as scalar multiplication.
Otherwise, \spad{a*b} is the inner product summing the last index of
\spad{a} with the first index of \spad{b}.
}{
\spadpaste{Tm*Tv \free{Tm Tv}}
}
```

```
\xtc{
This definition is consistent with the inner product on matrices
and vectors.
}{
\spadpaste{Tmv = m * v \free{Tmv m v}}
}

\subsubsection{Selecting Components}
%\head{subsection}{Selecting Components}{ugxCartenSelect}

\labelSpace{2pc}
\xtc{
For tensors of low rank (that is, four or less), components can be selected
by applying the tensor to its indices.
}{

}
\xtc{
}{
\spadpaste{Tmn[2,1,2,1] \free{Tmn}}
}

\subsubsection{Contraction}
%\head{subsection}{Contraction}{ugxCartenContract}

A ``contraction'' between two tensors is an inner product, as we have
seen above.
You can also contract a pair of indices of a single tensor.
This corresponds to a ``trace'' in linear algebra.
The expression \spad{contract(t,k1,k2)} forms a new tensor by summing the
diagonal given by indices in position \spad{k1} and \spad{k2}.
\xtc{
This is the tensor given by
\texht{$xT_{mn} = \sum_{k=1}^{\hbox{\tiny\rm dim}} T_{mn}(k,k,i,j).$}{%
\spad{cTmn(i,j) = sum Tmn(k,k,i,j) for k in 1..dim.}}
}{
\spadpaste{cTmn := contract(Tmn,1,2) \free{Tmn}\bound{cTmn}}
}
\xtc{
Since \spad{Tmn} is the outer product of matrix \spad{m} and matrix \spad{n},
the above is equivalent to this.
}{
\spadpaste{trace(m) * n \free{m n}}
}
\xtc{
In this and the next few examples,
we show all possible contractions of \spad{Tmn} and their matrix
algebra equivalents.
}{
\spadpaste{contract(Tmn,1,2) = trace(m) * n      \free{Tmn m n}}
}
\xtc{
}{
\spadpaste{contract(Tmn,1,3) = transpose(m) * n  \free{Tmn m n}}
}
\xtc{
}{
\spadpaste{contract(Tmn,1,4) = transpose(m) * transpose(n) \free{Tmn m n}}
}
\xtc{
}{
\spadpaste{contract(Tmn,2,3) = m * n             \free{Tmn m n}}
}
\xtc{
}{
```

```
\spadpaste{contract(Tmn,2,4) = m * transpose(n)  \free{Tmn m n}}
}
\xtc{
}{
\spadpaste{contract(Tmn,3,4) = trace(n) * m      \free{Tmn m n}}
}

\subsubsection{Transpositions}
%\head{subsection}{Transpositions}{ugxCartenTranspos}

You can exchange any desired pair of indices using the
\spadfunFrom{transpose}{CartesianTensor} operation.

\labelSpace{1pc}
\xtc{
Here the indices in positions one and three are exchanged, that is,
\texht{$tT_{mn}(i,j,k,l) = T_{mn}(k,j,i,l).$}{%
\spad{tTmn(i,j,k,l) = Tmn(k,j,i,l).}}
}{
\spadpaste{tTmn := transpose(Tmn,1,3) \free{tTmn}}
}
\xtc{
If no indices are specified, the first and last index are exchanged.
}{
\spadpaste{transpose Tmn \free{Tmn}}
}
\xtc{
This is consistent with the matrix transpose.
}{
\spadpaste{transpose Tm = transpose m \free{Tm m}}
}

If a more complicated reordering of the indices is required, then the
\spadfunFrom{reindex}{CartesianTensor} operation can be used.
This operation allows the indices to be arbitrarily permuted.
\xtc{
This defines
\texht{$rT_{mn}(i,j,k,l) = \allowbreak T_{mn}(i,l,j,k).$}{%
\spad{rTmn(i,j,k,l) = Tmn(i,l,j,k).}}
}{
\spadpaste{rTmn := reindex(Tmn, [1,4,2,3]) \free{Tmn}\bound{rTmn}}
}

\subsubsection{Arithmetic}
%\head{subsection}{Arithmetic}{ugxCartenArith}

\labelSpace{2pc}
\xtc{
Tensors of equal rank can be added or subtracted so arithmetic
expressions can be used to produce new tensors.
```

```
}{
\spadpaste{tt := transpose(Tm)*Tn - Tn*transpose(Tm) \free{Tm Tn}\bound{tt2}}
}
\xtc{
}{
\spadpaste{Tv*(tt+Tn) \free{tt2 Tv Tn}}
}
\xtc{
}{
\spadpaste{reindex(product(Tn,Tn),[4,3,2,1])+3*Tn*product(Tm,Tm) \free{Tm Tn}}
}

\subsubsection{Specific Tensors}
%\head{subsection}{Specific Tensors}{ugxCartenSpecific}

Two specific tensors have properties which depend only on the
dimension.

\labelSpace{1pc}
\xtc{
The Kronecker delta satisfies
\texht{}{%
\begin{verbatim}
             +-
             |   1  if i  = j
delta(i,j) = |
             |   0  if i ^= j
             +-
\end{verbatim}
}%
}{
\spadpaste{delta:  CT := kroneckerDelta()   \free{CT}\bound{delta}}
}
\xtc{
This can be used to reindex via contraction.
}{
\spadpaste{contract(Tmn, 2, delta, 1) = reindex(Tmn, [1,3,4,2])
\free{Tmn delta}}
}

\xtc{
The Levi Civita symbol determines the sign of a permutation of indices.
}{
\spadpaste{epsilon:CT := leviCivitaSymbol() \free{CT}\bound{epsilon}}
}
Here we have:
\texht{}{%
\begin{verbatim}
epsilon(i1,...,idim)
     = +1  if i1,...,idim is an even permutation of i0,...,i0+dim-1
     = -1  if i1,...,idim is an  odd permutation of i0,...,i0+dim-1
     =  0  if i1,...,idim is not   a permutation of i0,...,i0+dim-1
\end{verbatim}
}
\xtc{
This property can be used to form determinants.
}{
\spadpaste{contract(epsilon*Tm*epsilon, 1,2) = 2 * determinant m \free{epsilon Tm m}}
}

\subsubsection{Properties of the CartesianTensor domain}
%\head{subsection}{Properties of the CartesianTensor domain}{ugxCartenProp}

\spadtype{GradedModule(R,E)} denotes ‘‘\spad{E}-graded \spad{R}-module’’,
that is, a collection of \spad{R}-modules indexed by an abelian monoid
\spad{E.}
An element \spad{g} of \spad{G[s]} for some specific \spad{s}
in \spad{E} is said to be an element of \spad{G} with
\spadfunFrom{degree}{GradedModule} \spad{s}.
Sums are defined in each module \spad{G[s]} so two elements of
\spad{G} can be added if they have the same degree.
Morphisms can be defined and composed by degree to give the
mathematical category of graded modules.

\spadtype{GradedAlgebra(R,E)} denotes ‘‘\spad{E}-graded \spad{R}-algebra.’’
{CartesianTensor}
A graded algebra is a graded module together with a degree preserving
\spad{R}-bilinear map, called the \spadfunFrom{product}{GradedAlgebra}.

\begin{verbatim}
degree(product(a,b))= degree(a) + degree(b)

product(r*a,b) = product(a,r*b) = r*product(a,b)
product(a1+a2,b) = product(a1,b) + product(a2,b)
product(a,b1+b2) = product(a,b1) + product(a,b2)
product(a,product(b,c)) = product(product(a,b),c)
\end{verbatim}

The domain \spadtype{CartesianTensor(i0, dim, R)} belongs
to the category \spadtype{GradedAlgebra(R, NonNegativeInteger)}.
The non-negative integer \spadfunFrom{degree}{GradedAlgebra}
is the tensor rank
and the graded algebra \spadfunFrom{product}{GradedAlgebra}
is the tensor outer product.
The graded module addition captures the notion that
only tensors of equal rank can be added.

If \spad{V} is a vector space of dimension \spad{dim} over \spad{R},
then the tensor module \spad{T[k](V)} is defined as
\begin{verbatim}
```

```
T[0](V) = R
T[k](V) = T[k-1](V) * V
\end{verbatim}
where \spadop{*} denotes the \spad{R}-module tensor
\spadfunFrom{product}{GradedAlgebra}.
\spadtype{CartesianTensor(i0,dim,R)} is the graded algebra in which
the degree \spad{k} module is \spad{T[k](V)}.

\subsubsection{Tensor Calculus}
%\head{subsection}{Tensor Calculus}{ugxCartenCalculus}

It should be noted here that often tensors are used in the context of
tensor-valued manifold maps.  This leads to the notion of covariant
and contravariant bases with tensor component functions transforming
in specific ways under a change of coordinates on the manifold.  This
is no more directly supported by the \spadtype{CartesianTensor} domain
than it is by the \spadtype{Vector} domain.  However, it is possible
to have the components implicitly represent component maps by choosing
a polynomial or expression type for the components.  In this case, it
is up to the user to satisfy any constraints which arise on the basis
of this interpretation.

3.14.1 CharacterClass

— cclass.ht —

```
\begin{page}{CharacterClassXmpPage}{CharacterClass}
\beginscroll

The \spadtype{CharacterClass} domain allows classes of characters to be
defined and manipulated efficiently.

\xtc{
Character classes can be created by giving either a string or a list
of characters.
}{
\spadpaste{cl1 :=
charClass [char "a", char "e", char "i", char "o", char "u", char "y"]
\bound{cl1}}
}
\xtc{
}{
\spadpaste{cl2 := charClass "bcdfghjklmnpqrstvwxyz" \bound{cl2}}
}
\xtc{
A number of character classes are predefined for convenience.
}{
\spadpaste{digit()}
}
\xtc{
}{
\spadpaste{hexDigit()}
}
\xtc{
}{
\spadpaste{upperCase()}
}
\xtc{
}{
\spadpaste{lowerCase()}
}
\xtc{
}{
\spadpaste{alphabetic()}
}
\xtc{
}{
\spadpaste{alphanumeric()}
}
\xtc{
You can quickly test whether a character belongs to a class.
}{
\spadpaste{member?(char "a", cl1) \free{cl1}}
}
\xtc{
}{
\spadpaste{member?(char "a", cl2) \free{cl2}}
}
\xtc{
Classes have the usual set operations because
the \spadtype{CharacterClass} domain belongs to the category
\spadtype{FiniteSetAggregate(Character)}.
}{
\spadpaste{intersect(cl1, cl2)  \free{cl1 cl2}}
}
\xtc{
}{

The members of the domain \spadtype{Character} are values
representing letters, numerals and other text elements.
For more information on related topics, see
\downlink{'CharacterClass'}{CharacterClassXmpPage}\ignore{CharacterClass}
and \downlink{'String'}{StringXmpPage}\ignore{String}.

\xtc{
Characters can be obtained using \spadtype{String} notation.
}{
\spadpaste{chars := [char "a", char "A", char "X", char "8", char "+"]
\bound{chars}}
}
\xtc{
Certain characters are available by name.
This is the blank character.
}{
\spadpaste{space()}
}
\xtc{
This is the quote that is used in strings.
}{
```

```
\spadpaste{quote()}
}
\xtc{
This is the escape character that allows quotes and other characters
within strings.
}{
\spadpaste{escape()}
}
\xtc{
Characters are represented as integers in a machine-dependent way.
The integer value can be obtained using the \spadfunFrom{ord}{Character}
operation.
It is always true that \spad{char(ord c) = c} and \spad{ord(char i) = i},
provided that \spad{i} is in the range \spad{0..size()\$Character-1}.
}{
\spadpaste{[ord c for c in chars] \free{chars}}
}

\xtc{
The \spadfunFrom{lowerCase}{Character} operation converts an upper case
letter to the corresponding lower case letter.
If the argument is not an upper case letter, then it is returned
unchanged.
}{
\spadpaste{[upperCase c for c in chars] \free{chars}}
}
\xtc{
Likewise, the \spadfunFrom{upperCase}{Character} operation converts lower
case letters to upper case.
}{
\spadpaste{[lowerCase c for c in chars] \free{chars}}
}

\xtc{
A number of tests are available to determine whether characters
belong to certain families.

— **clif.ht** —

```
\begin{page}{CliffordAlgebraXmpPage}{CliffordAlgebra}
\beginscroll

\noindent
\spadtype{CliffordAlgebra(n,K,Q)} defines a vector space of dimension
\texht{$2^n$}{\spad{2**n}} over the field \texht{$K$}{\spad{K}} with a
given quadratic form \spad{Q}.
If \texht{$\{e_1, \ldots, e_n\}$}{\spad{\{e(i), 1<=i<=n\}}}
is a basis for  \texht{$K^n$}{\spad{K**n}} then
\begin{verbatim}
```

```
{ 1,
  e(i) 1 <= i <= n,
  e(i1)*e(i2) 1 <= i1 < i2 <=n,
  ...,
  e(1)*e(2)*...*e(n) }
\end{verbatim}
is a basis for the Clifford algebra.
The algebra is defined by the relations
\begin{verbatim}
e(i)*e(i) = Q(e(i))
e(i)*e(j) = -e(j)*e(i),  i ^= j
\end{verbatim}
Examples of Clifford Algebras are
gaussians (complex numbers), quaternions,
exterior algebras and spin algebras.

3.15.5 The Exterior Algebra on a Three Space

— clif.ht —

```
\begin{page}{ugxCliffordExteriorPage}{The Exterior Algebra on a Three Space}
\beginscroll

\labelSpace{4pc}
\xtc{
This is the field over which we will work, rational functions with
integer coefficients.
}{
\spadpaste{K := Fraction Polynomial Integer \bound{K}}
}
\xtc{
```

```
If we chose the three by three zero quadratic form, we obtain
the exterior algebra on \spad{e(1),e(2),e(3)}.
}{
\spadpaste{Ext := CliffordAlgebra(3, K, quadraticForm 0) \bound{Ext}
\free{K}}
}
\xtc{
This is a three dimensional vector algebra.
We define \spad{i}, \spad{j}, \spad{k} as the unit vectors.
}{
\spadpaste{i: Ext := e(1) \free{Ext}\bound{i}}
}
\xtc{
}{
\spadpaste{j: Ext := e(2) \free{Ext}\bound{j}}
}
\xtc{
}{
\spadpaste{k: Ext := e(3) \free{Ext}\bound{k}}
}
\xtc{
Now it is possible to do arithmetic.
}{
\spadpaste{x := x1*i + x2*j + x3*k \free{i j k}\bound{x}}
}
\xtc{
}{
\spadpaste{y := y1*i + y2*j + y3*k \free{i j k}\bound{y}}
}
\xtc{
}{
\spadpaste{x + y         \free{x y}}
}
\xtc{
}{
\spadpaste{x * y + y * x \free{x y}}
}
\xtc{
On an \spad{n} space, a grade \spad{p} form has a dual \spad{n-p} form.
In particular, in three space the dual of a grade two element identifies
\spad{e1*e2->e3, e2*e3->e1, e3*e1->e2}.
}{
\spadpaste{dual2 a == coefficient(a,[2,3]) * i + coefficient(a,[3,1]) *
j + coefficient(a,[1,2]) * k \free{i j k}\bound{dual2}}
}
\xtc{
The vector cross product is then given by this.
}{
\spadpaste{dual2(x*y) \free{x y dual2}}
}
```

3.15.6 The Dirac Spin Algebra

— **clif.ht** —

```
\begin{page}{ugxCliffordDiracPage}{The Dirac Spin Algebra}
\beginscroll

\labelSpace{4pc}
{The Dirac Spin Algebra}
%
\xtc{
In this section we will work over the field of rational numbers.
}{
\spadpaste{K := Fraction Integer \bound{K}}
}
\xtc{
We define the quadratic form to be the Minkowski space-time metric.
}{
\spadpaste{g := matrix {\tt{}1,0,0,0],\ [0,-1,0,0],\ [0,0,-1,0],\ [0,0,0,-1}
\bound{g}}
}
\xtc{
We obtain the Dirac spin algebra
used in Relativistic Quantum Field Theory.
{9.10.4.}{The Dirac Spin Algebra}
}{
\spadpaste{D := CliffordAlgebra(4,K, quadraticForm g) \free{K g}\bound{D}}
}
\xtc{
The usual notation for the basis is \texht{$\gamma$}{\spad{gamma}}
with a superscript.
For Axiom input we will use \spad{gam(i)}:
}{
\spadpaste{gam := [e(i)\$D for i in 1..4] \free{D}\bound{gam}}
}
\noindent
There are various contraction identities of the form
\begin{verbatim}
g(l,t)*gam(l)*gam(m)*gam(n)*gam(r)*gam(s)*gam(t) =
      2*(gam(s)gam(m)gam(n)gam(r) + gam(r)*gam(n)*gam(m)*gam(s))
\end{verbatim}
where a sum over \spad{l} and \spad{t} is implied.
\xtc{
Verify this identity for particular values of \spad{m,n,r,s}.
}{
\spadpaste{m := 1; n:= 2; r := 3; s := 4; \bound{m,n,r,s}}
}
\xtc{
}{
```

```
\spadpaste{lhs :=
reduce(+, [reduce(+,
[ g(l,t)*gam(l)*gam(m)*gam(n)*gam(r)*gam(s)*gam(t) for l in 1..4])
for t in 1..4]) \bound{lhs}\free{g gam m n r s}}
}
\xtc{
}{
\spadpaste{rhs := 2*(gam s * gam m*gam n*gam r + gam r*gam n*gam m*gam s)
\bound{rhs}\free{lhs g gam m n r s}}
}

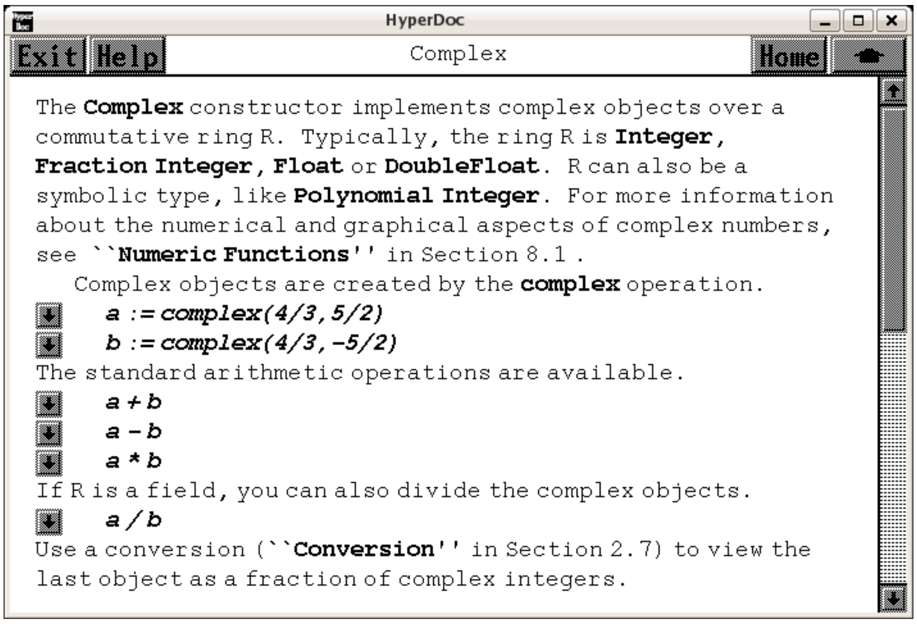
3.16 complex.ht

3.16.1 Complex



The **Complex** constructor implements complex objects over a commutative ring R. Typically, the ring R is **Integer**, **Fraction Integer**, **Float** or **DoubleFloat**. R can also be a symbolic type, like **Polynomial Integer**. For more information about the numerical and graphical aspects of complex numbers, see ``**Numeric Functions**'' in Section 8.1 .

Complex objects are created by the **complex** operation.

a := complex(4/3,5/2)

b := complex(4/3,-5/2)

The standard arithmetic operations are available.

a + b

a - b

*a * b*

If R is a field, you can also divide the complex objects.

a / b

Use a conversion (``**Conversion**'' in Section 2.7) to view the last object as a fraction of complex integers.

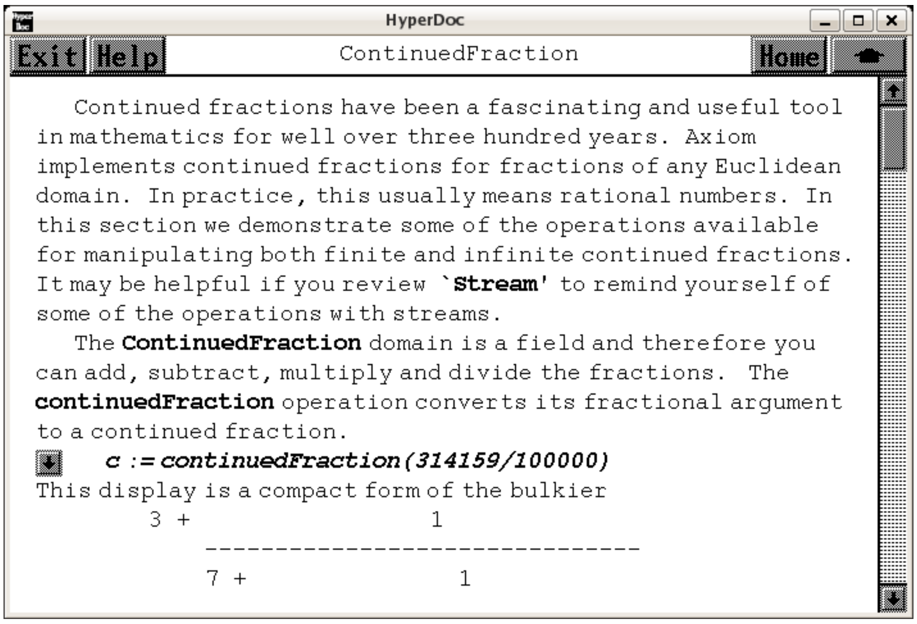
3.17 contfrac.ht

3.17.1 ContinuedFraction



Continued fractions have been a fascinating and useful tool in mathematics for well over three hundred years. Axiom implements continued fractions for fractions of any Euclidean domain. In practice, this usually means rational numbers. In this section we demonstrate some of the operations available for manipulating both finite and infinite continued fractions. It may be helpful if you review **`Stream'** to remind yourself of some of the operations with streams.

The **ContinuedFraction** domain is a field and therefore you can add, subtract, multiply and divide the fractions. The **continuedFraction** operation converts its fractional argument to a continued fraction.

c := continuedFraction(314159/100000)

This display is a compact form of the bulkier

                                        4
\end{verbatim}
}
You can write any rational number in a similar form.  The fraction
will be finite and you can always take the ``numerators'' to be
\spad{1}.  That is, any rational number can be written as a simple,
finite continued fraction of the form
\texht{\narrowDisplay{%
a_1 + {\displaystyle 1 \over {\displaystyle
a_2 + {1 \over {\displaystyle
a_3 + {1 \over {\displaystyle \ddots
a_{n-1} + {1 \over a_n}}}}}}}%
}{
\begin{verbatim}
        a(1) +          1
               -------------------------
               a(2) +         1
                      --------------------
                      a(3) +
                             .
                              .
                               .
                                     1
                               -------------
                               a(n-1) +  1
                                        ----
                                        a(n)
\end{verbatim}
}
\xtc{
The \texht{$a_i$}{\spad{a(i)}} are called partial quotients and the
operation \spadfunFrom{partialQuotients}{ContinuedFraction} creates a
stream of them.
}{
\spadpaste{partialQuotients c \free{c}}
}
\xtc{
By considering more and more of the fraction, you get the
\spadfunFrom{convergents}{ContinuedFraction}.
For example, the first convergent is \texht{$a_1$}{\spad{a(1)}},
the second is
\texht{$a_1 + 1/a_2$}{\spad{a(1) + 1/a(2)}} and so on.
}{
\spadpaste{convergents c \free{c}}
}
%
\xtc{
Since this is a finite continued fraction, the last convergent is
the original rational number, in reduced form.
The result of \spadfunFrom{approximants}{ContinuedFraction}
is always an infinite stream, though it may just repeat the ‘‘last’’
value.
}{
\spadpaste{approximants c \free{c}}
}
\xtc{
Inverting \spad{c} only changes the partial quotients of its fraction
by inserting a \spad{0} at the beginning of the list.
}{
```

```
\spadpaste{pq := partialQuotients(1/c) \free{c}\bound{pq}}
}
\xtc{
Do this to recover the original continued fraction from this list of
partial quotients.
The three-argument form of the
\spadfunFrom{continuedFraction}{ContinuedFraction} operation takes an
element which is the whole part of the fraction, a stream of elements
which are the numerators of the fraction, and a stream of elements which
are the denominators of the fraction.
}{
\spadpaste{continuedFraction(first pq,repeating [1],rest pq) \free{pq}}
}
\xtc{
The streams need not be finite for
\spadfunFrom{continuedFraction}{ContinuedFraction}.
Can you guess which irrational number has the following continued
fraction?
See the end of this section for the answer.
}{
\spadpaste{z:=continuedFraction(3,repeating [1],repeating [3,6]) \bound{z}}
}
%

In 1737 Euler discovered the infinite continued fraction expansion
\texht{\narrowDisplay{%

1 + {1 \over {\displaystyle
6 + {1 \over {\displaystyle
10 + {1 \over {\displaystyle
14 + \cdots}}}}}}}}}%
}{
\begin{verbatim}
        e - 1             1
        ----- = ---------------------
          2     1 +         1
                    -----------------
                    6 +       1
                        -------------
                        10 +    1
                             --------
                             14 + ...
\end{verbatim}
}
We use this expansion to compute rational and floating point
approximations of \spad{e}.\footnote{For this and other interesting
expansions, see C. D. Olds, {\it Continued Fractions,}
New Mathematical Library, (New York: Random House, 1963), pp.
134--139.}
```

```
\xtc{
By looking at the above expansion, we see that the whole part is
\spad{0} and the numerators are all equal to \spad{1}.  This
constructs the stream of denominators.
}{
\spadpaste{dens:Stream Integer := cons(1,generate((x+->x+4),6))
\bound{dens}}
}
\xtc{
Therefore this is the continued fraction expansion for
\texht{$(e - 1) / 2$}{\spad{(e-1)/2}}.
}{
\spadpaste{cf := continuedFraction(0,repeating [1],dens)
\free{dens}\bound{cf}}
}
\xtc{
These are the rational number convergents.
}{
\spadpaste{ccf := convergents cf \free{cf}\bound{ccf}}
}
\xtc{
You can get rational convergents for \spad{e} by multiplying by \spad{2} and
adding \spad{1}.
}{
\spadpaste{eConvergents := [2*e + 1 for e in ccf] \bound{ec}\free{ccf}}
}
%
\xtc{
You can also compute the floating point approximations to these convergents.
}{
\spadpaste{eConvergents :: Stream Float \free{ec}}
}
\xtc{
Compare this to the value of \spad{e} computed by the
\spadfunFrom{exp}{Float} operation in \spadtype{Float}.
}{
\spadpaste{exp 1.0}
}

In about 1658, Lord Brouncker established the following expansion
for \texht{$4 / \pi$}{\spad{4/pi}}.
\texht{\narrowDisplay{%
1 + {\displaystyle
1 \over {\displaystyle
2 + {9 \over {\displaystyle
2 + {25 \over {\displaystyle
2 + {49 \over {\displaystyle
2 + {81 \over {\displaystyle
2 + \cdots}}}}}}}}}}}%
```

```
}{
\begin{verbatim}
        1 +           1
            -----------------------
            2 +         9
                -------------------
                2 +       25
                    ---------------
                    2 +      49
                        -----------
                        2 +    81
                            -------
                            2 + ...
\end{verbatim}
}
\xtc{
Let's use this expansion to compute rational and floating point
approximations for \texht{$\pi$}{\spad{pi}}.
}{
\spadpaste{
cf := continuedFraction(1,[(2*i+1)**2 for i in 0..],repeating [2])
\bound{cf1}}
}
\xtc{
}{
\spadpaste{ccf := convergents cf \free{cf1}\bound{ccf1}}
}
\xtc{
}{
\spadpaste{
piConvergents := [4/p for p in ccf] \bound{piConvergents}\free{ccf1}}
}
\xtc{
As you can see, the values are converging to
\texht{$\pi$}{\spad{pi}} = 3.14159265358979323846...,
but not very quickly.
}{
\spadpaste{piConvergents :: Stream Float \free{piConvergents}}
}

\xtc{
You need not restrict yourself to continued fractions of integers.
Here is an expansion for a quotient of Gaussian integers.
}{
\spadpaste{continuedFraction((- 122 + 597*\%i)/(4 - 4*\%i))}
}
\xtc{
This is an expansion for a quotient of polynomials in one variable
with rational number coefficients.
}{
```

```
\spadpaste{r : Fraction UnivariatePolynomial(x,Fraction Integer)
\bound{rdec}}
}
\xtc{
}{
\spadpaste{r := ((x - 1) * (x - 2)) / ((x-3) * (x-4)) \free{rdec}
\bound{r}}
}
\xtc{
}{
\spadpaste{continuedFraction r \free{r}}
}

To conclude this section, we give you evidence that
\texht{\narrowDisplay{%
z =
{3+\zag{1}{3}+\zag{1}{6}+\zag{1}{3}+\zag{1}{6}+\zag{1}{3}+\zag{1}{6}+
\zag{1}{3}+\zag{1}{6}+\zag{1}{3}+\zag{1}{6}+...}}%
}{
\begin{verbatim}
    z = 3 +           1
            -----------------------
            3 +         1
                -------------------
                6 +       1
                    ---------------
                    3 +      1
                        -----------
                        6 +    1
                            -------
                            3 + ...
\end{verbatim}
}
is the expansion of \texht{$\sqrt{11}$}{the square root of \spad{11}}.

3.19 cycles.ht

3.19.1 CycleIndicators

— **cycles.ht** —

```
\begin{page}{CycleIndicatorsXmpPage}{CycleIndicators}
\beginscroll
This section is based upon the paper
J. H. Redfield, ``The Theory of Group-Reduced Distributions'',
and is an application of group theory to enumeration problems.
It is a development of the work by P. A. MacMahon on the

The theory is based upon the power sum symmetric functions
\subscriptIt{s}{i}
which are the sum of the \eth{\it i} powers of the variables.
The cycle index of a permutation is an expression that specifies
the sizes of the cycles of a permutation, and
may be represented as a partition.
A partition of a non-negative integer \spad{n} is a collection
of positive integers called its parts whose sum is \spad{n}.
For example, the partition
\texht{$(3^2 \  2 \ 1^2)$}{\spad{3**2 2 1**2)}}
will be used to represent
\texht{$s^2_3 s_2 s^2_1$}{\spad{(s_3)**2 s_2 (s_1)**2}}
and will indicate that the permutation has two cycles of length 3,
one of length 2 and two of length 1.
The cycle index of a permutation group is the sum of the cycle indices
of its permutations divided by the number of permutations.
The cycle indices of certain groups are provided.
\xtc{
We first expose something from the library.
}{
\spadpaste{)expose EVALCYC}
}
\xtc{
The operation \spadfun{complete} returns the cycle index of the
symmetric group of order \spad{n} for argument \spad{n}.
Alternatively, it is the \eth{\spad{n}} complete homogeneous symmetric
function expressed in terms of power sum symmetric functions.
}{
\spadpaste{complete 1}
}
\xtc{
}{
\spadpaste{complete 2}
}
\xtc{
}{
\spadpaste{complete 3}
}
\xtc{
}{
\spadpaste{complete 7}
}
\xtc{
```

```
The operation \spadfun{elementary} computes the \eth{\spad{n}}
elementary symmetric function for argument \spad{n.}
}{
\spadpaste{elementary 7}
}
\xtc{
The operation \spadfun{alternating} returns
the cycle index of the alternating group
having an even number of even parts in each cycle partition.
}{
\spadpaste{alternating 7}
}
\xtc{
The operation \spadfun{cyclic} returns the cycle index of the cyclic group.
}{
\spadpaste{cyclic 7}
}
\xtc{
The operation \spadfun{dihedral} is the cycle index of the
dihedral group.
}{
\spadpaste{dihedral 7}
}
\xtc{
The operation \spadfun{graphs} for argument \spad{n} returns
the cycle index of the group of permutations on
the edges of the complete graph with \spad{n} nodes induced by
applying the symmetric group to the nodes.
}{
\spadpaste{graphs 5}
}

The cycle index of a direct product of two groups is the product
of the cycle indices of the groups.
Redfield provided two operations on two cycle indices which will
be called ``cup'' and ``cap'' here.
The \spadfun{cup} of two cycle indices is a kind of scalar product
that combines monomials for permutations with the same cycles.
The \spadfun{cap} operation provides the sum of the coefficients
of the result of the \spadfun{cup} operation which will be an
integer that enumerates what Redfield called
group-reduced distributions.

We can, for example, represent  \spad{complete 2 * complete 2}
as the set of objects \spad{a a b b} and
\spad{complete 2 * complete 1 * complete 1} as \spad{c c d e.}

\xtc{
This integer
is the number of different sets of four pairs.
```

```
}{
\spadpaste{cap(complete 2**2, complete 2*complete 1**2)}
}
For example,
\begin{verbatim}
a a b b    a a b b   a a b b  a a b b
c c d e    c d c e   c e c d  d e c c
\end{verbatim}

\xtc{
This integer
is the number of different sets of four pairs no two pairs being equal.
}{
\spadpaste{cap(elementary 2**2, complete 2*complete 1**2)}
}
For example,
\begin{verbatim}
a a b b   a a b b
c d c e   c e c d
\end{verbatim}
In this case the configurations enumerated are easily constructed,
however the theory merely enumerates them providing little help in
actually constructing them.
\xtc{
Here are the
number of 6-pairs, first from \spad{a a a b b c,} second from
\spad{d d e e f g.}
}{
\spadpaste{cap(complete 3*complete 2*complete 1,
complete 2**2*complete 1**2)}
}
\xtc{
Here it is again, but with no equal pairs.
}{
\spadpaste{cap(elementary 3*elementary 2*elementary 1,
complete 2**2*complete 1**2)}
}
\xtc{
}{
\spadpaste{cap(complete 3*complete 2*complete 1,
elementary 2**2*elementary 1**2)}
}
\xtc{
The number of 6-triples, first from \spad{a a a b b c,} second from
\spad{d d e e f g,} third from \spad{h h i i j j.}
}{
\spadpaste{eval(cup(complete 3*complete 2*complete 1,
cup(complete 2**2*complete 1**2,complete 2**3)))}
}
\xtc{
```

```
The cycle index of vertices of a square is dihedral 4.
}{
\spadpaste{square:=dihedral 4}
}
\xtc{
The number of different squares with 2 red vertices and 2 blue vertices.
}{
\spadpaste{cap(complete 2**2,square)}
}
\xtc{
The number of necklaces with 3 red beads, 2 blue beads and 2 green beads.
}{
\spadpaste{cap(complete 3*complete 2**2,dihedral 7)}
}
\xtc{
The number of graphs with 5 nodes and 7 edges.
}{
\spadpaste{cap(graphs 5,complete 7*complete 3)}
}
\xtc{
The cycle index of rotations of vertices of a cube.
}{
\spadpaste{s(x) == powerSum(x)}
}
\xtc{
}{
\spadpaste{cube:=(1/24)*(s 1**8+9*s 2**4 + 8*s 3**2*s 1**2+6*s 4**2)}
}
\xtc{
The number of cubes with 4 red vertices and 4 blue vertices.
}{
\spadpaste{cap(complete 4**2,cube)}
}
\xtc{
The number of labeled graphs with degree sequence \spad{2 2 2 1 1}
with no loops or multiple edges.
}{
\spadpaste{
cap(complete 2**3*complete 1**2,wreath(elementary 4,elementary 2))}
}
\xtc{
Again, but
with loops allowed but not multiple edges.
}{
\spadpaste{
cap(complete 2**3*complete 1**2,wreath(elementary 4,complete 2))}
}
\xtc{
Again, but
with multiple edges allowed, but not loops
```

```
}{
\spadpaste{cap(complete 2**3*complete 1**2,wreath(complete 4,elementary 2))}
}
\xtc{
Again, but
with both multiple edges and loops allowed
}{
\spadpaste{cap(complete 2**3*complete 1**2,wreath(complete 4,complete 2))}
}

Having constructed a cycle index for a configuration
we are at liberty to evaluate the
\subscriptIt{s}{i}
components any way we please.
For example we can produce enumerating generating functions.
{CycleIndicators}
This is done by providing a function \spad{f} on an integer \spad{i}
to the value required of \subscriptIt{s}{i},
and then evaluating \spad{eval(f, cycleindex)}.
\xtc{
}{
\spadpaste{x: ULS(FRAC INT,'x,0) := 'x \bound{x}}
}
\xtc{
}{
\spadpaste{ZeroOrOne: INT -> ULS(FRAC INT, 'x, 0) \bound{zodec}}
}
\xtc{
}{
\spadpaste{Integers: INT -> ULS(FRAC INT, 'x, 0) \bound{idec}}
}
\xtc{
For the integers 0 and 1, or two colors.
}{
\spadpaste{ZeroOrOne n == 1+x**n \free{x zodec}\bound{zo}}
}
\xtc{
}{
\spadpaste{ZeroOrOne 5 \free{zo}}
}
\xtc{
For the integers \spad{0, 1, 2, ...} we have this.
}{
\spadpaste{Integers n == 1/(1-x**n) \free{x idec}\bound{i}}
}
\xtc{
}{
\spadpaste{Integers 5 \free{i}}
}
```

```
\xtc{
The coefficient of \texht{$x^n$}{\spad{x**n}}
is the number of graphs with 5 nodes
and \spad{n} edges.
}{
\spadpaste{eval(ZeroOrOne, graphs 5) \free{zo}}
}
\xtc{
The coefficient of \texht{$x^n$}{\spad{x**n}}  is the number of
necklaces with \spad{n} red beads and \spad{n-8} green beads.
}{
\spadpaste{eval(ZeroOrOne,dihedral 8) \free{zo}}
}
\xtc{
The coefficient of \texht{$x^n$}{\spad{x**n}} is the number of
partitions of \spad{n} into 4 or fewer parts.
}{
\spadpaste{eval(Integers,complete 4) \free{i}}
}
\xtc{
The coefficient of \texht{$x^n$}{\spad{x**n}} is the number of
partitions of \spad{n} into 4
boxes containing ordered distinct parts.
}{
\spadpaste{eval(Integers,elementary 4) \free{i}}
}
\xtc{
The coefficient of \texht{$x^n$}{\spad{x**n}} is the number of
different cubes with \spad{n} red vertices and \spad{8-n} green ones.
}{
\spadpaste{eval(ZeroOrOne,cube) \free{zo}}
}
\xtc{
The coefficient of \texht{$x^n$}{\spad{x**n}}
is the number of different cubes with integers
on the vertices whose sum is \spad{n.}
}{
\spadpaste{eval(Integers,cube) \free{i}}
}
\xtc{
The coefficient of \texht{$x^n$}{\spad{x**n}} is the number of
graphs with 5 nodes and with integers on the edges whose sum is
\spad{n.}
In other words, the enumeration is of multigraphs with 5 nodes and
\spad{n} edges.
}{
\spadpaste{eval(Integers,graphs 5) \free{i}}
}
\xtc{
Graphs with 15 nodes enumerated with respect to number of edges.
}{
\spadpaste{eval(ZeroOrOne ,graphs 15) \free{zo}}
}
\xtc{
Necklaces with 7 green beads, 8 white beads, 5 yellow beads and 10
red beads.
}{
\spadpaste{cap(dihedral 30,complete 7*complete 8*complete 5*complete 10)}
}
The operation \spadfun{SFunction} is the S-function or Schur function
of a partition written
as a descending list of integers expressed in terms of power sum
symmetric functions.
\xtc{
In this case the argument partition represents a tableau shape.
For example \spad{3,2,2,1} represents a tableau with three boxes in the
first row, two boxes in the second and third rows, and one box in the
fourth row.
\spad{SFunction [3,2,2,1]}
counts the number of different tableaux of shape \spad{3, 2, 2, 1} filled
with objects with an ascending order in the columns and a
non-descending order in the rows.
}{
\spadpaste{sf3221:= SFunction [3,2,2,1] \bound{sf3221}}
}
\xtc{
This is the number filled with \spad{a a b b c c d d.}
}{
\spadpaste{cap(sf3221,complete 2**4) \free{sf3221}}
}
The configurations enumerated above are:
\begin{verbatim}
a a b    a a c    a a d
b c      b b      b b
c d      c d      c c
d        d        d
\end{verbatim}
\xtc{
This is the number of tableaux filled with \spad{1..8.}
}{
\spadpaste{cap(sf3221, powerSum 1**8)\free{sf3221}}
}
\xtc{
The coefficient of \texht{$x^n$}{\spad{x**n}} is the number
of column strict reverse plane partitions of \spad{n} of shape
\spad{3 2 2 1.}
}{
\spadpaste{eval(Integers, sf3221)\free{i sf3221}}
}
The smallest is

3.22 derham.ht

3.22.1 DeRhamComplex

— derham.ht —

```
\begin{page}{DeRhamComplexXmpPage}{DeRhamComplex}
\beginscroll

The domain constructor \spadtype{DeRhamComplex} creates the
class of differential forms of arbitrary degree over a coefficient ring.
The De Rham complex constructor takes two arguments: a ring,
\spad{coefRing,} and a list of coordinate variables.

\xtc{
This is the ring of coefficients.
}{
\spadpaste{coefRing := Integer \bound{coefRing}}
}
\xtc{
These are the coordinate variables.
```

```
}{
\spadpaste{lv : List Symbol := [x,y,z] \bound{lv}}
}
\xtc{
This is the De Rham complex of Euclidean three-space using
coordinates \spad{x, y} and \spad{z.}
}{
\spadpaste{der := DERHAM(coefRing,lv) \free{coefRing}\free{lv}
\bound{der}}
}

This complex allows us to describe differential forms having
expressions of integers as coefficients.
These coefficients can involve any number of variables, for example,
\spad{f(x,t,r,y,u,z).}
As we've chosen to work with ordinary
Euclidean three-space, expressions involving these forms
are treated as functions of
\spad{x, y} and \spad{z} with the additional arguments
\spad{t, r} and \spad{u} regarded as symbolic constants.
\xtc{
Here are some examples of coefficients.
}{
\spadpaste{R := Expression coefRing \free{coefRing}\bound{R}}
}
\xtc{
}{
\spadpaste{f : R := x**2*y*z-5*x**3*y**2*z**5 \free{R}\bound{f}}
}
\xtc{
}{
\spadpaste{g : R := z**2*y*cos(z)-7*sin(x**3*y**2)*z**2 \free{R}\bound{g}}
}
\xtc{
}{
\spadpaste{h : R :=x*y*z-2*x**3*y*z**2 \free{R}\bound{h}}
}
\xtc{
We now define
the multiplicative basis elements for the exterior algebra over \spad{R}.
}{
\spadpaste{dx : der := generator(1) \free{der}\bound{dx}}
}
\xtc{
}{
\spadpaste{dy : der := generator(2)\free{der}\bound{dy}}
}
\xtc{
}{
\spadpaste{dz : der := generator(3)\free{der}\bound{dz}}
```

```
}
\xtc{
This is an alternative way to give the above assignments.
}{
\spadpaste{[dx,dy,dz] := [generator(i)\$der for i in 1..3] \free{der}
\bound{dxyz}}
}
\xtc{
Now we define some one-forms.
}{
\spadpaste{alpha : der := f*dx + g*dy + h*dz \bound{alpha}
\free{der f g h dxyz}}
}
\xtc{
}{
\spadpaste{beta  : der := cos(tan(x*y*z)+x*y*z)*dx + x*dy
\bound{beta}\free{der f g h dxyz}}
}
\xtc{
A well-known theorem states that the composition of
\spadfunFrom{exteriorDifferential}{DeRhamComplex}
with itself is the zero map for continuous forms.
Let's verify this theorem for \spad{alpha}.
}{
\spadpaste{exteriorDifferential alpha; \free{alpha}\bound{ed}}
}
\xtc{
We suppressed the lengthy output of the last expression, but nevertheless, the
composition is zero.
}{
\spadpaste{exteriorDifferential \% \free{ed}}
}

\xtc{
Now we check that \spadfunFrom{exteriorDifferential}{DeRhamComplex}
is a ``graded derivation'' \spad{D,} that is, \spad{D} satisfies:
\begin{verbatim}
D(a*b) = D(a)*b + (-1)**degree(a)*a*D(b)
\end{verbatim}
}{
\spadpaste{gamma := alpha * beta \bound{gamma}\free{alpha}\free{beta}}
}
\xtc{
We try this for the one-forms \spad{alpha} and \spad{beta}.
}{
\spadpaste{exteriorDifferential(gamma) -
(exteriorDifferential(alpha)*beta - alpha * exteriorDifferential(beta))
\free{alpha beta gamma}}
}
\xtc{
```

```
Now we define some ‘‘basic operators’’ (see
\downlink{‘Operator’}{OperatorXmpPage}\ignore{Operator}).
}{
\spadpaste{a : BOP := operator(’a) \bound{ao}}
}
\xtc{
}{
\spadpaste{b : BOP := operator(’b) \bound{bo}}
}
\xtc{
}{
\spadpaste{c : BOP := operator(’c) \bound{co}}
}
\xtc{
We also define
some indeterminate one- and two-forms using these operators.
}{
\spadpaste{sigma := a(x,y,z) * dx + b(x,y,z) * dy + c(x,y,z) * dz
\bound{sigma}\free{ao bo co dxyz}}
}
\xtc{
}{
\spadpaste{theta  := a(x,y,z) * dx * dy + b(x,y,z) * dx *
dz + c(x,y,z) * dy * dz \bound{theta}\free{ao bo co dxyz}}
}

\xtc{
This allows us to get formal definitions for the ‘‘gradient’’ \ldots
}{
\spadpaste{totalDifferential(a(x,y,z))\$der \free{ao der}}
}
\xtc{
the ‘‘curl’’ \ldots
}{
\spadpaste{exteriorDifferential sigma \free{sigma}}
}
\xtc{
and the ‘‘divergence.’’
}{
\spadpaste{exteriorDifferential theta \free{theta}}
}

\xtc{
Note that the De Rham complex is an algebra with unity.
This element \spad{1} is the basis for elements for zero-forms, that is,
functions in our space.
}{
\spadpaste{one : der := 1 \bound{one}\free{der}}
}
```

```
\xtc{
To convert a function to a function lying in the De Rham complex,
multiply the function by ‘‘one.’’
}{
\spadpaste{g1 : der := a([x,t,y,u,v,z,e]) * one \free{der one ao}\bound{g1}}
}
\xtc{
A current limitation of Axiom forces you to write
functions with more than four arguments using square brackets in this way.
}{
\spadpaste{h1 : der := a([x,y,x,t,x,z,y,r,u,x]) * one
\free{der one ao}\bound{h1}}
}

\xtc{
Now note how the system keeps track of where your coordinate functions
are located in expressions.
}{
\spadpaste{exteriorDifferential g1 \free{g1}}
}
\xtc{
}{
\spadpaste{exteriorDifferential h1 \free{h1}}
}

\xtc{
In this example of Euclidean three-space, the basis for the De Rham complex
consists of the eight forms: \spad{1}, \spad{dx}, \spad{dy}, \spad{dz},
\spad{dx*dy}, \spad{dx*dz}, \spad{dy*dz}, and \spad{dx*dy*dz}.
}{
\spadpaste{coefficient(gamma, dx*dy) \free{gamma dxyz}}
}
\xtc{
}{
\spadpaste{coefficient(gamma, one) \free{gamma one}}
}
\xtc{
}{
\spadpaste{coefficient(g1,one) \free{g1 one}}
}

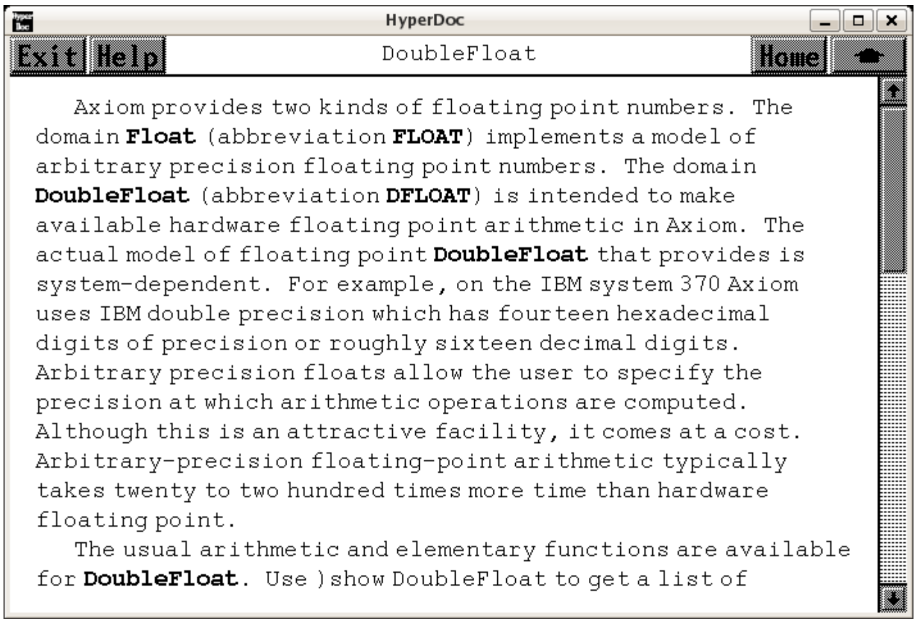
3.23 dfloat.ht

3.23.1 DoubleFloat



Axiom provides two kinds of floating point numbers. The domain **Float** (abbreviation **FLOAT**) implements a model of arbitrary precision floating point numbers. The domain **DoubleFloat** (abbreviation **DFLOAT**) is intended to make available hardware floating point arithmetic in Axiom. The actual model of floating point **DoubleFloat** that provides is system-dependent. For example, on the IBM system 370 Axiom uses IBM double precision which has fourteen hexadecimal digits of precision or roughly sixteen decimal digits. Arbitrary precision floats allow the user to specify the precision at which arithmetic operations are computed. Although this is an attractive facility, it comes at a cost. Arbitrary-precision floating-point arithmetic typically takes twenty to two hundred times more time than hardware floating point.

The usual arithmetic and elementary functions are available for **DoubleFloat**. Use)show DoubleFloat to get a list of

```
\begin{page}{DoubleFloatXmpPage}{DoubleFloat}
\beginscroll
Axiom provides two kinds of floating point numbers.
The domain \spadtype{Float} (abbreviation \spadtype{FLOAT})
implements a model of arbitrary
precision floating point numbers.
The domain \spadtype{DoubleFloat} (abbreviation \spadtype{DFLOAT})
is intended to make available
hardware floating point arithmetic in Axiom.
The actual model of floating point \spadtype{DoubleFloat} that provides is
system-dependent.
For example, on the IBM system 370 Axiom uses IBM double
precision which has fourteen hexadecimal digits of precision or roughly
sixteen decimal digits.
Arbitrary precision floats allow the user to specify the
precision at which arithmetic operations are computed.
Although this is an attractive facility, it comes at a cost.
```

```
Arbitrary-precision floating-point arithmetic typically takes
twenty to two hundred times more time than hardware floating point.

The usual arithmetic and elementary functions are available for
\spadtype{DoubleFloat}.
Use \spadsys{)show DoubleFloat} to get a list of operations or
the Hyperdoc \Browse{} facility to get more extensive
documentation about \spadtype{DoubleFloat}.

\xtc{
By default, floating point numbers that you enter into Axiom
are of type \spadtype{Float}.
}{
\spadpaste{2.71828}
}
You must therefore tell Axiom that you want to use
\spadtype{DoubleFloat} values and operations.
The following are some conservative guidelines for getting
Axiom to use \spadtype{DoubleFloat}.

\xtc{
To get a value of type \spadtype{DoubleFloat}, use a target with
\spadSyntax{@}, \ldots
}{
\spadpaste{2.71828@DoubleFloat}
}
\xtc{
a conversion, \ldots
}{
\spadpaste{2.71828 :: DoubleFloat}
}
\xtc{
or an assignment to a declared variable.
It is more efficient if you use a target rather than an explicit or
implicit conversion.
}{
\spadpaste{eApprox : DoubleFloat := 2.71828 \bound{eApprox}}
}

\xtc{
You also need to declare functions that work with
\spadtype{DoubleFloat}.
}{
\spadpaste{avg : List DoubleFloat -> DoubleFloat \bound{avgDec}}
}
\xtc{
}{
\begin{spadsrc}[\bound{avg}\free{avgDec}]
avg l ==
  empty? l => 0 :: DoubleFloat
  reduce(_+,l) / #l
\end{spadsrc}
}
\xtc{
}{
\spadpaste{avg [] \free{avg}}
}
\xtc{
}{
\spadpaste{avg [3.4,9.7,-6.8] \free{avg}}
}
\xtc{
Use package-calling for operations from \spadtype{DoubleFloat} unless
the arguments themselves are already of type \spadtype{DoubleFloat}.
}{
\spadpaste{cos(3.1415926)\$DoubleFloat}
}
\xtc{
}{
\spadpaste{cos(3.1415926 :: DoubleFloat)}
}

By far, the most common usage of \spadtype{DoubleFloat} is for functions
to be graphed.
For more information about Axiom's numerical and graphical
facilities, see
\downlink{``Graphics''}{ugGraphPage} in Section 7.
\ignore{ugGraph},
\downlink{``Numeric Functions''}{ugProblemNumericPage} in
Section 8.1\ignore{ugProblemNumeric}, and
\downlink{`Float'}{FloatXmpPage}\ignore{Float}.

\begin{page}{DistributedMultivariatePolyXmpPage}
{DistributedMultivariatePoly}
\beginscroll

\texht{\hyphenation{
Homo-gen-eous-Dis-tributed-Multi-var-i-ate-Pol-y-nomial
}}{}

\spadtype{DistributedMultivariatePoly} and
\spadtype{HomogeneousDistributedMultivariatePoly}, abbreviated
\spadtype{DMP} and \spadtype{HDMP}, respectively, are very similar to
\spadtype{MultivariatePolynomial} except that they are represented and
displayed in a non-recursive manner.
\xtc{
}{
\spadpaste{(d1,d2,d3) : DMP([z,y,x],FRAC INT) \bound{d1dec d2dec d3dec}}
}
\xtc{
The constructor
\spadtype{DMP} orders its monomials lexicographically while
\spadtype{HDMP} orders them by total order refined by reverse
lexicographic order.
}{
\spadpaste{d1 := -4*z + 4*y**2*x + 16*x**2 + 1 \bound{d1}\free{d1dec}}
}
\xtc{
}{
\spadpaste{d2 := 2*z*y**2 + 4*x + 1 \bound{d2}\free{d2dec}}
}
\xtc{
}{
\spadpaste{d3 := 2*z*x**2 - 2*y**2 - x \bound{d3}\free{d3dec}}
}
```

```
\xtc{
These constructors are mostly used in \texht{Gr\"{o}bner}{Groebner}
basis calculations.
}{
\spadpaste{groebner [d1,d2,d3] \free{d1 d2 d3}}
}
\xtc{
}{
\spadpaste{(n1,n2,n3) : HDMP([z,y,x],FRAC INT) \bound{ndec}}
}
\xtc{
}{
\spadpaste{(n1,n2,n3) := (d1,d2,d3) \free{ndec}\bound{n}\free{d1 d2 d3}}
}
\xtc{
Note that we get a different
\texht{Gr\"{o}bner}{Groebner} basis
when we use the \spadtype{HDMP} polynomials, as expected.
}{
\spadpaste{groebner [n1,n2,n3] \free{n}}
}

\spadtype{GeneralDistributedMultivariatePoly} is somewhat
more flexible in the sense that as well as accepting a list of
variables to specify the variable ordering, it also takes a
predicate on exponent vectors to specify the term ordering.
With this polynomial type the user can experiment with the effect
of using completely arbitrary term orderings.
This flexibility is mostly important for algorithms such as
\texht{Gr\"{o}bner}{Groebner} basis calculations which can be very
sensitive to term ordering.

3.25 eq.ht

3.25.1 Equation

— **eq.ht** —

```
\begin{page}{EquationXmpPage}{Equation}
\beginscroll

The \spadtype{Equation} domain provides equations as mathematical objects.
These are used, for example, as the input to various
\spadfunFrom{solve}{TransSolvePackage} operations.

\xtc{
Equations are created using the equals symbol, \spadopFrom{=}{Equation}.
}{
\spadpaste{eq1 := 3*x + 4*y = 5 \bound{eq1}}
}
\xtc{
}{
\spadpaste{eq2 := 2*x + 2*y = 3 \bound{eq2}}
}
\xtc{
The left- and right-hand sides of an equation are accessible using
the operations \spadfunFrom{lhs}{Equation} and \spadfunFrom{rhs}{Equation}.
}{
\spadpaste{lhs eq1 \free{eq1}}
}
\xtc{
}{
\spadpaste{rhs eq1 \free{eq1}}
}
```

```
\xtc{
Arithmetic operations are supported
and operate on both sides of the equation.
}{
\spadpaste{eq1 + eq2   \free{eq1 eq2}}
}
\xtc{
}{
\spadpaste{eq1 * eq2   \free{eq1 eq2}}
}
\xtc{
}{
\spadpaste{2*eq2 - eq1 \free{eq1 eq2}}
}
\xtc{
Equations may be created for any type so the arithmetic operations
will be defined only when they make sense.  For example,
exponentiation is not defined for equations involving non-square matrices.
}{
\spadpaste{eq1**2 \free{eq1}}
}

\xtc{
Note that an equals symbol is also used to {\it test}
for equality of values in certain contexts.
For example, \spad{x+1} and \spad{y} are unequal as polynomials.
}{
\spadpaste{if x+1 = y then "equal" else "unequal"}
}
\xtc{
}{
\spadpaste{eqpol := x+1 = y \bound{eqpol}}
}
\xtc{
If an equation is used where a \spadtype{Boolean} value
is required, then it is evaluated using the equality
test from the operand type.
}{
\spadpaste{if eqpol then "equal" else "unequal" \free{eqpol}}
}
\xtc{
If one wants a \spadtype{Boolean} value rather than an equation,
all one has to do is ask!
}{
\spadpaste{eqpol::Boolean \free{eqpol}}
}

```
\begin{page}{EqTableXmpPage}{EqTable}
\beginscroll

The \spadtype{EqTable} domain provides tables where the keys are compared
using \spadfunFrom{eq?}{EqTable}.
Keys are considered equal only if they are the same instance of a
structure.
This is useful if the keys are themselves updatable structures.
Otherwise, all operations are the same as for type \spadtype{Table}.
See \downlink{'Table'}{TableXmpPage}\ignore{Table}
for general information about tables.
\showBlurb{EqTable}

\xtc{
The operation \spadfunFrom{table}{EqTable} is here used to create a table
where the keys are lists of integers.
}{
\spadpaste{e: EqTable(List Integer, Integer) := table() \bound{e}}
}

3.27 evalex.ht

3.27.1 Example of Standard Evaluation

— evalex.ht —

```
\begin{page}{PrefixEval}{Example of Standard Evaluation}
\beginscroll
We illustrate the general evaluation of {\em op a} for some
prefix operator {\em op} and operand {\em a}
by the example: {\em cos(2)}.
The evaluation steps are as follows:
\vspace{1}\newline
1.\tab{3}{\em a} evaluates to a value of some type.
\newline\tab{3}{\em Example:} {\em 2} evaluates to {\em 2} of type
\spadtype{Integer}
\newline
2.\tab{3}Axiom then chooses a function {\em op} based on the
type of {\em a}.
\newline\tab{3}{\em Example:} The function {\em cos:} \spadtype{Float} {\em ->}
\spadtype{Float} is chosen.
\newline
3.\tab{3}If the argument type of the function is different from that
of {\em a},
then the system coerces
%\downlink{coerces}{Coercion}
the value of {\em a} to the
argument type.
\newline\tab{3}{\em Example:} The integer {\em 2} is coerced to the
float {\em 2.0}.
\newline
4.\tab{3}The function is then applied to the value of {\em a} to
produce the value
for {\em op a}.
\newline\tab{3}{\em Example:} The function {\em cos} is applied to {\em 2.0}.
\vspace{1}\newline
Try it:
\example{cos(2)}
\endscroll
\autobuttons
\end{page}
```

```

3.27.2 Example of Standard Evaluation

— evalex.ht —

```
\begin{page}{InfixEval}{Example of Standard Evaluation}
\beginscroll
We illustrate the general evaluation of {\em a op b} for some
infix operator {\em op} with operands {\em a} and {\em b}
by the example: {\em 2 + 3.4}.
The evaluation steps are as follows:
\vspace{1}\newline
1.\tab{3}{\em a} and {\em b} are evaluated, each producing
a value and a type.
\newline\tab{3}{\em Example:} {\em 2} evaluates to {\em 2} of type
\spadtype{Integer};
{\em 3.4} evaluates to {\em 3.4} of type \spadtype{Float}.
\vspace{1}\newline
2.\tab{3}Axiom then chooses a function {\em op} based on the
types of {\em a} and {\em b}.
\newline\tab{3}{\em Example:} The function {\em +: (D,D) -> D}
is chosen requiring a common type {\em D} for both arguments to {\em +}.
An operation called {\em resolve} determines the ‘smallest common
type’ \spadtype{Float}.
\vspace{1}\newline
3.\tab{3}If the argument types for the function are different from
those of {\em a} and {\em b},
then the system coerces
%\downlink{coerces}{Coercion}
the values to the argument types.
```

```
\newline\tab{3}{\em Example:} The integer {\em 2} is coerced to the
float {\em 2.0}.
\vspace{1}\newline
4.\tab{3}The function is then applied to the values of {\em a} and {\em b}
to produce the value for {\em a op b}.
\newline\tab{3}{\em Example:} The function {\em +: (D,D) -> D}, where
{\em D} = \spadtype{Float} is applied to {\em 2.0} and {\em 3.4} to
produce {\em 5.4}.
\vspace{1}\newline
Try it:
\example{2 + 3.4}

\tab{5}\spadcommand{differentiate(exp(x**2),x,4)}
\end{paste}\end{patch}
```

———-

3.28.4 Multiple Derivatives I

— exdiff.ht —

```
\begin{page}{ExDiffMultipleI}{Multiple Derivatives I}
\beginscroll
When given a function of several variables, you may take derivatives
repeatedly and with respect to different variables.
The following command differentiates the function
{\em sin(x)/(x**2 + y**2)} first with respect to {\em x} and then with
respect to {\em y}:
\spadpaste{differentiate(sin(x)/(x**2 + y**2),[x,y])}
As you can see, we first specify the function and then a list of
the variables of differentiation.
Variables may appear on the list more than once.
For example, the following command differentiates the same function with
respect to {\em x} and then twice with respect to {\em y}.
\spadpaste{differentiate(sin(x)/(x**2 + y**2),[x,y,y])}
\endscroll
\autobuttons
```

```

3.28.7 Exit

— exit.ht —

```
\begin{page}{ExitXmpPage}{Exit}
\beginscroll

A function that does not return directly to its caller has
\spadtype{Exit} as its return type.
The operation \spadfun{error} is an example of one which does not return
to its caller.
Instead, it causes a return to top-level.
\xtc{
}{
\spadpaste{n := 0 \bound{n}}
}
\xtc{
The function \userfun{gasp} is given return type \spadtype{Exit} since
it is guaranteed never to return a value to its caller.
}{
\begin{spadsrc}[\bound{gasp}\free{n}]
gasp(): Exit ==
    free n
    n := n + 1
    error "Oh no!"
\end{spadsrc}
}
\xtc{
The return type of \userfun{half} is determined by resolving the
types of the two branches of the \spad{if}.
}{
\begin{spadsrc}[\bound{half}\free{gasp}]
half(k) ==
  if odd? k then gasp()
  else k quo 2
\end{spadsrc}
}
\xtc{
Because
\userfun{gasp} has the return type \spadtype{Exit}, the type of
\spad{if} in \userfun{half} is resolved to be \spadtype{Integer}.
}{
\spadpaste{half 4 \free{half}\bound{app1}}
}
\xtc{
}{
\spadpaste{half 3 \free{half app1}\bound{app2}}
}
\xtc{
}{
\spadpaste{n \free{app2}}
}

For functions which return no value at all, use \spadtype{Void}.
See \downlink{``User-Defined Functions, Macros and Rules''}
{ugUserPage} in Section 6\ignore{ugUser} and
\downlink{`Void'}{VoidXmpPage}\ignore{Void} for more information.

3.30 exint.ht

3.30.1 Integral of a Rational Function

— exint.ht —

```
\begin{page}{ExIntRationalFunction}{Integral of a Rational Function}
\beginscroll
The following fraction has a denominator which factors into
a quadratic and a quartic irreducible polynomial. The usual
partial fraction approach used by most other computer algebra
systems either fails or introduces expensive unneeded algebraic
numbers.
We use a factorization-free algorithm.
\spadpaste{integrate((x**2+2*x+1)/((x+1)**6+1),x)}
There are cases where algebraic numbers are absolutely necessary.
In that case the answer to the \spadfun{integrate} command will contain
symbols like \spad{\%\%F0} denoting the algebraic numbers used.
To find out what the definitions for these numbers is use the
\spadfun{definingPolynomial} operation on these numbers.
```

```
\spadpaste{integrate(1/(x**3+x+1),x) \bound{i}}
For example, if a symbol like \spad{\%\%F0} appears in the result of this last
integration, then \spad{definingPolynomial \%\%F0} will return the
polynomial that \spad{\%\%F0} is a root of. The next command isolates the
algebraic number from the expression and displays its defining polynomial.
\spadpaste{definingPolynomial(tower(\%).2::EXPR INT) \free{i}}

3.30.4 Two Similar Integrands Producing Very Different Results

— exint.ht —

```
\begin{page}{ExIntTwoSimilarIntegrands}
```

```
{Two Similar Integrands Producing Very Different Results}
\beginscroll
The following two examples illustrate the limitations of table based
approaches. The two integrands are very similar, but the answer to one
of them requires the addition of two new algebraic numbers.
This one is the easy one:
\spadpaste{integrate(x**3 / (a+b*x)**(1/3),x)}
The next one looks very similar
but the answer is much more complicated. Only an algorithmic approach
is guaranteed to find what new constants must be added in order to
find a solution:
\spadpaste{integrate(1 / (x**3 * (a+b*x)**(1/3)),x)}
\endscroll
\autobuttons

3.30.5 An Integral Which Does Not Exist

— exint.ht —

```
\begin{page}{ExIntNoSolution}{An Integral Which Does Not Exist}
\beginscroll
Most computer algebra systems use heuristics or table-driven
approaches to integration. When these systems cannot determine
the answer to an integration problem, they reply "I don't know".
Axiom uses a complete algorithm for integration.
It will conclusively prove that an integral
cannot be expressed in terms of elementary functions.
When Axiom returns an integral sign, it has proved
that no answer exists as an elementary function.
\spadpaste{integrate(log(1 + sqrt(a*x + b)) / x,x)}

3.30.8 Details for integrating a function with a Hidden Algebraic Relation

— exint.ht —

```
\begin{page}{ExIntAlgebraicRelationExplain}
{Details for integrating a function with a Hidden Algebraic Relation}
\beginscroll
Steps taken for integration of:
\centerline{{\em f := tan(atan(x)/3)}}
\beginitems
\item
1. Replace {\em f} by an equivalent algebraic function {\em g}
satisfying the algebraic relation:
\centerline{{\em g**3 - 3*x*g - 3*g + x = 0}}
\item
2. Integrate {\em g} using using this algebraic relation; this produces:
\centerline{{\em (24g**2 - 8)log(3g**2 - 1) + (81x**2 + 24)g**2 + 72xg - 27x**2 - 16}}
\centerline{{\em /   (54g**2 - 18)}}
\item
3. Rationalize the denominator, producing:
\centerline{{\em (8log(3g**2-1) - 3g**2 + 18xg + 15)/18}}
\item
```

```
4. Replace {\em g} by the initial {\em f} to produce the final result:
\centerline{{\em (8log(3tan(atan(x/3))**2-1) - 3tan(atan(x/3))**2 -
18xtan(atan(x/3) + 16)/18)}}
\enditems

3.31 exlimit.ht

3.31.1 Computing Limits

⇒ “notitle” (ExLimitTwoSided) 3.31.4 on page 406
⇒ “notitle” (ExLimitOneSided) 3.31.3 on page 405

— **exlimit.ht** —

```
\begin{page}{ExLimitBasic}{Computing Limits}
```

```
\beginscroll
To compute a limit, you must specify a functional expression,
a variable, and a limiting value for that variable.
For example, to compute the limit of (x**2 - 3*x + 2)/(x**2 - 1)
as x approaches 1, issue the following command:
\spadpaste{limit((x**2 - 3*x + 2)/(x**2 - 1),x = 1)}
% answer := -1/2
Since you have not specified a direction, Axiom will attempt
to compute a two-sided limit. Sometimes the limit when approached from
the left is different from the limit from the right.
\downlink{Example}{ExLimitTwoSided}. In this case, you may
wish to ask for a one-sided limit.
\downlink{How.  }{ExLimitOneSided}

\end{paste}\end{patch}
```

———

3.31.3 One-sided Limits

— exlimit.ht —

```
\begin{page}{ExLimitOneSided}{One-sided Limits}
\beginscroll
If you have a function which is only defined on one side of a particular value,
you may wish to compute a one-sided limit.
For instance, the function \spad{log(x)} is only defined to the right of zero,
i.e. for \spad{x > 0}.
Thus, when computing limits of functions involving \spad{log(x)}, you probably
will want a 'right-hand' limit.
Here's an example:
\spadpaste{limit(x * log(x),x = 0,"right")}
% answer := 0
When you do not specify \spad{right} or \spad{left} as an optional fourth
argument, the function \spadfun{limit} will try to compute a two-sided limit.
In the above case, the limit from the left does not exist, as Axiom
will indicate when you try to take a two-sided limit:
\spadpaste{limit(x * log(x),x = 0)}
% answer := [left = "failed",right = 0]
\endscroll
```

```
\autobuttons

\end{paste}\end{patch}
```

———-

3.31.4 Two-sided Limits

— exlimit.ht —

```
\begin{page}{ExLimitTwoSided}{Two-sided Limits}
\beginscroll
A function may be defined on both sides of a particular value, but will
tend to different limits as its variable tends to that value from the
left and from the right.
We can construct an example of this as follows:
```

```
Since { \em sqrt(y**2)} is simply the absolute value of \spad{y},
the function \spad{sqrt(y**2)/y}
is simply the sign (+1 or -1) of the real number \spad{y}.
Therefore, \spad{sqrt(y**2)/y = -1} for \spad{y < 0} and
\spad{sqrt(y**2)/y = +1} for \spad{y > 0}.
Watch what happens when we take the limit at \spad{y = 0}.
\spadpaste{limit(sqrt(y**2)/y,y = 0)}
% answer := [left = -1,right = 1]
The answer returned by Axiom gives both a 'left-hand' and a 'right-hand'
limit.
Here's another example, this time using a more complicated function:
\spadpaste{limit(sqrt(1 - cos(t))/t,t = 0)}
% answer := [left = -sqrt(1/2),right = sqrt(1/2)]
\endscroll

3.31.5 Limits at Infinity

— exlimit.ht —

```
\begin{page}{ExLimitInfinite}{Limits at Infinity}
\beginscroll
You can compute limits at infinity by passing either 'plus infinity'
or 'minus infinity' as the third argument of the function \spadfun{limit}.
To do this, use the constants \spad{\%plusInfinity} and
\spad{\%minusInfinity}. Here are two examples:
\spadpaste{limit(sqrt(3*x**2 + 1)/(5*x),x = \%plusInfinity)}
\spadpaste{limit(sqrt(3*x**2 + 1)/(5*x),x = \%minusInfinity)}
\endscroll
\autobuttons
\end{page}

3.31.6 Real Limits vs. Complex Limits

— exlimit.ht —

```
\begin{page}{ExLimitRealComplex}{Real Limits vs. Complex Limits}
\beginscroll
When you use the function \spadfun{limit}, you will be taking the limit of a real
function of a real variable.
For example, you can compute
\spadpaste{limit(z * sin(1/z),z = 0)}
Axiom returns \spad{0} because as a function of a real variable
\spad{sin(1/z)} is always between \spad{-1} and \spad{1}, so \spad{z * sin(1/z)}
tends to \spad{0} as \spad{z} tends to \spad{0}.
However, as a function of a complex variable, \spad{sin(1/z)} is badly
behaved around \spad{0}
(one says that \spad{sin(1/z)} has an 'essential singularity' at \spad{z = 0}).
When viewed as a function of a complex variable, \spad{z * sin(1/z)}
does not approach any limit as \spad{z} tends to \spad{0} in the complex plane.
Axiom indicates this when we call the function \spadfun{complexLimit}:
\spadpaste{complexLimit(z * sin(1/z),z = 0)}
\endscroll

———-

3.31.7 Complex Limits at Infinity

— exlimit.ht —

```
\begin{page}{ExLimitComplexInfinite}{Complex Limits at Infinity}
\beginscroll
You may also take complex limits at infinity, i.e. limits of a function of
\spad{z} as \spad{z} approaches infinity on the Riemann sphere.
Use the symbol \spad{\%infinity} to denote ‘complex infinity’.
Also, to compute complex limits rather than real limits, use the
function \spadfun{complexLimit}.
Here is an example:
\spadpaste{complexLimit((2 + z)/(1 - z),z = \%infinity)}
In many cases, a limit of a real function of a real variable will exist
when the corresponding complex limit does not.
For example:
\spadpaste{limit(sin(x)/x,x = \%plusInfinity)}
\spadpaste{complexLimit(sin(x)/x,x = \%infinity)}

3.32 exmatrix.ht

3.32.1 Basic Arithmetic Operations on Matrices

— exmatrix.ht —

```
\begin{page}{ExMatrixBasicFunction}
{Basic Arithmetic Operations on Matrices}
\beginscroll
You can create a matrix using the function \spadfun{matrix}.
The function takes a list of lists of elements of the ring and
produces a matrix whose \spad{i}th row contains the elements of
the \spad{i}th list. For example:
\spadpaste{m1 := matrix({\tt{}1,-2,1],[4,2,-4}) \bound{m1}}
\spadpaste{m2 := matrix({\tt{}1,0,2],[20,30,10],[0,200,100}) \bound{m2}}
\spadpaste{m3 := matrix({\tt{}1,2,3],[2,4,6}) \bound{m3}}
Some of the basic arithmetic operations on matrices are:
\spadpaste{m1 + m3 \free{m1} \free{m3}}
\spadpaste{100 * m1 \free{m1}}
\spadpaste{m1 * m2 \free{m1} \free{m2}}
\spadpaste{-m1 + m3 * m2 \free{m1} \free{m2} \free{m3}}
You can also multiply a matrix and a vector provided
that the matrix and vector have compatible dimensions.
\spadpaste{m3 *vector([1,0,1]) \free{m3}}
However, the dimensions of the matrices must be compatible in order for
Axiom to perform an operation - otherwise an error message will occur.

3.32.2 Constructing new Matrices

— exmatrix.ht —

```
\begin{page}{ExConstructMatrix}{Constructing new Matrices}
\beginscroll
A number of functions exist for constructing new matrices from existing ones.

If you want to create a matrix whose entries are 0 except on the main
diagonal you can use \spadfun{diagonalMatrix}.
This function takes a list of ring elements as an argument and returns a
square matrix which has these elements on the main diagonal.
Consider the following example:
\spadpaste{diagonalMatrix([1,2,3,2,1])}

The function \spadfun{subMatrix}(\spad{a},\spad{i},\spad{j},\spad{k},\spad{l})
constructs a new matrix
consisting of rows \spad{i} through \spad{j} and columns \spad{k} through
```

```
\spad{l} of \spad{a} , inclusive.
\spadpaste{subMatrix(matrix({\tt{}0,1,2,3,4],[5,6,7,8,9],[10,11,12,13,14}),
1,3,2,4)}

The functions \spadfun{horizConcat} and \spadfun{vertConcat}
concatenate matrices
horizontally and vertically, respectively.
\spadpaste{horizConcat(matrix({\tt{}1,2,3],[6,7,8}),
matrix({\tt{}11,12,13],[55,77,88})) }
\spadpaste{vertConcat(matrix({\tt{}1,2,3],[6,7,8}),
matrix({\tt{}11,12,13],[55,77,88})) }

The function \spadfunX{setsubMatrix}(\spad{a},\spad{i},\spad{k},\spad{b})
replaces the submatrix of \spad{a}
starting at row \spad{i} and column \spad{k} with the elements of the
matrix i\spad{b}.
\spadpaste{b:=matrix({\tt{}0,1,2,3,4],[5,6,7,8,9],[10,11,12,13,14}) \bound{b}}
\spadpaste{setsubMatrix!(b,1,1,transpose(subMatrix(b,1,3,1,3)))\free{b}}
changes the submatrix of \spad{b} consisting of the first 3 rows and columns
to its transpose.

3.32.3 Trace of a Matrix

— exmatrix.ht —

```
\begin{page}{ExTraceMatrix}{Trace of a Matrix}
\beginscroll
If you have a square matrix, then you can compute its ‘trace’.
The function \spadfun{trace} computes the sum of all elements
on the diagonal of a matrix.
For example ‘trace’ for a four by four Vandermonde matrix.
\spadpaste{trace( matrix({\tt{}1,x,x**2,x**3],[1,y,y**2,y**3],\nwnewline
[1,z,z**2,z**3],[1,u,u**2,u**3}) )}
\endscroll
\autobuttons
\end{page}

\begin{patch}{ExTraceMatrixPatch1}
\begin{paste}{ExTraceMatrixFull1}{ExTraceMatrixEmpty1}
\pastebutton{ExTraceMatrixFull1}{\hidepaste}
\tab{5}\spadcommand{trace( matrix({\tt{}1,x,x**2,x**3],[1,y,y**2,y**3],[1,z,z**2,z**3],[1,u,u**2,u**3})
\indentrel{3}\begin{verbatim}
         2       3
   (1)  z  + y + u  + 1
                               Type: Polynomial Integer
\end{verbatim}
\indentrel{-3}\end{paste}\end{patch}

\begin{patch}{ExTraceMatrixEmpty1}
\begin{paste}{ExTraceMatrixEmpty1}{ExTraceMatrixPatch1}
\pastebutton{ExTraceMatrixEmpty1}{\showpaste}
\tab{5}\spadcommand{trace( matrix({\tt{}1,x,x**2,x**3],[1,y,y**2,y**3],[1,z,z**2,z**3],[1,u,u**2,u**3})
\end{paste}\end{patch}
```

— **expr.ht** —

```
\begin{page}{ExpressionXmpPage}{Expression}
\beginscroll

\axiomType{Expression} is a constructor that creates domains whose
objects can have very general symbolic forms.
Here are some examples:
\xtc{
This is an object of type \axiomType{Expression Integer}.
}{
\spadpaste{sin(x) + 3*cos(x)**2}
}
\xtc{
This is an object of type \axiomType{Expression Float}.
}{
\spadpaste{tan(x) - 3.45*x}
}
\xtc{
This object contains symbolic function applications, sums,
products, square roots, and a quotient.
}{
\spadpaste{(tan sqrt 7 - sin sqrt 11)**2 / (4 - cos(x - y))}
}
As you can see, \axiomType{Expression} actually takes an argument
domain.
The {\it coefficients} of the terms within the expression belong
to the argument domain.
\axiomType{Integer} and \axiomType{Float}, along with
\axiomType{Complex Integer} and \axiomType{Complex Float}
are the most common coefficient domains.
\xtc{
The choice of whether
```

```
to use a \axiomType{Complex} coefficient domain or not is
important since Axiom can perform some simplifications
on real-valued objects
}{
\spadpaste{log(exp  x)@Expression(Integer)}
}
\xtc{
... which are not valid on complex ones.
}{
\spadpaste{log(exp  x)@Expression(Complex Integer)}
}
\xtc{
Many potential coefficient domains, such as
\axiomType{AlgebraicNumber}, are not usually used because
\axiomType{Expression} can subsume them.
}{
\spadpaste{sqrt 3 + sqrt(2 + sqrt(-5)) \bound{algnum1}}
}
\xtc{
}{
\spadpaste{\% :: Expression Integer \free{algnum1}}
}
Note that we sometimes talk about ``an object of type
\axiomType{Expression}.'' This is not really correct because we
should say, for example, ``an object of type \axiomType{Expression
Integer}'' or ``an object of type \axiomType{Expression Float}.''
By a similar abuse of language, when we refer to an ``expression''
in this section we will mean an object of type
\axiomType{Expression R} for some domain {\bf R}.

The Axiom documentation contains many examples of the use
of \axiomType{Expression}.
For the rest of this section, we'll give you some pointers to those
examples plus give you some idea of how to manipulate expressions.

It is important for you to know that \axiomType{Expression}
creates domains that have category \axiomType{Field}.
Thus you can invert any non-zero expression and you shouldn't
expect an operation like \axiomFun{factor} to give you much
information.
You can imagine expressions as being represented as quotients of
``multivariate'' polynomials where the ``variables'' are kernels
(see \downlink{`Kernel'}{KernelXmpPage}\ignore{Kernel}).
A kernel can either be a symbol such as \axiom{x} or a symbolic
function application like \axiom{sin(x + 4)}.
The second example is actually a nested kernel since the argument
to \axiomFun{sin} contains the kernel \axiom{x}.
\xtc{
}{
\spadpaste{height mainKernel sin(x + 4)}
```

```
}
Actually, the argument to \axiomFun{sin} is an expression, and so
the structure of \axiomType{Expression} is recursive.
\downlink{`Kernel'}{KernelXmpPage}\ignore{Kernel}
demonstrates how to extract the kernels in an
expression.

Use the Hyperdoc Browse facility to see what operations are
applicable to expression.
At the time of this writing, there were 262 operations with 147
distinct name in \axiomType{Expression Integer}.
For example, \axiomFunFrom{numer}{Expression} and
\axiomFunFrom{denom}{Expression} extract the numerator and
denominator of an expression.
\xtc{
}{
\spadpaste{e := (sin(x) - 4)**2 / ( 1 - 2*y*sqrt(- y) ) \bound{e}}
}
\xtc{
}{
\spadpaste{numer e \free{e}}
}
\xtc{
}{
\spadpaste{denom e \free{e}}
}
\xtc{
Use \axiomFunFrom{D}{Expression} to compute partial derivatives.
}{
\spadpaste{D(e, x) \free{e}}
}
\xtc{
See \downlink{``Derivatives''}{ugIntroCalcDerivPage} in Section 1.12
\ignore{ugIntroCalcDeriv}
for more examples of expressions and derivatives.
}{
\spadpaste{D(e, [x, y], [1, 2]) \free{e}}
}
See \downlink{``Limits''}{ugIntroCalcLimitsPage}
in Section 1.10\ignore{ugIntroCalcLimits} and
\downlink{``Series''}{ugIntroSeriesPage} in Section 1.11
\ignore{ugIntroSeries}
for more examples of expressions and calculus.
Differential equations involving expressions are discussed in
\downlink{``Solution of Differential Equations''}
{ugProblemDEQPage} in Section 8.10\ignore{ugProblemDEQ}.
Chapter 8 has many advanced examples: see
\downlink{``Integration''}{ugProblemIntegrationPage}
in Section 8.8\ignore{ugProblemIntegration}
for a discussion of Axiom's integration facilities.
```

```
When an expression involves no ‘‘symbol kernels’’ (for example,
\axiom{x}), it may be possible to numerically evaluate the
expression.
\xtc{
If you suspect the evaluation will create a complex number,
use \axiomFun{complexNumeric}.
}{
\spadpaste{complexNumeric(cos(2 - 3*\%i))}
}
\xtc{
If you know it will be real, use \axiomFun{numeric}.
}{
\spadpaste{numeric(tan 3.8)}
}
The \axiomFun{numeric} operation will display an error message if
the evaluation yields a calue with an non-zero imaginary part.
Both of these operations have an optional second argument
\axiom{n} which specifies that the accuracy of the approximation
be up to \axiom{n} decimal places.

When an expression involves no ‘‘symbolic application’’ kernels,
it may be possible to convert it a polynomial or rational
function in the variables that are present.
\xtc{
}{
\spadpaste{e2 := cos(x**2 - y + 3) \bound{e2}}
}
\xtc{
}{
\spadpaste{e3 := asin(e2) - \%pi/2 \free{e2}\bound{e3}}
}
\xtc{
}{
\spadpaste{e3 :: Polynomial Integer \free{e3}}
}
\xtc{
This also works for the polynomial types where specific variables
and their ordering are given.
}{
\spadpaste{e3 :: DMP([x, y], Integer) \free{e3}}
}

Finally, a certain amount of simplication takes place as
expressions are constructed.
\xtc{
}{
\spadpaste{sin \%pi}
}
\xtc{
}{
\spadpaste{cos(\%pi / 4)}
}
\xtc{
For simplications that involve multiple terms of the expression,
use \axiomFun{simplify}.
}{
\spadpaste{tan(x)**6 + 3*tan(x)**4 + 3*tan(x)**2 + 1 \bound{tan6}}
}
\xtc{
}{
\spadpaste{simplify \% \free{tan6}}
}
See \downlink{``Rules and Pattern Matching''}{ugUserRulesPage} in
Section 6.21\ignore{ugUserRules} for examples of how to write your own
rewrite rules for expressions.

3.34.4 Plotting Plane Algebraic Curves

— explot2d.ht —

```
\begin{page}{ExPlot2DAlgebraic}{Plotting Plane Algebraic Curves}
\beginscroll
Axiom can also plot plane algebraic curves (i.e. curves defined by
an equation {\em f(x,y) = 0}) provided that the curve is non-singular
in the region to be sketched.
Here's an example:
\graphpaste{draw(y**2 + y - (x**3 - x) = 0, x, y, range == [-2..2,-2..1])}
Here the region of the sketch is {\em -2 <= x <= 2, -2 <= y <= 1}.
\endscroll
\autobuttons
\end{page}

\begin{patch}{ExPlot2DAlgebraicPatch1}
\begin{paste}{ExPlot2DAlgebraicFull1}{ExPlot2DAlgebraicEmpty1}
\pastebutton{ExPlot2DAlgebraicFull1}{\hidepaste}
\tab{5}\spadgraph{draw(y**2 + y - (x**3 - x) = 0, x, y, range == [-2..2,-2..1])}
\center{\unixcommand{\inputimage{\env{AXIOM}/doc/viewports/explot2dalgebraic1.view/image}}{viewalone\spa

\tab{5}\spadgraph{draw(y**2 + y - (x**3 - x) = 0, x, y, range == [-2..2,-2..1])}
\end{paste}\end{patch}
```

———-

3.35 explot3d.ht

3.35.1 Plotting Functions of Two Variables

— explot3d.ht —

```
\begin{page}{ExPlot3DFunctions}{Plotting Functions of Two Variables}
\beginscroll
To plot a function {\em z = f(x,y)}, you need only specify the function
and the intervals over which the dependent variables will range.
```

```
For example, here's how you plot the function {\em z = cos(x*y)} as the
variables {\em x} and {\em y} both range between -3 and 3:
\graphpaste{draw(cos(x*y),x = -3..3,y = -3..3)}
\endscroll
\autobuttons
\end{page}

\begin{patch}{ExPlot3DFunctionsPatch1}
\begin{paste}{ExPlot3DFunctionsFull1}{ExPlot3DFunctionsEmpty1}
\pastebutton{ExPlot3DFunctionsFull1}{\hidepaste}
\tab{5}\spadgraph{draw(cos(x*y),x = -3..3,y = -3..3)}
\center{\unixcommand{\inputimage{\env{AXIOM}/doc/viewports/explot3dfunctions1.view/image}}{vi
\end{paste}\end{patch}

\begin{patch}{ExPlot3DFunctionsEmpty1}
\begin{paste}{ExPlot3DFunctionsEmpty1}{ExPlot3DFunctionsPatch1}
\pastebutton{ExPlot3DFunctionsEmpty1}{\showpaste}
\tab{5}\spadgraph{draw(cos(x*y),x = -3..3,y = -3..3)}
\end{paste}
\end{patch}
```

———-

3.35.2 Plotting Parametric Surfaces

— explot3d.ht —

```
\begin{page}{ExPlot3DParametricSurface}{Plotting Parametric Surfaces}
\beginscroll
To plot a parametric surface defined by {\em x = f(u,v)},
{\em y = g(u,v)}, {\em z = h(u,v)}, specify the functions
{\em f(u,v)}, {\em g(u,v)}, and {\em h(u,v)}
as arguments of the function 'surface', then give
the intervals over which {\em u} and {\em v} are to range.
With parametric surfaces, we can create some interesting graphs.
Here's an egg:
\graphpaste{draw(surface(5*sin(u)*cos(v),4*sin(u)*sin(v),3*cos(u)),
u=0..\%pi,v=0..2*\%pi)}
Here's a cone:
\graphpaste{draw(surface(u*cos(v),u*sin(v),u),u=0..4,v=0..2*\%pi)}
\endscroll
\autobuttons
\end{page}

\begin{patch}{ExPlot3DParametricSurfacePatch1}
\begin{paste}{ExPlot3DParametricSurfaceFull1}{ExPlot3DParametricSurfaceEmpty1}
\pastebutton{ExPlot3DParametricSurfaceFull1}{\hidepaste}
```

```
\tab{5}\spadgraph{draw(surface(5*sin(u)*cos(v),4*sin(u)*sin(v),3*cos(u)),u=0..\%pi,v=0..2*\%pi)}
\center{\unixcommand{\inputimage{\env{AXIOM}/doc/viewports/explot3dparametricsurface1.view/image}}{viewa

\end{paste}
\end{patch}
```

———-

3.36 expose.ht

3.36.1 Exposure

— **expose.ht** —

```
\begin{page}{helpExpose}{Exposure}
\beginscroll
Exposure determines what part of the Axiom library
is available to you when using Axiom.
At any time during your interactive Axiom session,
each constructor is either {\em exposed} or {\em unexposed}.
If a constructor is exposed, its operations are available to
the interpreter and therefore to you.
If a constructor is unexposed, the operations are not seen
by the interpreter and thus not available to you.
\par
If you are a beginner, you may only want
basic parts of the library exposed.
If you are an expert, you may want to have all parts of the
```

```
library exposed.
If you have an application that requires
only a segment of the library, you may want to arrange to expose
only that segment for your use.
\par
\endscroll
Additional Information:
\beginmenu
\menulink{What}{ExposureDef}\tab{8}What is an exposure group?
\menulink{System}{ExposureSystem}\tab{8}What exposure groups are
system defined?

\endmenu
\end{page}
```

———

3.36.2 System Defined Exposure Groups

— expose.ht —

```
\begin{page}{ExposureSystem}{System Defined Exposure Groups}
\beginscroll
Exposure is defined by {\em groups}.
Groups have names.
Seven exposure groups are system-defined:\beginmenu
\item\tab{3}{\em current}\tab{12}The currently active exposure group
\item\tab{3}{\em basic}\tab{12}The default value of {\em current}
\item\tab{3}{\em category}\tab{13}Category constructors not in {\em basic}
\item\tab{3}{\em domain}\tab{13}Domain constructors not in {\em basic}
\item\tab{3}{\em package}\tab{13}Package constructors not in {\em basic}
\item\tab{3}{\em default}\tab{13}Default constructors not in {\em basic}
\item\tab{3}{\em hidden}\tab{13}All constructors not in {\em basic}
\item\tab{3}{\em naglink}\tab{13}All constructors used in the Axiom NAG Link
\endmenu
\par
When you first use Axiom, the {\em current} exposure group is
set to {\em basic} and {\em naglink}. Using Hyperdoc or the system command
{\em expose}, you may
change the current exposure group by
adding or dropping constructors or by setting {\em current}
to an exposure group you have created.
\endscroll
Additional Information:
\beginmenu
\menulink{What}{ExposureDef}\tab{10}What is an exposure group?
```

```
%\menulink{User}{ExposureUser}\tab{10}How you can define your own exposure group
\endmenu
\end{page}
```

———-

3.36.3 What is an Exposure Group?

— **expose.ht** —

```
\begin{page}{ExposureDef}{What is an Exposure Group?}
\beginscroll
\par
An exposure group is a list of constructors to be exposed.
Those constructors on the list are exposed;
those not on the list are not exposed.
The library contains 4 kinds of constructors intuitively described as follows:
\beginmenu
\item\menuitemstyle{}{\em domain}\tab{10}Describes computational objects
and functions defined on these objects
\item\menuitemstyle{}{\em package}\tab{10}Describes functions which will
work over a variety of domains
\item\menuitemstyle{}{\em category}\tab{10}Names a set of operations
\item\menuitemstyle{}{\em default}\tab{10}Provides default functions for
a cateogry
\endmenu

An exposure group is defined by three lists:
\beginmenu
\item\menuitemstyle{}{\em groups}
\tab{13}A list of other (more basic) groups
\item\menuitemstyle{}{\em additions}
\tab{13}A list of explicit constructors to be included
\item\menuitemstyle{}{\em subtractions}
\tab{13}A list of explicit constructors to be dropped
\endmenu
You can define your own exposure groups: give them names and define the
three above lists to be anything you like.
Using Hyperdoc, you can conveniently edit your exposure groups,
install them as the {\em current} exposure, and so on.
\endscroll
\end{page}
```

———-

3.36.4 Details on Exposure

— **expose.ht** —

```
\begin{page}{ExposureDetails}{Details on Exposure}
\beginscroll
Exposure is generally defined by the set of domain and package
constructors you want to have available.  Category and default
constructors are generally implied.  A category constructor is exposed
if mentioned by {\em any} other constructor (including another
category).  A default constructor is exposed if its corresponding
category constructor is exposed.
\par
If you explicitly add a domain or package
constructor, its name will be put in an {\em Additions} list.
The system will also add automatically to the {\em Additions} list
any category explicity exported by that domain or package.
If that category has a corresponding default constructor, that
default constructor will also be added as well.
\par
If you like, you can explicitly drop a constructor.  Any such name is
added to the {\em Subtractions} list.  The system will drop this name
from the {\em Additions} list if it appears.
\par
If the package or domain takes arguments from an unexported
domain or declares that its arguments can come from a domain
which is a member of an unexported category, these constructors
will {\em not} be added.

3.37.1 Converting Expressions to Series

— **exseries.ht** —

```
\begin{page}{ExSeriesConvert}{Converting Expressions to Series}
\beginscroll
You can convert a functional expression to a power series by using the
function 'series'.
Here's an example:
```

```
\spadpaste{series(sin(a*x),x = 0)}
This causes {\em sin(a*x)} to be expanded in powers of {\em (x - 0)},
that is, in powers of {\em x}.
You can have {\em sin(a*x)} expanded in powers of {\em (a - \%pi/4)} by
issuing the following command:
\spadpaste{series(sin(a*x),a = \%pi/4)}
\endscroll
\autobuttons
\end{page}

\begin{patch}{ExSeriesConvertPatch1}

———-

3.38.4 Closed Form Summations

— exsum.ht —

```
\begin{page}{ExSumClosedForm}{Closed Form Summations}
\beginscroll
In a previous example, we found the sum of the squares of the integers
between {\em 5} and {\em 20}.
We can also use Axiom to find a formula for the sum of the squares of
the integers between {\em a} and {\em b}, where {\em a} and {\em b}
are integers which will remain
unspecified:
\spadpaste{s := sum(k**2,k = a..b) \bound{s}}
{\em sum(k**2,k = a..b)} returns the sum of {\em k**2} as the index {\em k}
runs from {\em a} to {\em b}.
Let's check our answer in one particular case by substituting specific values
for {\em a} and {\em b} in our formula:
% Warning: syntax for polynomial evaluation will probably change.
\spadpaste{eval(s,[a,b],[1,25]) \free{s}}
\spadpaste{reduce(+,[i**2 for i in 1..25])}
\endscroll
\autobuttons
\end{page}

\begin{patch}{ExSumClosedFormPatch1}
\begin{paste}{ExSumClosedFormFull1}{ExSumClosedFormEmpty1}
\pastebutton{ExSumClosedFormFull1}{\hidepaste}

3.39 farray.ht

3.39.1 FlexibleArray

⇒ “notitle” (OneDimensionalArrayXmpPage) 3.4.1 on page 124

⇒ “notitle” (VectorXmpPage) 3.102.1 on page 1331

— **farray.ht** —

```
\begin{page}{FlexibleArrayXmpPage}{FlexibleArray}
\beginscroll
The \spadtype{FlexibleArray} domain constructor creates
one-dimensional arrays of elements of the same type.
Flexible arrays are an attempt to provide a data type that has the
best features of both one-dimensional arrays (fast, random access
to elements) and lists (flexibility).
They are implemented by a fixed block of storage.
When necessary for expansion, a new, larger block of storage is
allocated and the elements from the old storage area are copied
into the new block.

Flexible arrays have available most of the operations provided by
\spadtype{OneDimensionalArray}
(see \downlink{`OneDimensionalArray'}{OneDimensionalArrayXmpPage}
\ignore{OneDimensionalArray}
and \downlink{`Vector'}{VectorXmpPage}\ignore{Vector}).
Since flexible arrays are also of category
\spadtype{ExtensibleLinearAggregate}, they have operations
\spadfunX{concat}, \spadfunX{delete}, \spadfunX{insert},
\spadfunX{merge}, \spadfunX{remove}, \spadfunX{removeDuplicates},
and \spadfunX{select}.
In addition, the operations \spadfun{physicalLength} and
\spadfunX{physicalLength} provide user-control over expansion and
contraction.

\xtc{
A convenient way to create a flexible array is to apply
the operation \spadfun{flexibleArray} to a list of values.
}{
\spadpaste{flexibleArray [i for i in 1..6]}
}
\xtc{
Create a flexible array of six zeroes.
}{
\spadpaste{f : FARRAY INT := new(6,0)\bound{f}}
}
\xtc{
For \texht{$i=1\ldots 6$}{i = 1..6},
set the \eth{\smath{i}} element to \smath{i}.
Display \spad{f}.
}{
\spadpaste{for i in 1..6 repeat f.i := i; f\bound{f1}\free{f}}
}
\xtc{
Initially, the physical length is the same as the number of elements.
}{
\spadpaste{physicalLength f\free{f1}}
}
\xtc{
```

```
Add an element to the end of \spad{f}.
}{
\spadpaste{concat!(f,11)\bound{f2}\free{f1}}
}
\xtc{
See that its physical length has grown.
}{
\spadpaste{physicalLength f\free{f2}}
}
\xtc{
Make \spad{f} grow to have room for \spad{15} elements.
}{
\spadpaste{physicalLength!(f,15)\bound{f3}\free{f2}}
}
\xtc{
Concatenate the elements of \spad{f} to itself.
The physical length allows room for three more values at the end.
}{
\spadpaste{concat!(f,f)\bound{f4}\free{f3}}
}
\xtc{
Use \spadfunX{insert} to add an element to the front of
a flexible array.
}{
\spadpaste{insert!(22,f,1)\bound{f5}\free{f4}}
}
\xtc{
Create a second flexible array from \spad{f} consisting of the
elements from index 10 forward.
}{
\spadpaste{g := f(10..)\bound{g}\free{f5}}
}
\xtc{
Insert this array at the front of \spad{f}.
}{
\spadpaste{insert!(g,f,1)\bound{g1}\free{g f5}}
}
\xtc{
Merge the flexible array \spad{f} into \spad{g} after sorting each in place.
}{
\spadpaste{merge!(sort! f, sort! g)\bound{f6}\free{g f5}}
}
\xtc{
Remove duplicates in place.
}{
\spadpaste{removeDuplicates! f\bound{f7}\free{f6}}
}
\xtc{
Remove all odd integers.
}{
```

```
\spadpaste{select!(i +-> even? i,f)\bound{f8}\free{f7}}
}
\xtc{
All these operations have shrunk the physical length of \spad{f}.
}{
\spadpaste{physicalLength f\free{b8}}
}
\xtc{
To force Axiom not to shrink flexible arrays call the
\spadfun{shrinkable} operation with the argument \axiom{false}.
You must package call this operation.
The previous value is returned.
}{
\spadpaste{shrinkable(false)\$FlexibleArray(Integer)}
}

\beginscroll

The \spadtype{File(S)} domain provides a basic interface to read and
write values of type \spad{S} in files.
```

```
\xtc{
Before working with a file, it must be made accessible to Axiom with
the \spadfunFrom{open}{File} operation.
}{
\spadpaste{ifile:File List Integer:=open("/tmp/jazz1","output")
\bound{ifile}}
}
The \spadfunFrom{open}{File} function arguments are a \spadtype{FileName}
and a \spadtype{String} specifying the mode.
If a full pathname is not specified, the current default directory is
assumed.
The mode must be one of \spad{"input"} or \spad{"output"}.
If it is not specified, \spad{"input"} is assumed.
Once the file has been opened, you can read or write data.
\xtc{
The operations \spadfunFromX{read}{File} and \spadfunFromX{write}{File}
are provided.
}{
\spadpaste{write!(ifile, [-1,2,3])        \free{ifile}\bound{ifile1}}
}
\xtc{
}{
\spadpaste{write!(ifile, [10,-10,0,111])  \free{ifile1}\bound{ifile2}}
}
\xtc{
}{
\spadpaste{write!(ifile, [7])             \free{ifile2}\bound{ifile3}}
}
\xtc{
You can change from writing to reading (or vice versa)
by reopening a file.
}{
\spadpaste{reopen!(ifile, "input")        \free{ifile3}\bound{ifile4}}
}
\xtc{
}{
\spadpaste{read! ifile                    \free{ifile4}\bound{ifile5}}
}
\xtc{
}{
\spadpaste{read! ifile                    \free{ifile5}\bound{ifile6}}
}
\xtc{
The \spadfunFromX{read}{File} operation can cause an error if one tries to
read more data than is in the file.
To guard against this possibility the \spadfunFromX{readIfCan}{File}
operation should be used.
}{
\spadpaste{readIfCan! ifile  \free{ifile6}\bound{ifile7}}
}
```

```
\xtc{
}{
\spadpaste{readIfCan! ifile  \free{ifile7}\bound{ifile8}}
}
\xtc{
You can find the current mode of the file, and the file's name.
}{
\spadpaste{iomode ifile           \free{ifile}}
}
\xtc{
}{
\spadpaste{name ifile             \free{ifile}}
}
\xtc{
When you are finished with a file, you should close it.
}{
\spadpaste{close! ifile           \free{ifile}\bound{ifileA}}
}
\noOutputXtc{
}{
\spadpaste{)system rm /tmp/jazz1  \free{ifileA}}
}
%\xtc{
%}{
%\spadcommand{)clear all  \free{}\bound{}}
%}

A limitation of the underlying LISP system is that not all values can be
represented in a file.
In particular, delayed values containing compiled functions cannot be
saved.

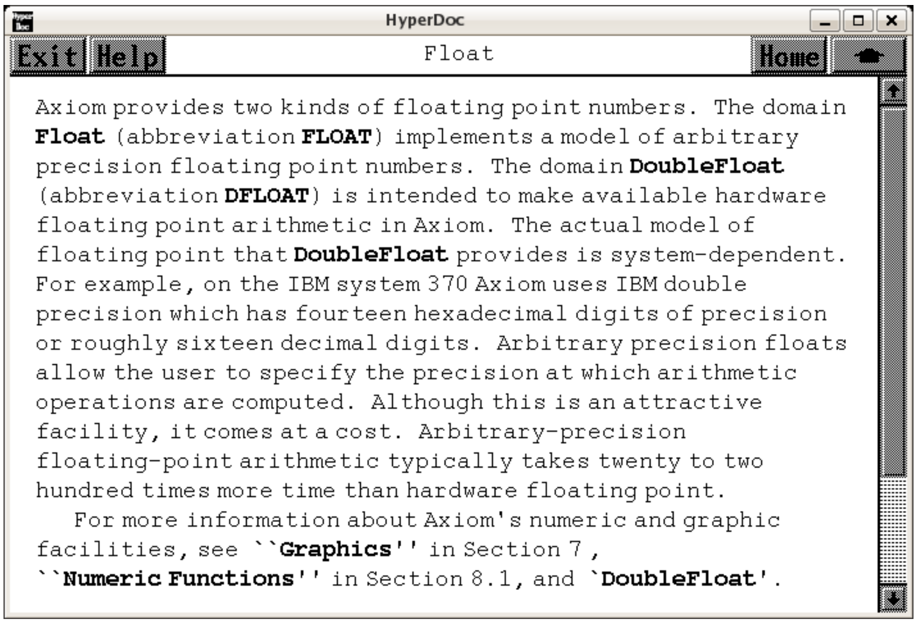
3.41 float.ht

3.41.1 Float



Axiom provides two kinds of floating point numbers. The domain **Float** (abbreviation **FLOAT**) implements a model of arbitrary precision floating point numbers. The domain **DoubleFloat** (abbreviation **DFLOAT**) is intended to make available hardware floating point arithmetic in Axiom. The actual model of floating point that **DoubleFloat** provides is system-dependent. For example, on the IBM system 370 Axiom uses IBM double precision which has fourteen hexadecimal digits of precision or roughly sixteen decimal digits. Arbitrary precision floats allow the user to specify the precision at which arithmetic operations are computed. Although this is an attractive facility, it comes at a cost. Arbitrary-precision floating-point arithmetic typically takes twenty to two hundred times more time than hardware floating point.

For more information about Axiom's numeric and graphic facilities, see ``**Graphics**'' in Section 7 , ``**Numeric Functions**'' in Section 8.1, and `**DoubleFloat**'.

3.41.2 Introduction to Float

— float.ht —

```
\begin{page}{ugxFloatIntroPage}{Introduction to Float}
\beginscroll

Scientific notation is supported for input and output
of floating point numbers.
A floating point number is written as a string of digits containing a
decimal point optionally followed by the letter ``{\tt E}'', and then
the exponent.
\xtc{
We begin by doing some calculations using arbitrary precision floats.
The default precision is twenty decimal digits.
}{
\spadpaste{1.234}
}
\xtc{
A decimal base for the exponent is assumed, so the number
\spad{1.234E2}  denotes
\texht{$1.234 \cdot  10^2$}{\spad{1.234 * 10**2}}.
}{
\spadpaste{1.234E2}
}
\xtc{
The normal arithmetic operations are available for floating point
numbers.

}{
\spadpaste{digits 20}
}
Numbers of type \spadtype{Float} are represented as a record of two
integers, namely, the mantissa and the exponent where the base of the
exponent is binary.
That is, the floating point number \spad{(m,e)} represents the number
\texht{$m \cdot 2^e$}{\spad{m * 2**e}}.
A consequence of using a binary base is that decimal numbers can not, in
general, be represented exactly.

3.41.4 Output Functions

— float.ht —

```
\begin{page}{ugxFloatOutputPage}{Output Functions}
\beginscroll

A number of operations exist for specifying how
numbers of type \spadtype{Float} are to be
displayed.
By default, spaces are inserted every ten digits in the
output for readability.\footnote{Note that you cannot include spaces
in the input form of a floating point number, though you can use
underscores.}

\xtc{
Output spacing can be modified with the \spadfunFrom{outputSpacing}{Float}
operation.
This inserts no spaces and then displays the value of \spad{x}.
}{
\spadpaste{outputSpacing 0; x := sqrt 0.2 \bound{x}\bound{os0}}
}
```

```
\xtc{
Issue this to have the spaces inserted every \spad{5} digits.
}{
\spadpaste{outputSpacing 5; x \bound{os5}\free{x}}
}
\xtc{
By default, the system displays floats in either fixed format
or scientific format, depending on the magnitude of the number.
}{
\spadpaste{y := x/10**10 \bound{y}\free{x os5}}
}
\xtc{
A particular format may be requested with the operations
\spadfunFrom{outputFloating}{Float} and \spadfunFrom{outputFixed}{Float}.
}{
\spadpaste{outputFloating(); x \bound{of} \free{os5 x}}
}
\xtc{
}{
\spadpaste{outputFixed(); y \bound{ox} \free{os5 y}}
}
\xtc{
Additionally, you can ask for \spad{n} digits to be displayed after the
decimal point.
}{
\spadpaste{outputFloating 2; y \bound{of2} \free{os5 y}}
}
\xtc{
}{
\spadpaste{outputFixed 2; x \bound{ox2} \free{os5 x}}
}
\xtc{
This resets the output printing to the default behavior.
}{
\spadpaste{outputGeneral()}
}

3.41.5 An Example: Determinant of a Hilbert Matrix

— **float.ht** —

```
\begin{page}{ugxFloatHilbertPage}
{An Example: Determinant of a Hilbert Matrix}
\beginscroll

Consider the problem of computing the determinant of a \spad{10} by \spad{10}
Hilbert matrix.
The \eth{\spad{(i,j)}} entry of a Hilbert matrix is given by
\spad{1/(i+j+1)}.

\labelSpace{2pc}
\xtc{
First do the computation using rational numbers to obtain the
exact result.
}{
\spadpaste{a: Matrix Fraction Integer :=
matrix {\tt{}}1/(i+j+1)\ for\ j\ in\ 0..9]\ for\ i\ in\ 0..9]\ {\char92}bound{\char123}a{\char
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ version\ of\ {\char92}spadfunFrom{\char123}determinant{\char125}{\char123}Matrix{\char
elimination.\nwnewline

{\char92}begin{\char123}chunk{\char125}{\char123}fname.ht{\char125}\nwnewline
{\char92}begin{\char123}page{\char125}{\char123}FileNameXmpPage{\char125}{\char123}FileName{\char125}\nw
{\char92}beginscroll\nwnewline
\ \nwnewline
The\ {\char92}spadtype{\char123}FileName{\char125}\ domain\ provides\ an\ interface\ to\ the\ computer's
file\ system.\nwnewline
Functions\ are\ provided\ to\ manipulate\ file\ names\ and\ to\ test\ properties\ of\nwnewline
files.\nwnewline
\ \nwnewline
The\ simplest\ way\ to\ use\ file\ names\ in\ the\ Axiom\ interpreter\ is\ to\nwnewline
rely\ on\ conversion\ to\ and\ from\ strings.\nwnewline
The\ syntax\ of\ these\ strings\ depends\ on\ the\ operating\ system.\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}fn:\ FileName\ {\char92}bound{\char123}fndecl{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
On\ AIX,\ this\ is\ a\ proper\ file\ syntax:\nwnewline
{\char125}{\char123}\nwnewline
```

```
{\char92}spadpaste{\char123}fn\ :=\ "/spad/src/input/fname.input"\ {\char92}free{\char123}fnd
{\char125}\nwnewline
\ \nwnewline
Although\ it\ is\ very\ convenient\ to\ be\ able\ to\ use\ string\ notation\nwnewline
for\ file\ names\ in\ the\ interpreter,\ it\ is\ desirable\ to\ have\ a\ portable\nwnewline
way\ of\ creating\ and\ manipulating\ file\ names\ from\ within\ programs.\nwnewline
{\char92}xtc{\char123}\nwnewline
A\ measure\ of\ portability\ is\ obtained\ by\ considering\ a\ file\ name\nwnewline
to\ consist\ of\ three\ parts:\ the\ {\char123}{\char92}it\ directory{\char125},\ the\ {\char
and\ the\ {\char123}{\char92}it\ extension{\char125}.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}directory\ fn\ {\char92}free{\char123}fn{\char125}{\char125}\nwne
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}name\ fn\ {\char92}free{\char123}fn{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}extension\ fn\ {\char92}free{\char123}fn{\char125}{\char125}\nwne
{\char125}\nwnewline
The\ meaning\ of\ these\ three\ parts\ depends\ on\ the\ operating\ system.\nwnewline
For\ example,\ on\ CMS\ the\ file\ {\char92}spad{\char123}"SPADPROF\ INPUT\ M"{\char125}\nwne
would\ have\ directory\ {\char92}spad{\char123}"M"{\char125},\ name\ {\char92}spad{\char123}"
extension\ {\char92}spad{\char123}"INPUT"{\char125}.\nwnewline
\ \nwnewline
{\char92}xtc{\char123}\nwnewline
It\ is\ possible\ to\ create\ a\ filename\ from\ its\ parts.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}fn\ :=\ filename("/u/smwatt/work",\ "fname",\ "input")\ \nwnewlin
{\char92}free{\char123}fndecl{\char125}{\char92}bound{\char123}fn1{\char125}{\char125}\nwnewl
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
When\ writing\ programs,\ it\ is\ helpful\ to\ refer\ to\ directories\ via\nwnewline
variables.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}objdir\ :=\ "/tmp"\ {\char92}bound{\char123}objdir{\char125}{\cha
{\char125}\nwnewline

{\char92}begin{\char123}page{\char125}{\char123}FactoredXmpPage{\char125}{\char123}Factored{\
{\char92}beginscroll\nwnewline
\nwnewline
{\char92}spadtype{\char123}Factored{\char125}\ creates\ a\ domain\ whose\ objects\ are\ kept\
form\ as\ long\ as\ possible.\nwnewline
Thus\ certain\ operations\ like\ {\char92}spadopFrom{\char123}*{\char125}{\char123}Factored{\
(multiplication)\ and\ {\char92}spadfunFrom{\char123}gcd{\char125}{\char123}Factored{\char125
easy\ to\ do.\nwnewline
Others,\ such\ as\ addition,\ require\ somewhat\ more\ work,\ and\nwnewline
the\ result\ may\ not\ be\ completely\ factored\nwnewline
unless\ the\ argument\ domain\ {\char92}spad{\char123}R{\char125}\ provides\ a\nwnewline
{\char92}spadfunFrom{\char123}factor{\char125}{\char123}Factored{\char125}\ operation.\nwnewl
Each\ object\ consists\ of\ a\ unit\ and\ a\ list\ of\ factors,\ where\ each\nwnewline
factor\ consists\ of\ a\ member\ of\ {\char92}spad{\char123}R{\char125}\ (the\ {\char123}{\ch
exponent,\ and\ a\ flag\ indicating\ what\ is\ known\ about\ the\ base.\nwnewline
A\ flag\ may\ be\ one\ of\ {\char92}spad{\char123}"nil"{\char125},\ {\char92}spad{\char123}"s
or\ {\char92}spad{\char123}"prime"{\char125},\ which\ mean\ that\ nothing\ is\ known\ about\
base,\ it\ is\ square-free,\ it\ is\ irreducible,\ or\ it\ is\ prime,\nwnewline
respectively.\nwnewline
The\ current\ restriction\ to\ factored\ objects\ of\ integral\ domains\nwnewline
allows\ simplification\ to\ be\ performed\ without\ worrying\ about\nwnewline
multiplication\ order.\nwnewline

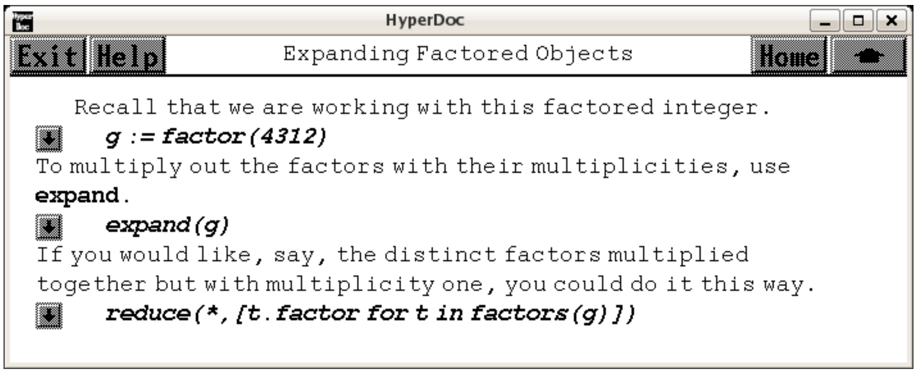
3.41.6 Expanding Factored Objects



Recall that we are working with this factored integer.

g := factor(4312)

To multiply out the factors with their multiplicities, use **expand**.

expand(g)

If you would like, say, the distinct factors multiplied together but with multiplicity one, you could do it this way.

reduce(*, [t.factor for t in factors(g)])

⇐ "Factored" (FactoredXmpPage) ?? on page ??

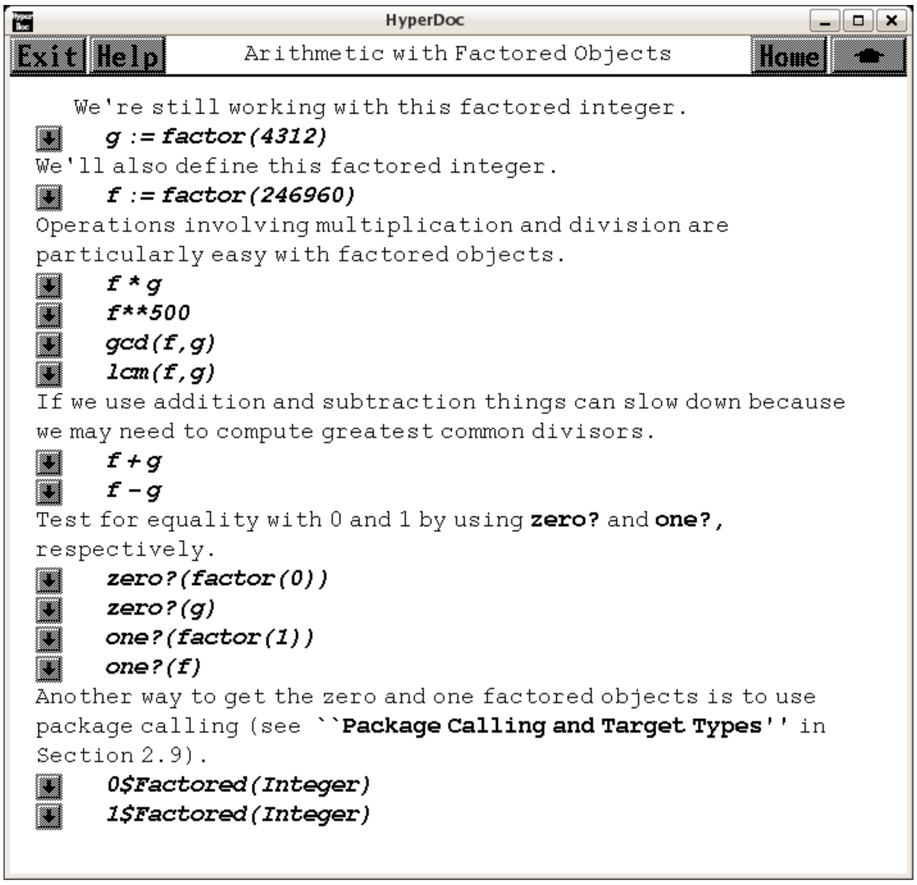
———-

3.41.7 Arithmetic with Factored Objects



We're still working with this factored integer.

```
g := factor(4312)
```

We'll also define this factored integer.

```
f := factor(246960)
```

Operations involving multiplication and division are particularly easy with factored objects.

```
f * g
f**500
gcd(f,g)
lcm(f,g)
```

If we use addition and subtraction things can slow down because we may need to compute greatest common divisors.

```
f + g
f - g
```

Test for equality with 0 and 1 by using **zero?** and **one?**, respectively.

```
zero?(factor(0))
zero?(g)
one?(factor(1))
one?(f)
```

Another way to get the zero and one factored objects is to use package calling (see ``**Package Calling and Target Types**'' in Section 2.9).

```
0$Factored(Integer)
1$Factored(Integer)
```

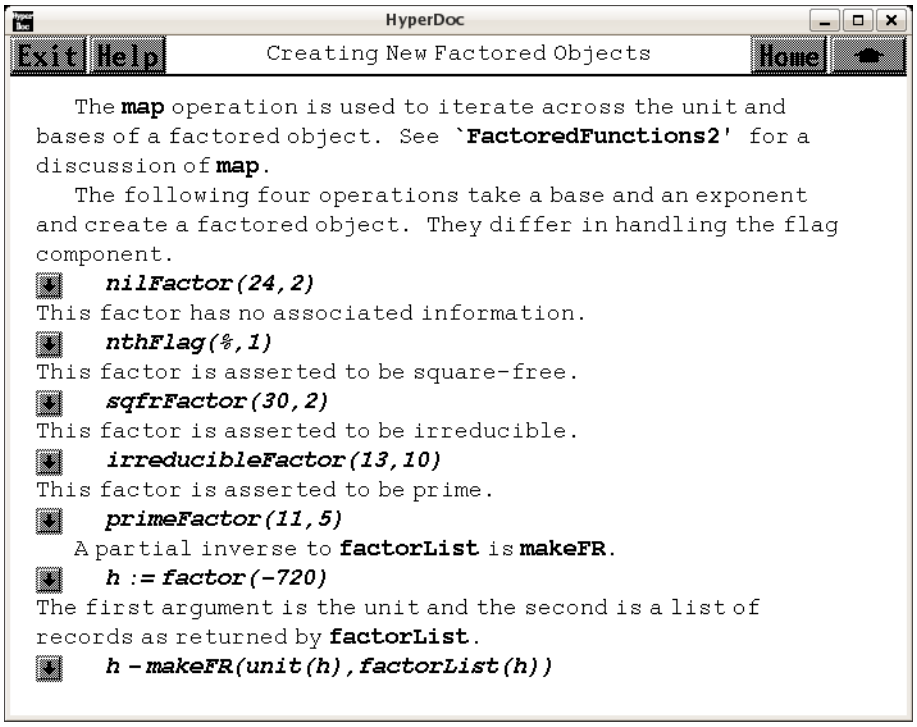
3.41.8 Creating New Factored Objects



The **map** operation is used to iterate across the unit and bases of a factored object. See `**FactoredFunctions2**' for a discussion of **map**.

The following four operations take a base and an exponent and create a factored object. They differ in handling the flag component.

nilFactor(24,2)

This factor has no associated information.

nthFlag(%,1)

This factor is asserted to be square-free.

sqfrFactor(30,2)

This factor is asserted to be irreducible.

irreducibleFactor(13,10)

This factor is asserted to be prime.

primeFactor(11,5)

A partial inverse to **factorList** is **makeFR**.

h := factor(-720)

The first argument is the unit and the second is a list of records as returned by **factorList**.

h - makeFR(unit(h),factorList(h))

⇐ "Factored" (FactoredXmpPage) **??** on page **??**

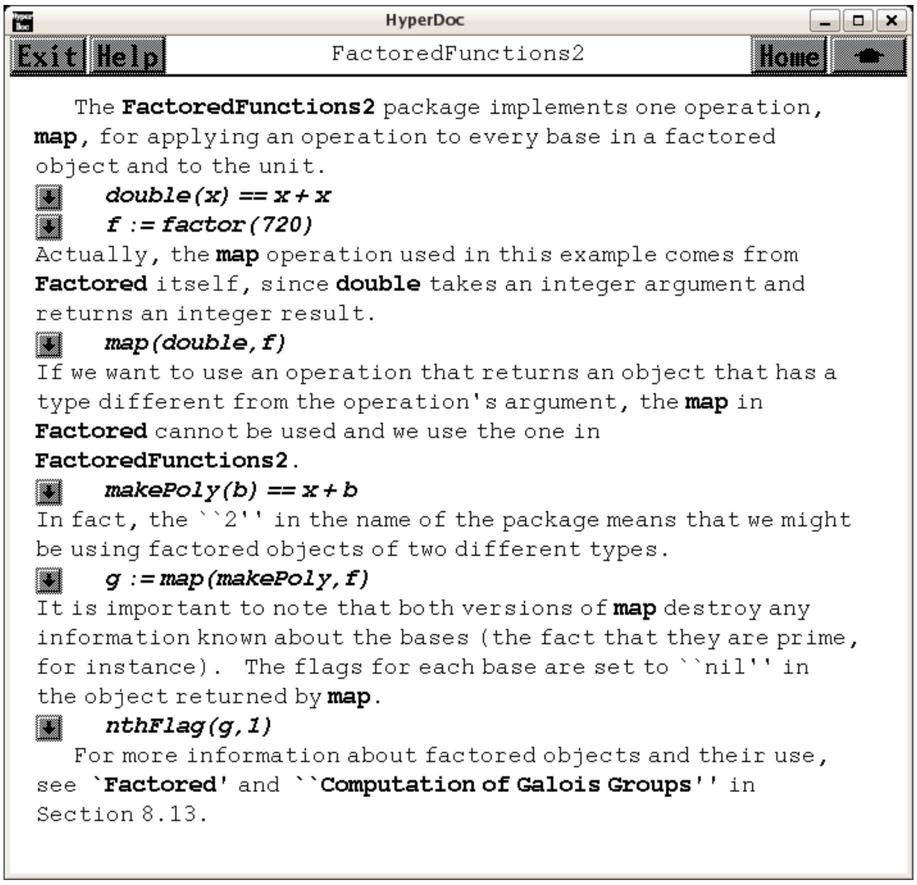
3.42 fr2.ht

3.42.1 FactoredFunctions2



The **FactoredFunctions2** package implements one operation, **map**, for applying an operation to every base in a factored object and to the unit.

double(x) == x + x

f := factor(720)

Actually, the **map** operation used in this example comes from **Factored** itself, since **double** takes an integer argument and returns an integer result.

map(double, f)

If we want to use an operation that returns an object that has a type different from the operation's argument, the **map** in **Factored** cannot be used and we use the one in **FactoredFunctions2**.

makePoly(b) == x + b

In fact, the ``2'' in the name of the package means that we might be using factored objects of two different types.

g := map(makePoly, f)

It is important to note that both versions of **map** destroy any information known about the bases (the fact that they are prime, for instance). The flags for each base are set to ``nil'' in the object returned by **map**.

nthFlag(g, 1)

For more information about factored objects and their use, see **`Factored'** and **``Computation of Galois Groups''** in Section 8.13.

— **frac.ht** —

```
\begin{page}{FractionXmpPage}{Fraction}
\beginscroll

The \spadtype{Fraction} domain implements quotients.
The elements must belong to a domain of category \spadtype{IntegralDomain}:
multiplication must be commutative and the product of two non-zero
elements must not be zero.
This allows you to make fractions of most things you would think of,
but don't expect to create a fraction of two matrices!
The abbreviation for \spadtype{Fraction} is \spadtype{FRAC}.

\xtc{
Use \spadopFrom{/}{Fraction} to create a fraction.
}{
\spadpaste{a := 11/12 \bound{a}}
}
\xtc{
}{
\spadpaste{b := 23/24 \bound{b}}
}
\xtc{
The standard arithmetic operations are available.
}{
\spadpaste{3 - a*b**2 + a + b/a \free{a}\free{b}}
}
\xtc{
Extract the numerator and denominator by using
\spadfunFrom{numer}{Fraction} and \spadfunFrom{denom}{Fraction},
respectively.
}{
\spadpaste{numer(a) \free{a}}
}
\xtc{
}{
\spadpaste{denom(b) \free{b}}
}
Operations like \spadfunFrom{max}{Fraction}, \spadfunFrom{min}{Fraction},
\spadfunFrom{negative?}{Fraction}, \spadfunFrom{positive?}{Fraction} and
\spadfunFrom{zero?}{Fraction} are all available if they are provided for
the numerators and denominators.
See \downlink{`Integer'}{IntegerXmpPage}\ignore{Integer} for examples.

Don't expect a useful answer from \spadfunFrom{factor}{Fraction},
\spadfunFrom{gcd}{Fraction} or \spadfunFrom{lcm}{Fraction} if you apply
them to fractions.
\xtc{
}{
\spadpaste{r := (x**2 + 2*x + 1)/(x**2 - 2*x + 1) \bound{r}}
}
\xtc{
Since all non-zero fractions are invertible, these operations have trivial
definitions.
}{
\spadpaste{factor(r) \free{r}}
}
\xtc{
Use \spadfunFrom{map}{Fraction} to apply \spadfunFrom{factor}{Fraction} to
the numerator and denominator, which is probably what you mean.
}{
\spadpaste{map(factor,r) \free{r}}
}

\xtc{
Other forms of fractions are available.
Use \spadfun{continuedFraction} to create a continued fraction.
}{
\spadpaste{continuedFraction(7/12)}
}
\xtc{
Use \spadfun{partialFraction} to create a partial fraction.
See \downlink{`ContinuedFraction'}{ContinuedFractionXmpPage}
\ignore{ContinuedFraction} and
\downlink{`PartialFraction'}{PartialFractionXmpPage}
\ignore{PartialFraction} for
additional information and examples.
}{
\spadpaste{partialFraction(7,12)}
}
```

```
\xtc{
Use conversion to create alternative views of fractions with objects
moved in and out of the numerator and denominator.
}{
\spadpaste{g := 2/3 + 4/5*\%i \bound{g}}
}
\xtc{
Conversion is discussed in detail in
\downlink{‘‘Conversion’’}{ugTypesConvertPage}
in Section 2.7\ignore{ugTypesConvert}.
}{
\spadpaste{g :: FRAC COMPLEX INT \free{g}}
}

```
\begin{page}{FullPartialFracExpansionXmpPage}{FullPartialFracExpansion}
```

```
\beginscroll

The domain \spadtype{FullPartialFracExpansion} implements
factor-free conversion of quotients to full partial fractions.

\xtc{
Our examples will all involve quotients of univariate polynomials
with rational number coefficients.
}{
\spadpaste{Fx := FRAC UP(x, FRAC INT) \bound{Fx}}
}
\xtc{
Here is a simple-looking rational function.
}{
\spadpaste{f : Fx := 36 / (x**5-2*x**4-2*x**3+4*x**2+x-2) \bound{f}\free{Fx}}
}
\xtc{
We use \spadfunFrom{fullPartialFraction}{FullPartialFracExpansion}
to convert it to an object of type
\spadtype{FullPartialFracExpansion}.
}{
\spadpaste{g := fullPartialFraction f \bound{g}\free{f}}
}
\xtc{
Use a coercion to change it back into a quotient.
}{
\spadpaste{g :: Fx \free{g}}
}
\xtc{
Full partial fractions differentiate faster than rational
functions.
}{
\spadpaste{g5 := D(g, 5) \free{g}\bound{g5}}
}
\xtc{
}{
\spadpaste{f5 := D(f, 5) \free{f}\bound{f5}}
}
\xtc{
We can check that the two forms represent the same function.
}{
\spadpaste{g5::Fx - f5 \free{Fx g5 f5}}
}
\xtc{
Here are some examples that are more complicated.
}{
\spadpaste{f : Fx := (x**5 * (x-1)) / ((x**2 + x + 1)**2 * (x-2)**3)
\free{Fx}\bound{f2}}
}
\xtc{
}{
\spadpaste{g := fullPartialFraction f \free{f2}\bound{g2}}
}
\xtc{
}{
\spadpaste{g :: Fx - f \free{f2 g2 Fx}}
}
\xtc{
}{
\spadpaste{f : Fx := (2*x**7-7*x**5+26*x**3+8*x) /
(x**8-5*x**6+6*x**4+4*x**2-8) \free{Fx}\bound{f3}}
}
\xtc{
}{
\spadpaste{g := fullPartialFraction f \free{f3}\bound{g3}}
}
\xtc{
}{
\spadpaste{g :: Fx - f \free{f3 g3 Fx}}
}
\xtc{
}{
\spadpaste{f:Fx := x**3 /
(x**21 + 2*x**20 + 4*x**19 + 7*x**18 + 10*x**17 + 17*x**16 +
22*x**15 + 30*x**14 + 36*x**13 + 40*x**12 + 47*x**11 + 46*x**10 +
49*x**9 + 43*x**8 + 38*x**7 + 32*x**6 + 23*x**5 + 19*x**4 +
10*x**3 + 7*x**2 + 2*x + 1)\free{Fx}\bound{f4}}
}
\xtc{
}{
\spadpaste{g := fullPartialFraction f \free{f4}\bound{g4}}
}
\xtc{
This verification takes much longer than the conversion to
partial fractions.
}{
\spadpaste{g :: Fx - f \free{f4 g4 Fx}}
}

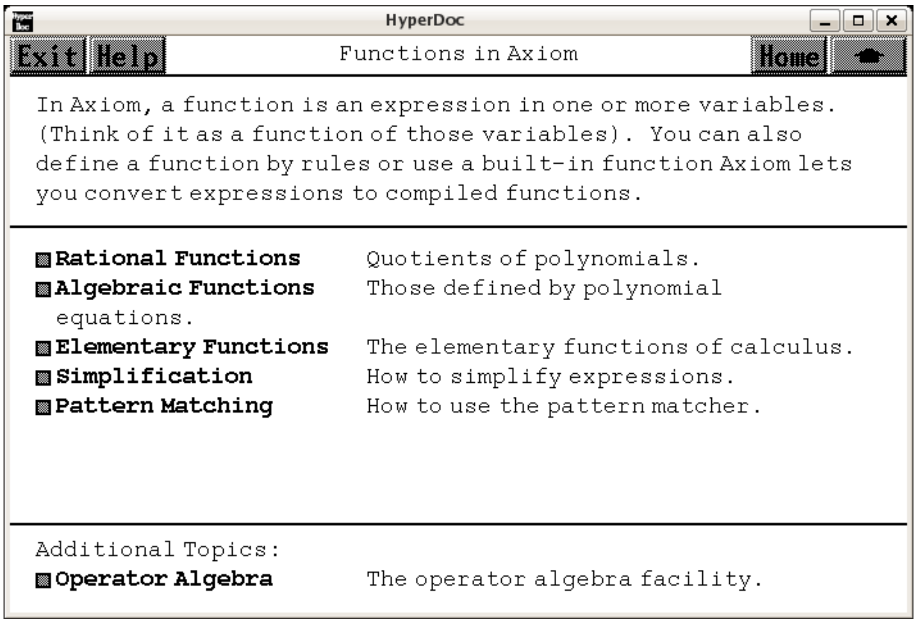
3.45 function.ht

3.45.1 Functions in Axiom



In Axiom, a function is an expression in one or more variables. (Think of it as a function of those variables). You can also define a function by rules or use a built-in function Axiom lets you convert expressions to compiled functions.

▨ **Rational Functions**	Quotients of polynomials.
▨ **Algebraic Functions**	Those defined by polynomial equations.
▨ **Elementary Functions**	The elementary functions of calculus.
▨ **Simplification**	How to simplify expressions.
▨ **Pattern Matching**	How to use the pattern matcher.

Additional Topics:

▨ **Operator Algebra**	The operator algebra facility.

3.45.2 Rational Functions

— function.ht —

```
\begin{page}{RationalFunctionPage}{Rational Functions}
\beginscroll
To create a rational function, just compute the
quotient of two polynomials:
\spadpaste{f := (x - y) / (x + y)\bound{f}}
```

```
Use the functions \spadfun{numer} and \spadfun{denom}:
to recover the numerator and denominator of a fraction:
%
\spadpaste{numer f\free{f}}
\spadpaste{denom f\free{f}}
%
Since these are polynomials, you can apply all the
\downlink{polynomial operations}{PolynomialPage}
to them.
You can substitute values or
other rational functions for the variables using
the function \spadfun{eval}. The syntax for \spadfun{eval} is
similar to the one for polynomials:
\spadpaste{eval(f, x = 1/x)\free{f}}
\spadpaste{eval(f, [x = y, y = x])\free{f}}
\endscroll

3.45.3 Algebraic Functions

— function.ht —

```
\begin{page}{AlgebraicFunctionPage}{Algebraic Functions}
\beginscroll
Algebraic functions are functions defined by algebraic equations. There
are two ways of constructing them: using rational powers, or implicitly.
For rational powers, use \spadopFrom{**}{RadicalCategory}
(or the system functions \spadfun{sqrt} and
\spadfun{nthRoot} for square and nth roots):
\spadpaste{f := sqrt(1 + x ** (1/3))\bound{f}}
To define an algebraic function implicitly
use \spadfun{rootOf}. The following
line defines a function \spad{y} of \spad{x} satisfying the equation
\spad{y**3 = x*y - y**2 - x**3 + 1}:
\spadpaste{y := rootOf(y**3 + y**2 - x*y + x**3 - 1, y)\bound{y}}
You can manipulate, differentiate or integrate an implicitly defined
algebraic function like any other Axiom function:
\spadpaste{differentiate(y, x)\free{y}}
Higher powers of algebraic functions are automatically reduced during
calculations:
\spadpaste{(y + 1) ** 3\free{y}}
But denominators, are not automatically rationalized:
\spadpaste{g := inv f\bound{g}\free{y}}
Use \spadfun{ratDenom} to remove the algebraic quantities
from the denominator:
\spadpaste{ratDenom g\free{g}}
\endscroll
\autobuttons

3.45.4 Elementary Functions

— function.ht —

```
\begin{page}{ElementaryFunctionPage}{Elementary Functions}
\beginscroll
Axiom has most of the usual functions from calculus built-in:
\spadpaste{f := x * log y * sin(1/(x+y))\bound{f}}
You can substitute values or another elementary functions for
the variables with the function \spadfun{eval}:
\spadpaste{eval(f, [x = y, y = x])\free{f}}
As you can see, the substitutions are made 'in parallel' as in the
case of polynomials. It's also possible to substitute expressions
for kernels instead of variables:
\spadpaste{eval(f, log y = acosh(x + sqrt y))\free{f}}
\endscroll
\autobuttons
\end{page}

———-

3.45.5 Simplification

⇒ “notitle” (ugUserRulesPage) **??** on page **??**
— **function.ht** —

```
\begin{page}{FunctionSimplificationPage}{Simplification}
\beginscroll
Simplifying an expression often means different things at
different times, so Axiom offers a large number of
‘simplification’ functions.
The most common one, which performs the usual trigonometric
simplifications is \spadfun{simplify}:
\spadpaste{f := cos(x)/sec(x) * log(sin(x)**2/(cos(x)**2+sin(x)**2))
\bound{f}}
```

```
\spadpaste{g := simplify f\bound{g}\free{f}}
If the result of \spadfun{simplify} is not satisfactory, specific
transformations are available.
For example, to rewrite \spad{g} in terms of secants and
cosecants instead of sines and cosines, issue:
%
\spadpaste{h := sin2csc cos2sec g\bound{h}\free{g}}
%
To apply the logarithm simplification rules to \spad{h}, issue:
\spadpaste{expandLog h\free{h}}
Since the square root of \spad{x**2} is the absolute value of
\spad{x} and not \spad{x} itself, algebraic radicals are not
automatically simplified, but you can specifically request it by
calling \spadfun{rootSimp}:
%
\spadpaste{f1 := sqrt((x+1)**3)\bound{f1}}
\spadpaste{rootSimp f1\free{f1}}
%
There are other transformations which are sometimes useful.
Use the functions \spadfun{complexElementary} and \spadfun{trigs}
to go back and forth between the complex exponential and
trigonometric forms of an elementary function:
%
\spadpaste{g1 := sin(x + cos x)\bound{g1}}
\spadpaste{g2 := complexElementary g1\bound{g2}\free{g1}}
\spadpaste{trigs g2\free{g2}}
%
Similarly, the functions \spadfun{realElementary} and
\spadfun{htrigs} convert hyperbolic functions in and out of their
exponential form:
%
\spadpaste{h1 := sinh(x + cosh x)\bound{h1}}
\spadpaste{h2 := realElementary h1\bound{h2}\free{h1}}
\spadpaste{htrigs h2\free{h2}}
%
Axiom has other transformations, most of which
are in the packages
\spadtype{ElementaryFunctionStructurePackage},
\spadtype{TrigonometricManipulations},
\spadtype{AlgebraicManipulations},
and \spadtype{TranscendentalManipulations}.
If you need to apply a simplification rule not built into the
system, you can use Axiom's \downlink{pattern
matcher}{ugUserRulesPage}.

```
\begin{page}{GroebnerFactorizationPkgXmpPage}
{GroebnerFactorizationPkg}
\beginscroll
%%  J. Grabmeier 26 04 91
Solving systems of polynomial equations with the
\texht{Gr\"{o}bner}{Groebner}
basis algorithm can often be very time consuming because, in general,
the algorithm has exponential run-time.
These systems, which often come from concrete applications,
frequently have symmetries which are not taken advantage of by the
algorithm.
However, it often happens in this case
that the polynomials which occur during the
\texht{Gr\"{o}bner}{Groebner} calculations are reducible.
Since Axiom has an excellent polynomial factorization algorithm, it is
very natural to combine the
\texht{Gr\"{o}bner}{Groebner} and factorization algorithms.

\spadtype{GroebnerFactorizationPkg} exports the
\axiomFunFrom{groebnerFactorize}{GroebnerFactorizationPkg}
operation which implements a modified
\texht{Gr\"{o}bner}{Groebner} basis algorithm.
In this algorithm, each polynomial that is to be put into the
partial list of the basis is first factored.
The remaining calculation is split into as many parts as there are
irreducible factors.
Call these factors \texht{$p_1, \ldots,p_n.$}{\spad{p1, ..., pn.}}
In the branches corresponding to \texht{$p_2,
\ldots,p_n,$}{\spad{p2, ..., pn,}} the factor
\texht{$p_1$}{\spad{p1}} can be divided out, and so on.
This package also contains operations that allow you to specify the
polynomials that are not zero on the common roots of the final
\texht{Gr\"{o}bner}{Groebner} basis.
```

```
Here is an example from chemistry.
In a theoretical model of the cyclohexan
\texht{${\rm C}_6{\rm H}_{12}$}{C6H12},
the six carbon atoms each sit in the center of gravity of a
tetrahedron that has two hydrogen atoms and two carbon atoms at its
corners.
We first normalize and set the length of each edge to 1.
Hence, the distances of one fixed carbon atom to each of its
immediate neighbours is 1.
We will denote the distances to the other three carbon atoms by
\smath{x}, \smath{y} and \smath{z}.

%% reference?
\texht{A.~Dress}{A. Dress} developed a theory to decide whether a set
of points and distances between them can be realized in an
\smath{n}-dimensional space. Here, of course, we have \smath{n = 3}.
\xtc{
}{
\spadpaste{mfzn : SQMATRIX(6,DMP([x,y,z],Fraction INT)) :=
{\tt{}0,1,1,1,1,1],\ [1,0,1,8/3,x,8/3],\ [1,1,0,1,8/3,y],\ [1,8/3,1,0,1,8/3],\ \nwnewline
[1,x,8/3,1,0,1],\ [1,8/3,y,8/3,1,0} \bound{mfzn}}
}
\xtc{
For the cyclohexan, the distances have to satisfy this equation.
}{
\spadpaste{eq := determinant mfzn \free{mfzn}\bound{eq}}
}
\xtc{
They also must satisfy the equations
given by cyclic shifts of the indeterminates.
}{
\spadpaste{groebnerFactorize [eq, eval(eq, [x,y,z], [y,z,x]),
eval(eq, [x,y,z], [z,x,y])] \free{eq}}
}

The union of the solutions of this list is the
solution of our original problem.
If we impose positivity conditions, we get two relevant ideals.
One ideal is
zero-dimensional, namely \smath{x = y = z = 11/3}, and this
determines the ``boat'' form of the cyclohexan.
The other ideal is one-dimensional,
which means that we have a solution space given by one parameter.
This gives the ``chair'' form of the cyclohexan.
The parameter describes the angle of the ``back of the chair.''

\axiomFunFrom{groebnerFactorize}{GroebnerFactorizationPkg}
has an optional \axiomType{Boolean}-valued second argument.
When it is \spad{true} partial results are displayed,
since it may happen that the
```

```
calculation does not terminate in a reasonable time.
See the source code for \spadtype{GroebnerFactorizationPkg}
in {\bf groebf\spadFileExt{}} for more details about the algorithms
used.

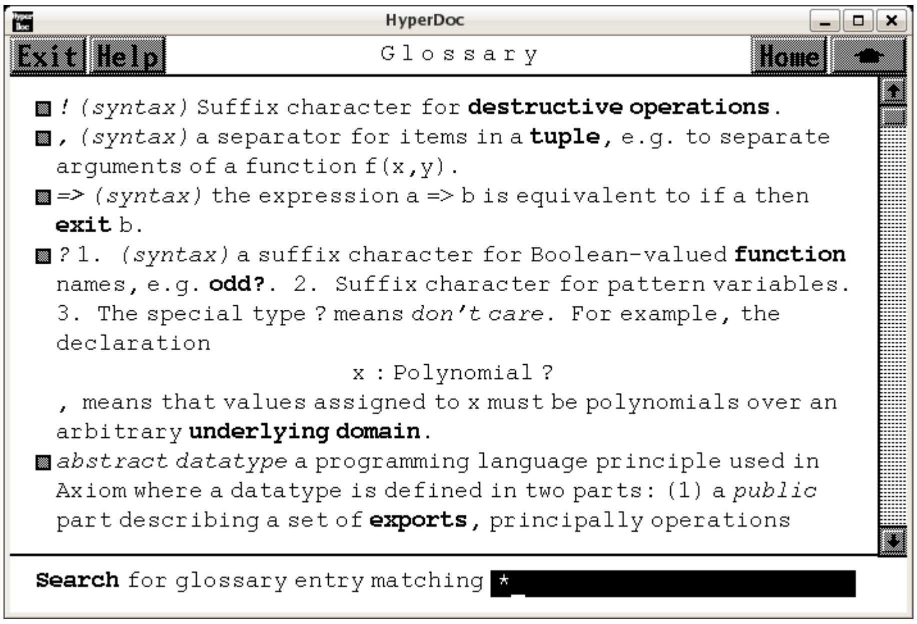
3.47 gloss.ht

3.47.1 Glossary



- *!* *(syntax)* Suffix character for **destructive operations**.
- *,* *(syntax)* a separator for items in a **tuple**, e.g. to separate arguments of a function f(x,y).
- *=>* *(syntax)* the expression a => b is equivalent to if a then **exit** b.
- *?* 1. *(syntax)* a suffix character for Boolean-valued **function** names, e.g. **odd?**. 2. Suffix character for pattern variables. 3. The special type ? means *don't care*. For example, the declaration

  x : Polynomial ?

  , means that values assigned to x must be polynomials over an arbitrary **underlying domain**.
- *abstract datatype* a programming language principle used in Axiom where a datatype is defined in two parts: (1) a *public* part describing a set of **exports**, principally operations

```
\begin{page}{GlossaryPage}{G l o s s a r y}
\beginscroll\beginmenu\item\newline{\em \menuitemstyle{}}{\em !}\space{}
{\em (syntax)} Suffix character for \spadgloss{destructive operations}.
\item\newline{\em \menuitemstyle{}}{\em ,}\space{}
{\em (syntax)} a separator for items in a \spadgloss{tuple},{}
\spadignore{e.g.} to separate arguments of a function \spad{f(x,{}y)}.
\item\newline{\em \menuitemstyle{}}{\em =>}\space{}
{\em (syntax)} the expression \spad{a => b} is equivalent to
\spad{if a then} \spadgloss{exit} \spad{b}.
\item\newline{\em \menuitemstyle{}}{\em ?}\space{}
1. {\em (syntax)} a suffix character for Boolean-valued \spadfun{function}
names,{} \spadignore{e.g.} \spadfun{odd?}. 2. Suffix character for pattern
variables. 3. The special type \spad{?} means {\em don't care}. For
example,{} the declaration \newline\center{\spad{x : Polynomial ?}}\newline,
{} means that values assigned to \spad{x} must be polynomials over an
arbitrary \spadgloss{underlying domain}.
\item\newline{\em \menuitemstyle{}}{\em abstract datatype}\space{}
a programming language principle used in Axiom where a datatype
is defined in two parts: (1) a {\em public} part describing a set of
\spadgloss{exports},{} principally operations that apply to objects of
that type,{} and (2) a {\em private} part describing the implementation
of the datatype usually in terms of a \spadgloss{representation} for
objects of the type. Programs which create and otherwise manipulate
objects of the type may only do so through its exports. The representation
and other implementation information is specifically hidden.
\item\newline{\em \menuitemstyle{}}{\em abstraction}\space{}
described functionally or conceptually without regard to implementation
\item\newline{\em \menuitemstyle{}}{\em accuracy}\space{}
the degree of exactness of an approximation or measurement. In computer
algebra systems,{} computations are typically carried out with complete
accuracy using integers or rational numbers of indefinite size. Domain
\spadtype{Float} provides a function \spadfunFrom{precision}{Float} to
change the precision for floating point computations. Computations using
\spadtype{DoubleFloat} have a fixed precision but uncertain accuracy.
\item\newline{\em \menuitemstyle{}}{\em add-chain}\space{}
a hierarchy formed by \spadgloss{domain extensions}. If domain \spad{A}
extends domain \spad{B} and domain \spad{B} extends domain \spad{C},{}
then \spad{A} has {\em add-chain} \spad{B}-\spad{C}.
\item\newline{\em \menuitemstyle{}}{\em aggregate}\space{}
a data structure designed to hold multiple values. Examples of aggregates
are \spadtype{List},{} \spadtype{Set},{} \spadtype{Matrix} and \spadtype{Bits}.
\item\newline{\em \menuitemstyle{}}{\em AKCL}\space{}
Austin Kyoto Common LISP,{} a version of \spadgloss{\spad{KCL}} produced
by William Schelter,{} Austin,{} Texas.
\item\newline{\em \menuitemstyle{}}{\em algorithm}\space{}
a step-by-step procedure for a solution of a problem; a program
```

```
\item\newline{\em \menuitemstyle{}}{\em ancestor}\space{}
(of a domain) a category which is a \spadgloss{parent} of the domain,{}
or a \spadgloss{parent} of a \spadgloss{parent},{} and so on.
\item\newline{\em \menuitemstyle{}}{\em application}\space{}
{\em (syntax)} an expression denoting "application" of a function to a set
of \spadgloss{argument} parameters. Applications are written as a
\spadgloss{parameterized form}. For example,{} the form \spad{f(x,{}y)}
indicates the "application of the function \spad{f} to the tuple of
arguments \spad{x} and \spad{y}". See also \spadgloss{evaluation} and
\spadgloss{invocation}.
\item\newline{\em \menuitemstyle{}}{\em apply}\space{}
See \spadgloss{application}.
\item\newline{\em \menuitemstyle{}}{\em argument}\space{}
1. (actual argument) a value passed to a function at the time of a
\spadglossSee{function call}{application}; also called an {\em actual
parameter}. 2. (formal argument) a variable used in the definition of
a function to denote the actual argument passed when the function is called.
\item\newline{\em \menuitemstyle{}}{\em arity}\space{}
1. (function) the number of arguments. 2. (operator or operation)
corresponds to the arity of a function implementing the operator or operation.
\item\newline{\em \menuitemstyle{}}{\em assignment}\space{}
{\em (syntax)} an expression of the form \spad{x := e},{} meaning
"assign the value of \spad{e} to \spad{x"}. After \spadgloss{evaluation},{}
the \spadgloss{variable} \spad{x} \spadglossSee{points}{pointer} to an
object obtained by evaluating the expression \spad{e}. If \spad{x} has
a \spadgloss{type} as a result of a previous \spadgloss{declaration},{}
the object assigned to \spad{x} must have that type. An interpreter must
often \spadglossSee{coerce}{coercion} the value of \spad{e} to make that
happen. For example,{} in the interpreter,{} \center{\spad{x : Float := 11}}
first \spadglossSee{declares}{declaration} \spad{x} to be a float. This
declaration causes the interpreter to coerce 11 to 11.0 in order to assign
a floating point value to \spad{x}.
\item\newline{\em \menuitemstyle{}}{\em attribute}\space{}
a name or functional form denoting {\em any} useful computational property.
For example,{} \spadatt{commutative(\spad{"*"})} asserts that "\spadfun{*}
is commutative". Also,{} \spadatt{finiteAggregate} is used to assert that
an aggregate has a finite number of immediate components.
\item\newline{\em \menuitemstyle{}}{\em basis}\space{}
{\em (algebra)} \spad{S} is a basis of a module \spad{M} over a
\spadgloss{ring} if \spad{S} generates \spad{M},{} and \spad{S} is
linearly independent
\item\newline{\em \menuitemstyle{}}{\em benefactor}\space{}
(of a given domain) a domain or package that the given domain explicitly
references (for example,{} calls functions from) in its implementation
\item\newline{\em \menuitemstyle{}}{\em binary}\space{}
operation or function with \spadgloss{arity} 2
\item\newline{\em \menuitemstyle{}}{\em binding}\space{}
the association of a variable with properties such as \spadgloss{value}
and \spadgloss{type}. The top-level \spadgloss{environment} in the
interpreter consists of bindings for all user variables and functions.
```

```
Every \spadgloss{function} has an associated set of bindings,{} one for
each formal \spadgloss{argument} and \spadgloss{local variable}.
\item\newline{\em \menuitemstyle{}}{\em block}\space{}
{\em (syntax)} a control structure where expressions are sequentially
\spadglossSee{evaluated}{evaluation}.
\item\newline{\em \menuitemstyle{}}{\em body}\space{}
a \spadgloss{function body} or \spadgloss{loop body}.
\item\newline{\em \menuitemstyle{}}{\em boolean}\space{}
objects denoted by the \spadgloss{literals} \spad{true} and \spad{false};
elements of domain \spadtype{Boolean}. See also \spadtype{Bits}.
\item\newline{\em \menuitemstyle{}}{\em built-in function}\space{}
a \spadgloss{function} in the standard Axiom library. Contrast
\spadgloss{user function}.
\item\newline{\em \menuitemstyle{}}{\em cache}\space{}
1. (noun) a mechanism for immediate retrieval of previously computed data.
For example,{} a function which does a lengthy computation might store its
values in a \spadgloss{hash table} using argument as a key. The hash table
then serves as a cache for the function (see also \spadsyscom{)set function
cache}). Also,{} when \spadgloss{recurrence relations} which depend upon
\spad{n} previous values are compiled,{} the previous \spad{n} values are
normally cached (use \spadsyscom{)set functions recurrence} to change this).
2. (verb) to save values in a cache.
\item\newline{\em \menuitemstyle{}}{\em capsule}\space{}
the part of the \spadglossSee{body}{function body} of a
\spadgloss{domain constructor} that defines the functions implemented by
the constructor.
\item\newline{\em \menuitemstyle{}}{\em case}\space{}
{\em (syntax)} an operator used to conditionally evaluate code based on
the branch of a \spadgloss{Union}. For example,{} if value \spad{u} is
\spad{Union(Integer,{}"failed")},{} the conditional expression \spad{if u
case Integer then A else B} evaluate \spad{A} if \spad{u} is an integer
and \spad{B} otherwise.
\item\newline{\em \menuitemstyle{}}{\em Category}\space{}
the distinguished object denoting the type of a category; the class of
all categories.
\item\newline{\em \menuitemstyle{}}{\em category}\space{}
{\em (basic concept)} second-order types which serve to define useful
"classification worlds" for domains,{} such as algebraic constructs
(\spadignore{e.g.} groups,{} rings,{} fields),{} and data structures
(\spadignore{e.g.} homogeneous aggregates,{} collections,{} dictionaries).
Examples of categories are \spadtype{Ring} ("the class of all rings") and
\spadtype{Aggregate} ("the class of all aggregates"). The categories of a
given world are arranged in a hierarchy (formally,{} a directed acyclic
graph). Each category inherits the properties of all its ancestors. Thus,{}
for example,{} the category of ordered rings (\spadtype{OrderedRing})
inherits the properties of the category of rings (\spadtype{Ring}) and
those of the ordered sets (\spadtype{OrderedSet}). Categories provide a
database of algebraic knowledge and ensure mathematical correctness,{}
\spadignore{e.g.} that "matrices of polynomials" is correct but "polynomials
of hash tables" is not,{} that the multiply operation for "polynomials of
```

```
continued fractions" is commutative,{} but that for "matrices of power
series" is not. optionally provide "default definitions" for operations
they export. Categories are defined in Axiom by functions called
\spadgloss{category constructors}. Technically,{} a category designates
a class of domains with common \spadgloss{operations} and
\spadgloss{attributes} but usually with different \spadgloss{functions}
and \spadgloss{representations} for its constituent \spadgloss{objects}.
Categories are always defined using the Axiom library language
(see also \spadgloss{category extension}). See also file {\em catdef.spad}
for definitions of basic algebraic categories in Axiom.
\item\newline{\em \menuitemstyle{}}{\em category constructor}\space{}
a function that creates categories,{} described by an abstract datatype in
the Axiom programming language. For example,{} the category
constructor \spadtype{Module} is a function which takes a domain parameter
\spad{R} and creates the category "modules over \spad{R}".
\item\newline{\em \menuitemstyle{}}{\em category extension}\space{}
created by a category definition,{} an expression usually of the form
\spad{A == B with ...}. In English,{} this means "category A is a \spad{B}
with the new operations and attributes as given by ... . See,{} for
example,{} file {\em catdef.spad} for a definitions of the algebra
categories in Axiom,{} {\em aggcat.spad} for data structure categories.
\item\newline{\em \menuitemstyle{}}{\em category hierarchy}\space{}
hierarchy formed by category extensions. The root category is
\spadtype{Object}. A category can be defined as a \spadgloss{Join} of two
or more categories so as to have multiple \spadgloss{parents}. Categories
may also have parameterized so as to allow conditional inheritance.
\item\newline{\em \menuitemstyle{}}{\em character}\space{}
1. an element of a character set,{} as represented by a keyboard key. 2.
a component of a string. For example,{} the 0th element of the string
\spad{"hello there"} is the character {\em h}.
\item\newline{\em \menuitemstyle{}}{\em client}\space{}
(of a given domain) any domain or package that explicitly calls functions
from the given domain
\item\newline{\em \menuitemstyle{}}{\em coercion}\space{}
an automatic transformation of an object of one \spadgloss{type} to an
object of a similar or desired target type. In the interpreter,{} coercions
and \spadgloss{retractions} are done automatically by the interpreter when
a type mismatch occurs. Compare \spadgloss{conversion}.
\item\newline{\em \menuitemstyle{}}{\em comment}\space{}
textual remarks imbedded in code. Comments are preceded by a double dash
({\em --}). For Axiom library code,{} stylized comments for on-line
documentation are preceded by a two plus signs ({\em ++}).
\item\newline{\em \menuitemstyle{}}{\em Common LISP}\space{}
A version of \spadgloss{LISP} adopted as an informal standard by major
users and suppliers of LISP
\item\newline{\em \menuitemstyle{}}{\em compile-time}\space{}
the time when category or domain constructors are compiled. Contrast
\spadgloss{run-time}.
\item\newline{\em \menuitemstyle{}}{\em compiler}\space{}
a program that generates low-level code from a higher-level source
```

```
language. Axiom has three compilers. A {\em graphics compiler}
converts graphical formulas to a compiled subroutine so that points can
be rapidly produced for graphics commands. An {\em interpreter compiler}
optionally compiles \spadgloss{user functions} when first
\spadglossSee{invoked}{invocation} (use \spadsyscom{}set functions compile}
to turn this feature on). A {\em library compiler} compiles all constructors
(not available in Release 1)
\item\newline{\em \menuitemstyle{}}{\em computational object}\space{}
In Axiom,{} domains are objects. This term is used to distinquish
the objects which are members of domains rather than domains themselves.
\item\newline{\em \menuitemstyle{}}{\em conditional}\space{}
a \spadgloss{control structure} of the form \spad{if A then B else C};
The \spadgloss{evaluation} of \spad{A} produces \spad{true} or \spad{false}.
If \spad{true},{} \spad{B} evaluates to produce a value; otherwise \spad{C}
evaluates to produce a value. When the value is not used,{} \spad{else C}
part can be omitted.
\item\newline{\em \menuitemstyle{}}{\em constant}\space{}
{\em (syntax)} a reserved word used in \spadgloss{signatures} in Axiom
programming language to signify that mark an operation always returns the
same value. For example,{} the signature \spad{0: constant -> \$} in the
source code of \spadtype{AbelianMonoid} tells the Axiom compiler that
\spad{0} is a constant so that suitable optimizations might be performed.
\item\newline{\em \menuitemstyle{}}{\em constructor}\space{}
a \spadgloss{function} which creates a \spadgloss{category},{}
\spadgloss{domain},{} or \spadgloss{package}.
\item\newline{\em \menuitemstyle{}}{\em continuation}\space{}
when a line of a program is so long that it must be broken into several
lines,{} then all but the first line are called {\em continuation lines}.
If such a line is given interactively,{} then each incomplete line must
end with an underscore.
\item\newline{\em \menuitemstyle{}}{\em control structure}\space{}
program structures which can specify a departure from normal sequential
execution. Axiom has four kinds of control structures:
\spadgloss{blocks},{} \spadgloss{case} statements,{}
\spadgloss{conditionals},{} and \spadgloss{loops}.
\item\newline{\em \menuitemstyle{}}{\em conversion}\space{}
the transformation of an object on one \spadgloss{type} to one of another
type. Conversions performed automatically are called \spadgloss{coercions}.
These happen when the interpreter has a type mismatch and a similar or
declared target type is needed. In general,{} the user must use the
infix operation \spadSyntax{\spad{::}} to cause this transformation.
\item\newline{\em \menuitemstyle{}}{\em copying semantics}\space{}
the programming language semantics used in Pascal but {\em not} in
Axiom. See also \spadgloss{pointer semantics} for details.
\item\newline{\em \menuitemstyle{}}{\em data structure}\space{}
a structure for storing data in the computer. Examples are
\spadgloss{lists} and \spadgloss{hash tables}.
\item\newline{\em \menuitemstyle{}}{\em datatype}\space{}
equivalent to \spadgloss{domain} in Axiom.
\item\newline{\em \menuitemstyle{}}{\em declaration}\space{}
```

```
{\em (syntax)} an expression of the form \spad{x : T} where \spad{T} is
some \spad{type}. A declaration forces all values
\spadglossSee{assigned}{assignment} to \spad{T} to be of that type. If a
value is of a different type,{} the interpreter will try to
\spadglossSee{coerce}{coercion} the value to type \spad{T}. Declarations
are necessary in case of ambiguity or when a user wants to introduce an
an \spadglossSee{unexposed}{expose} domain.
\item\newline{\em \menuitemstyle{}}{\em default definition}\space{}
a function defined by a \spadgloss{category}. Such definitions appear
category definitions of the form \spad{C: Category == T add I} in an
optional implmentation part \spad{I} to the right of the keyword \spad{add}.
\item\newline{\em \menuitemstyle{}}{\em default package}\space{}
a optional \spadgloss{package} of \spadgloss{functions} associated with
a category. Such functions are necessarily defined in terms over other
functions exported by the category.
\item\newline{\em \menuitemstyle{}}{\em definition}\space{}
{\em (syntax)} 1. An expression of the form \spad{f(a) == b} defining
function \spad{f} with \spadgloss{formal arguments} \spad{a} and
\spadgloss{body} \spad{b}; equivalent to the statement
\spad{f == (a) +-> b}. 2. An expression of the form \spad{a == b}
where \spad{a} is a \spadgloss{symbol},{} equivalent to \spad{a() == b}.
See also \spadgloss{macro} where a similar substitution is done at
\spadgloss{parse} time.
\item\newline{\em \menuitemstyle{}}{\em delimiter}\space{}
a \spadgloss{character} which marks the beginning or end of some
syntactically correct unit in the language,{} \spadignore{e.g.}
\spadSyntax{"} for strings,{} blanks for identifiers.
\item\newline{\em \menuitemstyle{}}{\em destructive operation}\space{}
An operation which changes a component or structure of a value. In
Axiom,{} all destructive operations have names which end with an
exclamation mark ({\em !}). For example,{} domain \spadtype{List} has
two operations to reverse the elements of a list,{} one named
\spadfunFrom{reverse}{List} which returns a copy of the original list with
the elements reversed,{} another named \spadfunFrom{reverse!}{List} which
reverses the elements {\em in place} thus destructively changing the
original list.
\item\newline{\em \menuitemstyle{}}{\em documentation}\space{}
1. on-line or hard copy descriptions of Axiom; 2. text in library
code preceded by {\em ++} comments as opposed to general comments
preceded by {\em --}.
\item\newline{\em \menuitemstyle{}}{\em domain}\space{}
{\em (basic concept)} a domain corresponds to the usual notion of
abstract datatypes: that of a set of values and a set of "exported
operations" for the creation and manipulation of these values. Datatypes
are parameterized,{} dynamically constructed,{} and can combine with others
in any meaningful way,{} \spadignore{e.g.} "lists of floats"
(\spadtype{List Float}),{} "fractions of polynomials with integer
coefficients" (\spadtype{Fraction Polynomial Integer}),{} "matrices
of infinite \spadgloss{streams} of cardinal numbers"
(\spadtype{Matrix Stream CardinalNumber}). The term {\em domain} is
```

```
actually abbreviates {\em domain of computation}. Technically,{} a
domain denotes a class of objects,{} a class of \spadgloss{operations}
for creating and other manipulating these objects,{} and a class of
\spadgloss{attributes} describing computationally useful properties.
Domains also provide \spadgloss{functions} for each operation often in
terms of some \spadgloss{representation} for the objects. A domain
itself is an \spadgloss{object} created by a \spadgloss{function}
called a \spadgloss{domain constructor}.
\item\newline{\em \menuitemstyle{}}{\em domain constructor}\space{}
a function that creates domains,{} described by an abstract datatype
in the Axiom programming language. Simple domains like
\spadtype{Integer} and \spadtype{Boolean} are created by domain
constructors with no arguments. Most domain constructors take one or
more parameters,{} one usually denoting an \spadgloss{underlying domain}.
For example,{} the domain \spadtype{Matrix(R)} denotes "matrices over
\spad{R"}. Domains {\em Mapping},{} {\em Record},{} and {\em Union} are
primitive domains. All other domains are written in the Axiom
programming language and can be modified by users with access to the
library source code.
\item\newline{\em \menuitemstyle{}}{\em domain extension}\space{}
a domain constructor \spad{A} is said to {\em extend} a domain
constructor \spad{B} if \spad{A}\spad{'s} definition has the form
\spad{A == B add ...}. This intuitively means "functions not defined
by \spad{A} are assumed to come from \spad{B}". Successive domain
extensions form \spadgloss{add-chains} affecting the the
\spadglossSee{search order}{lineage} for functions not implemented
directly by the domain during \spadgloss{dynamic lookup}.
\item\newline{\em \menuitemstyle{}}{\em dot notation}\space{}
using an infix dot ({\em .}) for function application. If \spad{u} is
the list \spad{[7,{}4,{}-11]} then both \spad{u(2)} and \spad{u.2} return
4. Dot notation nests to left. Thus \spad{f . g . h} is equivalent to
\spad{(f . g) . h}.
\item\newline{\em \menuitemstyle{}}{\em dynamic}\space{}
that which is done at \spadgloss{run-time} as opposed to
\spadgloss{compile-time}. For example,{} the interpreter will build the
domain "matrices over integers" dynamically in response to user input.
However,{} the compilation of all functions for matrices and integers is
done during \spadgloss{compile-time}. Constrast \spadgloss{static}.
\item\newline{\em \menuitemstyle{}}{\em dynamic lookup}\space{}
In Axiom,{} a \spadgloss{domain} may or may not explicitly provide
\spadgloss{function} definitions for all of its exported
\spadgloss{operations}. These definitions may instead come from domains
in the \spadgloss{add-chain} or from \spadgloss{default packages}. When
a \spadglossSee{function call}{application} is made for an operation in
the domain,{} up to five steps are carried out.\begin{items} \item (1)
If the domain itself implements a function for the operation,{} that
function is returned. \item (2) Each of the domains in the
\spadgloss{add-chain} are searched for one which implements the function;
if found,{} the function is returned. \item (3) Each of the
\spadgloss{default packages} for the domain are searched in order of
```

```
the \spadgloss{lineage}. If any of the default packages implements the
function,{} the first one found is returned. \item (4) Each of the
\spadgloss{default packages} for each of the domains in the
\spadgloss{add-chain} are searched in the order of their
\spadgloss{lineage}. If any of the default packages implements the
function,{} the first one found is returned. \item (5) If all of the
above steps fail,{} an error message is reported. \end{items}
\item\newline{\em \menuitemstyle{}}{\em empty}\space{}
the unique value of objects with type \spadtype{Void}.
\item\newline{\em \menuitemstyle{}}{\em environment}\space{}
a set of \spadgloss{bindings}.
\item\newline{\em \menuitemstyle{}}{\em evaluation}\space{}
a systematic process which transforms an \spadgloss{expression} into an
object called the \spadgloss{value} of the expression. Evaluation may
produce \spadgloss{side effects}.
\item\newline{\em \menuitemstyle{}}{\em exit}\space{}
{\em (reserved word)} an \spadgloss{operator} which forces an exit from
the current block. For example,{} the \spadgloss{block} \spad{(a := 1;
if i > 0 then exit a; a := 2)} will prematurely exit at the second
statement with value 1 if the value of \spad{i} is greater than 0.
See \spadgloss{\spad{=>}} for an alternate syntax.
\item\newline{\em \menuitemstyle{}}{\em explicit export}\space{}
1. (of a domain \spad{D}) any \spadgloss{attribute},{}
\spadgloss{operation},{} or \spadgloss{category} explicitly mentioned
in the \spadgloss{type} specification part \spad{T} for the domain
constructor definition \spad{D: T == I} 2. (of a category \spad{C})
any \spadgloss{attribute},{} \spadgloss{operation},{} or
\spadgloss{category} explicitly mentioned in the \spadgloss{type}
specification part \spad{T} for the domain constructor definition
\spad{C: \spadgloss{Category} == T}
\item\newline{\em \menuitemstyle{}}{\em export}\space{}
\spadgloss{explicit export} or \spadgloss{implicit export} of a domain
or category
\item\newline{\em \menuitemstyle{}}{\em expose}\space{}
some constructors are {\em exposed},{} others {\em unexposed}. Exposed
domains and packages are recognized by the interpreter. Use \spadsys{)set
expose} to control change what is exposed. To see both exposed and
unexposed constructors,{} use \Browse{} with give the system command
\spadsyscom{)set hyperdoc browse exposure on}. Unexposed constructors
will now appear prefixed by star(\spad{*}).
\item\newline{\em \menuitemstyle{}}{\em expression}\space{}
1. any syntactically correct program fragment. 2. an element of domain
\spadtype{Expression}
\item\newline{\em \menuitemstyle{}}{\em extend}\space{}
see \spadgloss{category extension} or \spadgloss{domain extension}
\item\newline{\em \menuitemstyle{}}{\em field}\space{}
{\em (algebra)} a \spadgloss{domain} which is \spadgloss{ring} where
every non-zero element is invertible and where \spad{xy=yx}; a member
of category \spadtype{Field}. For a complete list of fields,{} click
on {\em Domains} under {\em Cross Reference} for \spadtype{Field}.
```

```
\item\newline{\em \menuitemstyle{}}{\em file}\space{}
a program or collection of data stored on disk,{} tape or other medium.
\item\newline{\em \menuitemstyle{}}{\em float}\space{}
a floating-point number with user-specified precision; an element of
domain \spadtype{Float}. Floats are \spadgloss{literals} which are written
two ways: without an exponent (\spadignore{e.g.} \spad{3.1416}),{} or with
an exponent (\spadignore{e.g.} \spad{3.12E-12}). Use function
\spadgloss{precision} to change the precision of the mantissage
(20 digits by default). See also \spadgloss{small float}.
\item\newline{\em \menuitemstyle{}}{\em formal parameter}\space{}
(of a function) an identifier \spadglossSee{bound}{binding} to the value
of an actual \spadgloss{argument} on \spadgloss{invocation}. In the
function definition \spad{f(x,{}y) == u},{} for example,{} \spad{x}
and \spad{y} are the formal parameter.
\item\newline{\em \menuitemstyle{}}{\em frame}\space{}
the basic unit of an interactive session; each frame has its own
\spadgloss{step number},{} \spadgloss{environment},{} and
\spadgloss{history}. In one interactive session,{} users can create
and drop frames,{} and have several active frames simultaneously.
\item\newline{\em \menuitemstyle{}}{\em free}\space{}
{\em (syntax)} A keyword used in user-defined functions to declare
that a variable is a \spadgloss{free variable} of that function. For
example,{} the statement \spad{free x} declares the variable \spad{x}
within the body of a function \spad{f} to be a free variable in \spad{f}.
Without such a declaration,{} any variable \spad{x} which appears on the
left hand side of an assignment is regarded as a \spadgloss{local variable}
of that function. If the intention of the assignment is to give an value
to a \spadgloss{global variable} \spad{x},{} the body of that function
must contain the statement \spad{free x}.
\item\newline{\em \menuitemstyle{}}{\em free variable}\space{}
(of a function) a variable which appears in a body of a function but is
not \spadglossSee{bound}{binding} by that function. See \spadgloss{local
variable} by default.
\item\newline{\em \menuitemstyle{}}{\em function}\space{}
implementation of \spadgloss{operation}; it takes zero or more
\spadgloss{argument} parameters and produces zero or more values.
Functions are objects which can be passed as parameters to functions
and can be returned as values of functions. Functions can also create
other functions (see also \spadtype{InputForm}). See also
\spadgloss{application} and \spadgloss{invocation}. The terms
{\em operation} and {\em function} are distinct notions in Axiom.
An operation is an abstraction of a function,{} described by declaring a
\spadgloss{signature}. A function is created by providing an implementation
of that operation by some piece of Axiom code. Consider the example
of defining a user-function \spad{fact} to compute the \spadfun{factorial}
of a nonnegative integer. The Axiom statement
\spad{fact: Integer -> Integer} describes the operation,{} whereas the
statement \spad{fact(n) = reduce(*,{}[1..n])} defines the functions. See
also \spadgloss{generic function}.
\item\newline{\em \menuitemstyle{}}{\em function body}\space{}
```

```
the part of a \spadgloss{function}\spad{'s} definition which is evaluated
when the function is called at \spadgloss{run-time}; the part of the
function definition to the right of the \spadSyntax{\spad{==}}.
\item\newline{\em \menuitemstyle{}}{\em garbage collection}\space{}
a system function that automatically recycles memory cells from the
\spadgloss{heap}. Axiom is built upon \spadgloss{Common LISP}
which provides this facility.
\item\newline{\em \menuitemstyle{}}{\em garbage collector}\space{}
a mechanism for reclaiming storage in the \spadgloss{heap}.
\item\newline{\em \menuitemstyle{}}{\em Gaussian}\space{}
a complex-valued expression,{} \spadignore{e.g.} one with both a real
and imaginary part; a member of a \spadtype{Complex} domain.
\item\newline{\em \menuitemstyle{}}{\em generic function}\space{}
the use of one function to operate on objects of different types; One
might regard Axiom as supporting generic \spadgloss{operations}
but not generic functions. One operation \spad{+: (D,{}D) -> D} exists
for adding elements in a ring; each ring however provides its own
type-specific function for implementing this operation.
\item\newline{\em \menuitemstyle{}}{\em global variable}\space{}
A variable which can be referenced freely by functions. In Axiom,{}
all top-level user-defined variables defined during an interactive user
session are global variables. Axiom does not allow {\em fluid
variables},{} that is,{} variables \spadglossSee{bound}{binding} by
functions which can be referenced by functions those functions call.
\item\newline{\em \menuitemstyle{}}{\em Groebner basis}\space{}
{\em (algebra)} a special basis for a polynomial ideal that allows a
simple test for membership. It is useful in solving systems of polynomial
equations.
\item\newline{\em \menuitemstyle{}}{\em group}\space{}
{\em (algebra)} a monoid where every element has a multiplicative inverse.
\item\newline{\em \menuitemstyle{}}{\em hash table}\space{}
A data structure that efficiency maps a given object to another. A hash
table consists of a set of {\em entries},{} each of which associates a
{\em key} with a {\em value}. Finding the object stored under a key can
be very fast even if there are a large number of entries since keys are
{\em hashed} into numerical codes for fast lookup.
\item\newline{\em \menuitemstyle{}}{\em heap}\space{}
an area of storage used by data in programs. For example,{} Axiom will
use the heap to hold the partial results of symbolic computations. When
cancellations occur,{} these results remain in the heap until
\spadglossSee{garbage collected}{garbage collector}.
\item\newline{\em \menuitemstyle{}}{\em history}\space{}
a mechanism which records the results for an interactive computation.
Using the history facility,{} users can save computations,{} review
previous steps of a computation,{} and restore a previous interactive
session at some later time. For details,{} issue the system command
{\em )history ?} to the interpreter. See also \spadgloss{frame}.
\item\newline{\em \menuitemstyle{}}{\em ideal}\space{}
{\em (algebra)} a subset of a ring that is closed under addition and
multiplication by arbitrary ring elements,{} \spadignore{i.e.}
```

```
it\spad{'s} a module over the ring.
\item\newline{\em \menuitemstyle{}}{\em identifier}\space{}
{\em (syntax)} an Axiom name; a \spadgloss{literal} of type
\spadtype{Symbol}. An identifier begins with an alphabetical character or
\% and may be followed by alphabetic characters,{} digits,{} ? or !.
Certain distinquished \spadgloss{reserved words} are not allowed as
identifiers but have special meaning in the Axiom.
\item\newline{\em \menuitemstyle{}}{\em immutable}\space{}
an object is immutable if it cannot be changed by an \spadgloss{operation};
not a \spadglossSee{mutable object}{mutable}. Algebraic objects generally
immutable: changing an algebraic expression involves copying parts of the
original object. One exception is a matrix object of type \spadtype{Matrix}.
Examples of mutable objects are data structures such as those of type
\spadtype{List}. See also \spadgloss{pointer semantics}.
\item\newline{\em \menuitemstyle{}}{\em implicit export}\space{}
(of a domain or category) any \spadgloss{attribute} or
\spadgloss{operation} which is either an explicit export or else an
explicit export of some category which an explicit category export
\spadglossSee{extends}{category extension}.
\item\newline{\em \menuitemstyle{}}{\em index}\space{}
1. a variable that counts the number of times a \spadgloss{loop} is
repeated. 2. the "address" of an element in a data structure (see also
category \spadtype{LinearAggregate}).
\item\newline{\em \menuitemstyle{}}{\em infix}\space{}
{\em (syntax)} an \spadgloss{operator} placed between two
\spadgloss{operands}; also called a {\em binary operator},{}
\spadignore{e.g.} \spad{a + b}. An infix operator may also be used as a
\spadgloss{prefix},{} \spadignore{e.g.} \spad{+(a,{}b)} is also permissable
in the Axiom language. Infix operators have a relative
\spadgloss{precedence}.
\item\newline{\em \menuitemstyle{}}{\em input area}\space{}
a rectangular area on a Hyperdoc screen into which users can enter text.
\item\newline{\em \menuitemstyle{}}{\em instantiate}\space{}
to build a \spadgloss{category},{} \spadgloss{domain},{} or
\spadgloss{package} at run-time
\item\newline{\em \menuitemstyle{}}{\em integer}\space{}
a \spadgloss{literal} object of domain \spadtype{Integer},{} the class
of integers with an unbounded number of digits. Integer literals consist
of one or more consecutive digits (0-9) with no embedded blanks.
Underscores can be used to separate digits in long integers if desirable.
\item\newline{\em \menuitemstyle{}}{\em interactive}\space{}
a system where the user interacts with the computer step-by-step
\item\newline{\em \menuitemstyle{}}{\em interpreter}\space{}
the subsysystem of Axiom responsible for handling user input during
an interactive session. The following somewhat simplified description of
the typical action of the interpreter. The interpreter parsers the
user\spad{'s} input expression to create an expression tree then does a
bottom-up traversal of the tree. Each subtree encountered which is not a
value consists of a root node denoting an operation name and one or more
leaf nodes denoting \spadgloss{operands}. The interpreter resolves type
```

```
mismatches and uses type-inferencing and a library database to determine
appropriate types of the operands and the result,{} and an operation to
be performed. The interpreter then builds a domain to perform the
indicated operation,{} then invokes a function from the domain to compute
a value. The subtree is then replaced by that value and the process
continues. Once the entire tree has been processed,{} the value replacing
the top node of the tree is displayed back to the user as the value of the
expression.
\item\newline{\em \menuitemstyle{}}{\em invocation}\space{}
(of a function) the run-time process involved in
\spadglossSee{evaluating}{evaluation} a a \spadgloss{function}
\spadgloss{application}. This process has two steps. First,{} a
local \spadgloss{environment} is created where \spadgloss{formal arguments}
are locally \spadglossSee{bound}{binding} by \spadgloss{assignment} to
their respective actual \spadgloss{argument}. Second,{} the
\spadgloss{function body} is evaluated in that local environment.
The evaluation of a function is terminated either by completely
evaluating the function body or by the evaluation of a
\spadSyntax{return} expression.
\item\newline{\em \menuitemstyle{}}{\em iteration}\space{}
repeated evaluation of an expression or a sequence of expressions.
Iterations use the reserved words \spadSyntax{for},{}
\spadSyntax{while},{} and \spadSyntax{repeat}.
\item\newline{\em \menuitemstyle{}}{\em Join}\space{}
a primitive Axiom function taking two or more categories as
arguments and producing a category containing all of the operations
and attributes from the respective categories.
\item\newline{\em \menuitemstyle{}}{\em KCL}\space{}
Kyoto Common LISP,{} a version of \spadgloss{Common LISP} which
features compilation of the compilation of LISP into the \spad{C}
Programming Language
\item\newline{\em \menuitemstyle{}}{\em library}\space{}
In Axiom,{} a collection of compiled modules respresenting
the \spadgloss{category} or \spadgloss{domain} constructor.
\item\newline{\em \menuitemstyle{}}{\em lineage}\space{}
the sequence of \spadgloss{default packages} for a given domain to be
searched during \spadgloss{dynamic lookup}. This sequence is computed
first by ordering the category \spadgloss{ancestors} of the domain
according to their {\em level number},{} an integer equal to to the
minimum distance of the domain from the category. Parents have level
1,{} parents of parents have level 2,{} and so on. Among categories
with equal level numbers,{} ones which appear in the left-most branches
of {\em Join}\spad{s} in the source code come first. See also
\spadgloss{dynamic lookup}.
\item\newline{\em \menuitemstyle{}}{\em LISP}\space{}
acronymn for List Processing Language,{} a language designed for the
manipulation of nonnumerical data. The Axiom library is
translated into LISP then compiled into machine code by an underlying LISP.
\item\newline{\em \menuitemstyle{}}{\em list}\space{}
an object of a \spadtype{List} domain.
```

```
\item\newline{\em \menuitemstyle{}}{\em literal}\space{}
an object with a special syntax in the language. In Axiom,{}
there are five types of literals: \spadgloss{booleans},{}
\spadgloss{integers},{} \spadgloss{floats},{} \spadgloss{strings},{}
and \spadgloss{symbols}.
\item\newline{\em \menuitemstyle{}}{\em local}\space{}
{\em (syntax)} A keyword used in user-defined functions to declare that
a variable is a \spadgloss{local variable} of that function. Because of
default assumptions on variables,{} such a declaration is not necessary
but is available to the user for clarity when appropriate.
\item\newline{\em \menuitemstyle{}}{\em local variable}\space{}
(of a function) a variable \spadglossSee{bound}{binding} by that function
and such that its binding is invisible to any function that function calls.
Also called a {\em lexical} variable. By default in the
interpreter:\begin{items} \item 1. any variable \spad{x} which appears
on the left hand side of an assignment is regarded a local variable of
that function. If the intention of an assignment is to change the value
of a \spadgloss{global variable} \spad{x},{} the body of the function
must then contain the statement \spad{free x}. \item 2. any other variable
is regarded as a \spadgloss{free variable}. \end{items} An optional
declaration \spad{local x} is available to explicitly declare a variable
to be a local variable. All \spadgloss{formal parameters} to the function
can be regarded as local variables to the function.
\item\newline{\em \menuitemstyle{}}{\em loop}\space{}
1. an expression containing a \spadSyntax{repeat} 2. a collection expression
having a \spadSyntax{for} or a \spadSyntax{while},{} \spadignore{e.g.}
\spad{[f(i) for i in S]}.
\item\newline{\em \menuitemstyle{}}{\em loop body}\space{}
the part of a loop following the \spadSyntax{repeat} that tells what to
do each iteration. For example,{} the body of the loop \spad{for x in S
repeat B} is \spad{B}. For a collection expression,{} the body of the loop
precedes the initial \spadSyntax{for} or \spadSyntax{while}.
\item\newline{\em \menuitemstyle{}}{\em macro}\space{}
{\em (syntax)} 1. An expression of the form \spad{macro a == b} where
\spad{a} is a \spadgloss{symbol} causes \spad{a} to be textually replaced
by the expression \spad{b} at \spadgloss{parse} time. 2. An expression of
the form \spad{macro f(a) == b} defines a parameterized macro expansion for
a parameterized form \spad{f} This macro causes a form \spad{f}(\spad{x})
to be textually replaced by the expression \spad{c} at parse time,{} where
\spad{c} is the expression obtained by replacing \spad{a} by \spad{x}
everywhere in \spad{b}. See also \spadgloss{definition} where a similar
substitution is done during \spadgloss{evaluation}.
\item\newline{\em \menuitemstyle{}}{\em mode}\space{}
a type expression containing a question-mark ({\em ?}). For example,{}
the mode {\em P ?} designates {\em the class of all polynomials over an
arbitrary ring}.
\item\newline{\em \menuitemstyle{}}{\em mutable}\space{}
objects which contain \spadgloss{pointers} to other objects and which
have operations defined on them which alter these pointers. Contrast
\spadgloss{immutable}. Axiom uses \spadgloss{pointer semantics}
```

```
as does \spadgloss{LISP} in contrast with many other languages such as
Pascal which use \spadgloss{copying semantics}. See \spadgloss{pointer
semantics} for details.
\item\newline{\em \menuitemstyle{}}{\em name}\space{}
1. a \spadgloss{symbol} denoting a \spadgloss{variable},{}
\spadignore{i.e.} the variable \spad{x}. 2. a \spadgloss{symbol}
denoting an \spadgloss{operation},{} \spadignore{i.e.} the operation
\spad{divide: (Integer,{}Integer) -> Integer}.
\item\newline{\em \menuitemstyle{}}{\em nullary}\space{}
a function with no arguments,{} \spadignore{e.g.} \spadfun{characteristic}.
\item\newline{\em \menuitemstyle{}}{\em nullary}\space{}
operation or function with \spadgloss{arity} 0
\item\newline{\em \menuitemstyle{}}{\em Object}\space{}
a category with no operations or attributes,{} from which most categories
in Axiom are \spadglossSee{extensions}{category extension}.
\item\newline{\em \menuitemstyle{}}{\em object}\space{}
a data entity created or manipulated by programs. Elements of domains,{}
functions,{} and domains themselves are objects. Whereas categories are
created by functions,{} they cannot be dynamically manipulated in the
current system and are thus not considered as objects. The most basic
objects are \spadgloss{literals}; all other objects must be created
\spadgloss{functions}. Objects can refer to other objects using
\spadgloss{pointers}. Axiom language uses
\spadgloss{pointer semantics} when dealing with \spadgloss{mutable} objects.
\item\newline{\em \menuitemstyle{}}{\em object code}\space{}
code which can be directly executed by hardware; also known as
{\em machine language}.
\item\newline{\em \menuitemstyle{}}{\em operand}\space{}
an argument of an \spadgloss{operator} (regarding an operator as a
\spadgloss{function}).
\item\newline{\em \menuitemstyle{}}{\em operation}\space{}
an abstraction of a \spadgloss{function},{} described by a
\spadgloss{signature}. For example,{}
\center{\spad{fact: NonNegativeInteger -> NonNegativeInteger}} describes
an operation for "the factorial of a (non-negative) integer".
\item\newline{\em \menuitemstyle{}}{\em operator}\space{}
special reserved words in the language such as \spadop{+} and \spadop{*};
operators can be either \spadgloss{prefix} or \spadgloss{infix} and have a
relative \spadgloss{precedence}.
\item\newline{\em \menuitemstyle{}}{\em overloading}\space{}
the use of the same name to denote distinct functions; a function is
identified by a \spadgloss{signature} identifying its name,{} the number
and types of its arguments,{} and its return types. If two functions can
have identical signatures,{} a \spadgloss{package call} must be made to
distinquish the two.
\item\newline{\em \menuitemstyle{}}{\em package}\space{}
a domain whose exported operations depend solely on the parameters and
other explicit domains,{} \spadignore{e.g.} a package for solving systems
of equations of polynomials over any field,{} \spadignore{e.g.} floats,{}
rational numbers,{} complex rational functions,{} or power series.
```

```
Facilities for integration,{} differential equations,{} solution of
linear or polynomial equations,{} and group theory are provided by
"packages". Technically,{} a package is a domain which has no
\spadgloss{signature} containing the symbol \$. While domains intuitively
provide computational objects you can compute with,{} packages intuitively
provide functions (\spadgloss{polymorphic} functions) which will work over
a variety of datatypes.
\item\newline{\em \menuitemstyle{}}{\em package call}\space{}
{\em (syntax)} an expression of the form \spad{e \$ D} where \spad{e} is
an \spadgloss{application} and \spad{D} denotes some \spadgloss{package}
(or \spadgloss{domain}).
\item\newline{\em \menuitemstyle{}}{\em package call}\space{}
{\em (syntax)} an expression of the form \spad{f(x,{}y)\$D} used to identify
that the function \spad{f} is to be one from \spad{D}.
\item\newline{\em \menuitemstyle{}}{\em package constructor}\space{}
same as \spadgloss{domain constructor}.
\item\newline{\em \menuitemstyle{}}{\em parameter}\space{}
see \spadgloss{argument}
\item\newline{\em \menuitemstyle{}}{\em parameterized datatype}\space{}
a domain that is built on another,{} for example,{} polynomials with integer
coefficients.
\item\newline{\em \menuitemstyle{}}{\em parameterized form}\space{}
a expression of the form \spad{f(x,{}y)},{} an \spadgloss{application} of a
function.
\item\newline{\em \menuitemstyle{}}{\em parent}\space{}
(of a domain) a category which is explicitly declared in the source code
definition for the domain to be an \spadgloss{export} of the domain.
\item\newline{\em \menuitemstyle{}}{\em parse}\space{}
1. (verb) to produce an internal representation of a user input string;
the resultant internal representation is then "interpreted" by Axiom
to perform some indicated action.
\item\newline{\em \menuitemstyle{}}{\em parse}\space{}
the transformation of a user input string representing a valid Axiom
expression into an internal representation as a tree-structure.
\item\newline{\em \menuitemstyle{}}{\em partially ordered set}\space{}
a set with a reflexive,{} transitive and antisymetric \spadgloss{binary}
operation.
\item\newline{\em \menuitemstyle{}}{\em pattern match}\space{}
1. (on expressions) Given a expression called a "subject" \spad{u},{} the
attempt to rewrite \spad{u} using a set of "rewrite rules". Each rule has
the form \spad{A == B} where \spad{A} indicates a expression called a
"pattern" and \spad{B} denotes a "replacement". The meaning of this rule
is "replace \spad{A} by \spad{B"}. If a given pattern \spad{A} matches a
subexpression of \spad{u},{} that subexpression is replaced by \spad{B}.
Once rewritten,{} pattern matching continues until no further changes occur.
2. (on strings) the attempt to match a string indicating a "pattern" to
another string called a "subject",{} for example,{} for the purpose of
identifying a list of names. In \Browse{},{} users may enter
\spadgloss{search strings} for the purpose of identifying constructors,{}
operations,{} and attributes.
```

```
\item\newline{\em \menuitemstyle{}}{\em pile}\space{}
alternate syntax for a block,{} using indentation and column alignment
(see also \spadgloss{block}).
\item\newline{\em \menuitemstyle{}}{\em pointer}\space{}
a reference implemented by a link directed from one object to another in
the computer memory. An object is said to {\em refer} to another if it
has a pointer to that other object. Objects can also refer to themselves
(cyclic references are legal). Also more than one object can refer to the
same object. See also \spadgloss{pointer semantics}.
\item\newline{\em \menuitemstyle{}}{\em pointer semantics}\space{}
the programming language semantics used in languages such as LISP which
allow objects to be \spadgloss{mutable}. Consider the following sequence
of Axiom statements:\begin{items} \item \spad{x : Vector Integer :=
[1,{}4,{}7]} \item \spad{y := x} \item \spad{swap!(x,{}2,{}3)} \end{items}
The function \spadfunFrom{swap!}{Vector} is used to interchange the 2nd and
3rd value in the list \spad{x} producing the value \spad{[1,{}7,{}4]}.
What value does \spad{y} have after evaluation of the third statement?
The answer is different in Axiom than it is in a language with
\spadgloss{copying semantics}. In Axiom,{} first the vector
[1,{}2,{}3] is created and the variable \spad{x} set to
\spadglossSee{point}{pointer} to this object. Let\spad{'s} call this
object \spad{V}. Now \spad{V} refers to its \spadgloss{immutable}
components 1,{}2,{} and 3. Next,{} the variable \spad{y} is made to
point to \spad{V} just as \spad{x} does. Now the third statement
interchanges the last 2 elements of \spad{V} (the {\em !} at the end
of the name \spadfunFrom{swap!}{Vector} tells you that this operation
is destructive,{} that is,{} it changes the elements {\em in place}).
Both \spad{x} and \spad{y} perceive this change to \spad{V}. Thus both
\spad{x} and \spad{y} then have the value \spad{[1,{}7,{}4]}. In Pascal,{}
the second statement causes a copy of \spad{V} to be stored under \spad{y}.
Thus the change to \spad{V} made by the third statement does not affect
\spad{y}.
\item\newline{\em \menuitemstyle{}}{\em polymorphic}\space{}
a \spadgloss{function} parameterized by one or more \spadgloss{domains};
a \spadgloss{algorithm} defined \spadglossSee{categorically}{category}.
Every function defined in a domain or package constructor with a
domain-valued parameter is polymorphic. For example,{} the same matrix
\spadSyntax{*} function is used to multiply "matrices over integers" as
"matrices over matrices over integers" Likewise,{} various
\ignore{\spad{???}} in \ignore{\spad{???}} solves polynomial equations
over any \spadgloss{field}.
\item\newline{\em \menuitemstyle{}}{\em postfix}\space{}
an \spadgloss{operator} that follows its single \spadgloss{operand}.
Postfix operators are not available in Axiom.
\item\newline{\em \menuitemstyle{}}{\em precedence}\space{}
{\em (syntax)} refers to the so-called {\em binding power} of an operator.
For example,{} \spad{*} has higher binding power than \spad{+} so that the
expression \spad{a + b * c} is equivalent to \spad{a + (b * c)}.
\item\newline{\em \menuitemstyle{}}{\em precision}\space{}
the number of digits in the specification of a number,{} \spadignore{e.g.}
```

```
as set by \spadfunFrom{precision}{Float}.
\item\newline{\em \menuitemstyle{}}{\em predicate}\space{}
1. a Boolean valued function,{} \spadignore{e.g.}
\spad{odd: Integer -> Boolean}. 2. an Boolean valued expression
\item\newline{\em \menuitemstyle{}}{\em prefix}\space{}
{\em (syntax)} an \spadgloss{operator} such as \spad{-} and \spad{not}
that is written {\em before} its single \spadgloss{operand}. Every
function of one argument can be used as a prefix operator. For example,{}
all of the following have equivalent meaning in Axiom: \spad{f(x)},{}
\spad{f x},{} and \spad{f.x}. See also \spadgloss{dot notation}.
\item\newline{\em \menuitemstyle{}}{\em quote}\space{}
the prefix \spadgloss{operator} \spadSyntax{'} meaning {\em do not evaluate}.
\item\newline{\em \menuitemstyle{}}{\em Record}\space{}
(basic domain constructor) a domain constructor used to create a
inhomogeneous aggregate composed of pairs of "selectors" and
\spadgloss{values}. A Record domain is written in the form
\spad{Record(a1:D1,{}...,{}an:Dn)} (\spad{n} > 0) where
\spad{a1},{}...,{}\spad{an} are identifiers called the
{\em selectors} of the record,{} and \spad{D1},{}...,{}\spad{Dn}
are domains indicating the type of the component stored under selector
\spad{an}.
\item\newline{\em \menuitemstyle{}}{\em recurrence relation}\space{}
A relation which can be expressed as a function \spad{f} with some
argument \spad{n} which depends on the value of \spad{f} at \spad{k}
previous values. In many cases,{} Axiom will rewrite a recurrence
relation on compilation so as to \spadgloss{cache} its previous \spad{k}
values and therefore make the computation significantly more efficient.
\item\newline{\em \menuitemstyle{}}{\em recursion}\space{}
use of a self-reference within the body of a function. Indirect recursion
is when a function uses a function below it in the call chain.
\item\newline{\em \menuitemstyle{}}{\em recursive}\space{}
1. A function that calls itself,{} either directly or indirectly through
another function. 2. self-referential. See also \spadgloss{recursive}.
\item\newline{\em \menuitemstyle{}}{\em reference}\space{}
see \spadgloss{pointer}
\item\newline{\em \menuitemstyle{}}{\em Rep}\space{}
a special identifier used as \spadgloss{local variable} of a domain
constructor body to denote the representation domain for objects of a domain.
\item\newline{\em \menuitemstyle{}}{\em representation}\space{}
a \spadgloss{domain} providing a data structure for elements of a
domain; generally denoted by the special identifier \spadgloss{Rep}
in the Axiom programming language. As domains are
\spadgloss{abstract datatypes},{} this representation is not available
to users of the domain,{} only to functions defined in the
\spadgloss{function body} for a domain constructor. Any domain can be used
as a representation.
\item\newline{\em \menuitemstyle{}}{\em reserved word}\space{}
a special sequence of non-blank characters with special meaning in the
Axiom language. Examples of reserved words are names such as
\spadSyntax{for},{} \spadSyntax{if},{} and \spadSyntax{free},{} operator
```

```
names such as \spadSyntax{+} and \spad{mod},{} special character strings
such as spadSyntax{\spad{==}} and spadSyntax{\spad{:=}}.
\item\newline{\em \menuitemstyle{}}{\em retraction}\space{}
to move an object in a parameterized domain back to the underlying
domain,{} for example to move the object \spad{7} from a "fraction of
integers" (domain \spadtype{Fraction Integer}) to "the integers"
(domain \spadtype{Integer}).
\item\newline{\em \menuitemstyle{}}{\em return}\space{}
when leaving a function,{} the value of the expression following
\spadSyntax{return} becomes the value of the function.
\item\newline{\em \menuitemstyle{}}{\em ring}\space{}
a set with a commutative addition,{} associative multiplication,{}
a unit element,{} and multiplication distributes over addition and
subtraction.
\item\newline{\em \menuitemstyle{}}{\em rule}\space{}
{\em (syntax)} 1. An expression of the form \spad{rule A == B}
indicating a "rewrite rule". 2. An expression of the form
\spad{rule (R1;...;Rn)} indicating a set of "rewrite rules"
\spad{R1},{}...,{}\spad{Rn}. See \spadgloss{pattern matching} for details.
\item\newline{\em \menuitemstyle{}}{\em run-time}\space{}
the time of doing a computation. Contrast \spadgloss{compile-time}.
 rather than prior to it; \spadgloss{dynamic} as opposed to
\spadgloss{static}. For example,{} the decision of the intepreter
to build a structure such as "matrices with power series entries"
in response to user input is made at run-time.
\item\newline{\em \menuitemstyle{}}{\em run-time check}\space{}
an error-checking which can be done only when the program receives
user input; for example,{} confirming that a value is in the proper
range for a computation.
\item\newline{\em \menuitemstyle{}}{\em search string}\space{}
a string entered into an \spadgloss{input area} on a Hyperdoc screen
\item\newline{\em \menuitemstyle{}}{\em selector}\space{}
an identifier used to address a component value of a gloss{Record} datatype.
\item\newline{\em \menuitemstyle{}}{\em semantics}\space{}
the relationships between symbols and their meanings. The rules for
obtaining the {\em meaning} of any syntactically valid expression.
\item\newline{\em \menuitemstyle{}}{\em semigroup}\space{}
{\em (algebra)} a \spadgloss{monoid} which need not have an identity;
it is closed and associative.
\item\newline{\em \menuitemstyle{}}{\em side effect}\space{}
action which changes a component or structure of a value. See
\spadgloss{destructive operation} for details.
\item\newline{\em \menuitemstyle{}}{\em signature}\space{}
{\em (syntax)} an expression describing an \spadgloss{operation}.
A signature has the form as \spad{name : source -> target},{} where
\spad{source} gives the type of the arguments of the operation,{} and
\spad{target} gives the type of the result.
\item\newline{\em \menuitemstyle{}}{\em small float}\space{}
the domain for hardware floating point arithmetic as provided by the
computer hardware.
```

```
\item\newline{\em \menuitemstyle{}}{\em small integer}\space{}
the domain for hardware integer arithmetic. as provided by the computer
hardware.
\item\newline{\em \menuitemstyle{}}{\em source}\space{}
the \spadgloss{type} of the argument of a \spadgloss{function}; the type
expression before the \spad{->} in a \spadgloss{signature}. For example,{}
the source of \spad{f : (Integer,{}Integer) -> Integer} is
\spad{(Integer,{}Integer)}.
\item\newline{\em \menuitemstyle{}}{\em sparse}\space{}
data structure whose elements are mostly identical (a sparse matrix is
one filled with mostly zeroes).
\item\newline{\em \menuitemstyle{}}{\em static}\space{}
that computation done before run-time,{} such as compilation. Contrast
\spadgloss{dynamic}.
\item\newline{\em \menuitemstyle{}}{\em step number}\space{}
the number which precedes user input lines in an interactive session;
the output of user results is also labeled by this number.
\item\newline{\em \menuitemstyle{}}{\em stream}\space{}
an object of \spadtype{Stream(R)},{} a generalization of a
\spadgloss{list} to allow an infinite number of elements. Elements of
a stream are computed "on demand". Strings are used to implement various
forms of power series (\ignore{\spad{???}}).
\item\newline{\em \menuitemstyle{}}{\em string}\space{}
an object of domain \spadtype{String}. Strings are \spadgloss{literals}
consisting of an arbitrary sequence of \spadgloss{characters} surrounded
by double-quotes (\spadSyntax{"}),{} \spadignore{e.g.} \spad{"Look here!"}.
\item\newline{\em \menuitemstyle{}}{\em subdomain}\space{}
{\em (basic concept)} a \spadgloss{domain} together with a
\spadgloss{predicate} characterizing which members of the domain belong
to the subdomain. The exports of a subdomain are usually distinct from the
domain itself. A fundamental assumption however is that values in the
subdomain are automatically \spadglossSee{coerceable}{coercion} to values
in the domain. For example,{} if \spad{n} and \spad{m} are declared to be
members of a subdomain of the integers,{} then {\em any} \spadgloss{binary}
operation from \spadtype{Integer} is available on \spad{n} and \spad{m}.
On the other hand,{} if the result of that operation is to be assigned
to,{} say,{} \spad{k},{} also declared to be of that subdomain,{} a
\spadgloss{run-time} check is generally necessary to ensure that the
result belongs to the subdomain.
\item\newline{\em \menuitemstyle{}}{\em such that clause}\space{}
the use of \spadSyntax{|} followed by an expression to filter an iteration.
\item\newline{\em \menuitemstyle{}}{\em suffix}\space{}
{\em (syntax)} an \spadgloss{operator} which placed after its operand.
Suffix operators are not allowed in the Axiom language.
\item\newline{\em \menuitemstyle{}}{\em symbol}\space{}
objects denoted by \spadgloss{identifier} \spadgloss{literals}; an
element of domain \spadtype{Symbol}. The interpreter defaultly converts
a symbol \spad{x} into \spadtype{Variable(x)}.
\item\newline{\em \menuitemstyle{}}{\em syntax}\space{}
rules of grammar,{} punctuation etc. for forming correct expressions.
```

```
\item\newline{\em \menuitemstyle{}}{\em system commands}\space{}
top-level Axiom statements that begin with {\em )}. System
commands allow users to query the database,{} read files,{} trace
functions,{} and so on.
\item\newline{\em \menuitemstyle{}}{\em tag}\space{}
an identifier used to discriminate a branch of a \spadgloss{Union} type.
\item\newline{\em \menuitemstyle{}}{\em target}\space{}
the \spadgloss{type} of the result of a \spadgloss{function}; the
type expression following the \spad{->} in a \spadgloss{signature}.
\item\newline{\em \menuitemstyle{}}{\em top-level}\space{}
refers to direct user interactions with the Axiom interpreter.
\item\newline{\em \menuitemstyle{}}{\em totally ordered set}\space{}
{\em (algebra)} a partially ordered set where any two elements are
comparable.
\item\newline{\em \menuitemstyle{}}{\em trace}\space{}
use of system function \spadsys{)trace} to track the arguments passed
to a function and the values returned.
\item\newline{\em \menuitemstyle{}}{\em tuple}\space{}
an expression of two or more other expressions separated by commas,{}
\spadignore{e.g.} \spad{4,{}7,{}11}. Tuples are also used for multiple
arguments both for \spadgloss{applications} (\spadignore{e.g.}
\spad{f(x,{}y)}) and in \spadgloss{signatures} (\spadignore{e.g.}
\spad{(Integer,{}Integer) -> Integer}). A tuple is not a data structure,{}
rather a syntax mechanism for grouping expressions.
\item\newline{\em \menuitemstyle{}}{\em type}\space{}
The type of any \spadgloss{subdomain} is the unique symbol {\em Category}.
The type of a \spadgloss{domain} is any \spadgloss{category} that domain
belongs to. The type of any other object is either the (unique) domain
that object belongs to or any \spadgloss{subdomain} of that domain. The
type of objects is in general not unique.
\item\newline{\em \menuitemstyle{}}{\em type checking}\space{}
a system function which determines whether the datatype of an object is
appropriate for a given operation.
\item\newline{\em \menuitemstyle{}}{\em type constructor}\space{}
a \spadgloss{domain constructor} or \spadgloss{category constructor}.
\item\newline{\em \menuitemstyle{}}{\em type inference}\space{}
when the interpreter chooses the type for an object based on context.
For example,{} if the user interactively issues the definition
\center{\spad{f(x) == (x + \%i)**2}} then issues \spad{f(2)},{}
the interpreter will infer the type of \spad{f} to be
\spad{Integer -> Complex Integer}.
\item\newline{\em \menuitemstyle{}}{\em unary}\space{}
operation or function with \spadgloss{arity} 1
\item\newline{\em \menuitemstyle{}}{\em underlying domain}\space{}
for a \spadgloss{domain} that has a single domain-valued parameter,{}
the {\em underlying domain} refers to that parameter. For example,{}
the domain "matrices of integers" (\spadtype{Matrix Integer}) has
underlying domain \spadtype{Integer}.
\item\newline{\em \menuitemstyle{}}{\em Union}\space{}
(basic domain constructor) a domain constructor used to combine any
```

```
set of domains into a single domain. A Union domain is written in the
form \spad{Union(a1:D1,{}...,{}an:Dn)} (\spad{n} > 0) where
\spad{a1},{}...,{}\spad{an} are identifiers called the {\em tags} of
the union,{} and \spad{D1},{}...,{}\spad{Dn} are domains called the
{\em branches} of the union. The tags \spad{\spad{ai}} are optional,{}
but required when two of the \spad{\spad{Di}} are equal,{}
\spadignore{e.g.} \spad{Union(inches:Integer,{}centimeters:Integer)}.
In the interpreter,{} values of union domains are automatically coerced
to values in the branches and vice-versa as appropriate. See also
\spadgloss{case}.
\item\newline{\em \menuitemstyle{}}{\em unit}\space{}
{\em (algebra)} an invertible element.
\item\newline{\em \menuitemstyle{}}{\em user function}\space{}
a function defined by a user during an interactive session. Contrast
\spadgloss{built-in function}.
\item\newline{\em \menuitemstyle{}}{\em user variable}\space{}
a variable created by the user at top-level during an interactive session
\item\newline{\em \menuitemstyle{}}{\em value}\space{}
1. the result of \spadglossSee{evaluating}{evaluation} an expression.
2. a property associated with a \spadgloss{variable} in a \spadgloss{binding}
in an \spadgloss{environment}.
\item\newline{\em \menuitemstyle{}}{\em variable}\space{}
a means of referring to an object but itself {\spad{\bf} not} an object. A
variable has a name and an associated \spadgloss{binding} created by
\spadgloss{evaluation} of Axiom expressions such as
\spadgloss{declarations},{} \spadgloss{assignments},{} and
\spadgloss{definitions}. In the top-level \spadgloss{environment} of the
interpreter,{} variables are \spadgloss{global variables}. Such variables
can be freely referenced in user-defined functions although a
\spadgloss{free} declaration is needed to assign values to them.
See \spadgloss{local variable} for details.
\item\newline{\em \menuitemstyle{}}{\em Void}\space{}
the type given when the \spadgloss{value} and \spadgloss{type} of an
expression are not needed. Also used when there is no guarantee at
run-time that a value and predictable mode will result.
\item\newline{\em \menuitemstyle{}}{\em wild card}\space{}
a symbol which matches any substring including the empty string; for
example,{} the search string {\em *an*} matches an word containing the
consecutive letters {\em a} and {\em n}
\item\newline{\em \menuitemstyle{}}{\em workspace}\space{}
an interactive record of the user input and output held in an interactive
history file. Each user input and corresponding output expression in the
workspace has a corresponding \spadgloss{step number}. The current output
expression in the workspace is referred to as \spad{\%}. The output
expression associated with step number \spad{n} is referred to by
\spad{\%\%(n)}. The \spad{k}-th previous output expression relative
to the current step number \spad{n} is referred to by \spad{\%\%(- k)}.
Each interactive \spadgloss{frame} has its own workspace.

———-

3.48.9 Lists of Points

— graphics.ht —

```
\begin{page}{ListPointsGraphicsExamplePage}{Lists of Points}
Axiom has the ability to create lists of points in a two dimensional
graphics viewport.  This is done by utilizing the \spadtype{GraphImage}
and \spadtype{TwoDimensionalViewport} domain facilities.
\beginscroll
\indent{5}\newline
{\em NOTE:  It is only necessary to click on the makeViewport2D
command button to plot this curve example}.
\indent{0}\newline
\spadpaste{p1 := point [1::SF,1::SF]\$(Point SF) \bound{p1}}

{\char92}beginscroll\nwnewline
\nwnewline
This\ page\ describes\ the\ plotting\ of\ surfaces\ defined\ by\ an\ equation\ of\nwnewline
two\ variables,\ z\ =\ f(x,y),\ for\ which\ the\ ranges\ of\ x\ and\ y\ are\nwnewline
explicitly\ defined.\ \ The\ basic\ draw\ command\ for\ this\ function\ utilizes\nwnewline
either\ the\ uncompiled\ function\ or\ compiled\ function\ format.\ \ The\nwnewline
general\ format\ for\ an\ uncompiled\ function\ is:\nwnewline
{\char92}indent{\char123}5{\char125}{\char92}newline\nwnewline
{\char123}{\char92}em\ draw(f(x,y),\ x\ =\ a..b,\ y\ =\ c..d){\char125}\nwnewline
{\char92}indent{\char123}0{\char125}{\char92}newline\nwnewline
where\ a..b\ and\ c..d\ are\ segments\ defining\ the\ intervals\ [a,b]\ and\nwnewline
[c,d]\ over\ which\ the\ variables\ x\ and\ y\ span.\ \ In\ this\ case\ the\nwnewline
function\ is\ not\ compiled\ until\ the\ draw\ command\ is\ executed.\ \ Here\ is\nwnewline
an\ example:\nwnewline
{\char92}graphpaste{\char123}draw(cos(x*y),x=-3..3,y=-3..3){\char125}\nwnewline
In\ the\ case\ of\ a\ compiled\ function,\ the\ function\ is\ named\ and\ compiled\nwnewline
independently.\ \ This\ is\ useful\ if\ you\ intend\ to\ use\ a\ function\ often,\nwnewline
or\ if\ the\ function\ is\ long\ and\ complex.\ \ The\ following\ line\ shows\ a\nwnewline
function\ whose\ parameters\ are\ of\ the\ type\ Small\ Float.\ The\ function\ is\nwnewline
compiled\ and\ stored\ by\ Axiom\ when\ it\ is\ entered.\nwnewline
{\char92}indent{\char123}5{\char125}{\char92}newline\nwnewline
{\char123}{\char92}em\ NOTE:\ \ It\ is\ only\ necessary\ to\ click\ on\ the\ draw\ command\ button\ to\
plot\ this\ example{\char125}.\nwnewline
{\char92}indent{\char123}0{\char125}{\char92}newline\nwnewline
{\char92}spadpaste{\char123}f(x:SF,y:SF):SF\ ==\ sin(x)*cos(y)\ {\char92}bound{\char123}f{\char125}{\cha
{\char92}newline\nwnewline
Once\ the\ function\ is\ compiled\ the\ draw\ command\ only\ needs\ the\ name\ \nwnewline
of\ the\ function\ to\ execute.\ \ Here\ is\ a\ compiled\ function\ example:\nwnewline
{\char92}graphpaste{\char123}draw(f,-{\char92}{\char37}pi..{\char92}{\char37}pi,-{\char92}{\char37}pi..{
```

```
Note\ that\ the\ parameter\ ranges\ do\ not\ take\ the\ variable\ names\ as\ in\ the\nwnewlin
case\ of\ uncompiled\ functions.\ \ The\ variables\ are\ entered\ in\ the\ order\ in\nwnewlin
which\ they\ are\ defined\ in\ the\ function\ specification.\ \ In\ this\ case\ the\nwnewline
first\ range\ specifies\ the\ x-variable\ and\ the\ second\ range\ specifies\ the\nwnewline
y-variable.\nwnewline

{\char92}end{\char123}chunk{\char125}\nwnewline
{\char92}pagetitle{\char123}ParametricTubeGraphicsPage{\char125}{\char123}graphics.ht{\char125}{\char123
{\char92}begin{\char123}chunk{\char125}{\char123}graphics.ht{\char125}\nwnewline
{\char92}begin{\char123}page{\char125}{\char123}ParametricTubeGraphicsPage{\char125}{\char123}Parametric
{\char92}beginscroll\nwnewline
This\ page\ describes\ the\ plotting\ in\ three\ dimensional\ space\ of\ a\ tube\nwnewline
around\ a\ parametric\ space\ curve\ defined\ by\ the\ parametric\ equations\ \nwnewline
x\ =\ f(t),\ y\ =\ g(t),\ z\ =\ h(t),\ where\ f,\ g,\ and\ h\ are\ functions\ of\ the\nwnewline
parameter\ t\ which\ ranges\ over\ a\ specified\ interval.\ \ The\ basic\ draw\nwnewline
command\ for\ this\ function\ utilizes\ either\ the\ uncompiled\ functions\ or\nwnewline
compiled\ functions\ format\ and\ uses\ the\ {\char92}spadfun{\char123}curve{\char125}\ command\ to\nwne
specify\ the\ three\ functions\ for\ the\ x,\ y,\ and\ z\ components\ of\ the\nwnewline
curve.\ \ This\ uses\ the\ same\ format\ as\ that\ for\ space\ curves\ except\ that\nwnewline
it\ requires\ a\ specification\ for\ the\ radius\ of\ the\ tube.\ \ If\ the\ radius\nwnewline
of\ the\ tube\ is\ 0,\ then\ the\ result\ is\ the\ space\ curve\ itself.\ \ The\nwnewline
general\ format\ for\ uncompiled\ functions\ is:\nwnewline
{\char92}indent{\char123}5{\char125}{\char92}newline\nwnewline
{\char123}{\char92}em\ draw(curve(f(t),g(t),h(t)),\ t\ =\ a..b,\ tubeRadius\ ==\ r){\char125}\nwnewline
{\char92}indent{\char123}0{\char125}{\char92}newline\nwnewline
where\ a..b\ is\ the\ segment\ defining\ the\ interval\ [a,b]\ over\ which\ the\nwnewline
parameter\ t\ ranges,\ and\ the\ tubeRadius\ is\ indicated\ by\ the\ variable\ r.\nwnewline
In\ this\ case\ the\ functions\ are\ not\ compiled\ until\ the\ draw\ command\ is\nwnewline
executed.\ \ Here\ is\ an\ example:\nwnewline
{\char92}graphpaste{\char123}draw(curve(sin(t)*cos(3*t/5),\ cos(t)*cos(3*t/5),\ \nwnewline
cos(t)*sin(3*t/5)),\ t=0..15*{\char92}{\char37}pi,tubeRadius\ ==\ .15){\char125}\nwnewline
In\ the\ case\ of\ compiled\ functions,\ the\ functions\ are\ named\ and\nwnewline
compiled\ independently.\ \ This\ is\ useful\ if\ you\ intend\ to\ use\ the\nwnewline
functions\ often,\ or\ if\ the\ functions\ are\ long\ and\ complex.\ \ The\nwnewline
following\ lines\ show\ functions\ whose\ parameters\ are\ of\ the\ type\ Small\nwnewline
Float.\ The\ functions\ are\ compiled\ and\ stored\ by\ Axiom\ when\ entered.\nwnewline
{\char92}indent{\char123}5{\char125}{\char92}newline\nwnewline
{\char123}{\char92}em\ NOTE:\ \ It\ is\ only\ necessary\ to\ click\ on\ the\ draw\ command\ button\ to\
plot\ this\ example{\char125}.\nwnewline
{\char92}indent{\char123}0{\char125}{\char92}newline\nwnewline
{\char92}spadpaste{\char123}t1(t:SF):SF\ ==\ 4/(2-sin(3*t))*cos(2*t)\ {\char92}bound{\char123}t1{\char12
{\char92}newline\nwnewline
{\char92}spadpaste{\char123}t2(t:SF):SF\ ==\ 4/(2-sin(3*t))*sin(2*t)\ {\char92}bound{\char123}t2{\char12
```

```
{\char92}newline\nwnewline
{\char92}spadpaste{\char123}t3(t:SF):SF\ ==\ 4/(2-sin(3*t))*cos(3*t)\ {\char92}bound{\char123
{\char92}newline\nwnewline
Once\ the\ function\ is\ compiled\ the\ draw\ command\ only\ needs\ the\ names\ of\nwnewline
the\ functions\ to\ execute.\ \ Here\ is\ a\ compiled\ functions\ example\ of\ a\nwnewline
trefoil\ knot:\nwnewline
{\char92}graphpaste{\char123}draw(curve(t1,t2,t3),0..2*{\char92}{\char37}pi,tubeRadius\ ==\
{\char92}free{\char123}t1\ t2\ t3{\char125}{\char125}\nwnewline
Note\ that\ the\ parameter\ range\ does\ not\ take\ the\ variable\ name\ as\ in\nwnewline
the\ case\ of\ uncompiled\ functions.\ It\ is\ understood\ that\ the\ indicated\nwnewline
range\ applies\ to\ the\ parameter\ of\ the\ functions,\ which\ in\ this\ case\ is\nwnewline
t.\ \ Typically,\ the\ radius\ of\ the\ tube\ should\ be\ set\ between\ 0\ and\ 1.\nwnewline
A\ radius\ of\ less\ than\ 0\ results\ in\ it's\ positive\ counterpart\ and\ a\nwnewline
radius\ of\ greater\ than\ one\ causes\ self\ intersection.\nwnewline

{\char92}begin{\char123}page{\char125}{\char123}3DObjectGraphicsPage{\char125}{\char123}Buil
{\char92}beginscroll\nwnewline
This\ page\ describes\ the\ Axiom\ facilities\ for\ creating\ three\nwnewline
dimensional\ objects\ constructed\ from\ geometric\ primitives.\ \ The\ Axiom\nwnewline
operation\ {\char92}spadfun{\char123}create3Space(){\char125}\ creates\ a\ space\ to\ which\
curves,\ and\ polygons\ can\ be\ added\ using\ the\ operations\ from\ the\nwnewline
{\char92}spadtype{\char123}ThreeSpace{\char125}\ domain.\ \ The\ contents\ of\ this\ space\
displayed\ in\ a\ viewport\ using\ the\ {\char92}spadfun{\char123}makeViewport3D(){\char125}
It\ will\ be\ necessary\ to\ have\ these\ operations\ exposed\ in\ order\ to\ use\nwnewline
them.\ {\char92}indent{\char123}5{\char125}{\char92}newline\ {\char123}{\char92}em\ NOTE:\ I
the\ makeViewport3D\ command\ button\ to\ plot\ this\ curve\ example{\char125}.\nwnewline
{\char92}indent{\char123}0{\char125}{\char92}newline\nwnewline
Initially,\ the\ space\ which\ will\ hold\ the\ objects\ must\ be\ defined\ and\nwnewline
compiled,\ as\ in\ the\ following\ example:\nwnewline
{\char92}spadpaste{\char123}space\ :=\ create3Space(){\char92}{\char36}(ThreeSpace\ SF)\ {\c
Now\ objects\ can\ be\ sent\ to\ this\ {\char123}{\char92}em\ space{\char125}\ as\ per\ the\
allowed\ by\ the\ {\char92}spadtype{\char123}ThreeSpace{\char125}\ domain.\ \ The\ following
place\ curves\ into\nwnewline
{\char123}{\char92}em\ space{\char125}.\nwnewline
{\char92}spadpaste{\char123}curve(space,[[0,20,20],[0,20,30],[0,30,30],[0,30,100],\ \nwnewli

[30,0,70],\ [30,0,30],\ [40,0,20],\ [70,0,20]) \bound{curveG}}
Once {\em space} contains the desired elements a viewport is created
and displayed with the following command:
\graphpaste{makeViewport3D(space,[title("Curves")])\$VIEW3D
\free{space curveI curveB1 curveB2 curveM curveN curveA curveG}}
The parameters for \spadfun{makeViewport3D()} in this example are {\em
space}, which is the name of the three dimensional space that was
defined, and a string, "curve", which is the title for the viewport.
The tailing string {\em \$VIEW3D} exposes the command
\spadfun{makeViewport3D()} from the domain
\spadtype{ThreeDimensionalViewport} if these commands are unexposed.

3.48.11 Functions of One Variable

— graphics.ht —

```
\begin{page}{OneVariableGraphicsPage}{Functions of One Variable}
\beginscroll
Here we wish to plot a function y = f(x) on an interval [a,b].
As an example, let's take the function y = sin(tan(x)) - tan(sin(x))
on the interval [0,6].
Here is the simplest command that will do this:
\graphpaste{draw(sin(tan(x)) - tan(sin(x)),x = 0..6)}
Notice that Axiom compiled a function before the graph was put on the
screen.  The expression sin(tan(x)) - tan(sin(x)) was converted to a
compiled function so that it's value for various values of x could be
computed quickly and efficiently.  Let's graph the same function on a
different interval and this time we'll give the graph a title.  The
title is a String, which is an optional argument of the command
'draw'.
\graphpaste{draw(sin(tan(x)) - tan(sin(x)),x = 10..16,
title == "y = sin tan x - tan sin x")}
Once again the expression sin(tan(x)) - tan(sin(x)) was
converted to a compiled function before any points were computed.
If you want to graph the same function on a number of intervals, it's
a good idea to write down a function definition so that the function
only has to be compiled once.
Here's an example:
\spadpaste{f(x) == (x-1)*(x-2)*(x-3) \bound{f}}
\newline
\graphpaste{draw(f, 0..2, title == "y = f(x) on \[0,2\]") \free{f}}
\newline
\graphpaste{draw(f, 0..4,title == "y = f(x) on \[0,4\]") \free{f}}
Notice that our titles can be whatever we want, as long as they are
enclosed by double quotes.  However, a title which is too long to fit
within the viewport title window will be clipped.

———-

3.48.12 Parametric Curves

— graphics.ht —

```
\begin{page}{ParametricCurveGraphicsPage}{Parametric Curves}
\beginscroll
One way of producing interesting curves is by using parametric
equations.  Let x = f(t) and y = g(t) for two functions f and g as the
parameter t ranges over an interval \[a,b\].
Here's an example:
\graphpaste{draw(curve(sin(t)*sin(2*t)*sin(3*t),
sin(4*t)*sin(5*t)*sin(6*t)), t = 0..2*\%pi)}
Here 0..2*\%pi represents the interval over which the variable t ranges.
In the case of parametric curves, Axiom will compile two functions,
one for each of the functions f and g.
You may also put a title on a graph.
The title may be an arbitrary string and is an optional argument
to the command 'draw'.
For example:
\graphpaste{draw(curve(cos(t), sin(t)), t = 0..2*\%pi,
title == "The Unit Circle")}
If you plan on plotting x = f(t), y = g(t) as t ranges over several
intervals, you may want to define functions f and g, so that they need
not be recompiled every time you create a new graph.  Here's an
example:
\spadpaste{f(t:SF):SF == sin(3*t/4) \bound{f}}
\newline
\spadpaste{g(t:SF):SF == sin(t) \bound{g}}
\newline
\graphpaste{draw(curve(f,g), 0..\%pi) \free{f g}}
\newline
\graphpaste{draw(curve(f,g) ,\%pi..2*\%pi) \free{f g}}
\newline
```

```
\graphpaste{draw(curve(f,g), -4*\%pi..4*\%pi) \free{f g}}
These examples show how the curve changes as the range of
parameter t varies.

3.48.13 Polar Coordinates

— graphics.ht —

```
\begin{page}{PolarGraphicsPage}{Polar Coordinates}
\beginscroll
Graphs in polar coordinates are given by an equation r = f(theta) as
theta ranges over an interval.
This is equivalent to the parametric curve x = f(theta) * cos(theta),
y = f(theta) * sin(theta) as theta ranges over the same interval.
You may create such curves using the command 'draw', with the optional
argument 'coordinates == polar'.
Here are some examples:
\graphpaste{draw(1,t = 0..2*\%pi,coordinates == polar,
title == "The Unit Circle")}
\newline
\graphpaste{draw(sin(17*t), t = 0..2*\%pi, coordinates == polar,
title == "A Petal Curve")}
%When you don't specify an interval, Axiom will assume that you
%mean 0..2*\%pi.
You may also define your own functions, when you plan on plotting the
same curve as theta varies over several intervals.
\spadpaste{f(t) == cos(4*t/7) \bound{f}}
\newline
\graphpaste{draw(f, 0..2*\%pi, coordinates == polar) \free{f}}
\newline
\graphpaste{draw(f, 0..14*\%pi, coordinates == polar) \free{f}}
For information on plotting graphs in other coordinate systems see the
pages for the \spadtype{CoordinateSystems} domain.

———-

3.48.14 Implicit Curves

— graphics.ht —

```
\begin{page}{ImplicitCurveGraphicsPage}{Implicit Curves}
\beginscroll
Axiom has facilities for graphing a non-singular algebraic curve
in a rectangular region of the plane.
An algebraic curve is a curve defined by a polynomial equation
p(x,y) = 0.
Non-singular means that the curve is "smooth" in that it does not
cross itself or come to a point (cusp).
Algebraically, this means that for any point (a,b) on the curve
(i.e. a point such that p(a,b) = 0), the partial derivatives
dp/dx(a,b) and dp/dy(a,b) are not both zero.
We require that the polynomial have rational or integral coefficients.
Here is a Cartesian ovals algebraic curve example:
(click on the draw button to execute this example)
\spadpaste{p := ((x**2 + y**2 + 1) - 8*x)**2 -
(8*(x**2 + y**2 + 1) - 4*x - 1) \bound{p} }
\graphpaste{draw(p = 0, x, y, range == \[-1..11, -7..7\],
title == "Cartesian Ovals") \free{p}}
{\em A range must be declared for each variable specified in the
algebraic curve equation}.

3.48.15 Lists of Points

— graphics.ht —

```
\begin{page}{ListPointsGraphicsPage}{Lists of Points}
\beginscroll
Axiom has the ability to create lists of points in a two dimensional
graphics viewport.  This is done by utilizing the \spadtype{GraphImage}
and \spadtype{TwoDimensionalViewport} domain facilities.
\indent{5}\newline
{\em NOTE:  It is only necessary to click on the makeViewport2D command
button to plot this curve example}.
\indent{0}\newline
In this example, the \spadfun{makeGraphImage} command takes a list of
lists of points parameter, a list of colors for each point in the
graph, a list of colors for each line in the graph, and a list of
numbers which indicate the size of each point in the graph.  The
following lines create list of lists of points which can be read be
made into two dimensional graph images.
\spadpaste{p1 := point [1::SF,1::SF]\$(Point SF) \bound{p1}}
\newline
\spadpaste{p2 := point [0::SF,1::SF]\$(Point SF) \bound{p2}}
\newline
\spadpaste{p3 := point [0::SF,0::SF]\$(Point SF) \bound{p3}}
```

```
\newline
\spadpaste{p4 := point [1::SF,0::SF]\$(Point SF) \bound{p4}}
\newline
\spadpaste{p5 := point [1::SF,.5::SF]\$(Point SF) \bound{p5}}
\newline
\spadpaste{p6 := point [.5::SF,0::SF]\$(Point SF) \bound{p6}}
\newline
\spadpaste{p7 := point [0::SF,0.5::SF]\$(Point SF) \bound{p7}}
\newline
\spadpaste{p8 := point [.5::SF,1::SF]\$(Point SF) \bound{p8}}

bright red(), light green(), dim yellow(), bright blue(),
dark red(), pastel red(), light blue(), dim green(),
light yellow()] \bound{lc}}
\newline
Now the graph image is created and named according to the component
```

```
specifications indicated above.  The \spadfun{makeViewport2D} command
then creates a two dimensional viewport for this graph according to
the list of options specified within the brackets.
\spadpaste{g := makeGraphImage(llp,lpc,lc,lsize)\$GRIMAGE \bound{g}
\free{llp lpc lc lsize}}
\newline
\graphpaste{makeViewport2D(g,[title("Lines")])\$VIEW2D \free{g}}
The \spadfun{makeViewport2D} command takes a list of options as a
parameter.  In this example the string "Lines" is designated as the
viewport's title.

\nwnewline
{\char92}end{\char123}chunk{\char125}\nwnewline
{\char92}pagetitle{\char123}ViewportPage{\char125}{\char123}graphics.ht{\char125}{\char123}Stand-alone\
{\char92}begin{\char123}chunk{\char125}{\char123}graphics.ht{\char125}\nwnewline
{\char92}begin{\char123}page{\char125}{\char123}ViewportPage{\char125}{\char123}Stand-alone\ Viewport{\c
{\char92}beginscroll\nwnewline
To\ get\ a\ viewport\ on\ a\ Hyperdoc\ page,\ you\ first\ need\ to\nwnewline
create\ one\ in\ Axiom\ and\ write\ it\ out\ to\ a\nwnewline
file\ that\ Hyperdoc\ can\ call\ up.\ {\char92}newline\nwnewline
For\ example,\ here\ we\ draw\ a\ saddle\ function\ and\ assign\nwnewline
the\ result\ to\ the\ variable\ {\char92}spad{\char123}v{\char125}:\nwnewline
{\char92}newline\nwnewline
{\char92}graphpaste{\char123}v\ :=\ draw(x*x-y*y,x=-1..1,y=-1..1)\ {\char92}bound{\char123}v{\char125}{\
{\char92}newline\nwnewline
Now\ that\ we've\ created\ the\ viewport,\ we\ want\ to\ write\nwnewline
the\ data\ out\ to\ a\ file.\ {\char92}newline\nwnewline
To\ do\ this,\ we\ use\ the\ {\char92}spadfunFrom{\char123}write{\char125}{\char123}ThreeDimensionalView
command\ which\ takes\ the\ following\ arguments:\ the\ viewport\ to\ write\nwnewline
out,\ the\ title\ of\ the\ file\ to\ write\ it\ out\ to,\ and\ an\ optional\nwnewline
argument\ telling\ the\ write\ command\ what\ type\ (or\ types)\ of\ data\ you\nwnewline
want\ to\ write\ in\ additional\ to\ the\ one\ Axiom\ will\ always\ write\nwnewline
out.\ The\ optional\ argument\ could\ be\ a\ string,\ like\ "pixmap",\ or\ a\ list\nwnewline
of\ strings,\ like\ {\char92}["postscript","pixmap"{\char92}].\ \ Hyperdoc\ needs\ a\nwnewline
"pixmap"\ data\ type\ to\ include\ a\ graph\ in\ a\ page\ so\ in\ this\ case,\ we\nwnewline
write\ the\ viewport\ and\ tell\ it\ to\ also\ write\ a\ "pixmap"\ file,\ as\ well:\nwnewline
{\char92}newline\nwnewline
```

```
{\char92}spadpaste{\char123}write(v,"saddle","pixmap")\ {\char92}free{\char123}v{\char125}{\c
{\char92}newline\nwnewline
Now\ we\ want\ to\ put\ this\ viewport\ into\ a\ Hyperdoc\ page.\nwnewline
Say\ you've\ created\ a\ viewport\ and\ written\ it\ out\nwnewline
to\ a\ file\ called\ "/tmp/mobius".\ (Axiom\ actually\nwnewline
tags\ a\ ".view"\ at\ the\ end\ of\ a\ viewport\ data\ file\ to\nwnewline
make\ it\ easier\ to\ spot\ when\ you're\ rummaging\ through\nwnewline
your\ file\ system,\ but\ you\ needn't\ worry\ about\ that\ here\nwnewline
since\ Axiom\ will\ always\ automatically\ add\ on\ a\nwnewline
".view"\ for\ you.)\ \ {\char92}newline\nwnewline
\nwnewline
{\char123}{\char92}bf\ Including\ Viewports{\char125}\ {\char92}newline\nwnewline
To\ put\ a\ viewport\ in\ a\nwnewline
Hyperdoc\ page,\ include\ the\ following\ line\ in\ your\ Hyperdoc\nwnewline
source\ code:\ {\char92}newline\nwnewline
{\char92}space{\char123}5{\char125}{\char92}{\char92}viewport{\char92}{\char123}/tmp/mobius{\
You\ will\ get\ this\ on\ your\ page:\ {\char92}newline\nwnewline
{\char37}{\char37}{\char37}{\char92}space{\char123}4{\char125}{\char92}viewport{\char123}/tmp
{\char37}{\char92}space{\char123}4{\char125}{\char92}spadviewport{\char123}mobius{\char125}{\
{\char92}centerline{\char123}{\char92}spadviewport{\char123}mobius{\char125}{\char125}{\char
\nwnewline
{\char123}{\char92}bf\ Creating\ Viewport\ Buttons{\char125}\ {\char92}newline\nwnewline
To\ make\ an\ active\ button\ that\ would\ make\ this\ viewport\nwnewline
come\ to\ life,\ include\ the\ following:\ {\char92}newline\nwnewline
{\char92}space{\char123}5{\char125}{\char92}{\char92}viewportbutton{\char92}{\char123}ViewBut
this\ creates\ this\ button...{\char92}newline\nwnewline
{\char37}{\char37}{\char37}{\char92}centerline{\char123}{\char92}viewportbutton{\char123}View
{\char92}centerline{\char123}{\char92}spadviewportbutton{\char123}ViewButton{\char125}{\char
\nwnewline
{\char123}{\char92}bf\ Creating\ Active\ Viewports{\char125}\ {\char92}newline\nwnewline
To\ merge\ the\ two\ things\ descibed\ above,\ namely,\ getting\ a\ picture\ of\ a\nwnewline
viewport\ and\ creating\ a\ button\ to\ invoke\ a\ live\ viewport,\ you\ can\ do\nwnewline
the\ following:\ {\char92}newline\nwnewline
\nwnewline
{\char37}{\char92}space{\char123}5{\char125}{\char92}{\char92}viewportasbutton{\char92}{\char
{\char92}centerline{\char123}{\char92}{\char92}viewportasbutton{\char92}{\char123}/tmp/mobiu
\nwnewline
This\ would\ create\ a\ picture\ of\ a\ viewport\ that\ is\ an\ active\nwnewline
button\ as\ well.\ Try\ it:\nwnewline
\nwnewline
{\char37}{\char37}{\char37}{\char92}space{\char123}5{\char125}{\char92}viewportasbutton{\char
{\char37}{\char92}space{\char123}5{\char125}{\char92}spadviewportasbutton{\char123}mobius{\c
{\char92}centerline{\char123}{\char92}spadviewportasbutton{\char123}mobius{\char125}{\char12
\nwnewline
{\char123}{\char92}bf\ Including\ Viewports\ Distributed\ with\ Axiom{\char125}\ {\char92}new
All\ the\ above\ commands\ have\ counterparts\ that\ allow\ you\ to\nwnewline
access\ viewports\ that\ are\ already\ packaged\ with\ Axiom.\nwnewline
To\ include\ those\ viewports,\ just\ add\ on\ an\ "axiom"\ prefix\nwnewline
to\ the\ above\ commands:\ {\char92}newline\nwnewline
\nwnewline
```

```
{\char92}centerline{\char123}{\char92}{\char92}axiomviewport{\char92}{\char123}vA{\char92}{\char125}\ fo
{\char92}centerline{\char123}{\char92}{\char92}axiomviewportbutton{\char92}{\char123}vB{\char92}{\char12
{\char92}centerline{\char123}{\char92}{\char92}axiomviewportasbutton{\char92}{\char123}vC{\char92}{\char
{\char92}newline\nwnewline
\nwnewline
All\ these\ macros\ really\ do\ is\ include\ some\ path\ that\nwnewline
indicates\ where\ Axiom\ stores\ the\ viewports.\nwnewline
{\char92}newline\nwnewline
{\char92}endscroll\nwnewline
{\char92}autobuttons\ \nwnewline

{\char37}\ author:\ J.\ Grabmeier,\ \ 08/08/89\nwnewline
{\char92}beginscroll\nwnewline
In\ what\ follows\ you'll\ see\ how\ to\ use\ Axiom\ to\ get\ all\ the\ irreducible\nwnewlin
representations\ of\ the\ alternating\ group\ {\char92}texht{\char123}{\char36}A{\char95}6{\
field\ with\ two\ elements\ (GF\ 2).\ \ First,\ we\ generate\ {\char92}texht{\char123}{\char
```

```
by\ a\ three-cycle:\ x\ =\ (1,2,3)\ and\ a\ 5-cycle:\ y\ =\ (2,3,4,5,6).\ \ Next\ we\nwnewline
have\ Axiom\ calculate\ the\ permutation\ representation\ over\ the\ integers\nwnewline
and\ over\ GF\ 2:\nwnewline
{\char92}spadpaste{\char123}genA6\ :\ LIST\ PERM\ INT\ :=\ [cycle\ [1,2,3],cycle\ [2,3,4,5,6}
\bound{genA6}}
\spadpaste{pRA6 := permutationRepresentation (genA6, 6) \bound{pRA6}
\free{genA6}
}
Now we apply Parker's 'Meat-Axe' and split it:
\spadpaste{sp0 := meatAxe (pRA6::(LIST MATRIX PF 2)) \free{pRA6}
\bound{sp0}}
We have found the trivial module as a quotient module
and a 5-dimensional sub-module.
Try to split again:
\spadpaste{sp1 := meatAxe sp0.1 \bound{sp1}}
and we find a 4-dimensional sub-module and the trivial one again.
Now we can test if this representaton is absolutely irreducible:
\spadpaste{isAbsolutelyIrreducible? sp1.2 }
and we see that this 4-dimensional representation is absolutely
irreducible.  So, we have found a second irreducible representation.
Now, we construct a representation by reducing an irreducible one of
the symmetric group S_6 over the integers mod 2.  We take the one
labelled by the partition [2,2,1,1] and restrict it to
\texht{$A_6$}{A6}:
\spadpaste{d2211 := irreducibleRepresentation ([2,2,1,1],genA6)
\bound{d2211} }
Now split it:
\spadpaste{d2211m2 := d2211:: (LIST MATRIX PF 2);
sp2 := meatAxe d2211m2 \free{d2211}
\bound{sp2}}
This gave both a five and a four dimensional representation.
Now we take the 4-dimensional one
and we shall see that it is absolutely irreducible:
\spadpaste{isAbsolutelyIrreducible? sp2.1}
The two 4-dimensional representations are not equivalent:
\spadpaste{areEquivalent? (sp1.2, sp2.1)}
So we have found a third irreducible representation.
Now we construct a new representation using the tensor product
and try to split it:
\spadpaste{dA6d16 := tensorProduct(sp1.2,sp2.1);
meatAxe dA6d16 \bound{dA6d16}}
The representation is irreducible, but it may be not
absolutely irreducible.
\spadpaste{isAbsolutelyIrreducible? dA6d16}
So let's try the same procedure over the field with 4 elements:
\spadpaste{sp3 := meatAxe (dA6d16 :: (LIST MATRIX FF(2,2))) \bound{sp3}}
Now we find two 8-dimensional representations, dA6d8a and dA6d8b.
Both are absolutely irreducible...
\spadpaste{isAbsolutelyIrreducible?  sp3.1}
\spadpaste{isAbsolutelyIrreducible?  sp3.2}
```

```
and they are not equivalent:
\spadpaste{areEquivalent? (sp3.1,sp3.2)}
So we have found five absolutely irreducible representations
of \texht{$A_6$}{A6}
in characteristic 2.
General theory now tells us that there are no more irreducible ones.
Here, for future reference are all the absolutely irreducible 2-modular
representations of \texht{$A_6$}{A6}
\spadpaste{sp0.2 \free{sp0}}
\spadpaste{sp1.2 \free{sp1}}
\spadpaste{sp2.1 \free{sp2}}
\spadpaste{sp3.1 \free{sp3}}
\spadpaste{sp3.2 \free{sp3}}
And here again is the irreducible, but not absolutely irreducible
representations of \texht{$A_6$}{A6} over GF 2
\spadpaste{dA6d16 \free{dA6d16}}

3.48.16 Representation Theory

— grpthry.ht —

```
\begin{page}{InfoRepTheoryPage}{Representation Theory}
\beginscroll
\horizontalline
Representation theory for finite groups studies finite groups by
embedding them in a general linear group over a field or an integral
```

```
domain.  Hence, we are representing each element of the group by an
invertible matrix.  Two matrix representations of a given group are
equivalent, if, by changing the basis of the underlying space, you can
go from one to the other.  When you change bases, you transform the
matrices that are the images of elements by conjugating them by an
invertible matrix.
\newline
\newline
If we can find a subspace which is fixed under the image of the group,
then there exists a ‘base change’ after which all the representing
matrices are in upper triangular block form. The block matrices on
the main diagonal give a new representation of the group of lower
degree.  Such a representation is said to be ‘reducible’.

3.48.17 Group Theory

— **grpthry.ht** —

```
\begin{page}{InfoGroupTheoryPage}{Group Theory}
%%
%% Johannes Grabmeier 03/02/90
%%
\beginscroll
```

```
A {\it group} is a set G together with an associative operation *
satisfying the axioms of existence of a unit element and an inverse of
every element of the group.  The Axiom category \spadtype{Group}
represents this setting.  Many data structures in Axiom are groups and
therefore there is a large variety of examples as fields and
polynomials, although the main interest there is not the group
structure.

To work with and in groups in a concrete manner some way of
representing groups has to be chosen. A group can be given as a list
of generators and a set of relations. If there are no relations, then
we have a {\it free group}, realized in the domain
\spadtype{FreeMonoid} which won't be discussed here.  We consider {\it
permutation groups}, where a group is realized as a subgroup of the
symmetric group of a set, i.e.  the group of all bijections of a set,
the operation being the composition of maps.  Indeed, every group can
be realized this way, although this may not be practical.

Furthermore group elements can be given as invertible matrices.  The
group operation is reflected by matrix multiplication.  More precise
in representation theory group homomophisms from a group to general
linear groups are contructed.  Some algorithms are implemented in
Axiom.

3.49 gstbl.ht

3.49.1 GeneralSparseTable

⇒ "notitle" (TableXmpPage) 3.94.1 on page 1278

— gstbl.ht —

```
\begin{page}{GeneralSparseTableXmpPage}{GeneralSparseTable}
\beginscroll

Sometimes when working with tables there is a natural value to use as
the entry in all but a few cases.  The \spadtype{GeneralSparseTable}
constructor can be used to provide any table type with a default value
for entries.  See \downlink{`Table'}{TableXmpPage}\ignore{Table} for
general information about tables.
\showBlurb{GeneralSparseTable}

Suppose we launched a fund-raising campaign to raise fifty thousand
dollars.  To record the contributions, we want a table with strings as
keys (for the names) and integer entries (for the amount).  In a data
base of cash contributions, unless someone has been explicitly
entered, it is reasonable to assume they have made a zero dollar
contribution.
\xtc{
This creates a keyed access file with default entry \spad{0}.
}{
\spadpaste{patrons: GeneralSparseTable(String, Integer,
KeyedAccessFile(Integer), 0) := table() ; \bound{patrons}}
}
\xtc{
Now \spad{patrons} can be used just as any other table.
Here we record two gifts.
}{
\spadpaste{patrons."Smith" := 10500 \free{patrons}\bound{smith}}
}
\xtc{
}{
\spadpaste{patrons."Jones" := 22000 \free{smith}\bound{jones}}
}
\xtc{
Now let us look up the size of the contributions from Jones and Stingy.
}{
\spadpaste{patrons."Jones"  \free{jones}}
}
\xtc{
}{
\spadpaste{patrons."Stingy" \free{jones}}
}
\xtc{
Have we met our seventy thousand dollar goal?
}{
\spadpaste{reduce(+, entries patrons) \free{jones}}
}
\noOutputXtc{
So the project is cancelled and we can delete the data base:
}{
\spadpaste{)system rm -r kaf*.sdata \free{patrons}}

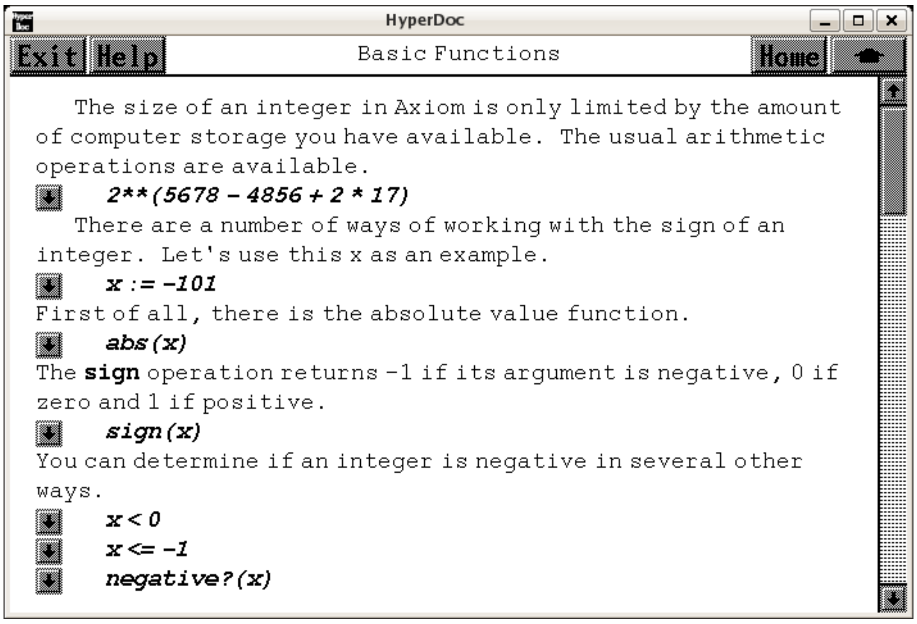
————-

3.52.2 Basic Functions



The size of an integer in Axiom is only limited by the amount of computer storage you have available. The usual arithmetic operations are available.

```
2**(5678 - 4856 + 2 * 17)
```

There are a number of ways of working with the sign of an integer. Let's use this x as an example.

```
x := -101
```

First of all, there is the absolute value function.

```
abs(x)
```

The **sign** operation returns -1 if its argument is negative, 0 if zero and 1 if positive.

```
sign(x)
```

You can determine if an integer is negative in several other ways.

```
x < 0
x <= -1
negative?(x)
```

\begin{page}{ugxIntegerBasicPage}{Basic Functions}
\beginscroll

\labelSpace{3pc}
\xtc{
The size of an integer in Axiom is only limited by the amount of
computer storage you have available.
The usual arithmetic operations are available.
}{
\spadpaste{2**(5678 - 4856 + 2 * 17)}
}

\xtc{
There are a number of ways of working with the sign of an integer.
Let's use this \spad{x} as an example.
}{
\spadpaste{x := -101 \bound{x}}
}
\xtc{
```

```
First of all, there is the absolute value function.
}{
\spadpaste{abs(x) \free{x}}
}
\xtc{
The \spadfunFrom{sign}{Integer} operation returns \spad{-1} if its
argument is negative, \spad{0} if zero and \spad{1} if positive.
}{
\spadpaste{sign(x) \free{x}}
}
%
\xtc{
You can determine if an integer is negative in several other ways.
}{
\spadpaste{x < 0 \free{x}}
}
\xtc{
}{
\spadpaste{x <= -1 \free{x}}
}
\xtc{
}{
\spadpaste{negative?(x) \free{x}}
}
%
\xtc{
Similarly, you can find out if it is positive.
}{
\spadpaste{x > 0 \free{x}}
}
\xtc{
}{
\spadpaste{x >= 1 \free{x}}
}
\xtc{
}{
\spadpaste{positive?(x) \free{x}}
}
\xtc{
This is the recommended way of determining whether an integer is zero.
}{
\spadpaste{zero?(x) \free{x}}
}

\beginImportant
Use the \spadfunFrom{zero?}{Integer} operation whenever you are
testing any mathematical object for equality with zero.  This is
usually more efficient that using \spadop{=} (think of matrices: it is
easier to tell if a matrix is zero by just checking term by term than
constructing another ``zero'' matrix and comparing the two matrices
```

```
term by term) and also avoids the problem that \spadop{=} is usually
used for creating equations.
\endImportant

\xtc{
This is the recommended way of determining
whether an integer is equal to one.
}{
\spadpaste{one?(x) \free{x}}
}

\xtc{
This syntax is used to test equality using \spadopFrom{=}{Integer}.
It says that you want a \spadtype{Boolean} (\spad{true} or
\spad{false}) answer rather than an equation.
}{
\spadpaste{(x = -101)@Boolean \free{x}}
}

\xtc{
The operations \spadfunFrom{odd?}{Integer} and
\spadfunFrom{even?}{Integer} determine whether an integer is odd or
even, respectively.  They each return a \spadtype{Boolean} object.
}{
\spadpaste{odd?(x) \free{x}}
}
\xtc{
}{
\spadpaste{even?(x) \free{x}}
}
\xtc{
The operation \spadfunFrom{gcd}{Integer} computes the greatest common
divisor of two integers.
}{
\spadpaste{gcd(56788,43688)}
}
\xtc{
The operation
\spadfunFrom{lcm}{Integer} computes their least common multiple.
}{
\spadpaste{lcm(56788,43688)}
}
\xtc{
To determine the maximum of two integers, use \spadfunFrom{max}{Integer}.
}{
\spadpaste{max(678,567)}
}
\xtc{
To determine the minimum, use \spadfunFrom{min}{Integer}.
}{
```

```
\spadpaste{min(678,567)}
}

\xtc{
The \spadfun{reduce} operation is used to extend
binary operations to more than two arguments.
For example, you can use \spadfun{reduce} to find the maximum integer in
a list or compute the least common multiple of all integers in the list.
}{
\spadpaste{reduce(max,[2,45,-89,78,100,-45])}
}
\xtc{
}{
\spadpaste{reduce(min,[2,45,-89,78,100,-45])}
}
\xtc{
}{
\spadpaste{reduce(gcd,[2,45,-89,78,100,-45])}
}
\xtc{
}{
\spadpaste{reduce(lcm,[2,45,-89,78,100,-45])}
}

\xtc{
The infix operator ``/'' is {\it not} used to compute the quotient
of integers.
Rather, it is used to create rational numbers as described in
\downlink{`Fraction'}{FractionXmpPage}\ignore{Fraction}.
}{
\spadpaste{13 / 4}
}
\xtc{
The infix operation \spadfunFrom{quo}{Integer} computes the integer
quotient.
}{
\spadpaste{13 quo 4}
}
\xtc{
The infix operation \spadfunFrom{rem}{Integer} computes the integer
remainder.
}{
\spadpaste{13 rem 4}
}
\xtc{
One integer is evenly divisible by another if the remainder is zero.
The operation \spadfunFrom{exquo}{Integer} can also be used.
See \downlink{``Unions''}{ugTypesUnionsPage} in Section 2.5
\ignore{ugTypesUnions} for an example.
}{
```

```
\spadpaste{zero?(167604736446952 rem 2003644)}
}

\xtc{
The operation \spadfunFrom{divide}{Integer} returns a record of the
quotient and remainder and thus is more efficient when both are needed.
}{
\spadpaste{d := divide(13,4) \bound{d}}
}
\xtc{
}{
\spadpaste{d.quotient \free{d}}
}
\xtc{
Records are discussed in detail in
\downlink{``Records''}{ugTypesRecordsPage} in Section 2.4
\ignore{ugTypesRecords}.
}{
\spadpaste{d.remainder \free{d}}
}

\endscroll

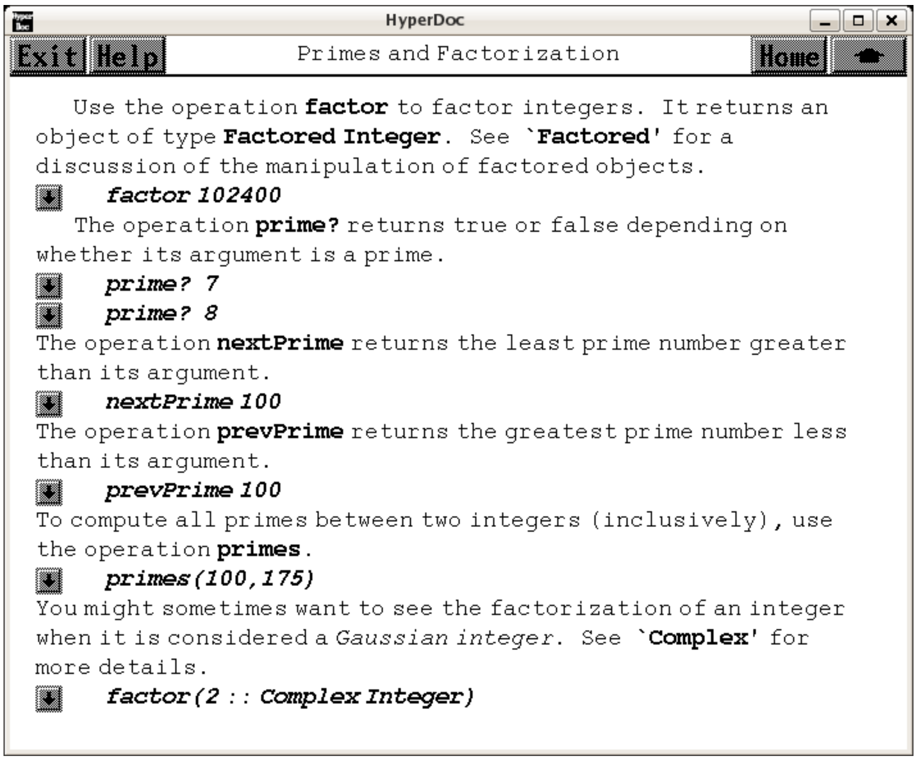
3.52.3 Primes and Factorization



Use the operation **factor** to factor integers. It returns an object of type **Factored Integer**. See `**Factored**' for a discussion of the manipulation of factored objects.

factor 102400

The operation **prime?** returns true or false depending on whether its argument is a prime.

prime? 7

prime? 8

The operation **nextPrime** returns the least prime number greater than its argument.

nextPrime 100

The operation **prevPrime** returns the greatest prime number less than its argument.

prevPrime 100

To compute all primes between two integers (inclusively), use the operation **primes**.

primes(100,175)

You might sometimes want to see the factorization of an integer when it is considered a *Gaussian integer*. See `**Complex**' for more details.

factor(2 :: Complex Integer)

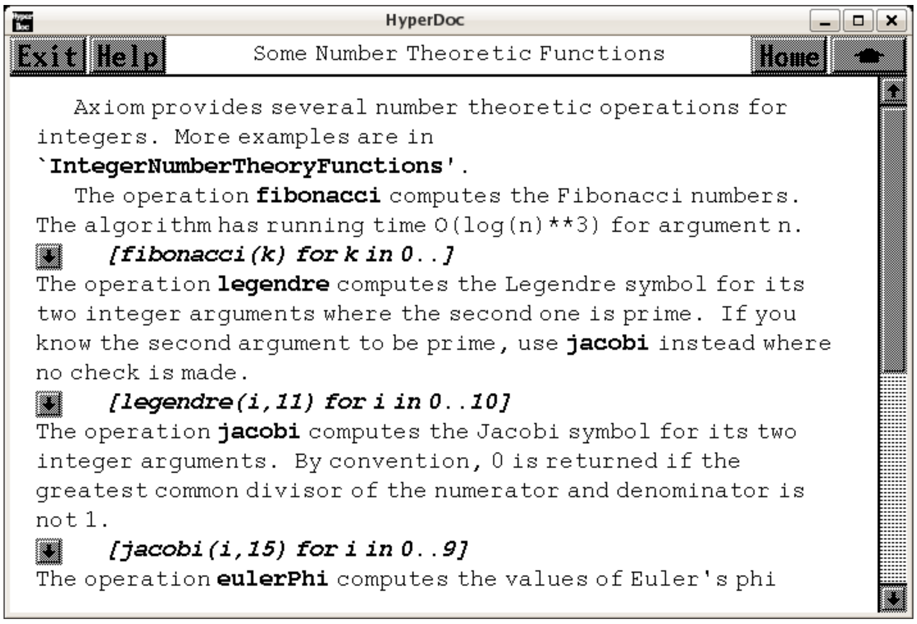
3.52.4 Some Number Theoretic Functions



Axiom provides several number theoretic operations for integers. More examples are in **`IntegerNumberTheoryFunctions'**.
The operation **fibonacci** computes the Fibonacci numbers. The algorithm has running time O(log(n)**3) for argument n.
[fibonacci(k) for k in 0..]
The operation **legendre** computes the Legendre symbol for its two integer arguments where the second one is prime. If you know the second argument to be prime, use **jacobi** instead where no check is made.
[legendre(i,11) for i in 0..10]
The operation **jacobi** computes the Jacobi symbol for its two integer arguments. By convention, 0 is returned if the greatest common divisor of the numerator and denominator is not 1.
[jacobi(i,15) for i in 0..9]
The operation **eulerPhi** computes the values of Euler's phi

⇐ “Integer” (IntegerXmpPage) 3.52.1 on page 679

⇒ "IntegerNumberTheoryFunctions" (IntNumberTheoryFnsXmpPage) 3.53.1 on page 705

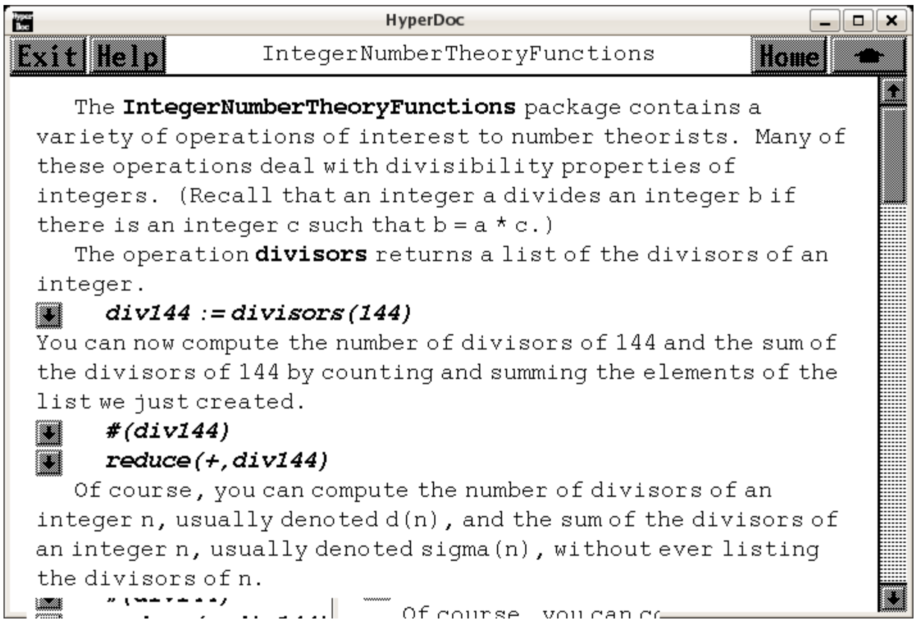
3.53 intheory.ht

3.53.1 IntegerNumberTheoryFunctions



The **IntegerNumberTheoryFunctions** package contains a variety of operations of interest to number theorists. Many of these operations deal with divisibility properties of integers. (Recall that an integer a divides an integer b if there is an integer c such that b = a * c.)

The operation **divisors** returns a list of the divisors of an integer.

div144 := divisors(144)

You can now compute the number of divisors of 144 and the sum of the divisors of 144 by counting and summing the elements of the list we just created.

#(div144)

reduce(+,div144)

Of course, you can compute the number of divisors of an integer n, usually denoted d(n), and the sum of the divisors of an integer n, usually denoted sigma(n), without ever listing the divisors of n.

```
\begin{page}{IntNumberTheoryFnsXmpPage}
{IntegerNumberTheoryFunctions}
\beginscroll

The \spadtype{IntegerNumberTheoryFunctions} package contains a variety
of operations of interest to number theorists.  Many of these
operations deal with divisibility properties of integers.  (Recall
that an integer \spad{a} divides an integer \spad{b} if there is an
integer \spad{c} such that \spad{b = a * c}.)

\xtc{
The operation \spadfunFrom{divisors}{IntegerNumberTheoryFunctions}
returns a list of the divisors of an integer.
}{
\spadpaste{div144 := divisors(144) \bound{div144}}
}
\xtc{
You can now compute the number of divisors of \spad{144} and the sum of
the divisors of \spad{144} by counting and summing the elements of the
list we just created.
}{
\spadpaste{\#(div144) \free{div144}}
}
\xtc{
}{
\spadpaste{reduce(+,div144) \free{div144}}
}

Of course, you can compute the number of divisors of an integer \spad{n},
usually denoted \spad{d(n)}, and the sum of the divisors of an integer
\spad{n}, usually denoted \spad{\texht{$\sigma$}{sigma}(n)},
without ever listing the divisors of \spad{n}.

\xtc{
In Axiom, you can simply call the operations
\spadfunFrom{numberOfDivisors}{IntegerNumberTheoryFunctions} and
\spadfunFrom{sumOfDivisors}{IntegerNumberTheoryFunctions}.
}{
\spadpaste{numberOfDivisors(144)}
}
\xtc{
}{
\spadpaste{sumOfDivisors(144)}
}

The key is that \spad{d(n)} and
\spad{\texht{$\sigma$}{sigma}(n)}
are ``multiplicative functions.''
This means that when \spad{n} and \spad{m} are relatively prime,
that is, when
\spad{n} and \spad{m} have no prime factor in common, then
\spad{d(nm) = d(n) d(m)} and
\spad{\texht{$\sigma$}{sigma}(nm) = \texht{$\sigma$}{sigma}(n)
\texht{$\sigma$}{sigma}(m)}.
Note that these functions are trivial to compute when \spad{n} is a prime
power and are computed for general \spad{n} from the prime factorization
of \spad{n}.
Other examples of multiplicative functions are
\spad{\texht{$\sigma_k$}{sigma_k}(n)}, the sum of the \eth{\spad{k}}
powers of the divisors of \spad{n} and
\texht{$\varphi(n)$}{\spad{phi(n)}}, the
number of integers between 1 and \spad{n} which are prime to \spad{n}.
The corresponding Axiom operations are called
\spadfunFrom{sumOfKthPowerDivisors}{IntegerNumberTheoryFunctions} and
\spadfunFrom{eulerPhi}{IntegerNumberTheoryFunctions}.

An interesting function is \spad{\texht{$\mu$}{mu}(n)},
the \texht{M\"{o}bius $\mu$}{Moebius mu} function, defined
```

```
as follows:
\spad{\texht{$\mu$}{mu}(1) = 1}, \spad{\texht{$\mu$}{mu}(n) = 0},
when \spad{n} is divisible by a
square, and
\spad{\texht{$\mu = {(-1)}^k$}{mu(n) = (-1) ** k}}, when \spad{n}
is the product of \spad{k} distinct primes.
The corresponding Axiom operation is
\spadfunFrom{moebiusMu}{IntegerNumberTheoryFunctions}.
This function occurs in the following theorem:

\noindent
{\bf Theorem} (\texht{M\"{o}bius}{Moebius} Inversion Formula): \newline
%\texht{\begin{quotation}\noindent}{\newline\indent{5}}
Let \spad{f(n)} be a function on the positive integers and let \spad{F(n)}
be defined by
\texht{\narrowDisplay{F(n) = \sum_{d \mid n} f(n)}}{\spad{F(n) =}
sum of \spad{f(n)} over \spad{d | n}}
where the sum is taken over the positive divisors of \spad{n}.
Then the values of \spad{f(n)} can be recovered from the values of
\spad{F(n)}:
\texht{\narrowDisplay{f(n) = \sum_{d \mid n} \mu(n) F({{n}\over {d}})}}
{\spad{f(n) =}
sum of \spad{mu(n) F(n/d)} over \spad{d | n},}
where again the sum is taken over the positive divisors of \spad{n}.

\xtc{
When \spad{f(n) = 1}, then \spad{F(n) = d(n)}.
Thus, if you sum \spad{\texht{$\mu$}{mu}(d) \texht{$\cdot$}{*} d(n/d)}
over the positive divisors
\spad{d} of \spad{n}, you should always get \spad{1}.
}{
\spadpaste{f1(n) == reduce(+,[moebiusMu(d) * numberOfDivisors(quo(n,d))
for d in divisors(n)]) \bound{f1}}
}
\xtc{
}{
\spadpaste{f1(200) \free{f1}}
}
\xtc{
}{
\spadpaste{f1(846) \free{f1}}
}
\xtc{
Similarly,
when \spad{f(n) = n}, then \spad{F(n) = \texht{$\sigma$}{sigma}(n)}.
Thus, if you sum \spad{\texht{$\mu$}{mu}(d) \texht{$\cdot$}{*}
\texht{$\sigma$}{sigma}(n/d)} over the positive divisors
\spad{d} of \spad{n}, you should always get \spad{n}.
}{
\spadpaste{f2(n) == reduce(+,[moebiusMu(d) * sumOfDivisors(quo(n,d))
for d in divisors(n)]) \bound{f2}}
}
\xtc{
}{
\spadpaste{f2(200) \free{f2}}
}
\xtc{
}{
\spadpaste{f2(846) \free{f2}}
}

The Fibonacci numbers are defined by \spad{F(1) = F(2) = 1} and
\spad{F(n) = F(n-1) + F(n-2)} for \spad{n = 3,4, ...}.
\xtc{
The operation \spadfunFrom{fibonacci}{IntegerNumberTheoryFunctions}
computes the \eth{\spad{n}} Fibonacci number.
}{
\spadpaste{fibonacci(25)}
}
\xtc{
}{
\spadpaste{[fibonacci(n) for n in 1..15]}
}
\xtc{
Fibonacci numbers can also be expressed as sums of binomial coefficients.
}{
\spadpaste{fib(n) == reduce(+,[binomial(n-1-k,k)
for k in 0..quo(n-1,2)]) \bound{fib}}
}
\xtc{
}{
\spadpaste{fib(25) \free{fib}}
}
\xtc{
}{
\spadpaste{[fib(n) for n in 1..15] \free{fib}}
}

Quadratic symbols can be computed with the operations
\spadfunFrom{legendre}{IntegerNumberTheoryFunctions} and
\spadfunFrom{jacobi}{IntegerNumberTheoryFunctions}.
The Legendre symbol
\texht{$\left({a \over p}\right)$}{\spad{(a/p)}}
is defined for integers \spad{a} and
\spad{p} with \spad{p} an odd prime number.
By definition, \texht{$\left({a \over p}\right)$}{\spad{(a/p) = +1}},
when \spad{a} is a square \spad{(mod p)},
\texht{$\left({a \over p}\right)$}{\spad{(a/p) = -1}},
when \spad{a} is not a square \spad{(mod p)}, and
```

```
\texht{$\left({a \over p}\right)$}{\spad{(a/p) = 0}},
when \spad{a} is divisible by \spad{p}.
\xtc{
You compute \texht{$\left({a \over p}\right)$}{\spad{(a/p)}}
via the command \spad{legendre(a,p)}.
}{
\spadpaste{legendre(3,5)}
}
\xtc{
}{
\spadpaste{legendre(23,691)}
}
The Jacobi symbol \texht{$\left({a \over n}\right)$}{\spad{(a/n)}}
is the usual extension of the Legendre
symbol, where \spad{n} is an arbitrary integer.
The most important property of the Jacobi symbol is the following:
if \spad{K} is a quadratic field with discriminant \spad{d} and quadratic
character \texht{$\chi$}{\spad{chi}},
then \texht{$\chi$}{\spad{chi}}\spad{(n) = (d/n)}.
Thus, you can use the Jacobi symbol
to compute, say, the class numbers of
imaginary quadratic fields from a standard class number formula.
\xtc{
This function computes the class number of the imaginary
quadratic field with discriminant \spad{d}.
}{
\spadpaste{h(d) == quo(reduce(+, [jacobi(d,k) for k in 1..quo(-d, 2)]),
2 - jacobi(d,2)) \bound{h}}
}
\xtc{
}{
\spadpaste{h(-163) \free{h}}
}
\xtc{
}{
\spadpaste{h(-499) \free{h}}
}
\xtc{
}{
\spadpaste{h(-1832) \free{h}}
}

\begin{page}{KeyedAccessFileXmpPage}{KeyedAccessFile}
\beginscroll

The domain \spadtype{KeyedAccessFile(S)} provides files which can be
used as associative tables.  Data values are stored in these files and
can be retrieved according to their keys.  The keys must be strings so
this type behaves very much like the \spadtype{StringTable(S)} domain.
The difference is that keyed access files reside in secondary storage
while string tables are kept in memory.  For more information on
table-oriented operations, see the description of \spadtype{Table}.

\xtc{
Before a keyed access file can be used, it must first be opened.
A new file can be created by opening it for output.
}{
\spadpaste{ey: KeyedAccessFile(Integer) :=
open("/tmp/editor.year", "output")  \bound{ey}}
}
\xtc{
Just as for vectors, tables or lists, values are saved in a keyed
access file by setting elements.
}{
\spadpaste{ey."Char"     := 1986 \free{ey}\bound{eya}}
}
\xtc{
}{
\spadpaste{ey."Caviness" := 1985 \free{ey}\bound{eyb}}
}
\xtc{
}{
\spadpaste{ey."Fitch"    := 1984 \free{ey}\bound{eyc}}
}
\xtc{
Values are retrieved using application, in any of its syntactic forms.
}{
\spadpaste{ey."Char"     \free{eya}}
}
\xtc{
}{
```

```
\spadpaste{ey("Char")    \free{eya}}
}
\xtc{
}{
\spadpaste{ey "Char"     \free{eya}}
}
\xtc{
Attempting to retrieve a non-existent element in this way causes an
error.  If it is not known whether a key exists, you should use the
\spadfunFrom{search}{KeyedAccessFile} operation.
}{
\spadpaste{search("Char", ey)   \free{eya,eyb,eyc}\bound{eyaa}}
}
\xtc{
}{
\spadpaste{search("Smith", ey)  \free{eyaa}}
}
\xtc{
When an entry is no longer needed, it can be removed from the file.
}{
\spadpaste{remove!("Char", ey)  \free{eyaa}\bound{eybb}}
}
\xtc{
The \spadfunFrom{keys}{KeyedAccessFile} operation returns a list of
all the keys for a given file.
}{
\spadpaste{keys ey  \free{eybb}}
}
\xtc{
The \spadfunFrom{\#}{KeyedAccessFile} operation gives the
number of entries.
}{
\spadpaste{\#ey     \free{eybb}}
}

The table view of keyed access files provides safe operations.
That is, if the Axiom program is terminated between file operations,
the file is left in a consistent, current state.
This means, however, that the operations are somewhat costly.
For example, after each update the file is closed.
\xtc{
Here we add several more items to the file, then check its contents.
}{
\spadpaste{KE := Record(key: String, entry: Integer)  \bound{KE}}
}
\xtc{
}{
\spadpaste{reopen!(ey, "output")  \free{eybb,KE}\bound{eycc}}
}
\xtc{
```

```
If many items are to be added to a file at the same time, then
it is more efficient to use the
\spadfunFromX{write}{KeyedAccessFile} operation.
}{
\spadpaste{write!(ey, ["van Hulzen", 1983]\$KE) \bound{eyccA}\free{eycc}}
}
\xtc{
}{
\spadpaste{write!(ey, ["Calmet", 1982]\$KE) \bound{eyccB}\free{eycc}}
}
\xtc{
}{
\spadpaste{write!(ey, ["Wang", 1981]\$KE) \bound{eyccC}\free{eycc}}
}
\xtc{
}{
\spadpaste{close! ey   \free{eyccA,eyccB,eyccC}\bound{eydd}}
}
\xtc{
The \spadfunFromX{read}{KeyedAccessFile} operation is also available
from the file view, but it returns elements in a random order.  It is
generally clearer and more efficient to use the
\spadfunFrom{keys}{KeyedAccessFile} operation and to extract elements
by key.
}{
\spadpaste{keys ey     \free{eydd}}
}
\xtc{
}{
\spadpaste{members ey  \free{eydd}}
}
\noOutputXtc{
}{
\spadpaste{)system rm -r /tmp/editor.year  \free{ey}}
}

3.55 kernel.ht

3.55.1 Kernel

⇒ “notitle” (BasicOperatorXmpPage) 3.10.1 on page 155
⇒ “notitle” (ExpressionXmpPage) 3.33.1 on page 422

— **kernel.ht** —

```
\begin{page}{KernelXmpPage}{Kernel}
\beginscroll

A {\it kernel} is a symbolic function application (such as
\spad{sin(x + y)}) or a symbol (such as \spad{x}).
More precisely, a non-symbol
kernel over a set {\it S} is an operator applied to a given list of
arguments from {\it S}.  The operator has type
\axiomType{BasicOperator} (see
\downlink{`BasicOperator'}{BasicOperatorXmpPage}\ignore{BasicOperator})
and the kernel object is usually part of an expression object (see
\downlink{`Expression'}{ExpressionXmpPage}\ignore{Expression}).

Kernels are created implicitly for you when you
create expressions.
\xtc{
}{
\spadpaste{x :: Expression Integer}
}
\xtc{
You can directly create a ``symbol'' kernel by using the
\axiomFunFrom{kernel}{Kernel} operation.
}{
\spadpaste{kernel x}
}
\xtc{
This expression has two different kernels.
}{
\spadpaste{sin(x) + cos(x) \bound{sincos}}
}
\xtc{
The operator \axiomFunFrom{kernels}{Expression} returns a list
of the kernels in an object of type \axiomType{Expression}.
}{
\spadpaste{kernels \% \free{sincos}}
}
\xtc{
This expression also has two different kernels.
}{
\spadpaste{sin(x)**2 + sin(x) + cos(x) \bound{sincos2}}
}
\xtc{
The \spad{sin(x)} kernel is used twice.
}{
\spadpaste{kernels \% \free{sincos2}}
}
\xtc{
An expression need not contain any kernels.
}{
\spadpaste{kernels(1 :: Expression Integer)}
}
\xtc{
If one or more kernels are present, one of them is
designated the {\it main} kernel.
```

```
}{
\spadpaste{mainKernel(cos(x) + tan(x))}
}
\xtc{
Kernels can be nested. Use \axiomFunFrom{height}{Kernel} to determine
the nesting depth.
}{
\spadpaste{height kernel x}
}
\xtc{
This has height 2 because the \spad{x} has height 1 and then we apply
an operator to that.
}{
\spadpaste{height mainKernel(sin x)}
}
\xtc{
}{
\spadpaste{height mainKernel(sin cos x)}
}
\xtc{
}{
\spadpaste{height mainKernel(sin cos (tan x + sin x))}
}
\xtc{
Use the \axiomFunFrom{operator}{Kernel} operation to extract the
operator component of the kernel.
The operator has type \axiomType{BasicOperator}.
}{
\spadpaste{operator mainKernel(sin cos (tan x + sin x))}
}
\xtc{
Use the \axiomFunFrom{name}{Kernel} operation to extract the name of
the operator component of the kernel.  The name has type
\axiomType{Symbol}.  This is really just a shortcut for a two-step
process of extracting the operator and then calling
\axiomFunFrom{name}{BasicOperator} on the operator.
}{
\spadpaste{name mainKernel(sin cos (tan x + sin x))}
}
Axiom knows about functions such as \axiomFun{sin}, \axiomFun{cos}
and so on and can make kernels and then expressions using them.
To create a kernel and expression using an arbitrary operator, use
\axiomFunFrom{operator}{BasicOperator}.
\xtc{
Now \spad{f} can be used to create symbolic function applications.
}{
\spadpaste{f := operator 'f \bound{f}}
}
\xtc{
}{
```

```
\spadpaste{e := f(x, y, 10) \free{f}\bound{e}}
}
\xtc{
Use the \axiomFunFrom{is?}{Kernel} operation to learn if the
operator component of a kernel is equal to a given operator.
}{
\spadpaste{is?(e, f) \free{f e}}
}
\xtc{
You can also use a symbol or a string as the second
argument to \axiomFunFrom{is?}{Kernel}.
}{
\spadpaste{is?(e, 'f) \free{e}}
}
\xtc{
Use the \axiomFunFrom{argument}{Kernel} operation to get a list containing
the argument component of a kernel.
}{
\spadpaste{argument mainKernel e \free{f}\free{e}}
}

Conceptually, an object of type \axiomType{Expression} can be thought
of a quotient of multivariate polynomials, where the ``variables''
are kernels.
The arguments of the kernels are again expressions and so the
structure recurses.
See
\downlink{`Expression'}{ExpressionXmpPage}\ignore{Expression}
for examples of using kernels to
take apart expression objects.

———-

3.56 lazm3pk.ht

3.56.1 LazardSetSolvingPackage

— lazm3pk.ht —

```
\begin{page}{LazardSetSolvingPackageXmpPage}{LazardSetSolvingPackage}
\beginscroll
The \spadtype{LazardSetSolvingPackage} package constructor solves
polynomial systems by means of Lazard triangular sets.  However one
condition is relaxed: Regular triangular sets whose saturated ideals
have positive dimension are not necessarily normalized.

The decompositions are computed in two steps.  First the algorithm of
Moreno Maza (implemented in the \spadtype{RegularTriangularSet} domain
constructor) is called.  Then the resulting decompositions are
converted into lists of square-free regular triangular sets and the
redundant components are removed.  Moreover, zero-dimensional regular
triangular sets are normalized.

Note that the way of understanding triangular decompositions
is detailed in the example of the \spadtype{RegularTriangularSet}
constructor.

The \spadtype{LazardSetSolvingPackage} constructor takes six arguments.
The first one, {\bf R}, is the coefficient ring of the polynomials;
it must belong to the category \spadtype{GcdDomain}.
The second one, {\bf E}, is the exponent monoid of the polynomials;
it must belong to the category \spadtype{OrderedAbelianMonoidSup}.
the third one, {\bf V}, is the ordered set of variables;
it must belong to the category \spadtype{OrderedSet}.
The fourth one is the polynomial ring;
it must belong to the category
\spadtype{RecursivePolynomialCategory(R,E,V)}.
The fifth one is a domain of the category
\spadtype{RegularTriangularSetCategory(R,E,V,P)}
and the last one is a domain of the category
\spadtype{SquareFreeRegularTriangularSetCategory(R,E,V,P)}.
The abbreviation for \spadtype{LazardSetSolvingPackage} is
\spad{LAZM3PK}.

{\bf N.B.} For the purpose of solving zero-dimensional algebraic
systems, see also \spadtype{LexTriangularPackage} and
\spadtype{ZeroDimensionalSolvePackage}.
These packages are easier to call than \spad{LAZM3PK}.
Moreover, the \spadtype{ZeroDimensionalSolvePackage}
package  provides operations
to compute either the complex roots or the real roots.

We illustrate now the use of the \spadtype{LazardSetSolvingPackage}
package constructor with two examples (Butcher and Vermeer).

\xtc{
Define the coefficient ring.
}{
```

```
\spadpaste{R := Integer \bound{R}}
}

\xtc{
Define the list of variables,
}{
\spadpaste{ls : List Symbol := [b1,x,y,z,t,v,u,w] \bound{ls}}
}

\xtc{
and make it an ordered set;
}{
\spadpaste{V := OVAR(ls) \free{ls} \bound{V}}
}

\xtc{
then define the exponent monoid.
}{
\spadpaste{E := IndexedExponents V \free{V} \bound{E}}
}

\xtc{
Define the polynomial ring.
}{
\spadpaste{P := NSMP(R, V) \free{R} \free{V} \bound{P}}
}

\xtc{
Let the variables be polynomial.
}{
\spadpaste{b1: P := 'b1  \free{P} \bound{b1}}
}
\xtc{
}{
\spadpaste{x: P := 'x \free{P} \bound{x}}
}
\xtc{
}{
\spadpaste{y: P := 'y \free{P} \bound{y}}
}
\xtc{
}{
\spadpaste{z: P := 'z \free{P} \bound{z}}
}
\xtc{
}{
\spadpaste{t: P := 't \free{P} \bound{t}}
}
\xtc{
}{
\spadpaste{u: P := 'u  \free{P} \bound{u}}
}
\xtc{
}{
\spadpaste{v: P := 'v  \free{P} \bound{v}}
}
\xtc{
}{
\spadpaste{w: P := 'w  \free{P} \bound{w}}
}

\xtc{
Now call the \spadtype{RegularTriangularSet} domain constructor.
}{
\spadpaste{T := REGSET(R,E,V,P) \free{R} \free{E} \free{V}
\free{P} \bound{T} }
}

\xtc{
Define a polynomial system (the Butcher example).
}{
\spadpaste{p0 := b1 + y + z - t - w \free{b1} \free{x} \free{y}
\free{z} \free{t} \free{u} \free{v} \free{w} \bound{p0}}
}
\xtc{
}{
\spadpaste{p1 := 2*z*u + 2*y*v + 2*t*w - 2*w**2 - w - 1 \free{b1}
\free{x} \free{y} \free{z} \free{t} \free{u} \free{v} \free{w} \bound{p1}}
}
\xtc{
}{
\spadpaste{p2 := 3*z*u**2 + 3*y*v**2 - 3*t*w**2 + 3*w**3 +
3*w**2 - t + 4*w \free{b1} \free{x} \free{y} \free{z} \free{t}
\free{u} \free{v} \free{w} \bound{p2}}
}
\xtc{
}{
\spadpaste{p3 := 6*x*z*v - 6*t*w**2 + 6*w**3 - 3*t*w +
6*w**2 - t + 4*w \free{b1} \free{x} \free{y} \free{z}
\free{t} \free{u} \free{v} \free{w} \bound{p3}}
}
\xtc{
}{
\spadpaste{p4 := 4*z*u**3+ 4*y*v**3+ 4*t*w**3- 4*w**4 -
6*w**3+ 4*t*w- 10*w**2- w- 1 \free{b1} \free{x} \free{y}
\free{z} \free{t} \free{u} \free{v} \free{w} \bound{p4}}
}
\xtc{
}{
```

```
\spadpaste{p5 := 8*x*z*u*v +8*t*w**3 -8*w**4 +4*t*w**2 -
12*w**3 +4*t*w -14*w**2 -3*w -1  \free{b1} \free{x} \free{y}
\free{z} \free{t} \free{u} \free{v} \free{w} \bound{p5}}
}
\xtc{
}{
\spadpaste{p6 := 12*x*z*v**2+12*t*w**3 -12*w**4 +12*t*w**2 -
18*w**3 +8*t*w -14*w**2 -w -1 \free{b1} \free{x} \free{y}
\free{z} \free{t} \free{u} \free{v} \free{w} \bound{p6}}
}
\xtc{
}{
\spadpaste{p7 := -24*t*w**3 + 24*w**4 - 24*t*w**2 + 36*w**3 -
8*t*w + 26*w**2 + 7*w + 1 \free{b1} \free{x} \free{y} \free{z}
\free{t} \free{u} \free{v} \free{w} \bound{p7}}
}
\xtc{
}{
\spadpaste{lp := [p0, p1, p2, p3, p4, p5, p6, p7] \free{p0}
\free{p1} \free{p2} \free{p3} \free{p4} \free{p5} \free{p6}
\free{p7} \bound{lp}}
}

\xtc{
First of all, let us solve this system in the sense of Lazard
by means of the \spadtype{REGSET} constructor:
}{
\spadpaste{lts := zeroSetSplit(lp,false)$T\free{lp}\free{T}\bound{lts}}
}

\xtc{
We can get the dimensions of each component
of a decomposition as follows.
}{
\spadpaste{[coHeight(ts) for ts in lts] \free{lts}}
}

The first five sets have a simple shape.
However, the last one, which has dimension zero, can be simplified
by using Lazard triangular sets.

\xtc{
Thus we call the \spadtype{SquareFreeRegularTriangularSet} domain
constructor,
}{
\spadpaste{ST := SREGSET(R,E,V,P) \free{R} \free{E} \free{V}
\free{P} \bound{ST} }
}

\xtc{
```

```
and set the \spadtype{LAZM3PK} package constructor to our situation.
}{
\spadpaste{pack := LAZM3PK(R,E,V,P,T,ST) \free{R} \free{E}
\free{V} \free{P} \free{T} \free{ST} \bound{pack} }
}

\xtc{
We are ready to solve the system by means of Lazard triangular sets:
}{
\spadpaste{zeroSetSplit(lp,false)$pack \free{lp} \free{pack}}
}

We see the sixth triangular set is {\em nicer} now:
each one of its polynomials has a constant initial.

We follow with the Vermeer example. The ordering is the usual one
for this system.

\xtc{
Define the polynomial system.
}{
\spadpaste{f0 := (w - v) ** 2 + (u - t) ** 2 - 1 \free{b1} \free{x}
\free{y} \free{z} \free{t} \free{u} \free{v} \free{w} \bound{f0}}
}
\xtc{
}{
\spadpaste{f1 := t ** 2 - v ** 3 \free{b1} \free{x} \free{y} \free{z}
\free{t} \free{u} \free{v} \free{w} \bound{f1}}
}
\xtc{
}{
\spadpaste{f2 := 2 * t * (w - v) + 3 * v ** 2 * (u - t) \free{b1}
\free{x} \free{y} \free{z} \free{t} \free{u} \free{v} \free{w}
\bound{f2}}
}
\xtc{
}{
\spadpaste{f3 := (3 * z * v ** 2 - 1) * (2 * z * t - 1) \free{b1}
\free{x} \free{y} \free{z} \free{t} \free{u} \free{v} \free{w}
\bound{f3}}
}
\xtc{
}{
\spadpaste{lf := [f0, f1, f2, f3] \free{f0} \free{f1} \free{f2}
\free{f3} \bound{lf}}
}

\xtc{
First of all, let us solve this system in the sense of Kalkbrener by
```

```
means of the \spadtype{REGSET}
constructor:
}{
\spadpaste{zeroSetSplit(lf,true)$T \free{lf} \free{T}}
}

We have obtained one regular chain (i.e. regular triangular set) with
dimension 1.  This set is in fact a characterist set of the (radical
of) of the ideal generated by the input system {\bf lf}.  Thus we have
only the {\em generic points} of the variety associated with {\bf lf}
(for the elimination ordering given by {\bf ls}).

So let us get now a full description of this variety.
\xtc{
Hence, we solve this system in the sense of Lazard by means of the
\spadtype{REGSET}
constructor:
}{
\spadpaste{zeroSetSplit(lf,false)$T \free{lf} \free{T}}
}

We retrieve our regular chain of dimension 1 and we get three regular
chains of dimension 0 corresponding to the {\em degenerated cases}.
We want now to simplify these zero-dimensional regular chains by using
Lazard triangular sets.  Moreover, this will allow us to prove that
the above decomposition has no redundant component.  {\bf N.B.}
Generally, decompositions computed by the \spadtype{REGSET}
constructor do not have redundant components.  However, to be sure
that no redundant component occurs one needs to use the
\spadtype{SREGSET} or \spadtype{LAZM3PK} constructors.

\xtc{
So let us solve the input system  in the sense of Lazard by means of
the \spadtype{LAZM3PK} constructor:
}{
\spadpaste{zeroSetSplit(lf,false)$pack \free{lf} \free{pack}}
}

Due to square-free factorization, we obtained now four
zero-dimensional regular chains.  Moreover, each of them is normalized
(the initials are constant).  Note that these zero-dimensional
components may be investigated further with the
\spadtype{ZeroDimensionalSolvePackage} package constructor.

3.58 lextripk.ht

3.58.1 LexTriangularPackage

— lextripk.ht —

```
\begin{page}{LexTriangularPkgXmpPage}{LexTriangularPackage}
\beginscroll
The \spadtype{LexTriangularPackage} package constructor provides
an implementation of the {\em lexTriangular} algorithm
(D. Lazard "Solving Zero-dimensional Algebraic Systems",
J. of Symbol. Comput., 1992).
This algorithm decomposes a zero-dimensional variety into zero-sets of
regular triangular sets.  Thus the input system must have a finite
number of complex solutions.  Moreover, this system needs to be a
lexicographical Groebner basis.

This package takes two arguments: the coefficient-ring {\bf R} of the
polynomials, which must be a \spadtype{GcdDomain} and their set of
variables given by {\bf ls} a \spadtype{List Symbol}.  The type of the
input polynomials must be
\spadtype{NewSparseMultivariatePolynomial(R,V)} where {\bf V} is
\spadtype{OrderedVariableList(ls)}.  The abbreviation for
\spadtype{LexTriangularPackage} is \spadtype{LEXTRIPK}.  The main
operations are \axiomOpFrom{lexTriangular}{LexTriangularPackage} and
\axiomOpFrom{squareFreeLexTriangular}{LexTriangularPackage}.  The
later provide decompositions by means of square-free regular
triangular sets, built with the \spadtype{SREGSET} constructor,
whereas the former uses the \spadtype{REGSET} constructor.  Note that
these constructors also implement another algorithm for solving
algebraic systems by means of regular triangular sets; in that case no
computations of Groebner bases are needed and the input system may
have any dimension (i.e. it may have an infinite number of solutions).
```

```
The implementation of the {\em lexTriangular} algorithm provided in
the \spadtype{LexTriangularPackage} constructor differs from that
reported in "Computations of gcd over algebraic towers of simple
extensions" by M. Moreno Maza and R. Rioboo (in proceedings of
AAECC11, Paris, 1995).  Indeed, the
\axiomOpFrom{squareFreeLexTriangular}{LexTriangularPackage} operation
removes all multiplicities of the solutions (i.e. the computed
solutions are pairwise different) and the
\axiomOpFrom{lexTriangular}{LexTriangularPackage} operation may keep
some multiplicities; this latter operation runs generally faster than
the former.

The interest of the {\em lexTriangular} algorithm is due to the
following experimental remark.  For some examples, a triangular
decomposition of a zero-dimensional variety can be computed faster via
a lexicographical Groebner basis computation than by using a direct
method (like that of \spadtype{SREGSET} and \spadtype{REGSET}).  This
happens typically when the total degree of the system relies
essentially on its smallest variable (like in the {\em Katsura}
systems).  When this is not the case, the direct method may give
better timings (like in the {\em Rose} system).

Of course, the direct method can also be applied to a lexicographical
Groebner basis.  However, the {\em lexTriangular} algorithm takes
advantage of the structure of this basis and avoids many unnecessary
computations which are performed by the direct method.

For this purpose of solving algebraic systems with a finite number of
solutions, see also the \spadtype{ZeroDimensionalSolvePackage}.  It
allows to use both strategies (the lexTriangular algorithm and the
direct method) for computing either the complex or real roots of a
system.

Note that the way of understanding triangular decompositions
is detailed in the example of the \spadtype{RegularTriangularSet}
constructor.

Since the \spadtype{LEXTRIPK} package constructor is limited to
zero-dimensional systems, it provides a
\axiomOpFrom{zeroDimensional?}{LexTriangularPackage} operation to
check whether this requirement holds.  There is also a
\axiomOpFrom{groebner}{LexTriangularPackage} operation to compute the
lexicographical Groebner basis of a set of polynomials with type
\spadtype{NewSparseMultivariatePolynomial(R,V)}.  The elimination
ordering is that given by {\bf ls} (the greatest variable being the
first element of {\bf ls}).  This basis is computed by the {\em FLGM}
algorithm (Faugere et al. "Efficient Computation of Zero-Dimensional
Groebner Bases by Change of Ordering" , J. of Symbol. Comput., 1993)
implemented in the \spadtype{LinGroebnerPackage} package constructor.
Once a lexicographical Groebner basis is computed,
then one can call the operations
\axiomOpFrom{lexTriangular}{LexTriangularPackage}
and \axiomOpFrom{squareFreeLexTriangular}{LexTriangularPackage}.
Note that these operations admit an optional argument
to produce normalized triangular sets.
There is also a \axiomOpFrom{zeroSetSplit}{LexTriangularPackage}
operation which does all the job from the input system;
an error is produced if this system is not zero-dimensional.

Let us illustrate the facilities of the \spadtype{LEXTRIPK} constructor
by a famous example, the {\em cyclic-6 root} system.
\xtc{
Define the coefficient ring.
}{
\spadpaste{R := Integer \bound{R}}
}
\xtc{
Define the list of variables,
}{
\spadpaste{ls : List Symbol := [a,b,c,d,e,f] \bound{ls}}
}
\xtc{
and make it an ordered set.
}{
\spadpaste{V := OVAR(ls) \free{ls} \bound{V}}
}
\xtc{
Define the polynomial ring.
}{
\spadpaste{P := NSMP(R, V) \free{R} \free{V} \bound{P}}
}
\xtc{
Define the polynomials.
}{
\spadpaste{p1: P :=  a*b*c*d*e*f - 1 \free{P} \bound{p1}}
}
\xtc{
}{
\spadpaste{p2: P := a*b*c*d*e +a*b*c*d*f +a*b*c*e*f +a*b*d*e*f +
a*c*d*e*f +b*c*d*e*f  \free{P} \bound{p2}}
}
\xtc{
}{
\spadpaste{p3: P :=  a*b*c*d + a*b*c*f + a*b*e*f + a*d*e*f +
b*c*d*e + c*d*e*f \free{P} \bound{p3}}
}
\xtc{
}{
\spadpaste{p4: P := a*b*c + a*b*f + a*e*f + b*c*d + c*d*e + d*e*f
\free{P} \bound{p4}}
```

```
}
\xtc{
}{
\spadpaste{p5: P := a*b + a*f + b*c + c*d + d*e + e*f \free{P}
\bound{p5}}
}
\xtc{
}{
\spadpaste{p6: P := a + b + c + d + e + f  \free{P} \bound{p6}}
}
\xtc{
}{
\spadpaste{lp := [p1, p2, p3, p4, p5, p6] \free{p1} \free{p2}
\free{p3} \free{p4} \free{p5} \free{p6} \bound{lp}}
}
\xtc{
Now call \spadtype{LEXTRIPK} .
}{
\spadpaste{lextripack :=  LEXTRIPK(R,ls) \free{R} \free{ls}
\bound{lextripack}}
}
\xtc{
Compute the lexicographical Groebner basis of the system.
This may take between 5 minutes and one hour, depending on your machine.
}{
\spadpaste{lg := groebner(lp)$lextripack \free{lp}
\free{lextripack} \bound{lg}}
}
\xtc{
Apply lexTriangular to compute a decomposition into regular triangular sets.
This should not take more than 5 seconds.
}{
\spadpaste{lexTriangular(lg,false)$lextripack \free{lg}
\free{lextripack}}
}
Note that the first set of the decomposition is normalized
(all initials are integer numbers) but not the second one
(normalized triangular sets are defined in the
description of the \spadtype{NormalizedTriangularSetCategory}
constructor).
\xtc{
So apply now lexTriangular to produce normalized triangular sets.
}{
\spadpaste{lts := lexTriangular(lg,true)$lextripack \free{lg}
\free{lextripack} \bound{lts}}
}
\xtc{
We check that all initials are constant.
}{
\spadpaste{{\tt{}init(p)\ for\ p\ in\ (ts\ ::\ List(P))]\ for\ ts\ in\ lts]\ \ \nwnewline

{\char92}axiomOpFrom{\char123}squareFreeLexTriangular{\char125}{\char123}LexTriangularPackage{\char125}\
we\ retrieve\ the\ above\ decomposition.\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}squareFreeLexTriangular(lg,true){\char36}lextripack\ {\char92}free{\char123}
{\char92}free{\char123}lextripack{\char125}{\char125}\nwnewline
{\char125}\nwnewline
Thus\ the\ solutions\ given\ by\ {\char123}{\char92}bf\ lts{\char125}\ are\ pairwise\ different.\nwnewli
{\char92}xtc{\char123}\nwnewline
We\ count\ them\ as\ follows.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}reduce(+,[degree(ts)\ for\ ts\ in\ lts])\ {\char92}free{\char123}lts{\char12
{\char125}\nwnewline
\nwnewline
We\ can\ investigate\ the\ triangular\ decomposition\ {\char123}{\char92}bf\ lts{\char125}\ by\nwnewline
using\ the\ {\char92}spadtype{\char123}ZeroDimensionalSolvePackage{\char125}.\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ requires\ to\ add\ an\ extra\ variable\ (smaller\ than\ the\ others)\ as\ follows.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}ls2\ :\ List\ Symbol\ :=\ concat(ls,new(){\char36}Symbol)\ {\char92}free{\ch
{\char92}bound{\char123}ls2{\char125}{\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
Then\ we\ call\ the\ package.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}zdpack\ :=\ ZDSOLVE(R,ls,ls2)\ {\char92}free{\char123}R{\char125}\ {\char92}
{\char92}free{\char123}ls2{\char125}\ {\char92}bound{\char123}zdpack{\char125}{\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
We\ compute\ a\ univariate\ representation\ of\ the\ variety\ associated\ with\nwnewline
the\ input\ system\ as\ follows.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}concat\ [univariateSolve(ts){\char36}zdpack\ for\ ts\ in\ lts]\ \nwnewline
{\char92}free{\char123}lts{\char125}\ {\char92}free{\char123}zdpack{\char125}{\char125}\nwnewline
{\char125}\nwnewline
Since\ the\ \nwnewline
{\char92}axiomOpFrom{\char123}univariateSolve{\char125}{\char123}ZeroDimensionalSolvePackage{\char125}\
split\ a\ regular\ set,\ it\ returns\ a\ list.\ This\ explains\ the\ use\nwnewline
of\ {\char92}axiomOpFrom{\char123}concat{\char125}{\char123}List{\char125}.\nwnewline
\nwnewline
Look\ at\ the\ last\ item\ of\ the\ result.\ It\ consists\ of\ two\ parts.\ \ For\nwnewline
any\ complex\ root\ {\char123}{\char92}bf\ ?{\char125}\ of\ the\ univariate\ polynomial\ in\
part,\ we\ get\ a\ tuple\ of\ univariate\ polynomials\ (in\ {\char123}{\char92}bf\ a{\char12
{\char123}{\char92}bf\ f{\char125}\ respectively)\ by\ replacing\ {\char123}{\char92}bf\ {\c
part.\ Each\ of\ these\ tuples\ {\char123}{\char92}bf\ t{\char125}\ describes\ a\ point\ of\
associated\ with\ {\char123}{\char92}bf\ lp{\char125}\ by\ equaling\ to\ zero\ the\ polynomi
{\char123}{\char92}bf\ t{\char125}.\nwnewline
\nwnewline
Note\ that\ the\ way\ of\ reading\ these\ univariate\ representations\ is\nwnewline
explained\ also\ in\ the\ example\ illustrating\ the\nwnewline
{\char92}spadtype{\char123}ZeroDimensionalSolvePackage{\char125}\ constructor.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
Now,\ we\ compute\ the\ points\ of\ the\ variety\ with\ real\ coordinates.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}concat\ [realSolve(ts){\char36}zdpack\ for\ ts\ in\ lts]\ {\char
{\char92}free{\char123}zdpack{\char125}{\char125}\nwnewline
{\char125}\nwnewline
We\ obtain\ 24\ points\ given\ by\ lists\ of\ elements\ in\ the\ \nwnewline
{\char92}spadtype{\char123}RealClosure{\char125}\ of\ {\char92}spadtype{\char123}Fraction{\c
In\ each\ list,\ the\ first\ value\ corresponds\ to\ the\ indeterminate\ {\char123}{\char92}
the\ second\ to\ {\char123}{\char92}bf\ e{\char125}\ and\ so\ on.\nwnewline
See\ {\char92}spadtype{\char123}ZeroDimensionalSolvePackage{\char125}\ to\ learn\ more\ abou

— **lib.ht** —

```
\begin{page}{LibraryXmpPage}{Library}
\beginscroll

The \spadtype{Library} domain provides a simple way to store Axiom
values in a file.  This domain is similar to
\spadtype{KeyedAccessFile} but fewer declarations are needed and items
of different types can be saved together in the same file.

\xtc{
To create a library, you supply a file name.
}{
\spadpaste{stuff := library "/tmp/Neat.stuff" \bound{stuff}}
}
\xtc{
Now values can be saved by key in the file.
The keys should be mnemonic, just as the field names are for records.
They can be given either as strings or symbols.
}{
\spadpaste{stuff.int    := 32**2     \free{stuff}\bound{stuffa}}
}
\xtc{
}{
\spadpaste{stuff."poly" := x**2 + 1  \free{stuffa}\bound{stuffb}}
}
\xtc{
}{
\spadpaste{stuff.str    := "Hello"   \free{stuffb}\bound{stuffc}}
}
\xtc{
You obtain
the set of available keys using the \spadfunFrom{keys}{Library} operation.
}{
\spadpaste{keys stuff \free{stuffa,stuffb,stuffc}\bound{stuffabc}}
}
\xtc{
You extract values  by giving the desired key in this way.
}{
\spadpaste{stuff.poly     \free{stuffb}}
}
\xtc{
}{
\spadpaste{stuff("poly")  \free{stuffb}}
}
\noOutputXtc{
When the file is no longer needed, you should remove it from the
file system.
}{
\spadpaste{)system rm -rf /tmp/Neat.stuff  \free{stuff}\bound{rmstuff}}
}
```

```

\beginscroll
A \spadgloss{list} is a finite collection of elements in a specified
order that can contain duplicates.
A list is a convenient structure to work with because it is easy
to add or remove elements and the length need not be constant.
There are many different kinds of lists in Axiom, but the
default types (and those used most often) are created by the
\spadtype{List} constructor.
For example, there are objects of type \spadtype{List Integer},
\spadtype{List Float} and \spadtype{List Polynomial Fraction Integer}.
Indeed, you can even have \spadtype{List List List Boolean}
(that is, lists of lists of lists of Boolean values).
You can have lists of any type of Axiom object.

3.61.2 Creating Lists

— list.ht —

```
\begin{page}{ugxListCreatePage}{Creating Lists}
\beginscroll

The easiest way to create a list with, for example, the elements
\spad{2, 4, 5, 6} is to enclose the elements with square
brackets and separate the elements with commas.
\xtc{
The spaces after the commas are optional, but they do improve the
readability.
}{
\spadpaste{[2, 4, 5, 6]}
}
\xtc{
To create a list with the single element \spad{1}, you can use
either \spad{[1]} or the operation \spadfunFrom{list}{List}.
}{
\spadpaste{[1]}
}
\xtc{
}{
\spadpaste{list(1)}
}
\xtc{
Once created, two lists \spad{k} and \spad{m} can be
concatenated by issuing \spad{append(k,m)}.
\spadfunFrom{append}{List} does {\it not} physically join the lists,
but rather produces a new list with the elements coming from the two
arguments.
}{
\spadpaste{append([1,2,3],[5,6,7])}
}
\xtc{
Use \spadfunFrom{cons}{List} to append an element onto the front of a
list.
}{
\spadpaste{cons(10,[9,8,7])}
}

3.61.3 Accessing List Elements

— list.ht —

```
\begin{page}{ugxListAccessPage}{Accessing List Elements}
\beginscroll

\labelSpace{4pc}
\xtc{
To determine whether a list has any elements, use the operation
\spadfunFrom{empty?}{List}.
}{
\spadpaste{empty? [x+1]}
}
\xtc{
Alternatively, equality with the list constant \spadfunFrom{nil}{List}
can be tested.
}{
```

```
\spadpaste{([] = nil)@Boolean}
}

\xtc{
We'll use this in some of the following examples.
}{
\spadpaste{k := [4,3,7,3,8,5,9,2] \bound{k}}
}
\xtc{
Each of the next four expressions extracts the \spadfunFrom{first}{List}
element of \spad{k}.
}{
\spadpaste{first k \free{k}}
}
\xtc{
}{
\spadpaste{k.first \free{k}}
}
\xtc{
}{
\spadpaste{k.1 \free{k}}
}
\xtc{
}{
\spadpaste{k(1) \free{k}}
}
The last two forms generalize to \spad{k.i} and \spad{k(i)},
respectively, where
\texht{$ 1 \leq i \leq n$}{\spad{1 <= i <= n}}
and
\spad{n} equals the length of \spad{k}.
\xtc{
This length is calculated by \spadopFrom{\#}{List}.
}{
\spadpaste{n := \#k \free{k}}
}
Performing an operation such as \spad{k.i} is sometimes
referred to as {\it indexing into k} or
{\it elting into k}.
The latter phrase comes about because the name of the operation
that extracts elements is called \spadfunFrom{elt}{List}.
That is, \spad{k.3} is just alternative syntax for \spad{elt(k,3)}.
It is important to remember that list indices
begin with 1.
If we issue \spad{k := [1,3,2,9,5]} then \spad{k.4}
returns \spad{9}.
It is an error to use an index that is not in the range from
\spad{1} to the length of the list.

\xtc{
```

```
The last element of a list is extracted by any of the
following three expressions.
}{
\spadpaste{last k \free{k}}
}
\xtc{
}{
\spadpaste{k.last \free{k}}
}
\xtc{
This form computes the index of the last element and then
extracts the element from the list.
}{
\spadpaste{k.(\#k) \free{k}}
}

3.61.4 Changing List Elements

— list.ht —

```
\begin{page}{ugxListChangePage}{Changing List Elements}
\beginscroll

\labelSpace{4pc}
\xtc{
We'll use this in some of the following examples.
}{
\spadpaste{k := [4,3,7,3,8,5,9,2] \bound{k}}
}
\xtc{
List elements are reset by using the \spad{k.i} form on
the left-hand side of an assignment.
This expression resets the first element of \spad{k} to \spad{999}.
}{
\spadpaste{k.1 := 999 \free{k}\bound{k1}}
}
\xtc{
As with indexing into a list, it is an error to use an index
that is not within the proper bounds.
Here you see that \spad{k} was modified.
}{
\spadpaste{k \free{k1}}
}

The operation that performs the assignment of an element to a particular
position in a list is called \spadfunFrom{setelt}{List}.
This operation is {\it destructive} in that it changes the list.
In the above example, the assignment returned the value \spad{999} and
\spad{k} was modified.
For this reason, lists are called \spadglos{mutable} objects: it is
possible to change part of a list (mutate it) rather than always returning
a new list reflecting the intended modifications.
\xtc{
Moreover, since lists can share structure, changes to one list can
sometimes affect others.
}{
\spadpaste{k := [1,2] \bound{k2}}
}
\xtc{
}{
\spadpaste{m := cons(0,k) \free{k2}\bound{m}}
}
\xtc{
Change the second element of \spad{m}.
}{
```

```
\spadpaste{m.2 := 99 \free{m}\bound{m2}}
}
\xtc{
See, \spad{m} was altered.
}{
\spadpaste{m \free{m2}}
}
\xtc{
But what about \spad{k}?
It changed too!
}{
\spadpaste{k  \free{m2 k2}}
}

3.61.5 Other Functions

— list.ht —

```
\begin{page}{ugxListOtherPage}{Other Functions}
\beginscroll

\labelSpace{3pc}
\xtc{
An operation that is used frequently in list processing is that
which returns all elements in a list after the first element.
}{
\spadpaste{k := [1,2,3] \bound{k}}
}
\xtc{
Use the \spadfunFrom{rest}{List} operation to do this.
}{
\spadpaste{rest k \free{k}}
}

\xtc{
To remove duplicate elements in a list \spad{k}, use
\spadfunFrom{removeDuplicates}{List}.
}{
\spadpaste{removeDuplicates [4,3,4,3,5,3,4]}
}
\xtc{
To get a list with elements in the order opposite to those in
a list \spad{k}, use \spadfunFrom{reverse}{List}.
}{
\spadpaste{reverse [1,2,3,4,5,6]}
}
\xtc{
To test whether an element is in a list, use \spadfunFrom{member?}{List}:
\spad{member?(a,k)} returns \spad{true} or \spad{false}
depending on whether \spad{a} is in \spad{k} or not.
}{
\spadpaste{member?(1/2,[3/4,5/6,1/2])}
}
\xtc{
}{
\spadpaste{member?(1/12,[3/4,5/6,1/2])}
}

As an exercise, the reader should determine how to get a
list containing all but the last of the elements in a given non-empty
list \spad{k}.\footnote{\spad{reverse(rest(reverse(k)))} works.}

3.61.6 Dot, Dot

— list.ht —

```
\begin{page}{ugxListDotPage}{Dot, Dot}
\beginscroll

Certain lists are used so often that Axiom provides an easy way
of constructing them.
If \spad{n} and \spad{m} are integers, then \spad{expand [n..m]}
creates a list containing \spad{n, n+1, ... m}.
If \spad{n > m} then the list is empty.
It is actually permissible to leave off the \spad{m} in the
dot-dot construction (see below).

\xtc{
The dot-dot notation can be used more than once in a list
construction and with specific elements being given.
Items separated by dots are called {\it segments.}
}{
\spadpaste{[1..3,10,20..23]}
}
\xtc{
Segments can be expanded into the range of items between the
endpoints by using \spadfunFrom{expand}{Segment}.
}{
\spadpaste{expand [1..3,10,20..23]}
}
\xtc{
What happens if we leave off a number on the right-hand side of
\spadopFrom{..}{UniversalSegment}?
}{
\spadpaste{expand [1..]}
}
What is created in this case is a \spadtype{Stream} which is a
generalization of a list.
See \downlink{‘Stream’}{StreamXmpPage}\ignore{Stream} for more information.

{LinearOrdinaryDifferentialOperator1}
\beginscroll

\spadtype{LinearOrdinaryDifferentialOperator1(A)} is the domain of
linear ordinary differential operators with coefficients in the
differential ring \spad{A}.
%This includes the cases of operators which are polynomials in \spad{D}
%acting upon scalar or vector expressions of a single variable.
%The coefficients of the operator polynomials can be integers, rational
%functions, matrices or elements of other domains.

3.63.2 Differential Operators with Rational Function Coefficients

— lodo1.ht —

```
\begin{page}{ugxLinearOrdinaryDifferentialOperatorOneRatPage}
{Differential Operators with Rational Function Coefficients}
\beginscroll

This example shows differential operators with rational function
coefficients.  In this case operator multiplication is non-commutative and,
since the coefficients form a field, an operator division algorithm exists.

\labelSpace{2pc}
\xtc{
We begin by defining \spad{RFZ} to be the rational functions in
\spad{x} with integer coefficients and \spad{Dx} to be the differential
operator for \spad{d/dx}.
}{
\spadpaste{RFZ := Fraction UnivariatePolynomial('x, Integer) \bound{RFZ0}}
}
\xtc{
}{
\spadpaste{x : RFZ := 'x \free{RFZ0}\bound{RFZ}}
}
\xtc{
}{
\spadpaste{Dx : LODO1 RFZ := D()\bound{Dx}\free{RFZ}}
}
\xtc{
Operators are created using the usual arithmetic operations.
}{
\spadpaste{b : LODO1 RFZ := 3*x**2*Dx**2 + 2*Dx + 1/x  \free{Dx}\bound{b}}
}
\xtc{
}{
\spadpaste{a : LODO1 RFZ := b*(5*x*Dx + 7)             \free{b Dx}\bound{a}}
}
\xtc{
Operator multiplication corresponds to functional composition.
}{
```

```
\spadpaste{p := x**2 + 1/x**2 \bound{p}\free{RFZ}}
}
\xtc{
Since operator coefficients depend on \spad{x}, the multiplication is
not commutative.
}{
\spadpaste{(a*b - b*a) p \free{a b p}}
}

When the coefficients of operator polynomials come from a field, as in
this case, it is possible to define operator division.  Division on
the left and division on the right yield different results when the
multiplication is non-commutative.

The results of
\spadfunFrom{leftDivide}{LinearOrdinaryDifferentialOperator1} and
\spadfunFrom{rightDivide}{LinearOrdinaryDifferentialOperator1} are
quotient-remainder pairs satisfying: \newline
%
\spad{leftDivide(a,b) = [q, r]} such that  \spad{a = b*q + r} \newline
\spad{rightDivide(a,b) = [q, r]} such that  \spad{a = q*b + r} \newline
%
\xtc{
In both cases, the
\spadfunFrom{degree}{LinearOrdinaryDifferentialOperator1}
of the remainder, \spad{r}, is less than
the degree of \spad{b}.
}{
\spadpaste{ld := leftDivide(a,b) \bound{ld}\free{a b}}
}
\xtc{
}{
\spadpaste{a = b * ld.quotient + ld.remainder \free{a b ld}}
}
\xtc{
The operations of left and right division
are so-called because the quotient is obtained by dividing
\spad{a} on that side by \spad{b}.
}{
\spadpaste{rd := rightDivide(a,b) \bound{rd}\free{a b}}
}
\xtc{
}{
\spadpaste{a = rd.quotient * b + rd.remainder \free{a b rd}}
}

\xtc{
Operations \spadfunFrom{rightQuotient}{LinearOrdinaryDifferentialOperator1}
and \spadfunFrom{rightRemainder}{LinearOrdinaryDifferentialOperator1}
are available if only one of the quotient or remainder are of
```

```
interest to you.
This is the quotient from right division.
}{
\spadpaste{rightQuotient(a,b) \free{a b}}
}
\xtc{
This is the remainder from right division.
The corresponding ``left'' functions
\spadfunFrom{leftQuotient}{LinearOrdinaryDifferentialOperator1} and
\spadfunFrom{leftRemainder}{LinearOrdinaryDifferentialOperator1}
are also available.
}{
\spadpaste{rightRemainder(a,b) \free{a b}}
}

\xtc{
For exact division, the operations
\spadfunFrom{leftExactQuotient}{LinearOrdinaryDifferentialOperator1} and
\spadfunFrom{rightExactQuotient}{LinearOrdinaryDifferentialOperator1}
are supplied.
These return the quotient but only if the remainder is zero.
The call \spad{rightExactQuotient(a,b)} would yield an error.
}{
\spadpaste{leftExactQuotient(a,b) \free{a b}}
}

\xtc{
The division operations allow the computation of left and right
greatest common divisors
(\spadfunFrom{leftGcd}{LinearOrdinaryDifferentialOperator1} and
\spadfunFrom{rightGcd}{LinearOrdinaryDifferentialOperator1}) via
remainder sequences, and consequently the computation of left and
right least common
multiples (\spadfunFrom{rightLcm}{LinearOrdinaryDifferentialOperator1}
and
\spadfunFrom{leftLcm}{LinearOrdinaryDifferentialOperator1}).
}{
\spadpaste{e := leftGcd(a,b) \bound{e}\free{a b}}
}
\xtc{
Note that a greatest common divisor doesn't necessarily divide \spad{a} and
{9.45.1.}{Differential Operators with Rational Function Coefficients}
\spad{b} on both sides.
Here the left greatest common divisor does not divide \spad{a} on the right.
}{
\spadpaste{leftRemainder(a, e) \free{a e}}
}
\xtc{
}{
\spadpaste{rightRemainder(a, e) \free{a e}}
```

```
}

\xtc{
Similarly, a least common multiple
is not necessarily divisible from both sides.
}{
\spadpaste{f := rightLcm(a,b) \bound{f}\free{a b}}
}
\xtc{
}{
\spadpaste{rightRemainder(f, b) \free{f b}}
}
\xtc{
}{
\spadpaste{leftRemainder(f, b) \free{f b}}
}

{LinearOrdinaryDifferentialOperator2}
\beginscroll

\spadtype{LinearOrdinaryDifferentialOperator2(A, M)} is the domain of
linear ordinary differential operators with coefficients in the
differential ring \spad{A} and operating on \spad{M}, an
\spad{A}-module.  This includes the cases of operators which are
```

```
polynomials in \spad{D} acting upon scalar or vector expressions of a
single variable.  The coefficients of the operator polynomials can be
integers, rational functions, matrices or elements of other domains.

3.64.2 Differential Operators with Constant Coefficients

— lodo2.ht —

```
\begin{page}{ugxLinearODEOperatorTwoConstPage}
{Differential Operators with Constant Coefficients}
\beginscroll

This example shows differential operators with rational
number coefficients operating on univariate polynomials.

\labelSpace{3pc}
\xtc{
We begin by making type assignments so we can conveniently refer
to univariate polynomials in \spad{x} over the rationals.
}{
\spadpaste{Q  := Fraction Integer \bound{Q}}
}
\xtc{
}{
\spadpaste{PQ := UnivariatePolynomial('x, Q) \free{Q}\bound{PQ0}}
}
\xtc{
}{
\spadpaste{x: PQ := 'x \free{PQ0}\bound{x}}
}
\xtc{
```

```
Now we assign \spad{Dx} to be the differential operator
\spadfunFrom{D}{LinearOrdinaryDifferentialOperator2}
corresponding to \spad{d/dx}.
}{
\spadpaste{Dx: LODO2(Q, PQ) := D() \free{Q PQ0}\bound{Dx}}
}
\xtc{
New operators are created as polynomials in \spad{D()}.
}{
\spadpaste{a := Dx  + 1 \bound{a}\free{Dx}}
}
\xtc{
}{
\spadpaste{b := a + 1/2*Dx**2 - 1/2 \bound{b}\free{Dx}}
}
\xtc{
To apply the operator \spad{a} to the value \spad{p} the usual function
call syntax is used.
}{
\spadpaste{p := 4*x**2 + 2/3 \free{x}\bound{p}}
}
\xtc{
}{
\spadpaste{a p \free{a p}}
}
\xtc{
Operator multiplication is defined by the identity \spad{(a*b) p = a(b(p))}
}{
\spadpaste{(a * b) p = a b p \free{a b p}}
}
\xtc{
Exponentiation follows from multiplication.
}{
\spadpaste{c := (1/9)*b*(a + b)**2 \free{a b}\bound{c}}
}
\xtc{
Finally, note that operator expressions may be applied directly.
}{
\spadpaste{(a**2 - 3/4*b + c) (p + 1) \free{a b c p}}
}

3.64.3 Differential Operators with Matrix Coefficients Operating on Vectors

— lodo2.ht —

```
\begin{page}{ugxLinearODEOperatorTwoMatrixPage}
{Differential Operators with Matrix Coefficients Operating on Vectors}
\beginscroll

This is another example of linear ordinary differential
```

```
operators with non-commutative multiplication.
Unlike the rational function case, the differential ring of
square matrices (of a given dimension) with univariate
polynomial entries does not form a field.
Thus the number of operations available is more limited.

\labelSpace{1pc}
\xtc{
In this section, the operators have three by three
matrix coefficients with polynomial entries.
}{
\spadpaste{PZ   := UnivariatePolynomial(x,Integer)\bound{PZ0}}
}
\xtc{
}{
\spadpaste{x:PZ := 'x \free{PZ0}\bound{PZ}}
}
\xtc{
}{
\spadpaste{Mat  := SquareMatrix(3,PZ)\free{PZ}\bound{Mat}}
}
\xtc{
The operators act on the vectors considered as a \spad{Mat}-module.
}{
\spadpaste{Vect := DPMM(3, PZ, Mat, PZ);\free{PZ,Mat}\bound{Vect}}
}
\xtc{
}{
\spadpaste{Modo := LODO2(Mat, Vect);\free{Mat Vect}\bound{Modo}}
}
\xtc{
The matrix \spad{m} is used as a coefficient and the vectors \spad{p}
and \spad{q} are operated upon.
}{
\spadpaste{m:Mat := matrix {\tt{}x**2,1,0],[1,x**4,0],[0,0,4*x**2}
\free{Mat}\bound{m}}
}
\xtc{
}{
\spadpaste{p:Vect := directProduct [3*x**2+1,2*x,7*x**3+2*x]
\free{Vect}\bound{p}}
}
\xtc{
}{
\spadpaste{q: Vect := m * p\free{m p Vect}\bound{q}}
}
\xtc{
Now form a few operators.
}{
\spadpaste{Dx : Modo := D()\bound{Dx}\free{Modo}}
```

```
}
\xtc{
}{
\spadpaste{a : Modo := Dx  + m\bound{a}\free{m Dx}}
}
\xtc{
}{
\spadpaste{b : Modo := m*Dx  + 1\bound{b}\free{m Dx}}
}
\xtc{
}{
\spadpaste{c := a*b \bound{c}\free{a b}}
}
\xtc{
These operators can be applied to vector values.
}{
\spadpaste{a p \free{p a}}
}
\xtc{
}{
\spadpaste{b p \free{p b}}
}
\xtc{
}{
\spadpaste{(a + b + c) (p + q) \free{a b c p q}}
}
\endscroll
\autobuttons

{\em S}, a domain of category \spadtype{SetCategory}
\newline\tab{10}...
\indent{0}\newline\tab{2}{\em Returns:}\indent{15}\tab{0}
the class of mappings from domain ({\em S,...})
into domain {\em T} as described below.
\indent{0}\newline\tab{2}{\em Description:}\indent{15}\tab{0}
{\em Mapping(T,S,...)} denotes the class of objects which are
mappings from a source domain ({\em S,...}) into a target domain {\em T}.
The {\em Mapping} constructor can take any number of arguments.
All but the first argument is regarded as part of a source tuple
for the mapping.
For example, {\em Mapping(T,A,B)} denotes the
class of mappings from {\em (A,B)} into {\em T}.
{\em Mapping} is a primitive domain of Axiom which cannot be
defined in the Axiom language.

3.69 mappkg1.ht

3.69.1 MappingPackage1

— **mappkg1.ht** —

```
\begin{page}{MappingPackageOneXmpPage}{MappingPackage1}
\beginscroll

Function are objects of type \pspadtype{Mapping}.
In this section we demonstrate some library operations from the
packages \spadtype{MappingPackage1}, \spadtype{MappingPackage2}, and
\spadtype{MappingPackage3} that manipulate and create functions.
Some terminology: a {\it nullary} function takes no arguments,
a {\it unary} function takes one argument, and
a {\it binary} function takes two arguments.

\xtc{
We begin by creating an example function that raises a
rational number to an integer exponent.
```

```
}{
\spadpaste{power(q: FRAC INT, n: INT): FRAC INT == q**n \bound{power}}
}
\xtc{
}{
\spadpaste{power(2,3) \free{power}}
}
\xtc{
The \spadfunFrom{twist}{MappingPackage3} operation
transposes the arguments of a binary function.
Here \spad{rewop(a, b)} is \spad{power(b, a)}.
}{
\spadpaste{rewop := twist power \free{power}\bound{rewop}}
}
\xtc{
This is \texht{$2^3.$}{\spad{2**3.}}
}{
\spadpaste{rewop(3, 2) \free{rewop}}
}
\xtc{
Now we define \userfun{square} in terms of \userfun{power}.
}{
\spadpaste{square: FRAC INT -> FRAC INT \bound{squaredec}}
}
\xtc{
The \spadfunFrom{curryRight}{MappingPackage3} operation creates a unary
function from a binary one by providing a constant
argument on the right.
}{
\spadpaste{square:= curryRight(power, 2) \free{squaredec poswer}
\bound{square}}
}
\xtc{
Likewise, the
\spadfunFrom{curryLeft}{MappingPackage3} operation provides a constant
argument on the left.
}{
\spadpaste{square 4 \free{square}}
}
\xtc{
The \spadfunFrom{constantRight}{MappingPackage3} operation creates
(in a trivial way) a binary function from a unary one:
\spad{constantRight(f)} is the function \spad{g} such that
\spad{g(a,b)= f(a).}
}{
\spadpaste{squirrel:= constantRight(square)\$MAPPKG3(FRAC INT,
FRAC INT,FRAC INT) \free{square}\bound{squirrel}}
}
\xtc{
Likewise,
\spad{constantLeft(f)} is the function \spad{g} such that
\spad{g(a,b)= f(b).}
}{
\spadpaste{squirrel(1/2, 1/3) \free{squirrel}}
}
\xtc{
The \spadfunFrom{curry}{MappingPackage2} operation makes a
unary function nullary.
}{
\spadpaste{sixteen := curry(square, 4/1) \free{square}\bound{sixteen}}
}
\xtc{
}{
\spadpaste{sixteen() \free{sixteen}}
}
\xtc{
The \spadopFrom{*}{MappingPackage3} operation
constructs composed functions.
}{
\spadpaste{square2:=square*square \free{square}\bound{square2}}
}
\xtc{
}{
\spadpaste{square2  3 \free{square2}}
}
\xtc{
Use the \spadopFrom{**}{MappingPackage1} operation to create
functions that are \spad{n}-fold iterations of other functions.
}{
\spadpaste{sc(x: FRAC INT): FRAC INT == x + 1 \bound{sc}}
}
\xtc{
This is a list of \pspadtype{Mapping} objects.
}{
\spadpaste{incfns := [sc**i for i in 0..10] \free{sc}\bound{incfns}}
}
\xtc{
This is a list of applications of those functions.
}{
\spadpaste{[f 4 for f in incfns] \free{incfns}}
}
\xtc{
Use the \spadfunFrom{recur}{MappingPackage1}
operation for recursion:
\spad{g := recur f} means \spad{g(n,x) == f(n,f(n-1,...f(1,x))).}
}{
\spadpaste{times(n:NNI, i:INT):INT == n*i \bound{rdec}}
}
\xtc{
}{
```

```
\spadpaste{r := recur(times) \free{rdec}\bound{r}}
}
\xtc{
This is a factorial function.
}{
\spadpaste{fact := curryRight(r, 1) \free{r}\bound{fact}}
}
\xtc{
}{
\spadpaste{fact 4 \free{fact}}
}
\xtc{
Constructed functions can be used within other functions.
}{
\begin{spadsrc}[\free{square}\bound{mto2ton}]
mto2ton(m, n) ==
  raiser := square**n
  raiser m
\end{spadsrc}
}
\xtc{
This is \texht{$3^{2^3}.$}{\spad{3**(2**3).}}
}{
\spadpaste{mto2ton(3, 3) \free{mto2ton}}
}
\xtc{
Here \userfun{shiftfib} is a unary function that modifies its argument.
}{
\begin{spadsrc}[\bound{shiftfib}]
shiftfib(r: List INT) : INT ==
  t := r.1
  r.1 := r.2
  r.2 := r.2 + t
  t
\end{spadsrc}
}
\xtc{
By currying over the argument we get a function with private state.
}{
\spadpaste{fibinit: List INT := [0, 1] \bound{fibinitdec}}
}
\xtc{
}{
\spadpaste{fibs := curry(shiftfib, fibinit)
\free{shiftfib fibinit}\bound{fibs}}
}
\xtc{
}{
\spadpaste{[fibs() for i in 0..30] \free{fibs}}
}
```

```

3.70.1 MultiSet

— mset.ht —

```
\begin{page}{MultiSetXmpPage}{MultiSet}
\beginscroll
The domain \spadtype{Multiset(R)} is similar to \spadtype{Set(R)}
except that multiplicities
(counts of duplications) are maintained and displayed.
Use the operation \spadfunFrom{multiset}{Multiset} to create
multisets from lists.
All the standard operations from sets are available for
multisets.
An element with multiplicity greater than one has the
multiplicity displayed first, then a colon, and then the element.

\xtc{
Create a multiset of integers.
}{
\spadpaste{s := multiset [1,2,3,4,5,4,3,2,3,4,5,6,7,4,10]\bound{s}}
}
\xtc{
The operation \spadfunX{insert} adds an element to a multiset.
}{
\spadpaste{insert!(3,s)\bound{s1}\free{s}}
}
\xtc{
Use \spadfunX{remove} to remove an element.
If a third argument is present, it specifies how many instances
to remove. Otherwise all instances of the element are removed.
Display the resulting multiset.
}{
\spadpaste{remove!(3,s,1); s\bound{s2}\free{s1}}
}
\xtc{
}{
\spadpaste{remove!(5,s); s\bound{s2}\free{s1}}
}
\xtc{
The operation \spadfun{count} returns the number of copies
of a given value.
}{
\spadpaste{count(5,s)\free{s2}}
}
\xtc{
A second multiset.
}{
\spadpaste{t := multiset [2,2,2,-9]\bound{t}}
}
\xtc{
The \spadfun{union} of two multisets is additive.
}{
\spadpaste{U := union(s,t)\bound{U}}
}
\xtc{
The \spadfun{intersect} operation gives the elements that are in
common, with additive multiplicity.
}{
\spadpaste{I := intersect(s,t)\bound{I}}
}
\xtc{
The \spadfun{difference} of \spad{s} and \spad{t} consists of
the elements that \spad{s} has but \spad{t} does not.
Elements are regarded as indistinguishable, so that if \spad{s}
and \spad{t} have any element in common, the \spadfun{difference}
does not contain that element.
}{
\spadpaste{difference(s,t)\free{s2 t}}
}
\xtc{
The \spadfun{symmetricDifference} is the \spadfun{union}
of \spad{difference(s, t)} and \spad{difference(t, s)}.
}{
\spadpaste{S := symmetricDifference(s,t)\bound{S}\free{s2 t}}
}
\xtc{
Check that the \spadfun{union} of the \spadfun{symmetricDifference} and
the \spadfun{intersect} equals the \spadfun{union} of the elements.
}{
\spadpaste{(U = union(S,I))@Boolean\free{S I U}}
}
\xtc{
Check some inclusion relations.
}{
\spadpaste{t1 := multiset [1,2,2,3]; [t1 < t, t1 < s, t < s, t1 <= s]
\free{t s2}}
}

```

———

3.71.2 Creating Matrices

— matrix.ht —

```
\begin{page}{ugxMatrixCreatePage}{Creating Matrices}
\beginscroll

There are many ways to create a matrix from a collection of
values or from existing matrices.

\xtc{
If the matrix has almost all items equal to the same value,
use \spadfunFrom{new}{Matrix} to create a matrix filled with that
value and then reset the entries that are different.
}{
\spadpaste{m : Matrix(Integer) := new(3,3,0) \bound{m}}
}
\xtc{
To change the entry in the second row, third column to \spad{5}, use
\spadfunFrom{setelt}{Matrix}.
}{
\spadpaste{setelt(m,2,3,5) \free{m}\bound{m1}}
}
\xtc{
An alternative syntax is to use assignment.
}{
\spadpaste{m(1,2) := 10 \free{m1}\bound{m2}}
}
\xtc{
```

```
The matrix was {\it destructively modified}.
}{
\spadpaste{m \free{m2}}
}

\xtc{
If you already have the matrix entries as a list of lists,
use \spadfunFrom{matrix}{Matrix}.
}{
\spadpaste{matrix {\tt{}1,2,3,4],[0,9,8,7}}
}

\xtc{
If the matrix is diagonal, use
\spadfunFrom{diagonalMatrix}{Matrix}.
}{
\spadpaste{dm := diagonalMatrix [1,x**2,x**3,x**4,x**5] \bound{dm}}
}
\xtc{
Use \spadfunFromX{setRow}{Matrix} and
\spadfunFromX{setColumn}{Matrix} to change a row or column of a matrix.
}{
\spadpaste{setRow!(dm,5,vector [1,1,1,1,1]) \free{dm}\bound{dm1}}
}
\xtc{
}{
\spadpaste{setColumn!(dm,2,vector [y,y,y,y,y]) \free{dm1}\bound{dm2}}
}

%
\xtc{
Use \spadfunFrom{copy}{Matrix} to make a copy of a matrix.
}{
\spadpaste{cdm := copy(dm) \free{dm2}\bound{cdm}}
}
\xtc{
This is useful if you intend to modify a matrix destructively but
want a copy of the original.
}{
\spadpaste{setelt(dm,4,1,1-x**7) \free{dm2}\bound{setdm}}
}
\xtc{
}{
\spadpaste{[dm,cdm] \free{setdm cdm}}
}

%
\xtc{
Use \spadfunFrom{subMatrix}{Matrix} to extract part of an
existing matrix.
```

```
The syntax is \spad{subMatrix({\it m, firstrow, lastrow, firstcol,
lastcol})}.
}{
\spadpaste{subMatrix(dm,2,3,2,4) \free{setdm}}
}

%
\xtc{
To change a submatrix, use \spadfunFromX{setsubMatrix}{Matrix}.
}{
\spadpaste{d := diagonalMatrix [1.2,-1.3,1.4,-1.5] \bound{d}}
}
\xtc{
If \spad{e} is too big to fit where you specify, an error message
is displayed.
Use \spadfunFrom{subMatrix}{Matrix} to extract part of \spad{e}, if
necessary.
}{
\spadpaste{e := matrix {\tt{}}6.7,9.11],[-31.33,67.19} \bound{e}}
}
\xtc{
This changes the submatrix of \spad{d} whose upper left corner is
at the first row and second column and whose size is that of \spad{e}.
}{
\spadpaste{setsubMatrix!(d,1,2,e) \free{d e}\bound{d1}}
}
\xtc{
}{
\spadpaste{d \free{d1}}
}
%

%
\xtc{
Matrices can be joined either horizontally or vertically to make
new matrices.
}{
\spadpaste{a := matrix {\tt{}}1/2,1/3,1/4],[1/5,1/6,1/7} \bound{a}}
}
\xtc{
}{
\spadpaste{b := matrix {\tt{}}3/5,3/7,3/11],[3/13,3/17,3/19} \bound{b}}
}
\xtc{
Use \spadfunFrom{horizConcat}{Matrix} to append them side to side.
The two matrices must have the same number of rows.
}{
\spadpaste{horizConcat(a,b) \free{a b}}
}
\xtc{
```

```
Use \spadfunFrom{vertConcat}{Matrix} to stack one upon the other.
The two matrices must have the same number of columns.
}{
\spadpaste{vab := vertConcat(a,b) \free{a b}\bound{vab}}
}

%
\xtc{
The operation
\spadfunFrom{transpose}{Matrix} is used to create a new matrix by
reflection across the main diagonal.
}{
\spadpaste{transpose vab \free{vab}}
}

\endscroll

```
\begin{page}{ugxMatrixOpsPage}{Operations on Matrices}
\beginscroll

\labelSpace{3pc}
\xtc{
Axiom provides both left and right scalar multiplication.
}{
\spadpaste{m := matrix {\tt{}1,2],[3,4} \bound{m}}
}
\xtc{
}{
\spadpaste{4 * m * (-5)\free{m}}
}
\xtc{
You can add, subtract, and multiply matrices provided, of course, that
the matrices have compatible dimensions.
If not, an error message is displayed.
}{
\spadpaste{n := matrix({\tt{}1,0,-2],[-3,5,1}) \bound{n}}
}
\xtc{
This following product is defined but \spad{n * m} is not.
}{
\spadpaste{m * n \free{m n}}
}

The operations \spadfunFrom{nrows}{Matrix} and \spadfunFrom{ncols}{Matrix}
return the number of rows and columns of a matrix.
You can extract a row or a column of a matrix using the operations
\spadfunFrom{row}{Matrix} and \spadfunFrom{column}{Matrix}.
The object returned is a \spadtype{Vector}.
\xtc{
Here is the third column of the matrix \spad{n}.
}{
\spadpaste{vec := column(n,3) \free{n} \bound{vec}}
}
\xtc{
You can multiply a matrix on the left by a ``row vector'' and on the right
by a ``column vector.''
}{
\spadpaste{vec * m \free{vec m}}
}
\xtc{
Of course, the dimensions of the vector and the matrix must be compatible
or an error message is returned.
}{
\spadpaste{m * vec \free{vec m}}
}

The operation \spadfunFrom{inverse}{Matrix} computes the inverse of a
```

```
matrix if
{Operations on Matrices}
the matrix is invertible, and returns \spad{"failed"} if not.
\xtc{
This Hilbert matrix is invertible.
}{
\spadpaste{hilb := matrix({\tt{}1/(i\ +\ j)\ for\ i\ in\ 1..3]\ for\ j\ in\ 1..3])\ \nwnewline
{\char92}bound{\char123}hilb{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}inverse(hilb)\ {\char92}free{\char123}hilb{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ matrix\ is\ not\ invertible.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}mm\ :=\ matrix([[1,2,3,4],\ [5,6,7,8],\ [9,10,11,12],\ \nwnewline
[13,14,15,16}) \bound{mm}}
}
\xtc{
}{
\spadpaste{inverse(mm) \free{mm}}
}

The operation
\spadfunFrom{determinant}{Matrix} computes the determinant of a matrix
{Operations on Matrices}
provided that the entries of the matrix belong to a
\spadtype{CommutativeRing}.
\xtc{
The above matrix \spad{mm} is not invertible and, hence, must have
determinant \spad{0}.
}{
\spadpaste{determinant(mm) \free{mm}}
}
\xtc{
The operation
\spadfunFrom{trace}{SquareMatrix} computes the trace of a {\em square}
matrix.
{Operations on Matrices}
}{
\spadpaste{trace(mm) \free{mm}}
}

\xtc{
The operation \spadfunFrom{rank}{Matrix} computes the {\it rank} of a
matrix:
the maximal number of linearly independent rows or columns.
}{
\spadpaste{rank(mm) \free{mm}}
}
\xtc{
The operation \spadfunFrom{nullity}{Matrix} computes the {\it nullity} of
a matrix: the dimension of its null space.
}{
\spadpaste{nullity(mm) \free{mm}}
}
\xtc{
The operation \spadfunFrom{nullSpace}{Matrix} returns a list containing
a basis for the null space of a matrix.
Note that the nullity is the number of elements in a basis for the null
space.
}{
\spadpaste{nullSpace(mm) \free{mm}}
}
\xtc{
The operation
\spadfunFrom{rowEchelon}{Matrix} returns the row echelon form of a
{Operations on Matrices}
matrix.
It is easy to see that the rank of this matrix is two and that its nullity
is also two.
}{
\spadpaste{rowEchelon(mm) \free{mm}}
}

3.72.1 MakeFunction

⇒ "notitle" (ugUserMakePage) ?? on page ??

— **mkfunc.ht** —

```
\begin{page}{MakeFunctionXmpPage}{MakeFunction}
\beginscroll
It is sometimes useful to be able to define a function given by
the result of a calculation.
%
\xtc{
Suppose that you have obtained the following expression
after several computations
and that you now want to tabulate the numerical values of \spad{f}
for \spad{x} between \spad{-1} and \spad{+1} with increment
\spad{0.1}.
}{
\spadpaste{expr := (x - exp x + 1)**2 * (sin(x**2) * x + 1)**3
\bound{expr}}
}
%
You could, of course, use the function
\spadfunFrom{eval}{Expression} within a loop and evaluate
\spad{expr} twenty-one times, but this would be quite slow.
A better way is to create a numerical function \spad{f} such that
\spad{f(x)} is defined by the expression \spad{expr} above,
but without retyping \spad{expr}!
The package \spadtype{MakeFunction} provides the operation
\spadfunFrom{function}{MakeFunction} which does exactly this.
%
\xtc{
Issue this to create the function \spad{f(x)} given by \spad{expr}.
}{
\spadpaste{function(expr, f, x) \bound{f}\free{expr}}
}
\xtc{
To tabulate \spad{expr}, we can now quickly evaluate \spad{f} 21 times.
}{
\spadpaste{tbl := [f(0.1 * i - 1) for i in 0..20]; \free{f}\bound{tbl}}
}
%
```

```
%
\xtc{
Use the list \spad{[x1,...,xn]} as the
third argument to \spadfunFrom{function}{MakeFunction}
to create a multivariate function \spad{f(x1,...,xn)}.
}{
\spadpaste{e := (x - y + 1)**2 * (x**2 * y + 1)**2 \bound{e}}
}
\xtc{
}{
\spadpaste{function(e, g, [x, y]) \free{e}}
}
%
%
\xtc{
In the case of just two
variables, they can be given as arguments without making them into a list.
}{
\spadpaste{function(e, h, x, y) \free{e}\bound{h}}
}
%
%
\xtc{
Note that the functions created by \spadfunFrom{function}{MakeFunction}
are not limited to floating point numbers, but can be applied to any type
for which they are defined.
}{
\spadpaste{m1 := squareMatrix {\tt{}1,\ 2],\ [3,\ 4} \bound{m1}}
}
\xtc{
}{
\spadpaste{m2 := squareMatrix {\tt{}1,\ 0],\ [-1,\ 1} \bound{m2}}
}
\xtc{
}{
\spadpaste{h(m1, m2) \free{h m1 m2}}
}
%

3.73 mpoly.ht

3.73.1 MultivariatePolynomial

⇒ "notitle" (PolynomialXmpPage) 3.84.1 on page 1093
⇒ "notitle" (UnivariatePolyXmpPage) 3.100.1 on page 1307
⇒ "notitle" (DistributedMultivariatePolyXmpPage) 3.24.1 on page 361

— **mpoly.ht** —

```
\begin{page}{MultivariatePolyXmpPage}{MultivariatePolynomial}
\beginscroll

The domain constructor \spadtype{MultivariatePolynomial} is similar to
\spadtype{Polynomial} except that it specifies the variables to be used.
\spadtype{Polynomial} are available for \spadtype{MultivariatePolynomial}.
The abbreviation for \spadtype{MultivariatePolynomial} is
\spadtype{MPOLY}.
The type expressions
\centerline{{\spadtype{MultivariatePolynomial([x,y],Integer)}}}
and
\centerline{{\spadtype{MPOLY([x,y],INT)}}}
refer to the domain of multivariate polynomials in the variables
\spad{x} and \spad{y} where the coefficients are restricted to be integers.
The first
variable specified is the main variable and the display of the
polynomial reflects this.
```

```
\xtc{
This polynomial appears with
terms in descending powers of the variable \spad{x}.
}{
\spadpaste{m : MPOLY([x,y],INT) := (x**2 - x*y**3 +3*y)**2 \bound{m}}
}
\xtc{
It is easy to see a different variable ordering by doing a conversion.
}{
\spadpaste{m :: MPOLY([y,x],INT) \free{m}}
}
\xtc{
You can use other, unspecified variables, by using
\spadtype{Polynomial} in the coefficient type of \spadtype{MPOLY}.
}{
\spadpaste{p : MPOLY([x,y],POLY INT) \bound{pdec}}
}
\xtc{
}{
\spadpaste{p := (a**2*x - b*y**2 + 1)**2 \free{pdec}\bound{p}}
}
\xtc{
Conversions can be used to re-express such polynomials in terms of
the other variables.  For example, you can first push all the
variables into a polynomial with integer coefficients.
}{
\spadpaste{p :: POLY INT \free{p}\bound{prev}}
}
\xtc{
Now pull out the variables of interest.
}{
\spadpaste{\% :: MPOLY([a,b],POLY INT) \free{prev}}
}

\beginImportant
\noindent {\bf Restriction:}
\texht{\begin{quotation}\noindent}{\newline\indent{5}}
Axiom does not allow you to create types where
\spadtype{MultivariatePolynomial} is contained in the coefficient type of
\spadtype{Polynomial}. Therefore,
\spad{MPOLY([x,y],POLY INT)} is legal but
\spad{POLY MPOLY([x,y],INT)} is not.
\texht{\end{quotation}}{\indent{0}}
\endImportant

\xtc{
Multivariate polynomials may be combined with univariate polynomials
to create types with special structures.
}{
\spadpaste{q : UP(x, FRAC MPOLY([y,z],INT)) \bound{qdec}}
}
\xtc{
This is a polynomial in \spad{x} whose coefficients are
quotients of polynomials in \spad{y} and \spad{z}.
}{
\spadpaste{q := (x**2 - x*(z+1)/y +2)**2 \free{qdec}\bound{q}}
}
\xtc{
Use conversions for structural rearrangements.
\spad{z} does not appear in a denominator and so it can be made
the main variable.
}{
\spadpaste{q :: UP(z, FRAC MPOLY([x,y],INT)) \free{q}}
}
\xtc{
Or you can make a multivariate polynomial in \spad{x} and \spad{z}
whose coefficients are fractions in polynomials in \spad{y}.
}{
\spadpaste{q :: MPOLY([x,z], FRAC UP(y,INT)) \free{q}}
}
A conversion like \spad{q :: MPOLY([x,y], FRAC UP(z,INT))} is not
possible in this example
because \spad{y} appears in the denominator of a fraction.
As you can see, Axiom provides extraordinary flexibility in the
manipulation and display of expressions via its conversion facility.

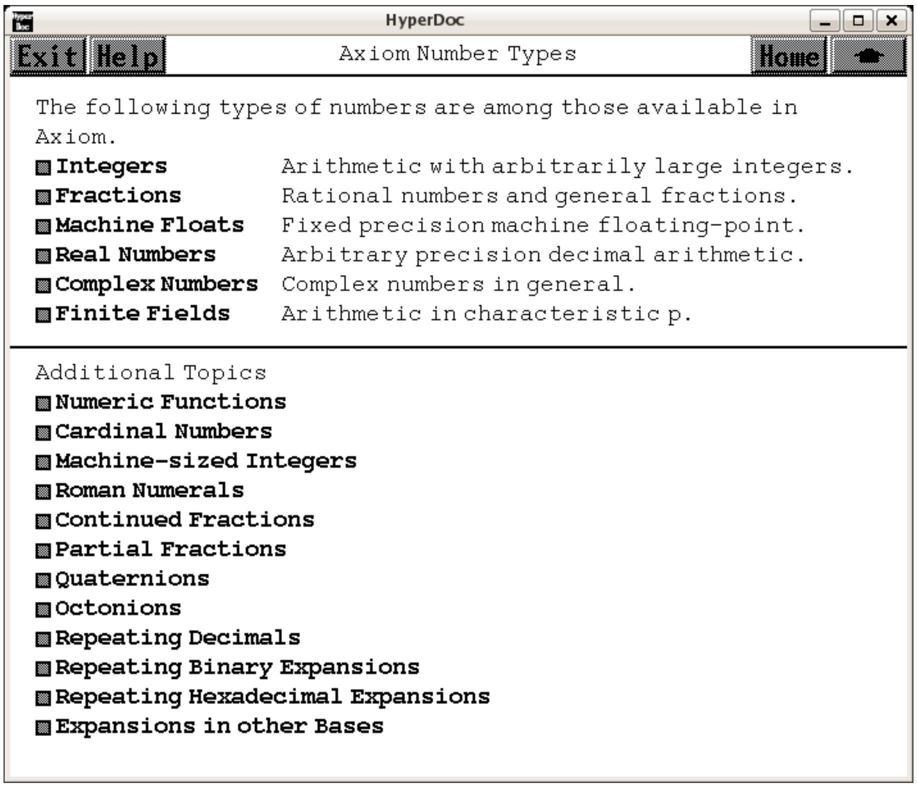
3.76 numbers.ht

3.76.1 Axiom Number Types



Axiom Number Types

The following types of numbers are among those available in Axiom.

▨ **Integers**	Arithmetic with arbitrarily large integers.
▨ **Fractions**	Rational numbers and general fractions.
▨ **Machine Floats**	Fixed precision machine floating-point.
▨ **Real Numbers**	Arbitrary precision decimal arithmetic.

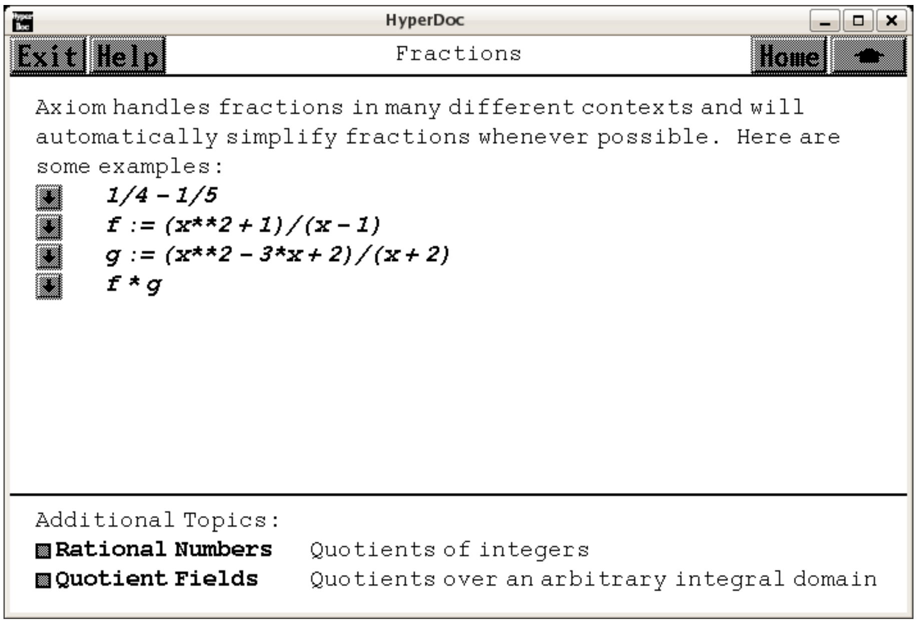
3.76.2 Fraction



Axiom handles fractions in many different contexts and will automatically simplify fractions whenever possible. Here are some examples:

```
1/4 - 1/5
f := (x**2 + 1)/(x - 1)
g := (x**2 - 3*x + 2)/(x + 2)
f * g
```

Additional Topics:

▨ **Rational Numbers**	Quotients of integers
▨ **Quotient Fields**	Quotients over an arbitrary integral domain

3.76.3 Rational Number

— numbers.ht —

```
\begin{page}{RationalNumberPage}{Rational Numbers}
\beginscroll
Like integers, rational numbers can be arbitrarily large.
For example:
\spadpaste{61657 ** 10 / 999983 ** 12}
Rational numbers will not be converted to decimals unless you explicitly
ask Axiom to do so.
To convert a rational number to a decimal, use the function
\spadfun{numeric}.
Here's an example:
\spadpaste{x := 104348/33215 \bound{x}}
```

```
\spadpaste{numeric x \free{x}}
You can find the numerator and denominator of rational numbers using
the functions \spadfun{numer} and \spadfun{denom}, respectively.
\spadpaste{numer(x) \free{x}}
\spadpaste{denom(x) \free{x}}
To factor the numerator and denominator of a fraction, use the following
command:
\spadpaste{factor(numer x) / factor(denom x) \free{x}}
\endscroll
\autobuttons
\end{page}

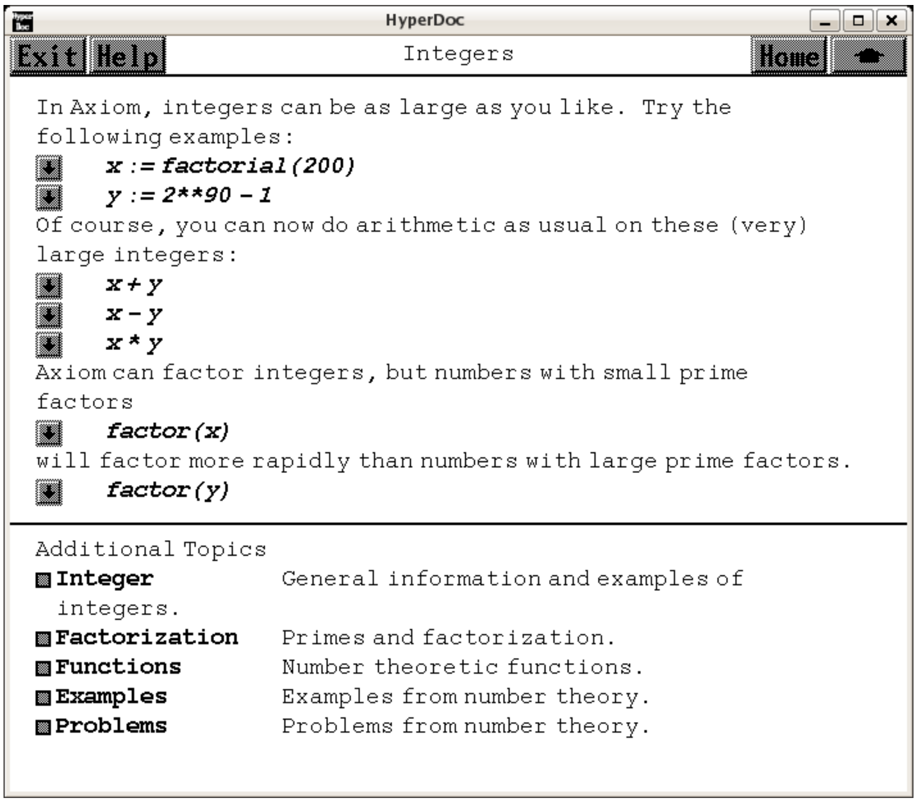
3.76.4 Integers



In Axiom, integers can be as large as you like. Try the following examples:

x := factorial(200)

y := 2**90 - 1

Of course, you can now do arithmetic as usual on these (very) large integers:

x + y

x - y

x * y

Axiom can factor integers, but numbers with small prime factors

factor(x)

will factor more rapidly than numbers with large prime factors.

factor(y)

Additional Topics

Integer	General information and examples of integers.
Factorization	Primes and factorization.
Functions	Number theoretic functions.
Examples	Examples from number theory.
Problems	Problems from number theory.

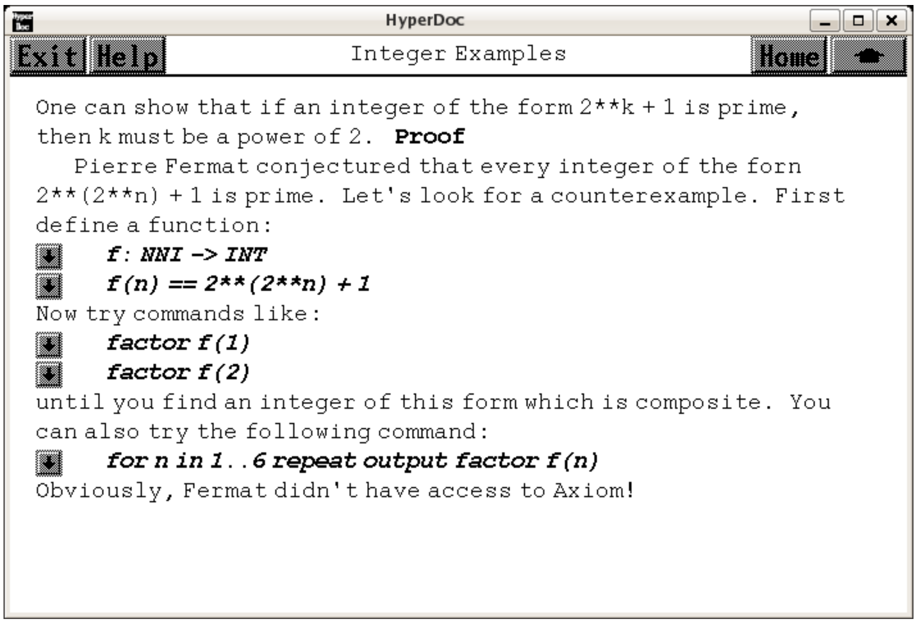
3.76.5 Integer Examples



One can show that if an integer of the form 2**k + 1 is prime, then k must be a power of 2. **Proof**

Pierre Fermat conjectured that every integer of the forn 2**(2**n) + 1 is prime. Let's look for a counterexample. First define a function:

f: NNI -> INT

f(n) == 2**(2**n) + 1

Now try commands like:

factor f(1)

factor f(2)

until you find an integer of this form which is composite. You can also try the following command:

for n in 1..6 repeat output factor f(n)

Obviously, Fermat didn't have access to Axiom!

3.76.6 Integer Example Proof

— numbers.ht —

```
\begin{page}{IntegerExampleProofPage}{Integer Example Proof}
\beginscroll
Proposition.  If 2**k + 1 is prime, then k is a power of 2.
\newline
Proof.  Suppose that k = m * n with m > 1 odd.  Then
%
```

```
\centerline{2**n = -1 (mod (2**n + 1))}
\centerline{2**(n * m) = (-1)**m = -1 (mod (2**n + 1))}
\centerline{2**k + 1 = 0 (mod (2**n + 1))}
%
Therefore, 2**k + 1 is divisible by 2**n + 1.
Now 1 < 2**n + 1 and since m > 1, 2**n + 1 < 2**k + 1.
Hence, 2**k + 1 has a non-trivial factor.

———-

3.76.9 Solution to Problem #1

— numbers.ht —

```
\begin{page}{IntegerProblemAnswerPage1}{Solution to Problem \#1}
\beginscroll
Problem \#1:  Find the smallest prime p such that \spad{2**p - 1}
is not prime.
\newline
First, define a function:
\spadpaste{f: NNI -> INT \bound{f1}}
\spadpaste{f(n) == 2**n - 1 \bound{f} \free{f1}}
You can try factoring f(p) as p ranges through the set of primes.
For example,
\spadpaste{factor f(7) \free{f}}
```

```
This gets tedious after a while, so let's use Axiom's stream
facility.  (A stream is essentially an infinite sequence.)
\newline
First, we create a stream consisting of the positive integers:
\spadpaste{ints := [n for n in 1..] \bound{ints}}
Now, we create a stream consisting of the primes:
\spadpaste{primes := [x for x in ints | prime? x] \bound{primes}
\free{ints}}
Here's the 25th prime:
\spadpaste{primes.25 \free{primes}}
Next, create the stream of numbers of the form 2**p - 1 with p prime:
\spadpaste{numbers := [f(n) for n in primes] \bound{numbers} \free{primes f}}
Finally, form
the stream of factorizations of the elements of \spad{numbers}:
\spadpaste{factors := [factor n for n in numbers] \bound{factors}
\free{numbers}}
You can see that the fifth number in the stream (2047 = 23*89)
is the first one that has a non-trivial factorization.
Since 2**11 = 2048, the solution to the problem is 11.
\newline
Here's another way to see that 2047 is the first number in the stream that
is composite:
\spadpaste{nums := [x for x in numbers | not prime? x] \bound{nums}
\free{numbers}}

3.76.10 Solution to Problem #2

— numbers.ht —

```
\begin{page}{IntegerProblemAnswerPage2}{Solution to Problem \#2}
\beginscroll
Problem \#2:  Find the smallest positive integer n such that
\spad{n**2 - n + 41} is not prime.
\newline
When n = 41, n**2 - n + 41 = 41**2, which certainly isn't prime.
Let's see if any smaller integer works.
Here are the first 40 values:
\spadpaste{numbers := [n**2 - n + 41 for n in 0..40] \bound{numbers}}
Now have Axiom factor the numbers on this list:
\spadpaste{[factor n for n in numbers] \free{numbers}}
You can see that 41 is the smallest positive integer n such that
n**n - n + 41 is not prime.
```

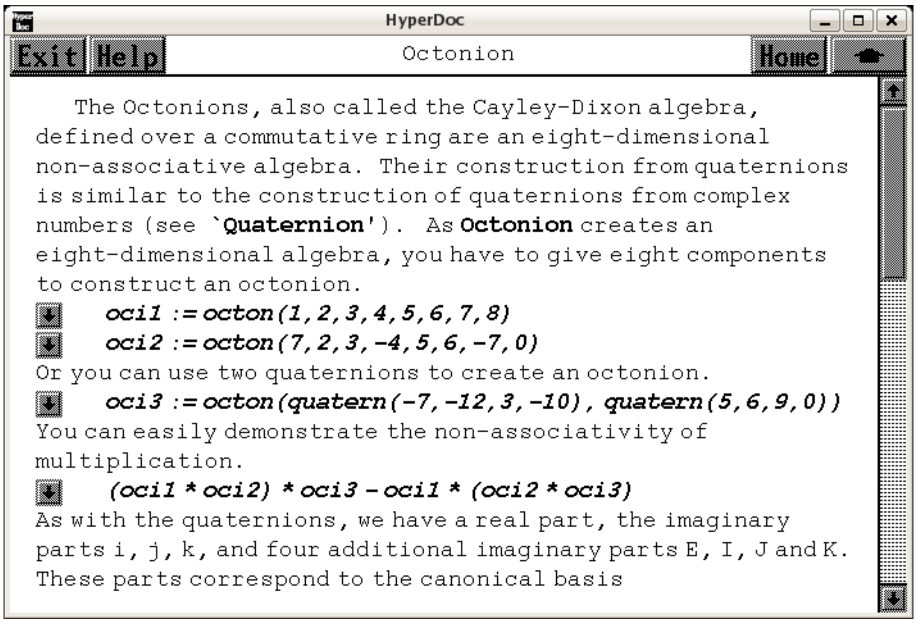
3.77 oct.ht

3.77.1 Octonion



The Octonions, also called the Cayley-Dixon algebra, defined over a commutative ring are an eight-dimensional non-associative algebra. Their construction from quaternions is similar to the construction of quaternions from complex numbers (see `Quaternion'). As **Octonion** creates an eight-dimensional algebra, you have to give eight components to construct an octonion.

```
oci1 := octon(1,2,3,4,5,6,7,8)
oci2 := octon(7,2,3,-4,5,6,-7,0)
```

Or you can use two quaternions to create an octonion.

```
oci3 := octon(quatern(-7,-12,3,-10), quatern(5,6,9,0))
```

You can easily demonstrate the non-associativity of multiplication.

```
(oci1 * oci2) * oci3 - oci1 * (oci2 * oci3)
```

As with the quaternions, we have a real part, the imaginary parts i, j, k, and four additional imaginary parts E, I, J and K. These parts correspond to the canonical basis

```
\begin{page}{OctonionXmpPage}{Octonion}
\beginscroll
The Octonions, also called the Cayley-Dixon algebra, defined over a
commutative ring are an eight-dimensional non-associative algebra.
Their construction from quaternions is similar to the construction
of quaternions from complex numbers
(see \downlink{‘Quaternion’}{QuaternionXmpPage}\ignore{Quaternion}).
%
\xtc{
As \spadtype{Octonion} creates an eight-dimensional algebra, you have to
give eight components to construct an octonion.
}{
\spadpaste{oci1 := octon(1,2,3,4,5,6,7,8) \bound{oci1}}
}
\xtc{
}{
\spadpaste{oci2 := octon(7,2,3,-4,5,6,-7,0) \bound{oci2}}
}
%
```

```
%
\xtc{
Or you can use two quaternions to create an octonion.
}{
\spadpaste{oci3 := octon(quatern(-7,-12,3,-10), quatern(5,6,9,0))
\bound{oci3}}
}
%
%
\xtc{
You can easily demonstrate the non-associativity of multiplication.
}{
\spadpaste{(oci1 * oci2) * oci3 - oci1 * (oci2 * oci3)
\free{oci1 oci2 oci3}}
}
%
As with the quaternions, we have a real part, the imaginary
parts \spad{i}, \spad{j}, \spad{k}, and four
additional imaginary parts \spad{E}, \spad{I}, \spad{J} and \spad{K}.
These parts correspond to the canonical basis
\spad{(1,i,j,k,E,I,J,K)}.
\xtc{
For each basis element there is a component operation to extract
the coefficient of the basis element for a given octonion.
%\spadfunFrom{real}{Octonion},
%\spadfunFrom{imagi}{Octonion},
%\spadfunFrom{imagj}{Octonion},
%\spadfunFrom{imagk}{Octonion},
%\spadfunFrom{imagE}{Octonion},
%\spadfunFrom{imagI}{Octonion},
%\spadfunFrom{imagJ}{Octonion}, and
%\spadfunFrom{imagK}{Octonion}.
}{
\spadpaste{[real oci1, imagi oci1, imagj oci1, imagk oci1, imagE oci1,
imagI oci1, imagJ oci1, imagK oci1] \free{oci1}}
}
%
A basis with respect to the
quaternions is given by \spad{(1,E)}.
However, you might ask, what then are the commuting rules?
To answer this, we create some generic elements.
%
\xtc{
We do this in Axiom
by simply changing the ground ring from \spadtype{Integer} to
\spadtype{Polynomial Integer}.
}{
\spadpaste{q : Quaternion Polynomial Integer := quatern(q1, qi, qj, qk)
\bound{q}}
}
```

```
\xtc{
}{
\spadpaste{E : Octonion Polynomial Integer:= octon(0,0,0,0,1,0,0,0)
\bound{E}}
}
%
\xtc{
Note that quaternions are automatically converted to octonions in the
obvious way.
}{
\spadpaste{q * E \free{q E}}
}
\xtc{
}{
\spadpaste{E * q \free{E q}}
}
\xtc{
}{
\spadpaste{q * 1\$(Octonion Polynomial Integer) \free{q}}
}
\xtc{
}{
\spadpaste{1\$(Octonion Polynomial Integer) * q \free{q}}
}
\xtc{
Finally, we check that the \spadfunFrom{norm}{Octonion},
defined as the sum of the squares of the coefficients,
is a multiplicative map.
}{
\spadpaste{o : Octonion Polynomial Integer := octon(o1, oi, oj, ok, oE,
oI, oJ, oK) \bound{o}}

```
Many systems of differential equations may be transformed to
equivalent systems of ordinary differential equations where the
equations are expressed polynomially in terms of the unknown
functions.  In Axiom, the domain constructors
\spadtype{OrderlyDifferentialPolynomial} (abbreviated
\spadtype{ODPOL}) and \spadtype{SequentialDifferentialPolynomial}
(abbreviation \spadtype{SDPOL}) implement two domains of ordinary
differential polynomials over any differential ring.  In the simplest
case, this differential ring is usually either the ring of integers,
or the field of rational numbers.  However, Axiom can handle ordinary
differential polynomials over a field of rational functions in a
single indeterminate.

The two domains \spadtype{ODPOL} and \spadtype{SDPOL} are almost
identical, the only difference being the choice of a different
ranking, which is an ordering of the derivatives of the
indeterminates.  The first domain uses an orderly ranking, that is,
derivatives of higher order are ranked higher, and derivatives of the
same order are ranked alphabetically.  The second domain uses a
sequential ranking, where derivatives are ordered first alphabetically
by the differential indeterminates, and then by order.  A more general
domain constructor,
\spadtype{DifferentialSparseMultivariatePolynomial} (abbreviation
\spadtype{DSMP}) allows both a user-provided list of differential
indeterminates as well as a user-defined ranking.  We shall illustrate
\spadtype{ODPOL(FRAC INT)}, which constructs a domain of ordinary
differential polynomials in an arbitrary number of differential
indeterminates with rational numbers as coefficients.  \xtc{ }{
\spadpaste{dpol:= ODPOL(FRAC INT) \bound{dpol}} }

\xtc{
A differential indeterminate \spad{w} may be viewed as an infinite
sequence of algebraic indeterminates, which are the derivatives of
\spad{w}.
To facilitate referencing these, Axiom provides the operation
\spadfunFrom{makeVariable}{OrderlyDifferentialPolynomial} to convert an
element of type \spadtype{Symbol} to a map from the natural numbers to the
differential polynomial ring.
}{
\spadpaste{w := makeVariable('w)\$dpol \free{dpol}\bound{w}}
}
\xtc{
}{
\spadpaste{z := makeVariable('z)\$dpol \free{dpol}\bound{z}}
}
\xtc{
The fifth derivative of \spad{w} can be obtained by applying the map
\spad{w} to the number \spad{5.}
Note that the order of differentiation is given as a subscript (except
when the order is 0).
```

```
}{
\spadpaste{w.5 \free{w}}
}
\xtc{
}{
\spadpaste{w 0 \free{w}}
}
\xtc{
The first five derivatives of \spad{z} can be generated by a list.
}{
\spadpaste{[z.i for i in 1..5] \free{z}}
}
\xtc{
The usual arithmetic can be used to form a differential polynomial from
the derivatives.
}{
\spadpaste{f:= w.4 - w.1 * w.1 * z.3 \free{w}\free{z}\bound{f}}
}
\xtc{
}{
\spadpaste{g:=(z.1)**3 * (z.2)**2 - w.2 \free{z}\free{w}\bound{g}}
}
\xtc{
The operation \spadfunFrom{D}{OrderlyDifferentialPolynomial}
computes the derivative of any differential polynomial.
}{
\spadpaste{D(f) \free{f}}
}
\xtc{
The same operation can compute higher derivatives, like the
fourth derivative.
}{
\spadpaste{D(f,4) \free{f}}
}
\xtc{
The operation \spadfunFrom{makeVariable}{OrderlyDifferentialPolynomial}
creates a map to facilitate referencing the derivatives of \spad{f},
similar to the map \spad{w}.
}{
\spadpaste{df:=makeVariable(f)\$dpol \free{f}\bound{df}}
}
\xtc{
The fourth derivative of f may be referenced easily.
}{
\spadpaste{df.4 \free{df}}
}
\xtc{
The operation \spadfunFrom{order}{OrderlyDifferentialPolynomial}
returns the order of a differential polynomial, or the order
in a specified differential indeterminate.
```

```
}{
\spadpaste{order(g)  \free{g}}
}
\xtc{
}{
\spadpaste{order(g, 'w)  \free{g}}
}
\xtc{
The operation
\spadfunFrom{differentialVariables}{OrderlyDifferentialPolynomial}
returns a list of differential indeterminates occurring in a
differential polynomial.
}{
\spadpaste{differentialVariables(g)  \free{g}}
}
\xtc{
The operation \spadfunFrom{degree}{OrderlyDifferentialPolynomial}
returns the degree, or the degree in the differential indeterminate
specified.
}{
\spadpaste{degree(g) \free{g}}
}
\xtc{
}{
\spadpaste{degree(g, 'w)  \free{g}}
}
\xtc{
The operation \spadfunFrom{weights}{OrderlyDifferentialPolynomial}
returns a list of weights of differential monomials appearing in
differential polynomial, or a list of weights in a specified
differential indeterminate.
}{
\spadpaste{weights(g)  \free{g}}
}
\xtc{
}{
\spadpaste{weights(g,'w) \free{g}}
}
\xtc{
The operation \spadfunFrom{weight}{OrderlyDifferentialPolynomial} returns
the maximum weight of all differential monomials appearing in the
differential polynomial.
}{
\spadpaste{weight(g)  \free{g}}
}
\xtc{
A differential polynomial is {\em isobaric} if the weights of all
differential monomials appearing in it are equal.
}{
\spadpaste{isobaric?(g) \free{g}}
```

```
}
\xtc{
To substitute {\em differentially}, use
\spadfunFrom{eval}{OrderlyDifferentialPolynomial}.  Note that we must
coerce \spad{'w} to \spadtype{Symbol}, since in \spadtype{ODPOL},
differential indeterminates belong to the domain \spadtype{Symbol}.
Compare this result to the next, which substitutes {\em algebraically}
(no substitution is done since \spad{w.0} does not appear in \spad{g}).
}{
\spadpaste{eval(g,['w::Symbol],[f]) \free{f}\free{g}}
}
\xtc{
}{
\spadpaste{eval(g,variables(w.0),[f]) \free{f}\free{g}}
}
\xtc{
Since \spadtype{OrderlyDifferentialPolynomial} belongs to
\spadtype{PolynomialCategory}, all the operations defined in the latter
category, or in packages for the latter category, are available.
}{
\spadpaste{monomials(g) \free{g}}
}
\xtc{
}{
\spadpaste{variables(g) \free{g}}
}
\xtc{
}{
\spadpaste{gcd(f,g) \free{f}\free{g}}
}
\xtc{
}{
\spadpaste{groebner([f,g]) \free{f}\free{g}}
}
\xtc{
The next three operations are essential for elimination procedures in
differential polynomial rings.
The operation \spadfunFrom{leader}{OrderlyDifferentialPolynomial} returns
the leader of a differential polynomial, which is the highest ranked
derivative of the differential indeterminates that occurs.
}{
\spadpaste{lg:=leader(g)  \free{g}\bound{lg}}
}
\xtc{
The operation \spadfunFrom{separant}{OrderlyDifferentialPolynomial}
returns the separant of a differential polynomial, which is the
partial derivative with respect to the leader.
}{
\spadpaste{sg:=separant(g)  \free{g}\bound{sg}}
}
```

```
\xtc{
The operation \spadfunFrom{initial}{OrderlyDifferentialPolynomial}
returns the initial, which is the leading coefficient when the given
differential polynomial is expressed as a polynomial in the leader.
}{
\spadpaste{ig:=initial(g)  \free{g}\bound{ig}}
}
\xtc{
Using these three operations, it is possible to reduce \spad{f} modulo
the differential ideal generated by \spad{g}.  The general scheme is
to first reduce the order, then reduce the degree in the leader.
First, eliminate \spad{z.3} using the derivative of \spad{g}.
}{
\spadpaste{g1 := D g \free{g}\bound{g1}}
}
\xtc{
Find its leader.
}{
\spadpaste{lg1:= leader g1 \free{g1}\bound{lg1}}
}
\xtc{
Differentiate \spad{f} partially with respect to this leader.
}{
\spadpaste{pdf:=D(f, lg1) \free{f}\free{lg1}\bound{pdf}}
}
\xtc{
Compute the partial remainder of \spad{f} with respect to \spad{g}.
}{
\spadpaste{prf:=sg * f- pdf * g1 \free{f}\free{sg}\free{pdf}
\free{g1}\bound{prf}}
}
\xtc{
Note that high powers of \spad{lg} still appear in \spad{prf}.
Compute the leading coefficient of \spad{prf}
as a polynomial in the leader of \spad{g}.
}{
\spadpaste{lcf:=leadingCoefficient univariate(prf, lg)
\free{prf}\free{lg}\bound{lcf}}
}
\xtc{
Finally, continue eliminating the high powers of \spad{lg} appearing in
\spad{prf} to obtain the (pseudo) remainder of \spad{f} modulo \spad{g}
and its derivatives.
}{
\spadpaste{ig * prf - lcf * g * lg \free{ig}\free{prf}
\free{lcf}\free{g}\free{lg}}
}
