———-

3.79 op.ht

3.79.1 Operator

— op.ht —

```
\begin{page}{OperatorXmpPage}{Operator}
\beginscroll
Given any ring \spad{R}, the ring of the \spadtype{Integer}-linear
operators over \spad{R} is called \spadtype{Operator(R)}.  To create
an operator over \spad{R}, first create a basic operator using the
operation \spadfun{operator}, and then convert it to
\spadtype{Operator(R)} for the \spad{R} you want.
%
\xtc{
```

```
We choose \spad{R} to be the two by two matrices over the integers.
}{
\spadpaste{R := SQMATRIX(2, INT)\bound{r}}
}
\xtc{
Create the operator \spad{tilde} on \spad{R}.
}{
\spadpaste{t := operator("tilde") :: OP(R) \free{r}\bound{t}}
}
%
Since \spadtype{Operator} is unexposed we must either package-call
operations from it, or expose it explicitly.  For convenience we will
do the latter.
%
\noOutputXtc{
Expose \spad{Operator}.
}{
\spadpaste{)set expose add constructor Operator \free{t}\bound{expose}}
}
%
To attach an evaluation function (from \spad{R} to \spad{R}) to an
operator over \spad{R}, use \spad{evaluate(op, f)} where \spad{op}
is an operator over \spad{R} and \spad{f} is a function \spad{R ->
R}.
This needs to be done only once when the operator is defined.
Note that \spad{f} must be \spadtype{Integer}-linear (that is,
\spad{f(ax+y) = a f(x) + f(y)} for any integer \spad{a}, and any
\spad{x} and \spad{y} in \spad{R}).
%
\xtc{
We now attach the transpose map to the above operator \spad{t}.
}{
\spadpaste{evaluate(t, m +-> transpose m)\free{expose}\free{t}\bound{evt}}
}
%
Operators can be manipulated formally as in any ring: \spadop{+} is the
pointwise addition and \spadop{*} is composition.
Any element \spad{x} of \spad{R} can be converted to an operator
\subscriptText{\tt op}{\tt x}
over \spad{R}, and the evaluation function of
\subscriptText{\tt op}{\tt x}
is left-multiplication by \spad{x}.
%
\xtc{
Multiplying on the
left by this matrix swaps the two rows.
}{
\spadpaste{s : R := matrix {\tt{}0,\ 1],\ [1,\ 0}\bound{s}}
}
%
```

```
\xtc{
Can you guess what is the action of the following operator?
}{
\spadpaste{rho := t * s\free{evt s}\bound{rho}}
}
%
%
\xtc{
Hint: applying \spad{rho} four times gives the identity, so
\spad{rho**4-1} should return 0 when applied to any two by two matrix.
}{
\spadpaste{z := rho**4 - 1\free{rho}\bound{z}}
}
%
%
\xtc{
Now check with this matrix.
}{
\spadpaste{m:R := matrix {\tt{}1,\ 2],\ [3,\ 4}\bound{m}}
}
\xtc{
}{
\spadpaste{z m\free{z m}}
}
%
%
\xtc{
As you have probably guessed by now, \spad{rho} acts on matrices
by rotating the elements clockwise.
}{
\spadpaste{rho m\free{rho m}}
}
\xtc{
}{
\spadpaste{rho rho m\free{rho m}}
}
\xtc{
}{
\spadpaste{(rho**3) m\free{rho m}}
}
%
%
\xtc{
Do the swapping of rows and transposition commute?
We can check by computing their bracket.
}{
\spadpaste{b := t * s - s * t\free{s evt}\bound{b}}
}
%
%
```

```
\xtc{
Now apply it to \spad{m}.
}{
\spadpaste{b m \free{b m}}
}
%

Next we demonstrate how to define a differential operator
on a polynomial ring.
\xtc{
This is the recursive definition of the \spad{n}-th Legendre polynomial.
}{
\begin{spadsrc}[\bound{l}]
L n ==
  n = 0 => 1
  n = 1 => x
  (2*n-1)/n * x * L(n-1) - (n-1)/n * L(n-2)
\end{spadsrc}
}
\xtc{
Create the differential operator \texht{$d \over {dx}$}{\spad{d/dx}} on
polynomials in \spad{x} over the rational numbers.
}{
\spadpaste{dx := operator("D") :: OP(POLY FRAC INT) \bound{dx}}
}
\xtc{
Now attach the map to it.
}{
\spadpaste{evaluate(dx, p +-> D(p, 'x)) \free{dx}\bound{edx}}
}
\xtc{
This is the differential equation satisfied by the \spad{n}-th
Legendre polynomial.
}{
\spadpaste{E n == (1 - x**2) * dx**2 - 2 * x * dx + n*(n+1)
\free{edx}\bound{E}}
}
\xtc{
Now we verify this for \spad{n = 15}.
Here is the polynomial.
}{
\spadpaste{L 15 \free{L}}
}
\xtc{
Here is the operator.
}{
\spadpaste{E 15 \free{E}}
}
\xtc{
Here is the evaluation.
}{
\spadpaste{(E 15)(L 15) \free{L E}}
}
\endscroll
\autobuttons
\end{page}

3.81 perman.ht

3.81.1 Permanent

— perman.ht —

```
\begin{page}{PermanentXmpPage}{Permanent}
\beginscroll
The package \spadtype{Permanent} provides the function
\spadfunFrom{permanent}{Permanent} for square matrices.
The \spadfunFrom{permanent}{Permanent} of a square matrix can be computed
in the same way as the determinant by expansion of minors except that for
the permanent the sign for each element is \spad{1}, rather than being
\spad{1} if the row plus column indices is positive and \spad{-1}
otherwise.
This function is much more difficult to compute efficiently than the
\spadfunFrom{determinant}{Matrix}.
An example of the use of \spadfunFrom{permanent}{Permanent} is the
calculation of the \eth{\spad{n}} derangement number, defined to be
the number of different possibilities for \spad{n} couples to dance
but never with their own spouse.
\xtc{
Consider an \spad{n} by \spad{n} matrix with entries
\spad{0} on the diagonal and
\spad{1} elsewhere.
Think of the rows as one-half of each couple (for example, the males)
and the columns the other half.  The permanent of such a matrix gives
the desired derangement number.

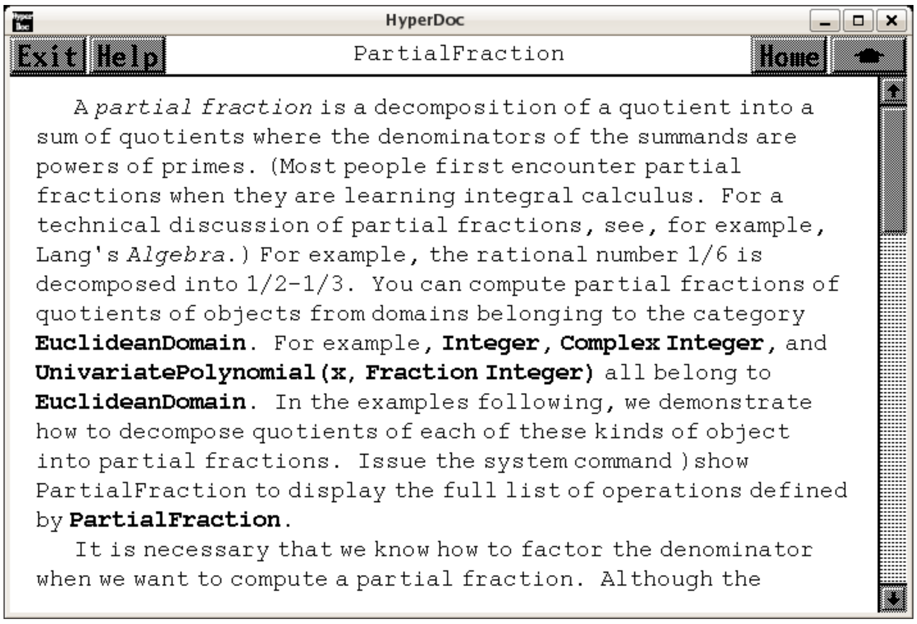
3.82 pfr.ht

3.82.1 PartialFraction



A *partial fraction* is a decomposition of a quotient into a sum of quotients where the denominators of the summands are powers of primes. (Most people first encounter partial fractions when they are learning integral calculus. For a technical discussion of partial fractions, see, for example, Lang's *Algebra*.) For example, the rational number 1/6 is decomposed into 1/2-1/3. You can compute partial fractions of quotients of objects from domains belonging to the category **EuclideanDomain**. For example, **Integer**, **Complex Integer**, and **UnivariatePolynomial(x, Fraction Integer)** all belong to **EuclideanDomain**. In the examples following, we demonstrate how to decompose quotients of each of these kinds of object into partial fractions. Issue the system command)show PartialFraction to display the full list of operations defined by **PartialFraction**.

It is necessary that we know how to factor the denominator when we want to compute a partial fraction. Although the

— **pfr.ht** —

```
\begin{page}{PartialFractionXmpPage}{PartialFraction}
\beginscroll
A {\it partial fraction} is a decomposition of a quotient into a sum
of quotients where the denominators of the summands are powers of
primes.\footnote{Most people first encounter partial fractions when
they are learning integral calculus.  For a technical discussion of
partial fractions, see, for example, Lang's {\it Algebra.}} For
example, the rational number \spad{1/6} is decomposed into
\spad{1/2-1/3}.  You can compute partial fractions of quotients of
objects from domains belonging to the category
\spadtype{EuclideanDomain}.  For
example, \spadtype{Integer}, \spadtype{Complex Integer}, and
\spadtype{UnivariatePolynomial(x, Fraction Integer)} all belong to
\spadtype{EuclideanDomain}.  In the examples following, we demonstrate
how to decompose quotients of each of these kinds of object into
partial fractions.  Issue the system command \spadcmd{)show
PartialFraction} to display the full list of operations defined by
\spadtype{PartialFraction}.
```

```
It is necessary that we know how to factor the denominator when we
want to compute a partial fraction.  Although the interpreter can
often do this automatically, it may be necessary for you to include a
call to \spadfun{factor}.  In these examples, it is not necessary to
factor the denominators explicitly.
%
\xtc{
The main operation for computing partial fractions is called
\spadfunFrom{partialFraction}{PartialFraction} and we use this to
compute a decomposition of \spad{1 / 10!}.
The first argument to \spadfunFrom{partialFraction}{PartialFraction} is
the numerator of the quotient and the second argument is the factored
denominator.
}{
\spadpaste{partialFraction(1,factorial 10) \bound{prev1}}
}
\xtc{
Since the denominators are powers of primes, it may be possible
to expand the numerators further with respect to those primes. Use the
operation \spadfunFrom{padicFraction}{PartialFraction} to do this.
}{
\spadpaste{f := padicFraction(\%) \free{prev1}\bound{f}}
}
%
%
\xtc{
The operation \spadfunFrom{compactFraction}{PartialFraction} returns an
expanded fraction into the usual form.
The compacted version is used internally for computational efficiency.
}{
\spadpaste{compactFraction(f) \free{f}}
}
%
\xtc{
You can add, subtract, multiply
and divide partial fractions.  In addition, you can extract the parts
of the decomposition.
\spadfunFrom{numberOfFractionalTerms}{PartialFraction} computes
the number of terms in the fractional part.
This does not include the whole part of the fraction,
which you get by calling \spadfunFrom{wholePart}{PartialFraction}.
In this example, the whole part is just \spad{0}.
}{
\spadpaste{numberOfFractionalTerms(f) \free{f}}
}
\xtc{
The operation \spadfunFrom{nthFractionalTerm}{PartialFraction} returns
the individual terms in the decomposition.  Notice that the object
returned is a partial fraction itself.
\spadfunFrom{firstNumer}{PartialFraction} and
```

```
\spadfunFrom{firstDenom}{PartialFraction} extract the numerator and
denominator of the first term of the fraction.
}{
\spadpaste{nthFractionalTerm(f,3) \free{f}}
}
%

%
\xtc{
Given two gaussian integers (see
\downlink{`Complex'}{ComplexXmpPage}\ignore{Complex}), you can
decompose their quotient into a partial fraction.
}{
\spadpaste{partialFraction(1,- 13 + 14 * \%i) \bound{prev2}}
}
%
\xtc{
To convert back to a quotient, simply use a conversion.
}{
\spadpaste{\% :: Fraction Complex Integer \free{prev2}}
}

To conclude this section, we compute the decomposition of
\texht{\narrowDisplay{1 \over {{(x + 1)}{(x + 2)}^2{(x + 3)}^3{(x + 4)}^4}}}{
\begin{verbatim}
                   1
     -------------------------------
                   2       3       4
     (x + 1)(x + 2) (x + 3) (x + 4)
\end{verbatim}
}
The polynomials in this object have type
\spadtype{UnivariatePolynomial(x, Fraction Integer)}.
%
\xtc{
We use the \spadfunFrom{primeFactor}{Factored} operation (see
\downlink{`Factored'}{FactoredXmpPage}
\ignore{Factored}) to create the denominator in factored form directly.
}{
\spadpaste{u : FR UP(x, FRAC INT) := reduce(*,[primeFactor(x+i,i)
for i in 1..4]) \bound{u}}
}
%
%
\xtc{
These are the compact and expanded partial fractions for the quotient.
}{
\spadpaste{partialFraction(1,u) \free{u}\bound{prev3}}
}
\xtc{
}{
\spadpaste{padicFraction \% \free{prev3}}
}

All see \downlink{‘FullPartialFracExpansion’}
{FullPartialFracExpansionXmpPage}
\ignore{FullPartialFracExpansion} for examples of
factor-free conversion of quotients to full partial fractions.

3.83.3 Basic Operations On Polynomials

— poly.ht —

```
\begin{page}{PolynomialBasicPage}{Basic Operations On Polynomials}
\beginscroll
You create
polynomials using the usual operations of \spadopFrom{+}{Polynomial},
\spadopFrom{-}{Polynomial}, \spadopFrom{*}{Polynomial}
(for multiplication), and
\spadopFrom{**}{Polynomial} (for exponentiation).
Here are two examples: \newline
\spadpaste{p := a*x**2 + b*x*y + c*y**2 \bound{p}}
\spadpaste{q := 13*x**2 + 3*z \bound{q}}
These operations can also be used to combine polynomials.
Try the following:
\spadpaste{p + q \free{p q}}
\spadpaste{p - 3*q \free{p q}}
\spadpaste{p**2 + p*q \free{p q}}
\spadpaste{r := (p + q)**2 \bound{r} \free{p q}}
As you can see from the above examples, the variables are ordered
by defaults \spad{z > y > x > c > b > a},
that is, \spad{z} is the main variable, then
\spad{y} and so on in reverse alphabetical order.
You can redefine this
ordering (for display purposes only) with the \spadfun{setVariableOrder}
command.
For example, the following
makes \spad{a} the main variable, then \spad{b}, and so on:
\spadpaste{setVariableOrder [a,b,c,x,y,z] \bound{vord}}
Now compare the way polynomials are displayed:
\spadpaste{p \free{p vord}}
\spadpaste{q \free{q vord}}
\spadpaste{r \free{r vord}}
To return to the system's default ordering,
use \spadfun{resetVariableOrder}.
\spadpaste{resetVariableOrder() \bound{rvord}}
\spadpaste{p \free{p rvord}}
Polynomial coefficients can be pulled out
using the function \spadfun{coefficient}. \newline
For example:
\spadpaste{coefficient(q,x,2) \free{q}}
will give you the coefficient of \spad{x**2} in the polynomial \spad{q}.
\newline
Try these commands:
\spadpaste{coefficient(r,x,3) \free{r}}
\spadpaste{c := coefficient(r,z,1) \free{r} \bound{c}}
\spadpaste{coefficient(c,x,2) \free{c}}
Coefficients of monomials can be obtained as follows:
\spadpaste{coefficient(q**2, [x,z], [2,1]) \free{q}}
This will return the coefficient of x**2 * z in the polynomial q**2.
Also,
\spadpaste{coefficient(r, [x,y], [2,2]) \free{r}}
will return the coefficient of \spad{x**2 * y**2}
in the polynomial \spad{r(x,y)}.

3.83.4 Polynomial Evaluation and Substitution

— **poly.ht** —

```
\begin{page}{PolynomialSubstitutionPage}
```

```
{Polynomial Evaluation and Substitution}
\beginscroll
The function \spadfun{eval} is used to substitute values into polynomials.
Here's an example of how to use it:
\spadpaste{p := x**2 + y**2 \bound{p}}
\spadpaste{eval(p,x=5) \free{p}}
\newline
This example would give you the value of the polynomial \spad{p} at 5.
You can also substitute into polynomials with
several variables.  First, specify the polynomial, then give
a list of bindings of the form \spad{variable = value}. For example:
\spadpaste{eval(p,[x = a + b,y = c + d]) \free{p}}
Here \spad{x} was replaced by \spad{a + b},
and \spad{y} was replaced by \spad{c + d}.
Here's another example:
\spadpaste{q := x**3 + 5*x - y**4 \bound{q}}
\spadpaste{eval(q,[x=y,y=x]) \free{q}}
Substitution is done ``in parallel.''
That is, Axiom takes
\spad{q(x,y)} and returns \spad{q(y,x)}.
\newline
You can also substitute numerical values for some or all of the
variables:
\spadpaste{px := eval(p, y = sin(2.0)) \bound{px} \free{p}}
\spadpaste{eval(px, x = cos(2.0)) \free{px}}

3.83.5 Greatest Common Divisors, Resultants, and Discriminants

— poly.ht —

```
\begin{page}{PolynomialGCDPage}
{Greatest Common Divisors, Resultants, and Discriminants}
\beginscroll
You can compute the greatest common divisor of two polynomials using
the function \spadfun{gcd}.
Here's an example:
\spadpaste{p := 3*x**8 + 2*x**7 + 6*x**2 + 7*x + 2 \bound{p}}
\spadpaste{q := 2*x**13 + 9*x**7 + 2*x**6 + 10*x + 5 \bound{q}}
\spadpaste{gcd(p,q) \free{p q}}
You could also see that \spad{p} and \spad{q} have a factor in
common by using the function \spadfun{resultant}:
\spadpaste{resultant(p,q,x) \free{p q}}
The resultant of two polynomials vanishes precisely when they have a
factor in common.
(In the example above
we specified the variable with
which we wanted to compute the resultant because the
polynomials could have involved variables other than x.)

```
\begin{page}{PolynomialXmpPage}{Polynomial}
\beginscroll

The domain constructor \spadtype{Polynomial}
(abbreviation: \spadtype{POLY})
```

```
provides polynomials with an arbitrary number of unspecified
variables.

\xtc{
It is used to create the default polynomial domains
in Axiom.
Here the coefficients are integers.
}{
\spadpaste{x + 1}
}
\xtc{
Here the coefficients have type \spadtype{Float}.
}{
\spadpaste{z - 2.3}
}
\xtc{
And here we have a polynomial in two variables with coefficients
which have type \spadtype{Fraction Integer}.
}{
\spadpaste{y**2 - z + 3/4}
}

The representation of objects of domains created by \spadtype{Polynomial}
is that of recursive univariate polynomials.\footnote{The term
\spad{univariate} means ``one variable.'' \spad{multivariate} means
``possibly more than one variable.''}
\xtc{
This recursive structure is sometimes obvious from the display of
a polynomial.
}{
\spadpaste{y **2 + x*y + y \bound{prev}}
}
In this example, you see that the polynomial is stored as a polynomial in
\spad{y} with coefficients that are polynomials in \spad{x} with integer
coefficients.
In fact, you really don't need to worry about the representation unless
you are working on an advanced application where it is critical.
The polynomial types created from
\spadtype{DistributedMultivariatePoly} and
\spadtype{NewDistributedMultivariatePoly} (discussed in
\downlink{`DistributedMultivariatePoly'}
{DistributedMultivariatePolyXmpPage}
\ignore{DistributedMultivariatePoly}) are stored and displayed in a
non-recursive manner.
\xtc{
You see a ``flat'' display of the above
polynomial by converting to one of those types.
}{
\spadpaste{\% :: DMP([y,x],INT) \free{prev}}
}
```

```
We will demonstrate many of the polynomial facilities by using two
polynomials with integer coefficients.
\xtc{
By default, the interpreter expands polynomial expressions, even if they
are written in a factored format.
}{
\spadpaste{p := (y-1)**2 * x * z \bound{p}}
}
\xtc{
See \downlink{`Factored'}{FactoredXmpPage}\ignore{Factored} to see
how to create objects in factored form directly.
}{
\spadpaste{q := (y-1) * x * (z+5) \bound{q}}
}
\xtc{
The fully factored form can be recovered by using
\spadfunFrom{factor}{Polynomial}.
}{
\spadpaste{factor(q) \free{q}}
}
This is the same name used for the operation to factor integers.  Such
reuse of names is called \spadglos{overloading} and makes it much
easier to think of solving problems in general ways.  Axiom facilities
for factoring polynomials created with \spadtype{Polynomial} are
currently restricted to the integer and rational number coefficient
cases.  There are more complete facilities for factoring univariate
polynomials: see
\downlink{``Polynomial Factorization''}{ugProblemFactorPage} in
Section 8.2\ignore{ugProblemFactor}.

\xtc{
The standard arithmetic operations are available for polynomials.
}{
\spadpaste{p - q**2\free{p q}}
}
\xtc{
The operation \spadfunFrom{gcd}{Polynomial} is used to compute the
greatest common divisor of two polynomials.
}{
\spadpaste{gcd(p,q) \free{p q}\bound{prev4}}
}
\xtc{
In the case of \spad{p} and \spad{q}, the gcd is obvious from their
definitions.
We factor the gcd to show this relationship better.
}{
\spadpaste{factor \% \free{prev4}}
}
\xtc{
```

```
The least common multiple is computed by using
\spadfunFrom{lcm}{Polynomial}.
}{
\spadpaste{lcm(p,q) \free{p q}}
}
\xtc{
Use \spadfunFrom{content}{Polynomial} to compute the
greatest common divisor of the
coefficients of the polynomial.
}{
\spadpaste{content p \free{p}}
}

Many of the operations on polynomials require you to specify a variable.
For example, \spadfunFrom{resultant}{Polynomial} requires you to give the
variable in which the polynomials should be expressed.
\xtc{
This computes the resultant of the values of \spad{p} and
\spad{q}, considering them as polynomials in the variable \spad{z}.
They do not share a root when thought of as polynomials in \spad{z}.
}{
\spadpaste{resultant(p,q,z) \free{p q}}
}
\xtc{
This value is \spad{0} because as polynomials in \spad{x} the polynomials
have a common root.
}{
\spadpaste{resultant(p,q,x) \free{p}\free{q}}
}
The data type used for the variables created by \spadtype{Polynomial} is
\spadtype{Symbol}.
As mentioned above, the representation used by \spadtype{Polynomial} is
recursive and so there is a main variable for nonconstant polynomials.
\xtc{
The operation \spadfunFrom{mainVariable}{Polynomial} returns this
variable.
The return type is actually a union of \spadtype{Symbol} and
\spad{"failed"}.
}{
\spadpaste{mainVariable p \free{p}}
}
\xtc{
The latter branch of the union is be used if the polynomial has no
variables, that is, is a constant.
}{
\spadpaste{mainVariable(1 :: POLY INT)}
}
\xtc{
You can also use the predicate \spadfunFrom{ground?}{Polynomial} to test
whether a polynomial is in fact a member of its ground ring.
```

```
}{
\spadpaste{ground? p \free{p}}
}
\xtc{
}{
\spadpaste{ground?(1 :: POLY INT)}
}
\xtc{
The complete list of variables actually used in a particular polynomial is
returned by \spadfunFrom{variables}{Polynomial}.
For constant polynomials, this list is empty.
}{
\spadpaste{variables p \free{p}}
}

\xtc{
The \spadfunFrom{degree}{Polynomial} operation returns the
degree of a polynomial in a specific variable.
}{
\spadpaste{degree(p,x) \free{p}}
}
\xtc{
}{
\spadpaste{degree(p,y) \free{p}}
}
\xtc{
}{
\spadpaste{degree(p,z) \free{p}}
}
\xtc{
If you give a list of variables for the second argument, a list
of the degrees in those variables is returned.
}{
\spadpaste{degree(p,[x,y,z]) \free{p}}
}
\xtc{
The minimum degree of a variable in a polynomial is computed using
\spadfunFrom{minimumDegree}{Polynomial}.
}{
\spadpaste{minimumDegree(p,z) \free{p}}
}
\xtc{
The total degree of a polynomial is returned by
\spadfunFrom{totalDegree}{Polynomial}.
}{
\spadpaste{totalDegree p \free{p}}
}

\xtc{
It is often convenient to think of a polynomial as a leading monomial
```

```
plus the remaining terms.
}{
\spadpaste{leadingMonomial p \free{p}}
}
\xtc{
The \spadfunFrom{reductum}{Polynomial} operation returns a polynomial
consisting of the sum of the monomials after the first.
}{
\spadpaste{reductum p \free{p}}
}
\xtc{
These have the obvious relationship that the original polynomial
is equal to the leading monomial plus the reductum.
}{
\spadpaste{p - leadingMonomial p - reductum p \free{p}}
}
\xtc{
The value returned by \spadfunFrom{leadingMonomial}{Polynomial} includes
the coefficient of that term.
This is extracted by using
\spadfunFrom{leadingCoefficient}{Polynomial} on the original polynomial.
}{
\spadpaste{leadingCoefficient p \free{p}}
}
\xtc{
The operation \spadfunFrom{eval}{Polynomial} is used to substitute a
value for a variable in a polynomial.
}{
\spadpaste{p  \free{p}}
}
\xtc{
This value may be another variable, a constant or a polynomial.
}{
\spadpaste{eval(p,x,w) \free{p}}
}
\xtc{
}{
\spadpaste{eval(p,x,1) \free{p}}
}
\xtc{
Actually, all the things being substituted are just polynomials,
some more trivial than others.
}{
\spadpaste{eval(p,x,y**2 - 1) \free{p}}
}

\xtc{
Derivatives are computed using the \spadfunFrom{D}{Polynomial}
operation.
}{
```

```
\spadpaste{D(p,x) \free{p}}
}
\xtc{
The first argument is the polynomial and the second is the variable.
}{
\spadpaste{D(p,y) \free{p}}
}
\xtc{
Even if the polynomial has only one variable, you must specify it.
}{
\spadpaste{D(p,z) \free{p}}
}

Integration of polynomials is similar and the
\spadfunFrom{integrate}{Polynomial} operation is used.

\xtc{
Integration requires that the coefficients support division.
Consequently,
Axiom converts polynomials over the integers to polynomials over
the rational numbers before integrating them.
}{
\spadpaste{integrate(p,y) \free{p}}
}

It is not possible, in general, to divide two polynomials.
In our example using polynomials over the integers, the operation
\spadfunFrom{monicDivide}{Polynomial} divides a polynomial by a monic
polynomial (that is, a polynomial with leading coefficient equal to 1).
The result is a record of the quotient and remainder of the
division.
\xtc{
You must specify the variable in which to express the polynomial.
}{
\spadpaste{qr := monicDivide(p,x+1,x) \free{p}\bound{qr}}
}
\xtc{
The selectors of the components of the record are
\spad{quotient} and \spad{remainder}.
Issue this to extract the remainder.
}{
\spadpaste{qr.remainder \free{qr}}
}
\xtc{
Now that we can extract the components, we can demonstrate the
relationship among them and the arguments to our original expression
\spad{qr := monicDivide(p,x+1,x)}.
}{
\spadpaste{p - ((x+1) * qr.quotient + qr.remainder) \free{p}\free{qr}}
}
```

```
\xtc{
If the \spadopFrom{/}{Fraction} operator is used with polynomials, a
fraction object is created.
In this example, the result is an object of type \spadtype{Fraction
Polynomial Integer}.
}{
\spadpaste{p/q \free{p}\free{q}}
}
\xtc{
If you use rational numbers as polynomial coefficients, the
resulting object is of type \spadtype{Polynomial Fraction Integer}.
}{
\spadpaste{(2/3) * x**2 - y + 4/5 \bound{prev1}}
}
\xtc{
This can be converted to a fraction of polynomials and back again, if
required.
}{
\spadpaste{\% :: FRAC POLY INT \free{prev1}\bound{prev2}}
}
\xtc{
}{
\spadpaste{\% :: POLY FRAC INT \free{prev2}\bound{prev3}}
}
\xtc{
To convert the coefficients to floating point,
map the \spadfun{numeric} operation on the coefficients of the polynomial.
}{
\spadpaste{map(numeric,\%) \free{prev3}}
}

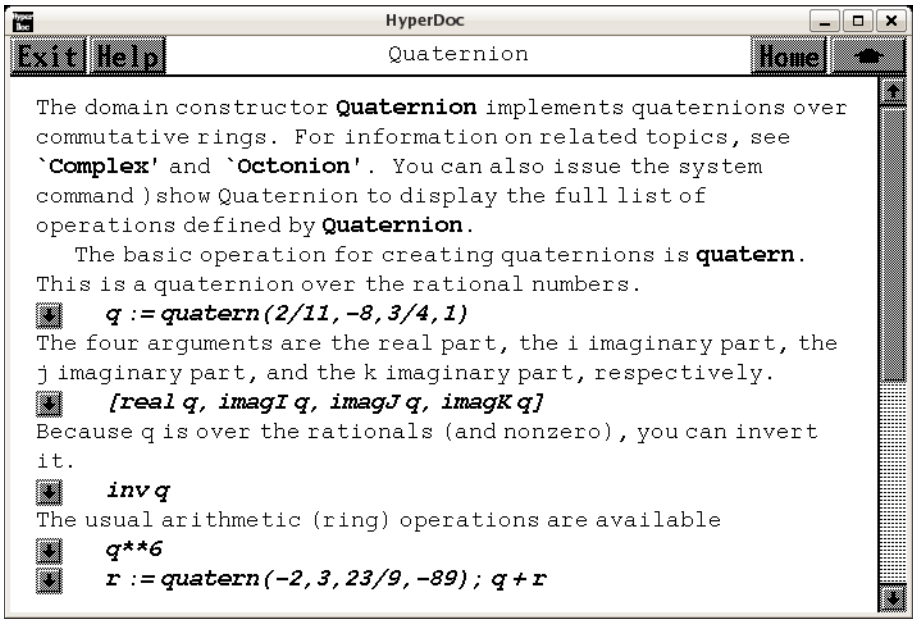
3.85 quat.ht

3.85.1 Quaternion



The domain constructor **Quaternion** implements quaternions over commutative rings. For information on related topics, see `Complex' and `Octonion'. You can also issue the system command)show Quaternion to display the full list of operations defined by **Quaternion**.

The basic operation for creating quaternions is **quatern**. This is a quaternion over the rational numbers.

q := quatern(2/11,-8,3/4,1)

The four arguments are the real part, the i imaginary part, the j imaginary part, and the k imaginary part, respectively.

[real q, imagI q, imagJ q, imagK q]

Because q is over the rationals (and nonzero), you can invert it.

inv q

The usual arithmetic (ring) operations are available

*q**6*

r := quatern(-2,3,23/9,-89); q + r

⇐ "Axiom Number Types" (NumberPage) 3.76.1 on page 1004

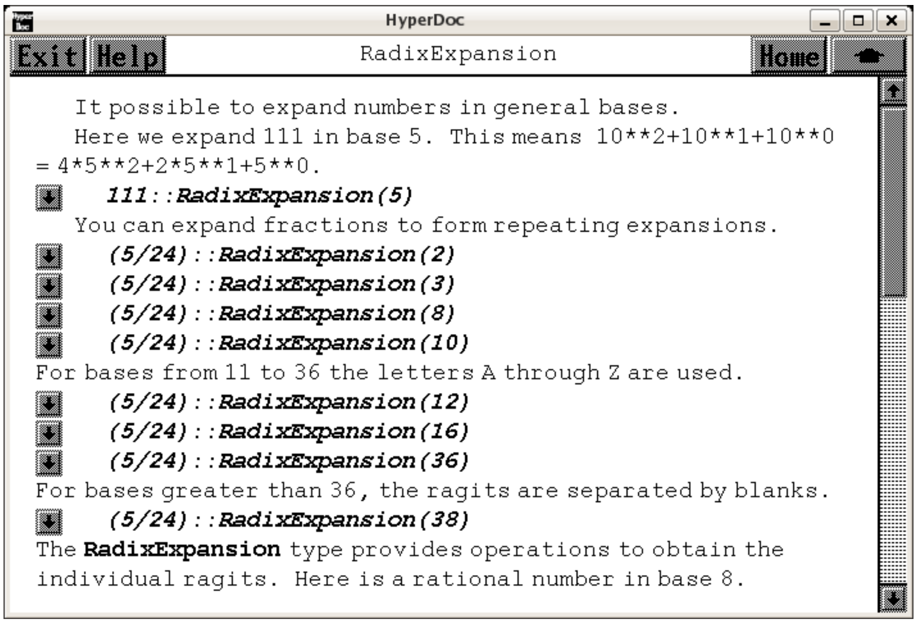
3.86 radix.ht

3.86.1 RadixExpansion



It possible to expand numbers in general bases.
Here we expand 111 in base 5. This means 10**2+10**1+10**0 = 4*5**2+2*5**1+5**0.

111::RadixExpansion(5)

You can expand fractions to form repeating expansions.

(5/24)::RadixExpansion(2)
(5/24)::RadixExpansion(3)
(5/24)::RadixExpansion(8)
(5/24)::RadixExpansion(10)

For bases from 11 to 36 the letters A through Z are used.

(5/24)::RadixExpansion(12)
(5/24)::RadixExpansion(16)
(5/24)::RadixExpansion(36)

For bases greater than 36, the ragits are separated by blanks.

(5/24)::RadixExpansion(38)

The **RadixExpansion** type provides operations to obtain the individual ragits. Here is a rational number in base 8.

⇐ "Axiom Number Types" (NumberPage) 3.76.1 on page 1004

3.87 reclos.ht

3.87.1 RealClosure

— reclos.ht —

```
\begin{page}{RealClosureXmpPage}{RealClosure}
\beginscroll

The Real Closure 1.0 package provided by
Renaud Rioboo (Renaud.Rioboo@lip6.fr) consists of different
packages, categories and domains :

\begin{items}
\item The package \axiomType{RealPolynomialUtilitiesPackage} which
needs a \axiomType{Field} {\em F} and a
\axiomType{UnivariatePolynomialCategory} domain with coefficients in
{\em F}.  It computes some simple functions such as Sturm and
Sylvester sequences
(\axiomOpFrom{sturmSequence}{RealPolynomialUtilitiesPackage},
\axiomOpFrom{sylvesterSequence}{RealPolynomialUtilitiesPackage}).

\item The category \axiomType{RealRootCharacterizationCategory}
provides abstract functions to work with "real roots" of univariate
polynomials. These resemble variables with some functionality needed
to compute important operations.

\item The category \axiomType{RealClosedField} provides common
operations available over real closed fiels. These include finding all
the roots of a univariate polynomial, taking square (and higher)
roots, ...

\item The domain \axiomType{RightOpenIntervalRootCharacterization} is
the main code that provides the functionality of
\axiomType{RealRootCharacterizationCategory} for the case of
archimedean fields. Abstract roots are encoded with a left closed
right open interval containing the root together with a defining
polynomial for the root.

\item The \axiomType{RealClosure} domain is the end-user code. It
provides usual arithmetic with real algebraic numbers, along with the
functionality of a real closed field. It also provides functions to
approximate a real algebraic number by an element of the base
field. This approximation may either be absolute
(\axiomOpFrom{approximate}{RealClosure}) or relative
(\axiomOpFrom{relativeApprox}{RealClosure}).
```

```
\end{items}

\centerline{CAVEATS}

Since real algebraic expressions are stored as depending on "real
roots" which are managed like variables, there is an ordering on
these. This ordering is dynamical in the sense that any new algebraic
takes precedence over older ones. In particular every creation
function raises a new "real root". This has the effect that when you
type something like \spad{sqrt(2) + sqrt(2)} you have two new
variables which happen to be equal. To avoid this name the expression
such as in \spad{s2 := sqrt(2) ; s2 + s2}

Also note that computing times depend strongly on the ordering you
implicitly provide. Please provide algebraics in the order which seems
most natural to you.

\centerline{LIMITATIONS}

This packages uses algorithms which are published in [1] and [2] which
are based on field arithmetics, in particular for polynomial gcd
related algorithms. This can be quite slow for high degree polynomials
and subresultants methods usually work best. Beta versions of the
package try to use these techniques in a better way and work
significantly faster. These are mostly based on unpublished algorithms
and cannot be distributed. Please contact the author if you have a
particular problem to solve or want to use these versions.

Be aware that approximations behave as post-processing and that all
computations are done exactly. They can thus be quite time consuming
when depending on several "real roots".

{\char92}section{\char123}regset.ht{\char125}\nwnewline
{\char92}pagetitle{\char123}RegularTriangularSetXmpPage{\char125}{\char123}regset.ht{\char12
{\char92}begin{\char123}chunk{\char125}{\char123}regset.ht{\char125}\nwnewline
{\char92}begin{\char123}page{\char125}{\char123}RegularTriangularSetXmpPage{\char125}{\char1
{\char92}beginscroll\nwnewline
The\ {\char92}spadtype{\char123}RegularTriangularSet{\char125}\ domain\ constructor\ impleme
regular\ triangular\ sets.\ \ These\ particular\ triangular\ sets\ were\nwnewline
introduced\ by\ M.\ Kalkbrener\ (1991)\ in\ his\ PhD\ Thesis\ under\ the\ name\nwnewline
regular\ chains.\ \ Regular\ chains\ and\ their\ related\ concepts\ are\nwnewline
presented\ in\ the\ paper\ "On\ the\ Theories\ of\ Triangular\ sets"\ By\nwnewline
P.\ Aubry,\ D.\ Lazard\ and\ M.\ Moreno\ Maza\ (to\ appear\ in\ the\ Journal\ of\nwnewline
Symbolic\ Computation).\ \ The\ {\char92}spadtype{\char123}RegularTriangularSet{\char125}\nw
constructor\ also\ provides\ a\ new\ method\ (by\ the\ third\ author)\ for\nwnewline
solving\ polynomial\ system\ by\ means\ of\ regular\ chains.\ \ This\ method\ has\nwnewline
two\ ways\ of\ solving.\ \ One\ has\ the\ same\ specifications\ as\ Kalkbrener's\nwnewline
algorithm\ (1991)\ and\ the\ other\ is\ closer\ to\ Lazard's\ method\nwnewline
(Discr.\ App.\ Math,\ 1991).\ \ Moreover,\ this\ new\ method\ removes\ redundant\nwnewline
```

```
component\ from\ the\ decompositions\ when\ this\ is\ not\ {\char123}{\char92}em\ too\nwnewline
expensive{\char125}.\ \ This\ is\ always\ the\ case\ with\ square-free\ regular\ chains.\nwnewline
So\ if\ you\ want\ to\ obtain\ decompositions\ without\ redundant\ components\nwnewline
just\ use\ the\ {\char92}spadtype{\char123}SquareFreeRegularTriangularSet{\char125}\ domain\nwnewline
constructor\ or\ the\ {\char92}spadtype{\char123}LazardSetSolvingPackage{\char125}\ package\nwnewline
constructor.\ \ See\ also\ the\ {\char92}spadtype{\char123}LexTriangularPackage{\char125}\ and\nwnewline
{\char92}spadtype{\char123}ZeroDimensionalSolvePackage{\char125}\ for\ the\ case\ of\ algebraic\nwnewlin
systems\ with\ a\ finite\ number\ of\ (complex)\ solutions.\nwnewline
\nwnewline
One\ of\ the\ main\ features\ of\ regular\ triangular\ sets\ is\ that\ they\nwnewline
naturally\ define\ towers\ of\ simple\ extensions\ of\ a\ field.\nwnewline
This\ allows\ to\ perform\ with\ multivariate\ polynomials\ the\ \nwnewline
same\ kind\ of\ operations\ as\ one\ can\ do\ in\ an\ {\char92}spadtype{\char123}EuclideanDomain{\char12
\nwnewline
The\ {\char92}spadtype{\char123}RegularTriangularSet{\char125}\ constructor\ takes\ four\ arguments.\nwn
The\ first\ one,\ {\char123}{\char92}bf\ R{\char125},\ is\ the\ coefficient\ ring\ of\ the\ polynomials;
must\ belong\ to\ the\ category\ {\char92}spadtype{\char123}GcdDomain{\char125}.\ \ The\ second\ one,\nw
{\char123}{\char92}bf\ E{\char125},\ is\ the\ exponent\ monoid\ of\ the\ polynomials;\ it\ must\ belong\
the\ category\ {\char92}spadtype{\char123}OrderedAbelianMonoidSup{\char125}.\ \ the\ third\ one,\ {\char
V{\char125},\ is\ the\ ordered\ set\ of\ variables;\ it\ must\ belong\ to\ the\ category\nwnewline
{\char92}spadtype{\char123}OrderedSet{\char125}.\ \ The\ last\ one\ is\ the\ polynomial\ ring;\ it\ must
belong\ to\ the\ category\ {\char92}spadtype{\char123}RecursivePolynomialCategory(R,E,V){\char125}.\nwne
The\ abbreviation\ for\ {\char92}spadtype{\char123}RegularTriangularSet{\char125}\ is\nwnewline
{\char92}spadtype{\char123}REGSET{\char125}.\ \ See\ also\ the\ constructor\ {\char92}spadtype{\char123}
which\ only\ takes\ two\ arguments,\ the\ coefficient\ ring\ and\ the\ ordered\nwnewline
set\ of\ variables;\ in\ that\ case,\ polynomials\ are\ necessarily\ built\ with\nwnewline
the\ {\char92}spadtype{\char123}NewSparseMultivariatePolynomial{\char125}\ domain\ constructor.\nwnewlin
\nwnewline
We\ shall\ explain\ now\ how\ to\ use\ the\ constructor\ {\char92}spadtype{\char123}REGSET{\char125}\ \n
and\ how\ to\ read\ the\ decomposition\ of\ a\ polynomial\ system\ by\ means\ \nwnewline
of\ regular\ sets.\nwnewline
\nwnewline
Let\ us\ give\ some\ examples.\ \ We\ start\ with\ an\ easy\ one\nwnewline
(Donati-Traverso)\ in\ order\ to\ understand\ the\ two\ ways\ of\ solving\nwnewline
polynomial\ systems\ provided\ by\ the\ {\char92}spadtype{\char123}REGSET{\char125}\ constructor.\nwnewl
{\char92}xtc{\char123}\nwnewline

{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}p3\ :=\ x\ **\ 10\ -\ t\ {\char92}free{\char123}x{\char125}\ {\c
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}lp\ :=\ [p1,\ p2,\ p3]\ {\char92}free{\char123}p1{\char125}\ {\c
{\char125}\nwnewline
```

```
{\char92}xtc{\char123}\nwnewline
First\ of\ all,\ let\ us\ solve\ this\ system\ in\ the\ sense\ of\ Kalkbrener.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}zeroSetSplit(lp){\char36}T\ {\char92}free{\char123}lp{\char125}\ {\char92}fr
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
And\ now\ in\ the\ sense\ of\ Lazard\ (or\ Wu\ and\ other\ authors).\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}lts\ :=\ zeroSetSplit(lp,false){\char36}T\ {\char92}free{\char123}lp{\char12
{\char125}\nwnewline
\nwnewline
We\ can\ see\ that\ the\ first\ decomposition\ is\ a\ subset\ of\ the\ second.\nwnewline
So\ how\ can\ both\ be\ correct\ ?\nwnewline
\nwnewline
Recall\ first\ that\ polynomials\ from\ a\ domain\ of\ the\ category\nwnewline
{\char92}spadtype{\char123}RecursivePolynomialCategory{\char125}\ are\ regarded\ as\ univariate\nwnewlin
polynomials\ in\ their\ main\ variable.\ \ For\ instance\ the\ second\nwnewline
polynomial\ in\ the\ first\ set\ of\ each\ decomposition\ has\ main\ variable\nwnewline
{\char123}{\char92}bf\ y{\char125}\ and\ its\ initial\ (i.e.\ its\ leading\ coefficient\ w.r.t.\ its\ ma
variable)\ is\ {\char123}{\char92}bf\ t\ z{\char125}.\nwnewline
\nwnewline
Now\ let\ us\ explain\ how\ to\ read\ the\ second\ decomposition.\ \ Note\ that\nwnewline
the\ non-constant\ initials\ of\ the\ first\ set\ are\ {\char92}texht{\char123}{\char36}t{\char94}4-t{\c
t{\char94}4\ -\ t{\char125}{\char125}\ and\ {\char92}texht{\char123}{\char36}t\ z{\char36}{\char125}{\ch
by\ this\ first\ set\ are\ the\ common\ zeros\ of\ its\ polynomials\ that\ do\ not\nwnewline
cancel\ the\ polynomials\ {\char92}texht{\char123}{\char36}t{\char94}4-t{\char36}{\char125}{\char123}{\c
{\char92}texht{\char123}{\char36}ty\ z{\char36}{\char125}{\char123}{\char123}{\char92}bf\ t\ z{\char125}
Now\ the\ solutions\ of\ the\ input\ system\ {\char123}{\char92}bf\ lp{\char125}\nwnewline
satisfying\ these\ equations\ are\ described\ by\ the\ second\ and\ the\ third\nwnewline
sets\ of\ the\ decomposition.\ \ Thus,\ in\ some\ sense,\ they\ can\ be\nwnewline
considered\ as\ degenerated\ solutions.\ \ The\ solutions\ given\ by\ the\ first\nwnewline
set\ are\ called\ the\ generic\ points\ of\ the\ system;\ they\ give\ the\ general\nwnewline
form\ of\ the\ solutions.\ \ The\ first\ decomposition\ only\ provides\ these\nwnewline
generic\ points.\ \ This\ latter\ decomposition\ is\ useful\ when\ they\ are\nwnewline
many\ degenerated\ solutions\ (which\ is\ sometimes\ hard\ to\ compute)\ and\nwnewline
when\ one\ is\ only\ interested\ in\ general\ informations,\ like\ the\nwnewline
dimension\ of\ the\ input\ system.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
We\ can\ get\ the\ dimensions\ of\ each\ component\nwnewline
of\ a\ decomposition\ as\ follows.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}[coHeight(ts)\ for\ ts\ in\ lts]\ {\char92}free{\char123}lts{\char125}{\char
{\char125}\nwnewline
\nwnewline
Thus\ the\ first\ set\ has\ dimension\ one.\nwnewline
Indeed\ {\char123}{\char92}bf\ t{\char125}\ can\ take\ any\ value,\ except\ {\char123}{\char92}bf\ 0{\ch
or\ any\ third\ root\ of\ {\char123}{\char92}bf\ 1{\char125},\ whereas\ {\char123}{\char92}bf\ z{\char12
is\ completely\ determined\ from\ {\char123}{\char92}bf\ t{\char125},\nwnewline
{\char123}{\char92}bf\ y{\char125}\ is\ given\ by\ {\char123}{\char92}bf\ z{\char125}\ and\ {\char123}{\
and\ finally\ {\char123}{\char92}bf\ x{\char125}\ is\ given\ by\ the\ other\ three\ variables
In\ the\ second\ and\ the\ third\ sets\ of\ the\ second\ decomposition\nwnewline
the\ four\ variables\ are\ completely\ determined\ and\ thus\nwnewline
these\ sets\ have\ dimension\ zero.\nwnewline
\nwnewline
We\ give\ now\ the\ precise\ specifications\ of\ each\ decomposition.\ \nwnewline
This\ assume\ some\ mathematical\ knowledge.\nwnewline
However,\ for\ the\ non-expert\ user,\ the\ above\ explanations\ will\ \nwnewline
be\ sufficient\ to\ understand\ the\ other\ features\ of\ the\nwnewline
{\char92}spadtype{\char123}RSEGSET{\char125}\ constructor.\nwnewline
\nwnewline
The\ input\ system\ {\char123}{\char92}bf\ lp{\char125}\ is\ decomposed\ in\ the\ sense\nwnew
of\ Kalkbrener\ as\ finitely\ many\ regular\ sets\ {\char123}{\char92}bf\ T1,...,Ts{\char125
such\ that\ the\ radical\ ideal\ generated\ by\ {\char123}{\char92}bf\ lp{\char125}\nwnewline
is\ the\ intersection\ of\ the\ radicals\ of\ the\nwnewline
saturated\ ideals\ of\ {\char123}{\char92}bf\ T1,...,Ts{\char125}.\nwnewline
In\ other\ words,\ the\ affine\ variety\ associated\ with\ {\char123}{\char92}bf\ lp{\char12
is\ the\ union\ of\ the\ closures\ (w.r.t.\ Zarisky\ topology)\nwnewline
of\ the\ regular-zeros\ sets\ of\ {\char123}{\char92}bf\ T1,...,Ts{\char125}.\nwnewline
\nwnewline
{\char123}{\char92}bf\ N.\ B.{\char125}\ The\ prime\ ideals\ associated\ with\ the\ \nwnewlin
radical\ of\ the\ saturated\ ideal\ of\nwnewline
a\ regular\ triangular\ set\ have\ all\ the\ same\ dimension;\nwnewline
moreover\ these\ prime\ ideals\ can\ be\ given\ by\ characteristic\nwnewline
sets\ with\ the\ same\ main\ variables.\ \nwnewline
Thus\ a\ decomposition\ in\ the\ sense\ of\ Kalkbrener\nwnewline
is\ unmixed\ dimensional.\nwnewline
Then\ it\ can\ be\ viewed\ as\ a\ {\char123}{\char92}em\ lazy{\char125}\nwnewline
decomposition\ into\ prime\ ideals\ (some\ of\ these\ \nwnewline
prime\ ideals\ being\ merged\ into\ unmixed\ dimensional\ ideals).\nwnewline
\nwnewline
Now\ we\ explain\ the\ other\ way\ of\ solving\ by\ means\ of\ regular\ \nwnewline
triangular\ sets.\nwnewline
The\ input\ system\ {\char123}{\char92}bf\ lp{\char125}\ is\ decomposed\ in\ the\ sense\nwnew
of\ Lazard\ as\ finitely\ many\ regular\ triangular\ sets\ {\char123}{\char92}bf\ T1,...,Ts{\
such\ that\ the\ affine\ variety\ associated\ with\ {\char123}{\char92}bf\ lp{\char125}\nwnew
is\ the\ union\ of\ the\ regular-zeros\ sets\ of\ {\char123}{\char92}bf\ T1,...,Ts{\char125}
Thus\ a\ decomposition\ in\ the\ sense\ of\ Lazard\ is\ also\nwnewline
a\ decomposition\ in\ the\ sense\ of\ Kalkbrener;\ the\ converse\nwnewline
is\ false\ as\ we\ have\ seen\ before.\nwnewline
\nwnewline
When\ the\ input\ system\ has\ a\ finite\ number\ of\ solutions,\nwnewline
both\ ways\ of\ solving\ provide\ similar\ decompositions\ as\nwnewline
we\ shall\ see\ with\ this\ second\ example\ (Caprasse).\nwnewline
\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline

{\char125}\nwnewline
\nwnewline
We\ study\ now\ the\ options\ of\ the\ {\char92}spadfun{\char123}zeroSetSplit{\char125}\ oper
As\ we\ have\ seen\ yet,\ there\ is\ an\ optional\ second\ argument\ \nwnewline
which\ is\ a\ boolean\ value.\ If\ this\ value\ is\ true\ (this\nwnewline
is\ the\ default)\ then\ the\ decomposition\ is\ computed\nwnewline
in\ the\ sense\ of\ Kalkbrener,\ otherwise\ it\ is\ computed\nwnewline
in\ the\ sense\ of\ Lazard.\nwnewline
\nwnewline
There\ is\ a\ second\ boolean\ optional\ argument\ that\nwnewline
can\ be\ used\ (in\ that\ case\ the\ first\ optional\nwnewline
argument\ must\ be\ present).\nwnewline
This\ second\ option\ allows\ you\ to\ get\ some\ information\nwnewline
during\ the\ computations.\nwnewline
\nwnewline
Therefore,\ we\ need\ to\ understand\ a\ little\ what\ is\ going\ on\ during\ the\nwnewline
computations.\ \ An\ important\ feature\ of\ the\ algorithm\ is\ that\ the\nwnewline
intermediate\ computations\ are\ managed\ in\ some\ sense\ like\ the\ processes\nwnewline
of\ a\ Unix\ system.\ \ Indeed,\ each\ intermediate\ computation\ may\ generate\nwnewline
other\ intermediate\ computations\ and\ the\ management\ of\ all\ these\nwnewline
computations\ is\ a\ crucial\ task\ for\ the\ efficiency.\ \ Thus\ any\nwnewline
intermediate\ computation\ may\ be\ suspended,\ killed\ or\ resumed,\nwnewline
depending\ on\ algebraic\ considerations\ that\ determine\ priorities\ for\nwnewline
these\ processes.\ \ The\ goal\ is\ of\ course\ to\ go\ as\ fast\ as\ possible\nwnewline
towards\ the\ final\ decomposition\ which\ means\ to\ avoid\ as\ much\ as\nwnewline
possible\ unnecessary\ computations.\nwnewline
\nwnewline
To\ follow\ the\ computations,\ one\ needs\ to\ set\ to\ {\char92}spad{\char123}true{\char12
argument.\ \ Then\ a\ lot\ of\ numbers\ and\ letters\ are\ displayed.\ \ Between\ a\nwnewline
{\char92}spad{\char123}[{\char125}\ and\ a\ {\char92}spad{\char123}]{\char125}\ one\ has\ the
time.\ \ Just\ after\ {\char92}spad{\char123}[{\char125}\ one\ can\ see\ the\ number\ of\ pro
each\ process\ is\ represented\ by\ two\ numbers\ between\ {\char92}spad{\char123}<{\char125}
{\char92}spad{\char123}>{\char125}.\ \ A\ process\ consists\ of\ a\ list\ of\ polynomial\ {\c
triangular\ set\ {\char123}{\char92}bf\ ts{\char125};\ its\ goal\ is\ to\ compute\ the\ commo
{\char123}{\char92}bf\ ps{\char125}\ that\ belong\ to\ the\ regular-zeros\ set\ of\ {\char12
processes,\ the\ number\ between\ pipes\ gives\ the\ total\ number\ of\nwnewline
polynomials\ in\ all\ the\ sets\ {\char92}spad{\char123}ps{\char125}.\ \ Finally,\ the\ numbe
braces\ gives\ the\ number\ of\ components\ of\ a\ decomposition\ that\ are\nwnewline
already\ computed.\ This\ number\ may\ decrease.\nwnewline
\nwnewline
Let\ us\ take\ a\ third\ example\ (Czapor-Geddes-Wang)\ to\ see\ how\ these\nwnewline
informations\ are\ displayed.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline

Each\ time\ a\ lower\ case\ letter\ appears\ a\ needed\ result\ has\ been\ found\nwnewline
in\ an\ hash-table.\ \ The\ use\ of\ these\ hash-tables\ generally\ speed\ up\ the\nwnewline
computations.\ \ However,\ on\ very\ large\ systems,\ it\ may\ happen\ that\nwnewline
these\ hash-tables\ become\ too\ big\ to\ be\ handle\ by\ your\ Axiom\nwnewline
```

```
configuration.\ \ Then\ in\ these\ exceptional\ cases,\ you\ may\ prefer\nwnewline
getting\ a\ result\ (even\ if\ it\ takes\ a\ long\ time)\ than\ getting\ nothing.\nwnewline
Hence\ you\ need\ to\ know\ how\ to\ prevent\ the\ {\char92}spadtype{\char123}RSEGSET{\char1
constructor\ from\ using\ these\ hash-tables.\ \ In\ that\ case\ you\ will\ be\nwnewline
using\ the\ {\char92}spadfun{\char123}zeroSetSplit{\char125}\ with\ five\ arguments.\ \ The\
is\ the\ input\ system\ {\char123}{\char92}bf\ lp{\char125}\ as\ above.\ \ The\ second\ one\
value\ {\char92}spad{\char123}hash?{\char125}\ which\ is\ {\char92}spad{\char123}true{\char1
hash-tables.\ \ The\ third\ one\ is\ boolean\ value\ {\char92}spad{\char123}clos?{\char125}\
{\char92}spad{\char123}true{\char125}\ iff\ you\ want\ to\ solve\ your\ system\ in\ the\ sens
Kalkbrener,\ the\ other\ way\ remaining\ that\ of\ Lazard.\ \ The\ fourth\nwnewline
argument\ is\ boolean\ value\ {\char92}spad{\char123}info?{\char125}\ which\ is\ {\char92}spa
want\ to\ display\ information\ during\ the\ computations.\ \ The\ last\ one\ is\nwnewline
boolean\ value\ {\char92}spad{\char123}prep?{\char125}\ which\ is\ {\char92}spad{\char123}tru
some\ heuristics\ that\ are\ performed\ on\ the\ input\ system\ before\ starting\nwnewline
the\ real\ algorithm.\ \ The\ value\ of\ this\ flag\ is\ {\char92}spad{\char123}true{\char12
are\ using\ {\char92}spadfun{\char123}zeroSetSplit{\char125}\ with\ less\ than\ five\ argumen
that\ there\ is\ no\ available\ signature\ for\ {\char92}spadfun{\char123}zeroSetSplit{\char1
four\ arguments.\nwnewline
\nwnewline
We\ finish\ this\ section\ by\ some\ remarks\ about\ both\ ways\ of\ solving,\ in\nwnewline
the\ sense\ of\ Kalkbrener\ or\ in\ the\ sense\ of\ Lazard.\ \ For\ problems\ with\nwnewline
a\ finite\ number\ of\ solutions,\ there\ are\ theoretically\ equivalent\ and\nwnewline
the\ resulting\ decompositions\ are\ identical,\ up\ to\ the\ ordering\ of\ the\nwnewline
components.\ \ However,\ when\ solving\ in\ the\ sense\ of\ Lazard,\ the\nwnewline
algorithm\ behaves\ differently.\ \ In\ that\ case,\ it\ becomes\ more\nwnewline
incremental\ than\ in\ the\ sense\ of\ Kalkbrener.\ That\ means\ the\nwnewline
polynomials\ of\ the\ input\ system\ are\ considered\ one\ after\ another\nwnewline
whereas\ in\ the\ sense\ of\ Kalkbrener\ the\ input\ system\ is\ treated\ more\nwnewline
globally.\nwnewline
\nwnewline
This\ makes\ an\ important\ difference\ in\ positive\ dimension.\ \ Indeed\ when\nwnewline
solving\ in\ the\ sense\ of\ Kalkbrener,\ the\ {\char123}{\char92}em\ Primeidealkettensatz{\c
Krull\ is\ used.\ \ That\ means\ any\ regular\ triangular\ containing\ more\nwnewline
polynomials\ than\ the\ input\ system\ can\ be\ deleted.\ \ This\ is\ not\nwnewline
possible\ when\ solving\ in\ the\ sense\ of\ Lazard.\ \ This\ explains\ why\nwnewline
Kalkbrener's\ decompositions\ usually\ contain\ less\ components\ than\ those\nwnewline
of\ Lazard.\ \ However,\ it\ may\ happen\ with\ some\ examples\ that\ the\nwnewline
incremental\ process\ (that\ cannot\ be\ used\ when\ solving\ in\ the\ sense\ of\nwnewline
Kalkbrener)\ provide\ a\ more\ efficient\ way\ of\ solving\ than\ the\ global\nwnewline
one\ even\ if\ the\ {\char123}{\char92}em\ Primeidealkettensatz{\char125}\ is\ used.\ \ Thus\
both,\ with\ the\ various\ options,\ before\ concluding\ that\ you\ cannot\nwnewline
solve\ your\ favorite\ system\ with\ {\char92}spadfun{\char123}zeroSetSplit{\char125}.\ \ The
more\ options\ at\ the\ development\ level\ that\ are\ not\ currently\ available\nwnewline
in\ this\ public\ version.\ \ So\ you\ are\ welcome\ to\ contact\ {\char123}{\char92}em\nwnew
marc@nag.co.uk{\char125}\ for\ more\ information\ and\ help.\nwnewline

{\char92}begin{\char123}page{\char125}{\char123}RomanNumeralXmpPage{\char125}{\char123}RomanNumeral{\cha
{\char92}beginscroll\nwnewline
The\ Roman\ numeral\ package\ was\ added\ to\ Axiom\ in\ MCMLXXXVI\nwnewline
for\ use\ in\ denoting\ higher\ order\ derivatives.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
For\ example,\ let\ {\char92}spad{\char123}f{\char125}\ be\ a\ symbolic\ operator.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}f\ :=\ operator\ 'f\ {\char92}bound{\char123}f{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ is\ the\ seventh\ derivative\ of\ {\char92}spad{\char123}f{\char125}\ with\ respect\ to\ {\char92}
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}D(f\ x,x,7)\ {\char92}free{\char123}f{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
You\ can\ have\ integers\ printed\ as\ Roman\ numerals\ by\ declaring\ variables\ to\nwnewline
be\ of\ type\ {\char92}spadtype{\char123}RomanNumeral{\char125}\ (abbreviation\ {\char92}spadtype{\char1
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}a\ :=\ roman(1978\ -\ 1965)\ {\char92}bound{\char123}a{\char125}{\char125}\n
{\char125}\nwnewline
\nwnewline
This\ package\ now\ has\ a\ small\ but\ devoted\ group\ of\ followers\ that\ claim\nwnewline
this\ domain\ has\ shown\ its\ efficacy\ in\ many\ other\ contexts.\nwnewline
They\ claim\ that\ Roman\ numerals\ are\ every\ bit\ as\ useful\ as\ ordinary\nwnewline
integers.\nwnewline
{\char92}xtc{\char123}\nwnewline
In\ a\ sense,\ they\ are\ correct,\ because\ Roman\ numerals\ form\ a\ ring\ and\ you\nwnewline
can\ therefore\ construct\ polynomials\ with\ Roman\ numeral\ coefficients,\nwnewline
matrices\ over\ Roman\ numerals,\ etc..\nwnewline
{\char125}{\char123}\nwnewline

The\ {\char92}axiomType{\char123}SingleInteger{\char125}\ domain\ is\ intended\ to\ provide\ support\ in
```

```
Axiom\ for\ machine\ integer\ arithmetic.\ \ It\ is\ generally\ much\ faster\nwnewline
than\ (bignum)\ {\char92}axiomType{\char123}Integer{\char125}\ arithmetic\ but\ suffers\ fro
limited\ range\ of\ values.\ \ Since\ Axiom\ can\ be\ implemented\ on\ top\ of\nwnewline
various\ dialects\ of\ Lisp,\ the\ actual\ representation\ of\ small\ integers\nwnewline
may\ not\ correspond\ exactly\ to\ the\ host\ machines\ integer\nwnewline
representation.\nwnewline
\nwnewline
In\ the\ CCL\ implementation\ of\ Axiom\ (Release\ 2.1\ onwards)\ the\nwnewline
underlying\ representation\ of\ {\char92}axiomType{\char123}SingleInteger{\char125}\ is\ the
{\char92}axiomType{\char123}Integer{\char125}.\ \ The\ underlying\ Lisp\ primitives\ treat\n
machine-word\ sized\ computations\ specially.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
You\ can\ discover\ the\ minimum\ and\ maximum\ values\ in\ your\ implementation\nwnewline
by\ using\ {\char92}spadfunFrom{\char123}min{\char125}{\char123}SingleInteger{\char125}\ and
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}min(){\char92}{\char36}SingleInteger{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}max(){\char92}{\char36}SingleInteger{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
To\ avoid\ confusion\ with\ {\char92}axiomType{\char123}Integer{\char125},\ which\ is\ the\ 
type\ for\ integers,\ you\ usually\ need\ to\ work\ with\ declared\ variables\nwnewline
({\char92}downlink{\char123}``Declarations''{\char125}{\char123}ugTypesDeclarePage{\char125}

3.88 sregset.ht

3.88.1 SquareFreeRegularTriangularSet

— sregset.ht —

```
\begin{page}{SqFreeRegTriangSetXmpPage}
{SquareFreeRegularTriangularSet}
\beginscroll

The \spadtype{SquareFreeRegularTriangularSet} domain constructor
implements square-free regular triangular sets.  See the
\spadtype{RegularTriangularSet} domain constructor for general regular
triangular sets.  Let {\em T} be a regular triangular set consisting
of polynomials {\em t1, ..., tm} ordered by increasing main variables.
The regular triangular set {\em T} is square-free if {\em T} is empty
or if {\em t1, ..., tm-1} is square-free and if the polynomial {\em
tm} is square-free as a univariate polynomial with coefficients in the
tower of simple extensions associated with {\em t1, ..., tm-1}.

The main interest of square-free regular triangular sets is that their
associated towers of simple extensions are product of fields.
Consequently, the saturated ideal of a square-free regular triangular
set is radical.  This property simplifies some of the operations
related to regular triangular sets.  However, building square-free
regular triangular sets is generally more expensive than building
general regular triangular sets.

As the \spadtype{RegularTriangularSet} domain constructor, the
\spadtype{SquareFreeRegularTriangularSet} domain constructor also
implements a method for solving polynomial systems by means of regular
triangular sets.  This is in fact the same method with some
adaptations to take into account the fact that the computed regular
chains are square-free.  Note that it is also possible to pass from a
decomposition into general regular triangular sets to a decomposition
into square-free regular triangular sets.  This conversion is used
internally by the \spadtype{LazardSetSolvingPackage} package
constructor.

{\bf N.B.} When solving polynomial systems with the
\spadtype{SquareFreeRegularTriangularSet} domain constructor or the
\spadtype{LazardSetSolvingPackage} package constructor, decompositions
have no redundant components.  See also
```

```
\spadtype{LexTriangularPackage} and
\spadtype{ZeroDimensionalSolvePackage} for the case of algebraic
systems with a finite number of (complex) solutions.

We shall explain now how to use the constructor
\spadtype{SquareFreeRegularTriangularSet}.

This constructor takes four arguments.  The first one, {\bf R}, is the
coefficient ring of the polynomials; it must belong to the category
\spadtype{GcdDomain}.  The second one, {\bf E}, is the exponent monoid
of the polynomials; it must belong to the category
\spadtype{OrderedAbelianMonoidSup}.  the third one, {\bf V}, is the
ordered set of variables; it must belong to the category
\spadtype{OrderedSet}.  The last one is the polynomial ring; it must
belong to the category \spadtype{RecursivePolynomialCategory(R,E,V)}.
The abbreviation for \spadtype{SquareFreeRegularTriangularSet} is
\spadtype{SREGSET}.

Note that the way of understanding triangular decompositions
is detailed in the example of the \spadtype{RegularTriangularSet}
constructor.

\xtc{
Let us illustrate the use of this constructor
with one example (Donati-Traverso).
Define the coefficient ring.
}{
\spadpaste{R := Integer \bound{R}}
}
\xtc{
Define the list of variables,
}{
\spadpaste{ls : List Symbol := [x,y,z,t] \bound{ls}}
}
\xtc{
and make it an ordered set;
}{
\spadpaste{V := OVAR(ls) \free{ls} \bound{V}}
}
\xtc{
then define the exponent monoid.
}{
\spadpaste{E := IndexedExponents V \free{V} \bound{E}}
}
\xtc{
Define the polynomial ring.
}{
\spadpaste{P := NSMP(R, V) \free{R} \free{V} \bound{P}}
}
\xtc{
```

```
Let the variables be polynomial.
}{
\spadpaste{x: P := 'x \free{P} \bound{x}}
}
\xtc{
}{
\spadpaste{y: P := 'y \free{P} \bound{y}}
}
\xtc{
}{
\spadpaste{z: P := 'z \free{P} \bound{z}}
}
\xtc{
}{
\spadpaste{t: P := 't \free{P} \bound{t}}
}
\xtc{
Now call the \spadtype{SquareFreeRegularTriangularSet} domain
constructor.
}{
\spadpaste{ST := SREGSET(R,E,V,P) \free{R} \free{E} \free{V}
\free{P} \bound{ST} }
}
\xtc{
Define a polynomial system.
}{
\spadpaste{p1 := x ** 31 - x ** 6 - x - y \free{x} \free{y}
\bound{p1}}
}
\xtc{
}{
\spadpaste{p2 := x ** 8  - z \free{x} \free{z} \bound{p2}}
}
\xtc{
}{
\spadpaste{p3 := x ** 10 - t \free{x} \free{t} \bound{p3}}
}
\xtc{
}{
\spadpaste{lp := [p1, p2, p3] \free{p1} \free{p2} \free{p3}
\bound{lp}}
}

\xtc{
First of all, let us solve this system in the sense of Kalkbrener.
}{
\spadpaste{zeroSetSplit(lp)$ST \free{lp} \free{ST}}
}
\xtc{
And now in the sense of Lazard (or Wu and other authors).
```

```
}{
\spadpaste{zeroSetSplit(lp,false)$ST \free{lp} \free{ST}
\bound{lts}}
}

Now to see the difference with the \spadtype{RegularTriangularSet}
domain constructor,
\xtc{
we define:
}{
\spadpaste{T := REGSET(R,E,V,P) \free{R} \free{E} \free{V}
\free{P} \bound{T} }
}
\xtc{
and compute:
}{
\spadpaste{lts := zeroSetSplit(lp,false)$T \free{lp}
\free{T} \bound{lts}}
}

If you look at the second set in both decompositions in the sense of
Lazard, you will see that the polynomial with main variable {\bf y} is
not the same.

Let us understand what has happened.
\xtc{
We define:
}{
\spadpaste{ts := lts.2  \free{lts}  \bound{ts}}
}
\xtc{
}{
\spadpaste{pol := select(ts,'y)$T \free{ts} \free{y} \free{T} \bound{pol}}
}
\xtc{
}{
\spadpaste{tower := collectUnder(ts,'y)$T \free{ts} \free{y}
\free{T} \bound{tower}}
}
\xtc{
}{
\spadpaste{pack := RegularTriangularSetGcdPackage(R,E,V,P,T)
\free{R} \free{E} \free{V} \free{P} \free{T} \bound{pack}}
}
\xtc{
Then we compute:
}{
\spadpaste{toseSquareFreePart(pol,tower)$pack \free{pol}
\free{tower} \free{pack}}
}
```

```

3.89.1 SparseTable

⇒ "notitle" (TableXmpPage) 3.94.1 on page 1278
⇒ "notitle" (GeneralSparseTableXmpPage) 3.49.1 on page 669

— **stbl.ht** —

```
\begin{page}{SparseTableXmpPage}{SparseTable}
\beginscroll
%
The \spadtype{SparseTable} domain provides a general purpose
table type with default entries.
\xtc{
Here we create a table to save strings under integer keys.
The value \spad{"Try again!"} is returned if no other value has been
stored for a key.
}{
\spadpaste{t: SparseTable(Integer, String, "Try again!") := table()
\bound{t}}
}
\xtc{
Entries can be stored in the table.
}{
\spadpaste{t.3 := "Number three" \free{t}\bound{t1}}
}
\xtc{
}{
\spadpaste{t.4 := "Number four" \free{t}\bound{t2}}
}
\xtc{
These values can be retrieved as usual, but if a look up fails
the default entry will be returned.
}{
\spadpaste{t.3 \free{t1}}
}
\xtc{
}{
\spadpaste{t.2 \free{t}}
}
\xtc{
To see which values are explicitly stored, the
\spadfunFrom{keys}{SparseTable} and \spadfunFrom{entries}{SparseTable}
functions can be used.
}{
\spadpaste{keys t \free{t1 t2}}
}
\xtc{
}{
\spadpaste{entries t \free{t1 t2}}
}
If a specific table representation
is required, the \spadtype{GeneralSparseTable} constructor should be
used. The domain \spadtype{SparseTable(K, E, dflt)} is equivalent to
\spadtype{GeneralSparseTable(K,E, Table(K,E), dflt)}.
For more information, see
\downlink{`Table'}{TableXmpPage}\ignore{Table} and

— **stream.ht** —

```
\begin{page}{StreamXmpPage}{Stream}
\beginscroll

A \spadtype{Stream} object is represented as a list whose
last element contains the
wherewithal to create the next element, should it ever be required.
\xtc{
Let \spad{ints} be the infinite stream of non-negative integers.
}{
\spadpaste{ints := [i for i in 0..] \bound{ints}}
}
By default, ten stream elements are calculated.
This number may be changed to something else by the system command
\spadcmd{)set streams calculate}.
For the display purposes of this book, we have chosen a smaller value.
\xtc{
More generally, you can construct a stream by specifying its initial
value and a function which, when given an element, creates the next
element.
}{
\spadpaste{f : List INT -> List INT \bound{fdec}}
}
\xtc{
}{
\spadpaste{f x == [x.1 + x.2, x.1] \bound{f}\free{fdec}}
}
\xtc{
}{
\spadpaste{fibs := [i.2 for i in [generate(f,[1,1])]] \bound{fibs}\free{f}}
}
```

```
\xtc{
You can create the stream of odd non-negative integers by either
filtering them from the integers, or by evaluating an expression for
each integer.
}{
\spadpaste{[i for i in ints | odd? i] \free{ints}}
}
\xtc{
}{
\spadpaste{odds := [2*i+1 for i in ints]\bound{odds}\free{ints}}
}
\xtc{
You can accumulate the initial segments of a stream using the
\spadfunFrom{scan}{StreamFunctions2} operation.
}{
\spadpaste{scan(0,+,odds) \free{odds}}
}
\xtc{
The corresponding elements of
two or more streams can be combined in this way.
}{
\spadpaste{[i*j for i in ints for j in odds]\free{ints} \free{odds}}
}
\xtc{
}{
\spadpaste{map(*,ints,odds)\free{ints odds}}
}
\xtc{
Many operations similar to those applicable to lists are available for
streams.
}{
\spadpaste{first ints \free{ints}}
}
\xtc{
}{
\spadpaste{rest ints \free{ints}}
}
\xtc{
}{
\spadpaste{fibs 20 \free{fibs}}
}
The packages \spadtype{StreamFunctions1},
\spadtype{StreamFunctions2} and
\spadtype{StreamFunctions3} export some useful stream manipulation
operations.

— **string.ht** —

```
\begin{page}{StringXmpPage}{String}
\beginscroll

The type \spadtype{String} provides character strings.  Character
strings provide all the operations for a one-dimensional array of
characters, plus additional operations for manipulating text.  For
more information on related topics, see
\downlink{`Character'}{CharacterXmpPage}\ignore{Character} and
\downlink{`CharacterClass'}{CharacterClassXmpPage}\ignore{CharacterClass}.
You can also issue the system command \spadcmd{)show String} to
display the full list of operations defined by \spadtype{String}.

\xtc{
String values can be created using double quotes.
}{
\spadpaste{hello := "Hello, I'm Axiom!" \bound{hello}}
}
\xtc{
Note, however, that double quotes and underscores must be preceded by
an extra underscore.
}{
\spadpaste{said  := "Jane said, _"Look!_"" \bound{said}}
}
\xtc{
}{
\spadpaste{saw   := "She saw exactly one underscore: __." \bound{saw}}
}
\xtc{
It is also possible to use \spadfunFrom{new}{String} to create a
string of any size filled with a given character.  Since there are
many \spadfun{new} functions it is necessary to indicate the desired
type.
}{
\spadpaste{gasp: String := new(32, char "x") \bound{gasp}}
}
\xtc{
The length of a string is given by \spadopFrom{\#}{List}.
```

```
}{
\spadpaste{\#gasp \free{gasp}}
}
\xtc{
Indexing operations allow characters to be extracted or replaced in
strings. For any string \spad{s},
indices lie in the range \spad{1..\#s}.
}{
\spadpaste{hello.2 \free{hello}}
}
\xtc{
Indexing is really just the application of a string to a subscript,
so any application syntax works.
}{
\spadpaste{hello 2  \free{hello}}
}
\xtc{
}{
\spadpaste{hello(2) \free{hello}}
}
\xtc{
If it is important not to modify a given string, it should be copied
before any updating operations are used.
}{
\spadpaste{hullo := copy hello \free{hello}\bound{hullo0}}
}
\xtc{
}{
\spadpaste{hullo.2 := char "u"; [hello, hullo] \free{hullo0 hello}
\bound{hullo}}
}

\xtc{
Operations are provided to split and join strings.
The \spadfunFrom{concat}{String} operation allows several strings
to be joined together.
}{
\spadpaste{saidsaw := concat ["alpha","---","omega"] \bound{saidsaw}}
}
\xtc{
There is a version of \spadfunFrom{concat}{String} that works with
two strings.
}{
\spadpaste{concat("hello ","goodbye")}
}
\xtc{
Juxtaposition can also be used to concatenate strings.
}{
\spadpaste{"This " "is " "several " "strings " "concatenated."}
}
```

```
\xtc{
Substrings are obtained by giving an index range.
}{
\spadpaste{hello(1..5) \free{hello}}
}
\xtc{
}{
\spadpaste{hello(8..) \free{hello}}
}
\xtc{
A string can be split into several substrings by giving a
separation character or character class.
}{
\spadpaste{split(hello, char " ")              \free{hello}}
}
\xtc{
}{
\spadpaste{other := complement alphanumeric(); \bound{other}}
}
\xtc{
}{
\spadpaste{split(saidsaw, other)               \free{saidsaw other}}
}
\xtc{
Unwanted characters can be trimmed from the beginning or end of a
string using the operations \spadfunFrom{trim}{String},
\spadfunFrom{leftTrim}{String} and \spadfunFrom{rightTrim}{String}.
}{
\spadpaste{trim     ("\#\# ++ relax ++ \#\#", char "\#")}
}
\xtc{
Each of these functions takes a string and a second argument to specify
the characters to be discarded.
}{
\spadpaste{trim     ("\#\# ++ relax ++ \#\#", other) \free{other}}
}
\xtc{
The second argument can be given
either as a single character or as a character class.
}{
\spadpaste{leftTrim ("\#\# ++ relax ++ \#\#", other) \free{other}}
}
\xtc{
}{
\spadpaste{rightTrim("\#\# ++ relax ++ \#\#", other) \free{other}}
}

\xtc{
Strings can be changed to upper case or lower case using the operations
\spadfunFrom{upperCase}{String}, \spadfunFromX{upperCase}{String},
\spadfunFrom{lowerCase}{String} and
\spadfunFromX{lowerCase}{String}.
}{
\spadpaste{upperCase hello \free{hello}}
}
\xtc{
The versions with the exclamation mark
change the original string, while the others produce a copy.
}{
\spadpaste{lowerCase hello \free{hello}}
}

\xtc{
Some basic string matching is provided.
The function \spadfunFrom{prefix?}{String}
tests whether one string is an initial prefix of another.
}{
\spadpaste{prefix?("He", "Hello")}
}
\xtc{
}{
\spadpaste{prefix?("Her", "Hello")}
}
\xtc{
A similar function, \spadfunFrom{suffix?}{String}, tests for suffixes.
}{
\spadpaste{suffix?("", "Hello")}
}
\xtc{
}{
\spadpaste{suffix?("LO", "Hello")}
}
\xtc{
The function \spadfunFrom{substring?}{String} tests for a substring
given a starting
position.
}{
\spadpaste{substring?("ll", "Hello", 3)}
}
\xtc{
}{
\spadpaste{substring?("ll", "Hello", 4)}
}

\xtc{
A number of \spadfunFrom{position}{String} functions locate things in
strings.  If the first argument to position is a string, then
\spad{position(s,t,i)} finds the location of \spad{s} as a substring
of \spad{t} starting the search at position \spad{i}.
}{
```

```
\spadpaste{n := position("nd", "underground",   1) \bound{n}}
}
\xtc{
}{
\spadpaste{n := position("nd", "underground", n+1) \free{n} \bound{n1}}
}
\xtc{
If \spad{s} is not found, then \spad{0} is returned (\spad{minIndex(s)-1}
in \spadtype{IndexedString}).
}{
\spadpaste{n := position("nd", "underground", n+1) \free{n1}\bound{n2}}
}
\xtc{
To search for a specific character or a member of a character class,
a different first argument is used.
}{
\spadpaste{position(char "d", "underground", 1)}
}
\xtc{
}{
\spadpaste{position(hexDigit(), "underground", 1)}
}

%
This domain provides a table type in which the keys are known to
be strings so special techniques can be used.
Other than performance, the type \spadtype{StringTable(S)} should
behave exactly the same way as \spadtype{Table(String,S)}.
See \downlink{‘Table’}{TableXmpPage}\ignore{Table}
for general information about tables.
\showBlurb{StringTable}

\xtc{
This creates a new table whose keys are strings.
}{

3.93 symbol.ht

3.93.1 Symbol

— symbol.ht —

```
\begin{page}{SymbolXmpPage}{Symbol}
\beginscroll

Symbols are one of the basic types manipulated by Axiom.
The \spadtype{Symbol} domain provides ways to create
symbols of many varieties.
\showBlurb{Symbol}

\xtc{
The simplest way to create a symbol is to ‘‘single quote’’ an identifier.
}{
\spadpaste{X: Symbol := ’x \bound{X}}
}
\xtc{
This gives the symbol even if \spad{x} has been assigned a value.
If \spad{x} has not been assigned a value, then it is possible to omit
the quote.
}{
\spadpaste{XX: Symbol := x}
}
\xtc{
Declarations must be used when working
with symbols, because otherwise the interpreter tries to place
values in a more specialized type \spadtype{Variable}.
}{
\spadpaste{A := ’a}
}
\xtc{
}{
\spadpaste{B := b}
}
\xtc{
The normal way of entering polynomials uses this fact.
}{
\spadpaste{x**2 + 1}
}

\xtc{
Another convenient way to create symbols is to convert a string.
This is useful when the name is to be constructed by a program.
}{
\spadpaste{"Hello"::Symbol}
```

```
}
\xtc{
Sometimes it is necessary to generate new unique symbols, for example, to
name constants of integration.
The expression \spad{new()} generates a symbol starting with \spad{\%}.
}{
\spadpaste{new()\$Symbol}
}
\xtc{
Successive calls to \spadfunFrom{new}{Symbol} produce different symbols.
}{
\spadpaste{new()\$Symbol}
}
\xtc{
The expression \spad{new("s")} produces a symbol starting with \spad{\%s}.
}{
\spadpaste{new("xyz")\$Symbol}
}

\xtc{
A symbol can be adorned in various ways.
The most basic thing is applying a symbol to a list
of subscripts.
}{
\spadpaste{X[i,j] \free{X}}
}

\xtc{
Somewhat less pretty is to attach subscripts, superscripts or arguments.
}{
\spadpaste{U := subscript(u, [1,2,1,2]) \bound{U}}
}
\xtc{
}{
\spadpaste{V := superscript(v, [n]) \bound{V}}
}
\xtc{
}{
\spadpaste{P := argscript(p, [t]) \bound{P}}
}

\xtc{
It is possible to test whether a symbol has scripts using the
\spadfunFrom{scripted?}{Symbol} test.
}{
\spadpaste{scripted? U \free{U}}
}
\xtc{
}{
\spadpaste{scripted? X \free{X}}
```

```
}
\xtc{
If a symbol is not scripted, then it may be converted to a string.
}{
\spadpaste{string X \free{X}}
}
\xtc{
The basic parts can always be extracted using the
\spadfunFrom{name}{Symbol} and \spadfunFrom{scripts}{Symbol} operations.
}{
\spadpaste{name U \free{U}}
}
\xtc{
}{
\spadpaste{scripts U \free{U}}
}
\xtc{
}{
\spadpaste{name X \free{X}}
}
\xtc{
}{
\spadpaste{scripts X \free{X}}
}

\xtc{
The most general form is obtained using the \spadfunFrom{script}{Symbol}
operation.
This operation takes an argument which is a list containing, in this order,
lists of subscripts, superscripts, presuperscripts, presubscripts and
arguments to a symbol.
}{
\spadpaste{M := script(Mammoth, {\tt{}i,j],[k,l],[0,1],[2],[u,v,w})
\bound{M}}
}
\xtc{
}{
\spadpaste{scripts M \free{M}}
}
\xtc{
If trailing lists of scripts are omitted, they are assumed to be empty.
}{
\spadpaste{N := script(Nut, {\tt{}i,j],[k,l],[0,1}) \bound{N}}
}
\xtc{
}{
\spadpaste{scripts N \free{N}}

— **table.ht** —

```
\begin{page}{TableXmpPage}{Table}
\beginscroll

The \spadtype{Table} constructor provides a general structure for
associative storage.  This type provides hash tables in which data
objects can be saved according to keys of any type.  For a given
table, specific types must be chosen for the keys and entries.

\xtc{
In this example the keys to the table are polynomials with
integer coefficients.
The entries in the table are strings.
}{
\spadpaste{t: Table(Polynomial Integer, String) := table() \bound{t}}
}
\xtc{
To save an entry in the table, the \spadfunFrom{setelt}{Table}
operation is used.
This can be called directly, giving the table a key and an entry.
}{
\spadpaste{setelt(t, x**2 - 1, "Easy to factor") \bound{p1}\free{t}}
}
\xtc{
Alternatively, you can use assignment syntax.
}{
\spadpaste{t(x**3 + 1) := "Harder to factor" \bound{p2}\free{p1}}
}
\xtc{
}{
\spadpaste{t(x)        := "The easiest to factor" \bound{p3}\free{p2}}
}
\xtc{
Entries are retrieved from the table by calling the
```

```
\spadfunFrom{elt}{Table} operation.
}{
\spadpaste{elt(t, x) \free{p3}}
}
\xtc{
This operation is called when a table is ``applied'' to a key using
this or the following syntax.
}{
\spadpaste{t.x \free{p3}}
}
\xtc{
}{
\spadpaste{t x \free{p3}}
}
\xtc{
Parentheses are used only for grouping.  They are needed if the key is
an infixed expression.
}{
\spadpaste{t.(x**2 - 1) \free{p3}}
}
\xtc{
Note that the \spadfunFrom{elt}{Table} operation is used only when the
key is known to be in the table---otherwise an error is generated.
}{
\spadpaste{t (x**3 + 1) \free{p3}}
}

\xtc{
You can get a list of all the keys to a table using the
\spadfunFrom{keys}{Table} operation.
}{
\spadpaste{keys t \free{p3}}
}
\xtc{
If you wish to test whether a key is in a table, the
\spadfunFrom{search}{Table} operation is used.
This operation returns either an entry or \spad{"failed"}.
}{
\spadpaste{search(x, t) \free{p3}}
}
\xtc{
}{
\spadpaste{search(x**2, t) \free{p3}}
}
\xtc{
The return type is a union so the success of the search can be tested
using \spad{case}.
\spadkey{case}
}{
\spadpaste{search(x**2, t) case "failed" \free{p3}}
```

```
}
\xtc{
The \spadfunFromX{remove}{Table} operation is used to delete values from a
table.
}{
\spadpaste{remove!(x**2-1, t) \free{p3} \bound{p4}}
}
\xtc{
If an entry exists under the key, then it is returned.  Otherwise
\spadfunFromX{remove}{Table} returns \spad{"failed"}.
}{
\spadpaste{remove!(x-1, t) \free{p4}\bound{p5}}
}

\xtc{
The number of key-entry pairs can be found using the
\spadfunFrom{\#}{Table} operation.
}{
\spadpaste{\#t \free{p5}}
}
\xtc{
Just as \spadfunFrom{keys}{Table} returns a list of keys to the table, a
list of all the entries can be obtained using the
\spadfunFrom{members}{Table} operation.
}{
\spadpaste{members t \free{p5}}
}
\xtc{
A number of useful operations take functions and map them on to the
table to compute the result.  Here we count the entries which
have \spad{"Hard"} as a prefix.
}{
\spadpaste{count(s: String +-> prefix?("Hard", s), t) \free{p5}}
}

Other table types are provided to support various needs.
\indent{4}
\beginitems
\item[-] \spadtype{AssociationList} gives a list with a table view.
This allows new entries to be appended onto the front of the list to
cover up old entries.  This is useful when table entries need to be
stacked or when frequent list traversals are required.  See
\downlink{‘AssociationList’}{AssociationListXmpPage}
\ignore{AssociationList} for more information.

\item[-] \spadtype{EqTable} gives tables in which keys are considered
equal only when they are in fact the same instance of a structure.
See \downlink{‘EqTable’}{EqTableXmpPage}\ignore{EqTable} for more
information.
```

```
\item[-] \spadtype{StringTable} should be used when the keys are known
to be strings.
See \downlink{‘StringTable’}{StringTableXmpPage}\ignore{StringTable}
for more information.

\item[-] \spadtype{SparseTable} provides tables with default entries,
so lookup never fails.  The \spadtype{GeneralSparseTable} constructor
can be used to make any table type behave this way.  See
\downlink{‘SparseTable’}{SparseTableXmpPage}\ignore{SparseTable} for
more information.

\item[-] \spadtype{KeyedAccessFile} allows values to be saved in a
file, accessed as a table.  See
\downlink{‘KeyedAccessFile’}{KeyedAccessFileXmpPage}
\ignore{KeyedAccessFile}
for more information.

\begin{page}{TextFileXmpPage}{TextFile}
\beginscroll

The domain \spadtype{TextFile} allows Axiom to read and write
character data and exchange text with other programs.
This type behaves in Axiom much like a \spadtype{File} of strings,
with additional operations to cause new lines.
We give an example of how to produce an upper case copy of a file.
\xtc{
This is the file from which we read the text.
}{
\spadpaste{f1: TextFile := open("/etc/group", "input")   \bound{f1}}
}
\xtc{
This is the file to which we read the text.
}{
\spadpaste{f2: TextFile := open("/tmp/MOTD", "output")  \bound{f2}}
}
\xtc{
Entire lines are handled using the \spadfunFromX{readLine}{TextFile} and
\spadfunFromX{writeLine}{TextFile} operations.
}{
\spadpaste{l := readLine! f1 \free{f1}\bound{l}}
}
\xtc{
}{
\spadpaste{writeLine!(f2, upperCase l) \free{f2 l}}
}
\xtc{
Use the
\spadfunFrom{endOfFile?}{TextFile} operation to check if you have
reached the end of the file.
}{
\begin{spadsrc}[\free{f1 f2}\bound{Copied}]
while not endOfFile? f1 repeat
    s := readLine! f1
    writeLine!(f2, upperCase s)
\end{spadsrc}
}
\xtc{
The file \spad{f1} is exhausted and should be closed.
}{
\spadpaste{close! f1  \free{Copied}\bound{closed1}}
}

\xtc{
It is sometimes useful to write lines a bit at a time.
The \spadfunFromX{write}{TextFile} operation allows this.
}{
\spadpaste{write!(f2, "-The-")  \free{Copied}\bound{tthhee}}
}
\xtc{
}{
\spadpaste{write!(f2, "-End-")  \free{tthhee}\bound{eenndd}}
}
\xtc{
This ends the line.
This is done in a machine-dependent manner.
}{
\spadpaste{writeLine! f2        \free{eenndd}\bound{LastLine}}
}
\xtc{
}{
\spadpaste{close! f2              \free{LastLine}\bound{closed2}}
}
\noOutputXtc{
Finally, clean up.
}{
\spadpaste{)system rm /tmp/MOTD   \free{closed2}}
}
```

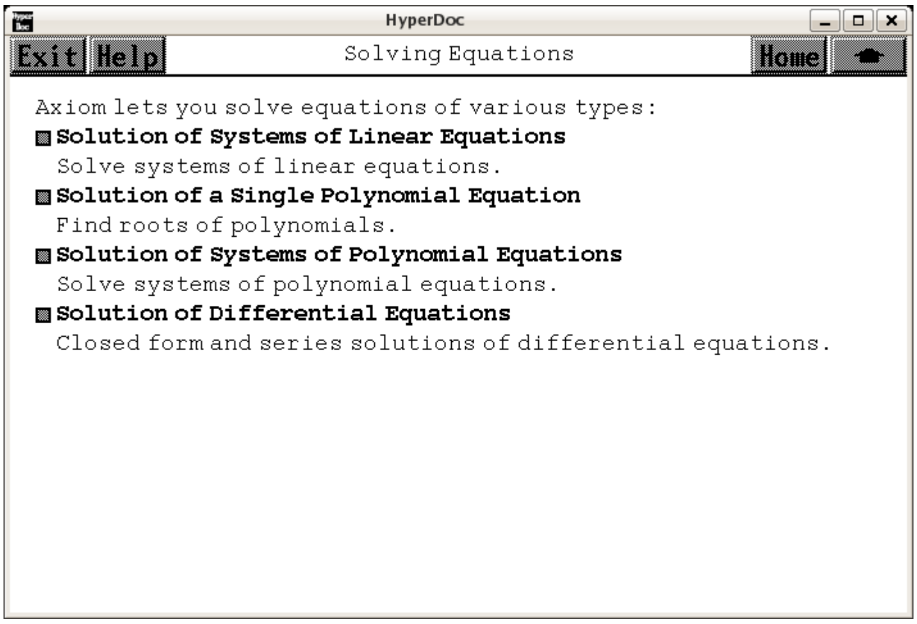
3.96.2 Solving Equations



Axiom lets you solve equations of various types:

▨ **Solution of Systems of Linear Equations**
Solve systems of linear equations.

▨ **Solution of a Single Polynomial Equation**
Find roots of polynomials.

▨ **Solution of Systems of Polynomial Equations**
Solve systems of polynomial equations.

▨ **Solution of Differential Equations**
Closed form and series solutions of differential equations.

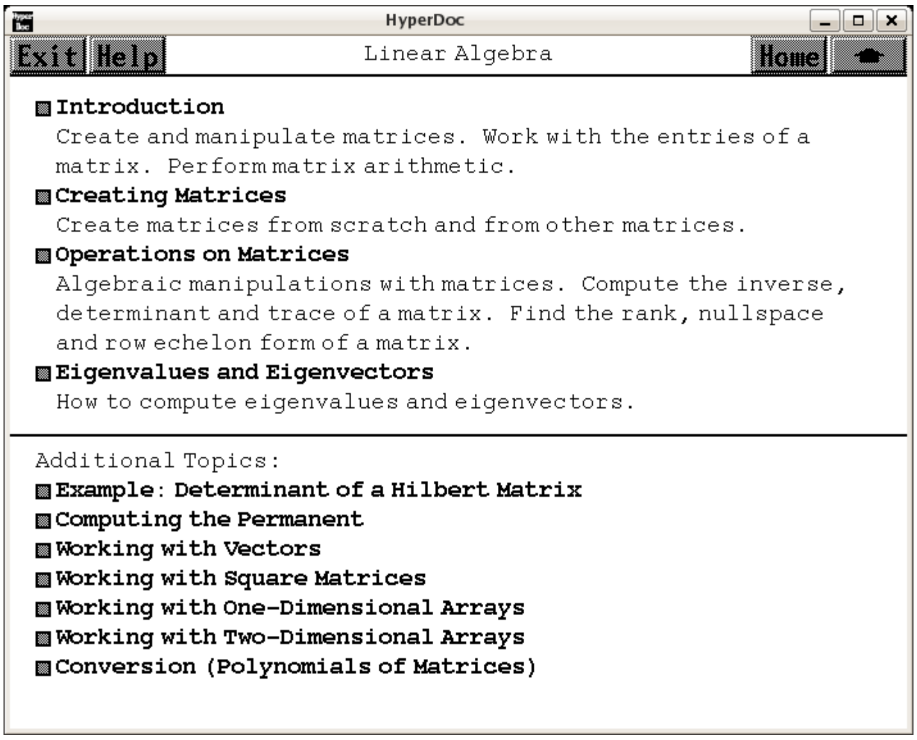
3.96.3 Linear Algebra



Linear Algebra

Introduction
Create and manipulate matrices. Work with the entries of a matrix. Perform matrix arithmetic.
Creating Matrices
Create matrices from scratch and from other matrices.
Operations on Matrices
Algebraic manipulations with matrices. Compute the inverse, determinant and trace of a matrix. Find the rank, nullspace and row echelon form of a matrix.
Eigenvalues and Eigenvectors
How to compute eigenvalues and eigenvectors.

Additional Topics:
Example: Determinant of a Hilbert Matrix
Computing the Permanent
Working with Vectors
Working with Square Matrices
Working with One-Dimensional Arrays
Working with Two-Dimensional Arrays
Conversion (Polynomials of Matrices)

3.97 type.ht

3.97.1 Category Type

— **type.ht** —

```
\begin{page}{CategoryType}{Category {\em Type}}
\beginscroll
{\em Type} is a primitive category in Axiom,
one which is an ancestor of all Axiom categories.

{\em Type} is the root of Axiom's category hierarchy,
a category with no properties (exported operations
and attributes) of which all other categories are descendants.
Two important children of {\em Type} are
\spadtype{SetCategory}, the category of all algebraic domains,
and \spadtype{Aggregate}, the category of all data structures.
\endscroll
```

\downlink{Union(A,B)}{UntaggedUnion}.
\endscroll\end{page}
```

———-

3.98.2 Domain Constructor Union

— union.ht —

```
\begin{page}{UnionDescription}{Domain Constructor {\em Union}}
\beginscroll
\newline\menuitemstyle{}\tab{2}Union({\em a:A},{\em b:B})
\newline\tab{2}{\em Arguments:}\indent{17}\tab{-2}
{\em a}, a tag, an element of domain \spadtype{Symbol}
\newline\tab{-2}
{\em A}, a domain of category \spadtype{SetCategory}
\newline\tab{-2}
{\em b}, a tag, an element of domain \spadtype{Symbol}
\newline\tab{-2}
{\em B}, a domain of category \spadtype{SetCategory}
\indent{0}\newline\tab{2}{\em Returns:}\indent{17}\tab{-2}
the "union of {\em A} and {\em B}" as described below.
\indent{0}\newline\tab{2}{\em Description:}\indent{15}\tab{0}
```

```
{\em Union(a:A,b:B)} denotes the class of objects
which are either members of domain {\em A} or of domain {\em B}.
The symbols {\em a} and {\em b} are called "tags" and
are used to identify the two "branches"
of the union.
The {\em Union} constructor can take any number of arguments and
has an alternate form without {\em tags}.
This tagged {\em Union} type is necessary, for example, to disambiguate
two branches of a union where {\em A} and {\em B} denote the same type.
{\em Union} is a primitive domain of Axiom which cannot be
defined in the Axiom language.
\endscroll\end{page}
```

```
\begin{page}{UnivariatePolyXmpPage}{UnivariatePolynomial}
\beginscroll

The domain constructor \spadtype{UnivariatePolynomial}
(abbreviated \spadtype{UP})
creates domains of univariate polynomials in a specified variable.
For example, the domain
\spadtype{UP(a1,POLY FRAC INT)} provides polynomials in the single
variable \spad{a1} whose coefficients are general polynomials with
rational number coefficients.

\beginImportant
\noindent {\bf Restriction:}
\texht{\begin{quotation}\noindent}{\newline\indent{5}}
Axiom does not allow you to create types where
\spadtype{UnivariatePolynomial} is contained in the coefficient type of
\spadtype{Polynomial}. Therefore,
\spadtype{UP(x,POLY INT)} is legal but \spadtype{POLY UP(x,INT)} is not.
\texht{\end{quotation}}{\indent{0}}
\endImportant

\xtc{
\spadtype{UP(x,INT)} is the domain of polynomials in the single
variable \spad{x} with integer coefficients.
}{
\spadpaste{(p,q) : UP(x,INT) \bound{pdec}\bound{qdec}}
}
\xtc{
}{
\spadpaste{p := (3*x-1)**2 * (2*x + 8) \free{pdec}\bound{p}}
}
\xtc{
}{
\spadpaste{q := (1 - 6*x + 9*x**2)**2 \free{qdec}\bound{q}}
}
\xtc{
```

```
The usual arithmetic operations are available for univariate
polynomials.
}{
\spadpaste{p**2 + p*q  \free{p q}}
}
\xtc{
The operation \spadfunFrom{leadingCoefficient}{UnivariatePolynomial}
extracts the coefficient of the term of highest degree.
}{
\spadpaste{leadingCoefficient p \free{p}}
}
\xtc{
The operation \spadfunFrom{degree}{UnivariatePolynomial} returns
the degree of the polynomial.
Since the polynomial has only one variable, the variable is not supplied
to operations like \spadfunFrom{degree}{UnivariatePolynomial}.
}{
\spadpaste{degree p \free{p}}
}
\xtc{
The reductum of the polynomial, the polynomial obtained by
subtracting the term of highest order, is returned by
\spadfunFrom{reductum}{UnivariatePolynomial}.
}{
\spadpaste{reductum p \free{p}}
}
\xtc{
The operation \spadfunFrom{gcd}{UnivariatePolynomial} computes the
greatest common divisor of two polynomials.
}{
\spadpaste{gcd(p,q) \free{p q}}
}
\xtc{
The operation \spadfunFrom{lcm}{UnivariatePolynomial} computes the
least common multiple.
}{
\spadpaste{lcm(p,q) \free{p q}}
}
\xtc{
The operation \spadfunFrom{resultant}{UnivariatePolynomial}
computes the resultant of two univariate polynomials.
In the case of \spad{p} and \spad{q}, the resultant is \spad{0} because they
share a common root.
}{
\spadpaste{resultant(p,q) \free{p q}}
}
\xtc{
To compute the derivative of a univariate polynomial with respect to its
variable, use \spadfunFrom{D}{UnivariatePolynomial}.
}{
```

```
\spadpaste{D p \free{p}}
}
\xtc{
Univariate polynomials can also be used as if they were functions.
To evaluate a univariate polynomial at some point, apply
the polynomial to the point.
}{
\spadpaste{p(2) \free{p}}
}
\xtc{
The same syntax is used for composing two univariate polynomials, i.e.
substituting one polynomial for the variable in another.
This substitutes \spad{q} for the variable in \spad{p}.
}{
\spadpaste{p(q) \free{p q}}
}
\xtc{
This substitutes \spad{p} for the variable in \spad{q}.
}{
\spadpaste{q(p) \free{p q}}
}
\xtc{
To obtain a list of coefficients of the polynomial, use
\spadfunFrom{coefficients}{UnivariatePolynomial}.
}{
\spadpaste{l := coefficients p \free{p}\bound{l}}
}
\xtc{
From this you can use \spadfunFrom{gcd}{UnivariatePolynomial}
and \spadfunFrom{reduce}{List}
to compute the content of the polynomial.
}{
\spadpaste{reduce(gcd,l) \free{l}}
}
\xtc{
Alternatively (and more easily),
you can just call \spadfunFrom{content}{UnivariatePolynomial}.
}{
\spadpaste{content p \free{p}}
}

Note that the operation \spadfunFrom{coefficients}{UnivariatePolynomial}
omits the zero coefficients from the list.
Sometimes it is useful to convert a univariate polynomial
to a vector whose \eth{\spad{i }} position contains the degree \spad{i-1}
coefficient of the polynomial.
\xtc{
}{
\spadpaste{ux := (x**4+2*x+3)::UP(x,INT) \bound{ux}}
}
```

```
\xtc{
To get a complete vector of coefficients, use the operation
\spadfunFrom{vectorise}{UnivariatePolynomial}, which takes a
univariate polynomial and an integer denoting the length of the
desired vector.
}{
\spadpaste{vectorise(ux,5) \free{ux}}
}

It is common to want to do something to every term of a polynomial,
creating a new polynomial in the process.
\xtc{
This is a function for iterating across the terms of a polynomial,
squaring each term.
}{
\begin{spadsrc}[\bound{squareTerms}]
squareTerms(p) ==
  reduce(+,[t**2 for t in monomials p])
\end{spadsrc}
}
\xtc{
Recall what \spad{p} looked like.
}{
\spadpaste{p \free{p}}
}
\xtc{
We can demonstrate \userfun{squareTerms} on \spad{p}.
}{
\spadpaste{squareTerms p \free{p}\free{squareTerms}}
}

When the coefficients of the univariate polynomial belong to a
field,\footnote{For example, when the coefficients are rational
numbers, as opposed to integers.  The important property of
a field is that non-zero elements can be divided and produce
another element. The quotient of the integers 2 and 3 is not
another integer.}
it is possible to compute quotients and remainders.
\xtc{
}{
\spadpaste{(r,s) : UP(a1,FRAC INT) \bound{rdec}\bound{sdec}}
}
\xtc{
}{
\spadpaste{r := a1**2 - 2/3  \free{rdec}\bound{r}}
}
\xtc{
}{
\spadpaste{s := a1 + 4       \free{sdec}\bound{s}}
}
```

```
\xtc{
When the coefficients are rational numbers or rational expressions, the
operation \spadfunFrom{quo}{UnivariatePolynomial} computes the quotient
of two polynomials.
}{
\spadpaste{r quo s \free{r s}}
}
\xtc{
The operation
\spadfunFrom{rem}{UnivariatePolynomial} computes the remainder.
}{
\spadpaste{r rem s \free{r s}}
}
\xtc{
The operation \spadfunFrom{divide}{UnivariatePolynomial} can be used to
return a record of both components.
}{
\spadpaste{d := divide(r, s) \free{r s}\bound{d}}
}
\xtc{
Now we check the arithmetic!
}{
\spadpaste{r - (d.quotient * s + d.remainder) \free{r s d}}
}
\xtc{
It is also possible to integrate univariate polynomials when the
coefficients belong to a field.
}{
\spadpaste{integrate r \free{r}}
}
\xtc{
}{
\spadpaste{integrate s \free{s}}
}

One application of univariate polynomials is to see expressions in terms
of a specific variable.
%
\xtc{
We start with a polynomial in \spad{a1} whose coefficients
are quotients of polynomials in \spad{b1} and \spad{b2}.
}{
\spadpaste{t : UP(a1,FRAC POLY INT) \bound{tdec}}
}
\xtc{
Since in this case we are not talking about using multivariate
polynomials in only two variables, we use \spadtype{Polynomial}.
We also use \spadtype{Fraction} because we want fractions.
}{
\spadpaste{t := a1**2 - a1/b2 + (b1**2-b1)/(b2+3) \free{tdec}\bound{t}}
}
\xtc{
We push all the variables into a single quotient of polynomials.
}{
\spadpaste{u : FRAC POLY INT := t \bound{u}\free{t}}
}
\xtc{
Alternatively, we can view this as a polynomial in the variable
This is a {\it mode-directed} conversion: you indicate
as much of the structure as you care about and let Axiom
decide on the full type and how to do the transformation.
}{
\spadpaste{u :: UP(b1,?) \free{u}}
}

3.101 oreup.ht

3.101.1 UnivariateSkewPolynomial

— **oreup.ht** —

```
\begin{page}{UnivariateSkewPolyXmpPage}{UnivariateSkewPolynomial}
\beginscroll

Skew or Ore polynomial rings provide a unified framework to
compute with differential and difference equations.
\newline
In the following, let A be an integral domain, equipped with two
endomorphisms \sigma and \delta where:
\blankline
\begin{items}
\item \sigma: A -> A is an injective ring endomorphism
\item \delta: A -> A, the pseudo-derivation with respect to
\sigma, is an additive endomorphism with
\blankline
\delta(ab) = \sigma(a)\delta(b) + \delta(a)b
\blankline
for all a,b in A
\end{items}
\blankline
The skew polynomial ring
[\Delta;\sigma,\delta] is the ring of
polynomials in \delta with coefficients in A, with the
usual addition, while the product is given by
\blankline
\delta a = \sigma(a)\delta + \delta(a) for a in A
\blankline
The two most important examples of skew polynomial rings are:
\blankline
K(x)[D,1,\delta]
\blankline
where 1 is the identity on K and \texht{$\delta$}{delta} is
the usual derviative, is the ring of differential polynomials
\blankline
  \subscriptIt{K}{n} [E,n,n->n+1,0]
\blankline
is the ring of linear recurrence operators with polynomial coefficients

\horizontalline
The UnivariateSkewPolynomialCategory (OREPCAT) provides a unified
framework for polynomial rings in a non-central indeterminate over
some coefficient ring R. The commutation relations between the
indeterminate x and the coefficient t is given by
```

```
\blankline
   x r = \sigma(r) x + \delta(r)
\blankline
where \sigma is a ring endomorphism of R
and   \delta is a \sigma-derivation of R
which is an additive map from R to R such that
\blankline
   \delta(rs) = \sigma(r) \delta(s) + \delta(r) s
\blankline
In case \sigma is the identity map on R, a \sigma-derivation of R
is just called a derivation.
\blankline
We start with a linear ordinary differential operator. First, we
define the coefficient ring to be expressions in one variable x
with fractional coefficients:
\blankline
   F := EXPR(FRAC(INT))
\blankline
Define Dx to be a derivative d/dx:
\blankline
   Dx: F->F := f+->D(f,['x])
\blankline
Define a skew polynomial ring over F with identity endomorphism as
\sigma and derivation d/dx as \delta:
\begin{verbatim}
   D0 := OREUP('d,F,1,Dx)
\end{verbatim}
\begin{verbatim}
   u:D0 := (operator 'u)(x)
\end{verbatim}
\begin{verbatim}
   d:D0 := 'd
\end{verbatim}
\begin{verbatim}
   a:D0:=u^3*d^3+u^2*d^2+u*d+1

            3 3       2 2
        u(x) d  + u(x) d  + u(x)d + 1
\end{verbatim}
\begin{verbatim}
   b:D0:=(u+1)*d^2+2*d

                   2
        (u(x) + 1)d  + 2d
\end{verbatim}
\begin{verbatim}
   r:=rightDivide(a,b)

                                 3 ,          3       2
                    3      - u(x) u (x) - u(x)  + u(x)
```

```
                u(x)
   [quotient= -------- d + ----------------------------,
              u(x) + 1                2
                                 u(x)  + 2u(x) + 1
                    3 ,           3
               2u(x) u (x) + 3u(x)  + u(x)

    remainder= --------------------------- d + 1]
                        2

\end{verbatim}

\horizontalline

   )clear all
\blankline
As a second example, we consider the so-called Weyl algebra.
\blankline
Define the coefficient ring to be an ordinary polynomial over integers
in one variable t
\blankline
\begin{verbatim}
   R := UP('t,INT)
\end{verbatim}
\blankline
Define a skew polynomial ring over R with identity map as
\sigma
and derivation d/dt as \delta.
```

```
The resulting algebra is then called a Weyl algebra:
\blankline
\begin{verbatim}
   W := OREUP('x,R,1,D)

   t:W := 't

   x:W := 'x
\end{verbatim}
\blankline
Let
\begin{verbatim}
   a:W:=(t-1)*x^4+(t^3+3*t+1)*x^2+2*t*x+t^3

                4     3           2           3
        (t - 1)x  + (t   + 3t + 1)x  + 2t x + t
\end{verbatim}
\begin{verbatim}
   b:W:=(6*t^4+2*t^2)*x^3+3*t^2*x^2

           4     2  3     2 2
        (6t  + 2t )x  + 3t x
\end{verbatim}
\blankline
Then
\begin{verbatim}
   a*b
           5     4     3     2  7       4      3      2        6
        (6t  - 6t  + 2t  - 2t )x  + (96t  - 93t  + 13t  - 16t)x
      +
           7      5     4       3       2       5
        (6t  + 20t  + 6t  + 438t  - 406t  - 24)x
      +
            6      5       4      3       2              4
        (48t  + 15t  + 152t  + 61t  + 603t  - 532t - 36)x
      +
           7      5      4       3       2              3
        (6t  + 74t  + 60t  + 226t  + 116t  + 168t - 140)x
      +
           5     3      2            2
        (3t  + 6t  + 12t  + 18t + 6)x

   a^3
         3     2           12      5     4      3      2           10
       (t  - 3t  + 3t - 1)x   + (3t  - 6t  + 12t  - 15t  + 3t + 3)x
     +
          3      2       9      7     6      5      4      3     2            8
       (6t  - 12t  + 6t)x  + (3t  - 3t  + 21t  - 18t  + 24t  - 9t  - 15t - 3)x
     +
           5      4      3      2        7
       (12t  - 12t  + 36t  - 24t  - 12t)x
     +
         9      7     6      5     4      3      2           6
       (t  + 15t  - 3t  + 45t  + 6t  + 36t  + 15t  + 9t + 1)x
     +
          7      5      3      2       5
       (6t  + 48t  + 54t  + 36t  + 6t)x
     +
          9      7     6      5      4      3      2  4
       (3t  + 21t  + 3t  + 39t  + 18t  + 39t  + 12t )x
     +
           7      5      4     3  3      9     7     6      5  2     7     9
       (12t  + 36t  + 12t  + 8t )x  + (3t  + 9t  + 3t  + 12t )x  + 6t x + t
\end{verbatim}

\horizontalline
   )clear all
\blankline
As a third example, we construct a difference operator algebra over
the ring of EXPR(INT) by using an automorphism S defined by a
"shift" operation S:EXPR(INT) -> EXPR(INT)
\blankline
\begin{verbatim}
   s(e)(n) = e(n+1)
\end{verbatim}
\blankline
and an S-derivation defined by DF:EXPR(INT) -> EXPR(INT) as
\blankline
\begin{verbatim}
   DF(e)(n) = e(n+1)-e(n)
\end{verbatim}
\blankline
Define S to be a "shift" operator, which acts on expressions with
the discrete variable n:
\blankline
\begin{verbatim}
   S:EXPR(INT)->EXPR(INT):=e+->eval(e,[n],[n+1])
\end{verbatim}
\blankline
Define DF to be a "difference" operator, which acts on expressions
with a discrete variable n:
\blankline
\begin{verbatim}
   DF:EXPR(INT)->EXPR(INT):=e+->eval(e,[n],[n+1])-e
\end{verbatim}
\blankline
Then define the difference operator algebra D0:
\blankline
\begin{verbatim}
   D0:=OREUP('D,EXPR(INT),morphism S,DF)
   u:=(operator 'u)[n]

   L:DO:='D+u

        D + u(n)

   L^2

         2                2
        D  + 2u(n)D + u(n)
\end{verbatim}

\horizontalline
   )clear all
\blankline
As a fourth example, we construct a skew polynomial ring by using an
inner derivation \delta induced by a fixed y in R:
\blankline
   \delta(r) = yr - ry
\blankline
First we should expose the constructor SquareMatrix so it is visible
in the interpreter:
\blankline
   )set expose add constructor SquareMatrix
\blankline
Define R to be the square matrix with integer entries:
\blankline
\begin{verbatim}
   R:=SQMATRIX(2,INT)

   y:R:=matrix {\tt{}1,1],[0,1}
        +1  1+
        |    |
        +0  1+
\end{verbatim}
\blankline
Define the inner derivative \delta:
\blankline
   delta:R->R:=r+->y*r-r*y
\blankline
Define S to be a skew polynomial determined by \sigma = 1
and \delta as an inner derivative:
\blankline
\begin{verbatim}
   S:=OREUP('x,R,1,delta)

   x:S:='x

   a:S:=matrix {\tt{}2,3],[1,1}
```

```
        +2  3+
        |    |
        +1  1+

   x^2*a
        +2  3+ 2   +2  - 2+    +0  - 2+
        |    |x  + |      |x + |      |
        +1  1+     +0  - 2+    +0   0 +
\end{verbatim}
\endscroll
\autobuttons
\end{page}
```

— **vector.ht** —

```
\begin{page}{VectorXmpPage}{Vector}
\beginscroll

The \spadtype{Vector} domain is used for storing data in a
one-dimensional indexed data structure.  A vector is a homogeneous
data structure in that all the components of the vector must belong to
the same Axiom domain.  Each vector has a fixed length specified by
the user; vectors are not extensible.  This domain is similar to the
\spadtype{OneDimensionalArray} domain, except that when the components
of a \spadtype{Vector} belong to a \spadtype{Ring}, arithmetic
operations are provided.  For more examples of operations that are
defined for both \spadtype{Vector} and \spadtype{OneDimensionalArray},
see \downlink{`OneDimensionalArray'}{OneDimensionalArrayXmpPage}
\ignore{OneDimensionalArray}.

As with the \spadtype{OneDimensionalArray} domain, a \spadtype{Vector}
can be created by calling the operation \spadfunFrom{new}{Vector}, its
```

```
components can be accessed by calling the operations
\spadfunFrom{elt}{Vector} and \spadfunFrom{qelt}{Vector}, and its
components can be reset by calling the operations
\spadfunFrom{setelt}{Vector} and \spadfunFromX{qsetelt}{Vector}.
\xtc{ This creates a vector of integers of length \spad{5} all of
whose components are \spad{12}.  }{ \spadpaste{u : VECTOR INT :=
new(5,12) \bound{u}} } \xtc{ This is how you create a vector from a
list of its components.  }{ \spadpaste{v : VECTOR INT :=
vector([1,2,3,4,5]) \bound{v}} }

\xtc{
Indexing for vectors begins at \spad{1}.
The last element has index equal to the length of the vector,
which is computed by \spadopFrom{\#}{Vector}.
}{
\spadpaste{\#(v) \free{v}}
}
\xtc{
This is the standard way to use \spadfunFrom{elt}{Vector} to extract an
element.
Functionally, it is the same as if you had typed \spad{elt(v,2)}.
}{
\spadpaste{v.2 \free{v}}
}
\xtc{
This is the standard way to use \spadfunFrom{setelt}{Vector} to change an
element.
It is the same as if you had typed \spad{setelt(v,3,99)}.
}{
\spadpaste{v.3 := 99 \free{v}\bound{vdelta}}
}
\xtc{
Now look at \spad{v} to see the change.  You can use
\spadfunFrom{qelt}{Vector} and \spadfunFromX{qsetelt}{Vector} (instead
of \spadfunFrom{elt}{Vector} and \spadfunFrom{setelt}{Vector},
respectively) but {\it only} when you know that the index is within
the valid range.
}{
\spadpaste{v \free{vdelta}}
}

\xtc{
When the components belong to a \spadtype{Ring}, Axiom
provides arithmetic operations for \spadtype{Vector}.
These include left and right scalar multiplication.
}{
\spadpaste{5 * v \free{vdelta}}
}
\xtc{
}{
```

```
\spadpaste{v * 7 \free{vdelta}}
}
\xtc{
}{
\spadpaste{w : VECTOR INT := vector([2,3,4,5,6]) \bound{w}}
}
\xtc{
Addition and subtraction are also available.
}{
\spadpaste{v + w \free{vdelta w}}
}
\xtc{
Of course, when adding or subtracting, the two vectors must have the same
length or an error message is displayed.
}{
\spadpaste{v - w \free{vdelta w}}
}

For more information about other aggregate domains,
see the following:
\downlink{‘List’}{ListXmpPage}\ignore{List},
\downlink{‘Matrix’}{MatrixXmpPage}\ignore{Matrix},
\downlink{‘OneDimensionalArray’}{OneDimensionalArrayXmpPage}
\ignore{OneDimensionalArray},

3.103 void.ht

3.103.1 Void

— void.ht —

```
\begin{page}{VoidXmpPage}{Void}
\beginscroll

When an expression is not in a value context, it is given
type \spadtype{Void}. For example, in the expression
\begin{verbatim}
r := (a; b; if c then d else e; f)
\end{verbatim}
values are used only from the subexpressions \spad{c} and \spad{f}:
all others are thrown away.
The subexpressions \spad{a}, \spad{b}, \spad{d} and \spad{e}
are evaluated for side-effects only and have type \spadtype{Void}.
There is a unique value of type \spadtype{Void}.

\xtc{
You will most often see results of type \spadtype{Void} when you
declare a variable.
}{
\spadpaste{a : Integer}
}

```
\begin{page}{WuWenTsunTriangularSetXmpPage}{WuWenTsunTriangularSet}
\beginscroll
The \spadtype{WuWenTsunTriangularSet} domain constructor implements
the characteristic set method of Wu Wen Tsun.  This algorithm computes
a list of triangular sets from a list of polynomials such that the
algebraic variety defined by the given list of polynomials decomposes
into the union of the regular-zero sets of the computed triangular
sets.  The constructor takes four arguments.  The first one, {\bf R},
is the coefficient ring of the polynomials; it must belong to the
category \spadtype{IntegralDomain}.  The second one, {\bf E}, is the
exponent monoid of the polynomials; it must belong to the category
\spadtype{OrderedAbelianMonoidSup}.  The third one, {\bf V}, is the
ordered set of variables; it must belong to the category
\spadtype{OrderedSet}.  The last one is the polynomial ring; it must
belong to the category \spadtype{RecursivePolynomialCategory(R,E,V)}.
The abbreviation for \spadtype{WuWenTsunTriangularSet} is
\spadtype{WUTSET}.

Let us illustrate the facilities by an example.

\xtc{
Define the coefficient ring.
}{
\spadpaste{R := Integer \bound{R}}
}
\xtc{
```

```
Define the list of variables,
}{
\spadpaste{ls : List Symbol := [x,y,z,t] \bound{ls}}
}
\xtc{
and make it an ordered set;
}{
\spadpaste{V := OVAR(ls) \free{ls} \bound{V}}
}
\xtc{
then define the exponent monoid.
}{
\spadpaste{E := IndexedExponents V \free{V} \bound{E}}
}
\xtc{
Define the polynomial ring.
}{
\spadpaste{P := NSMP(R, V) \free{R} \free{V} \bound{P}}
}
\xtc{
Let the variables be polynomial.
}{
\spadpaste{x: P := 'x \free{P} \bound{x}}
}
\xtc{
}{
\spadpaste{y: P := 'y \free{P} \bound{y}}
}
\xtc{
}{
\spadpaste{z: P := 'z \free{P} \bound{z}}
}
\xtc{
}{
\spadpaste{t: P := 't \free{P} \bound{t}}
}
\xtc{
Now call the \spadtype{WuWenTsunTriangularSet} domain constructor.
}{
\spadpaste{T := WUTSET(R,E,V,P) \free{R} \free{E} \free{V}
\free{P} \bound{T} }
}
\xtc{
Define a polynomial system.
}{
\spadpaste{p1 := x ** 31 - x ** 6 - x - y \free{x} \free{y} \bound{p1}}
}
\xtc{
}{
\spadpaste{p2 := x ** 8  - z \free{x} \free{z} \bound{p2}}
```

```
}
\xtc{
}{
\spadpaste{p3 := x ** 10 - t \free{x} \free{t} \bound{p3}}
}
\xtc{
}{
\spadpaste{lp := [p1, p2, p3] \free{p1} \free{p2} \free{p3} \bound{lp}}
}
\xtc{
Compute a characteristic set of the system.
}{
\spadpaste{characteristicSet(lp)$T \free{lp} \free{T}}
}
\xtc{
Solve the system.
}{
\spadpaste{zeroSetSplit(lp)$T \free{lp} \free{T}}
}

The \spadtype{RegularTriangularSet} and
\spadtype{SquareFreeRegularTriangularSet} domain constructors, and the
\spadtype{LazardSetSolvingPackage},
\spadtype{SquareFreeRegularTriangularSet} and
\spadtype{ZeroDimensionalSolvePackage} package constructors also
provide operations to compute triangular decompositions of algebraic
varieties.  These five constructor use a special kind of
characteristic sets, called regular triangular sets.  These special
characteristic sets have better properties than the general ones.
Regular triangular sets and their related concepts are presented in
the paper "On the Theories of Triangular sets" By P. Aubry, D. Lazard
and M. Moreno Maza (to appear in the Journal of Symbolic Computation).
The decomposition algorithm (due to the third author) available in the
four above constructors provide generally better timings than the
characteristic set method.  In fact, the \spadtype{WUTSET} constructor
remains interesting for the purpose of manipulating characteristic
sets whereas the other constructors are more convenient for solving
polynomial systems.

Note that the way of understanding triangular decompositions
is detailed in the example of the \spadtype{RegularTriangularSet}
constructor.

\begin{page}{XPolynomialXmpPage}{XPolynomial}
\beginscroll
The \spadtype{XPolynomial} domain constructor implements
multivariate polynomials
whose set of variables is \spadtype{Symbol}.
These variables do not commute.
The only parameter of this construtor is
the coefficient ring which may be non-commutative.
However, coefficients and variables commute.
The representation of the polynomials is recursive.
The abbreviation for \spadtype{XPolynomial} is \spadtype{XPOLY}.

Other constructors like \spadtype{XPolynomialRing},
\spadtype{XRecursivePolynomial}
\spadtype{XDistributedPolynomial},
\spadtype{LiePolynomial} and
\spadtype{XPBWPolynomial}
implement multivariate polynomials
in non-commutative variables.

We illustrate now some of the facilities of the \spadtype{XPOLY}
domain constructor.

\xtc{
Define a polynomial ring over the integers.
}{
```

```
\spadpaste{poly := XPolynomial(Integer) \bound{poly}}
}

\xtc{
Define a first polynomial,
}{
\spadpaste{pr: poly := 2*x + 3*y-5  \free{poly} \bound{pr}}
}

\xtc{
and a second one.
}{
\spadpaste{pr2: poly := pr*pr  \free{poly} \bound{pr2}}
}

\xtc{
Rewrite {\bf pr} in a distributive way,
}{
\spadpaste{pd  := expand pr   \free{pr} \bound{pd}}
}

\xtc{
compute its square,
}{
\spadpaste{pd2 := pd*pd   \free{pd} \bound{pd2}}
}

\xtc{
and checks that:
}{
\spadpaste{expand(pr2) - pd2 \free{pr2} \free{pd2}}
}

\xtc{
We define:
}{
\spadpaste{qr :=  pr**3 \free{pr} \bound{qr}}
}

\xtc{
and:
}{
\spadpaste{qd :=  pd**3 \free{pd} \bound{qd}}
}

\xtc{
We truncate {\bf qd} at degree {\bf 3}:
}{
```

```
\spadpaste{ trunc(qd,2) \free{qd}}
}

\xtc{
The same for {\bf qr}:
}{
\spadpaste{trunc(qr,2) \free{qr}}
}

\xtc{
We define:
}{
\spadpaste{Word := OrderedFreeMonoid Symbol \bound{Word}}
}

\xtc{
and:
}{

———-

3.108 xpr.ht

3.108.1 XPolynomialRing

— **xpr.ht** —

```
\begin{page}{XPolynomialRingXmpPage}{XPolynomialRing}
\beginscroll
The \spadtype{XPolynomialRing} domain constructor implements
generalized polynomials with coefficients from an arbitrary \spadtype{Ring}
(not necessarily commutative) and whose exponents are
words from an arbitrary \spadtype{OrderedMonoid}
(not necessarily commutative too).
```

```
Thus these polynomials are (finite) linear combinations of words.

This constructor takes two arguments.
The first one is a \spadtype{Ring}
and the second is an \spadtype{OrderedMonoid}.
The abbreviation for \spadtype{XPolynomialRing} is \spadtype{XPR}.

Other constructors like \spadtype{XPolynomial},
\spadtype{XRecursivePolynomial}
\spadtype{XDistributedPolynomial},
\spadtype{LiePolynomial} and
\spadtype{XPBWPolynomial}
implement multivariate polynomials
in non-commutative variables.

We illustrate now some of the facilities of the \spadtype{XPR} domain
constructor.

\xtc{
Define the free ordered monoid generated by the symbols.
}{
\spadpaste{Word := OrderedFreeMonoid(Symbol) \bound{Word}}
}

\xtc{
Define the linear combinations of these words with integer coefficients.
}{
\spadpaste{poly:= XPR(Integer,Word) \free{Word} \bound{poly}}
}

\xtc{
Then we define a first element from {\bf poly}.
}{
\spadpaste{p:poly := 2 * x - 3 * y + 1 \free{poly} \bound{p}}
}

\xtc{
And a second one.
}{
\spadpaste{q:poly := 2 * x + 1 \free{poly} \bound{q}}
}

\xtc{
We compute their sum,
}{
\spadpaste{p + q  \free{p}\free{q} }
}
```

```
\xtc{
their product,
}{
\spadpaste{p * q  \free{p}\free{q} }
}

\xtc{
and see that variables do not commute.
}{
\spadpaste{(p +q)^2 -p^2 -q^2 - 2*p*q  \free{p}\free{q} }
}

\xtc{
Now we define a ring of square matrices,
}{
\spadpaste{M := SquareMatrix(2,Fraction Integer)  \bound{M}}
}

\xtc{
and the linear combinations of words with these  matrices as coefficients.
}{
\spadpaste{poly1:= XPR(M,Word) \free{Word} \free{M} \bound{poly1}}
}

\xtc{
Define a first matrix,
}{
\spadpaste{m1:M := matrix {\tt{}i*j**2\ for\ i\ in\ 1..2]\ for\ j\ in\ 1..2]\ \nwnewline

```

```
{\char92}begin{\char123}page{\char125}{\char123}ZeroDimSolvePkgXmpPage{\char125}{\char123}Zer
{\char92}beginscroll\nwnewline
The\ {\char92}spadtype{\char123}ZeroDimensionalSolvePackage{\char125}\ package\ constructor\n
provides\ operations\ for\ computing\ symbolically\ the\ complex\ or\ real\nwnewline
roots\ of\ zero-dimensional\ algebraic\ systems.\nwnewline
\nwnewline
The\ package\ provides\ {\char123}{\char92}bf\ no{\char125}\ multiplicity\ information\ (i.e
returned\ roots\ may\ be\ double\ or\ higher)\ but\ only\ distinct\ roots\ are\nwnewline
returned.\nwnewline
\nwnewline
Complex\ roots\ are\ given\ by\ means\ of\ univariate\ representations\ of\nwnewline
irreducible\ regular\ chains.\ \ These\ representations\ are\ computed\ by\ the\nwnewline
{\char92}axiomOpFrom{\char123}univariateSolve{\char125}{\char123}ZeroDimensionalSolvePackage
(by\ calling\ the\nwnewline
{\char92}spadtype{\char123}InternalRationalUnivariateRepresentationPackage{\char125}\ package
constructor\ which\ does\ the\ job).\nwnewline
\nwnewline
Real\ roots\ are\ given\ by\ means\ of\ tuples\ of\ coordinates\ lying\ in\ the\nwnewline
{\char92}spadtype{\char123}RealClosure{\char125}\ of\ the\ coefficient\ ring.\ \ They\ are\ 
the\ {\char92}axiomOpFrom{\char123}realSolve{\char125}{\char123}ZeroDimensionalSolvePackage{
{\char92}axiomOpFrom{\char123}positiveSolve{\char125}{\char123}ZeroDimensionalSolvePackage{\
The\ former\ computes\ all\ the\ solutions\ of\ the\ input\ system\ with\ real\nwnewline
coordinates\ whereas\ the\ later\ concentrate\ on\ the\ solutions\ with\nwnewline
(strictly)\ positive\ coordinates.\ \ In\ both\ cases,\ the\ computations\ are\nwnewline
performed\ by\ the\ {\char92}spadtype{\char123}RealClosure{\char125}\ constructor.\nwnewline
\nwnewline
Both\ computations\ of\ complex\ roots\ and\ real\ roots\ rely\ on\ triangular\nwnewline
decompositions.\ \ These\ decompositions\ can\ be\ computed\ in\ two\ different\nwnewline
ways.\ \ First,\ by\ a\ applying\ the\nwnewline
{\char92}axiomOpFrom{\char123}zeroSetSplit{\char125}{\char123}RegularTriangularSet{\char125}\
{\char92}spadtype{\char123}REGSET{\char125}\ domain\ constructor.\ \ In\ that\ case,\ no\ Gro
are\ computed.\ \ This\ strategy\ is\ used\ by\ default.\ \ Secondly,\ by\nwnewline
applying\ the\ {\char92}axiomOpFrom{\char123}zeroSetSplit{\char125}{\char123}LexTriangularPac
{\char92}spadtype{\char123}LEXTRIPK{\char125}.\ \ To\ use\ this\ later\ strategy\ with\ the\ 
{\char92}axiomOpFrom{\char123}univariateSolve{\char125}{\char123}ZeroDimensionalSolvePackage
{\char92}axiomOpFrom{\char123}realSolve{\char125}{\char123}ZeroDimensionalSolvePackage{\char1
{\char92}axiomOpFrom{\char123}positiveSolve{\char125}{\char123}ZeroDimensionalSolvePackage{\c
needs\ to\ use\ an\ extra\ boolean\ argument.\nwnewline
\nwnewline
Note\ that\ the\ way\ of\ understanding\ triangular\ decompositions\ \nwnewline
is\ detailed\ in\ the\ example\ of\ the\ {\char92}spadtype{\char123}RegularTriangularSet{\cha
constructor.\nwnewline
\nwnewline
The\ {\char92}spadtype{\char123}ZeroDimensionalSolvePackage{\char125}\ constructor\ takes\ th
arguments.\ \ The\ first\ one\ {\char123}{\char92}bf\ R{\char125}\ is\ the\ coefficient\ ring
belong\ to\ the\ categories\ {\char92}spadtype{\char123}OrderedRing{\char125},\nwnewline
{\char92}spadtype{\char123}EuclideanDomain{\char125},\ {\char92}spadtype{\char123}Characteris
{\char92}spadtype{\char123}RealConstant{\char125}.\ \ This\ means\ essentially\ that\ {\char1
{\char92}spadtype{\char123}Integer{\char125}\ or\ {\char92}spadtype{\char123}Fraction(Integer
argument\ {\char123}{\char92}bf\ ls{\char125}\ is\ the\ list\ of\ variables\ involved\ in\ th
```

```
solve.\ \ The\ third\ one\ MUST\ BE\ {\char123}{\char92}bf\ concat(ls,s){\char125}\ where\ {\char123}{\c
additional\ symbol\ used\ for\ the\ univariate\ representations.\ \ The\nwnewline
abbreviation\ for\ {\char92}spadtype{\char123}ZeroDimensionalSolvePackage{\char125}\ is\nwnewline
{\char92}spadtype{\char123}ZDSOLVE{\char125}.\nwnewline
\nwnewline
We\ illustrate\ now\ how\ to\ use\ the\ constructor\ {\char92}spadtype{\char123}ZDSOLVE{\char125}\nwnewl
by\ two\ examples:\ the\ {\char123}{\char92}em\ Arnborg\ and\ Lazard{\char125}\ system\ and\ the\ \nwnew
{\char123}{\char92}em\ L-3{\char125}\ system\ (Aubry\ and\ Moreno\ Maza).\nwnewline
Note\ that\ the\ use\ of\ this\ package\ is\ also\ demonstrated\ in\ the\ example\nwnewline
of\ the\ {\char92}spadtype{\char123}LexTriangularPackage{\char125}\ constructor.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline

```

```
x*y*z\ +\ x*z\ +\ z\ +\ 1\ {\char92}bound{\char123}p3{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}lp\ :=\ [p1,\ p2,\ p3]\ {\char92}free{\char123}p1{\char125}\ {\c
{\char125}\nwnewline
Note\ that\ these\ polynomials\ do\ not\ involve\ the\ variable\ {\char123}{\char92}bf\ t{\c
we\ will\ use\ it\ in\ the\ second\ example.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
First\ compute\ a\ decomposition\ into\ regular\ chains\ \nwnewline
(i.e.\ regular\ triangular\ sets).\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}triangSolve(lp){\char36}pack\ {\char92}free{\char123}lp{\char125
{\char125}\nwnewline
\nwnewline
We\ can\ see\ easily\ from\ this\ decomposition\ (consisting\ of\ a\ single\nwnewline
regular\ chain)\ that\ the\ input\ system\ has\ 20\ complex\ roots.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
Then\ we\ compute\ a\ univariate\ representation\ of\ this\ regular\ chain.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}univariateSolve(lp){\char36}pack\ {\char92}free{\char123}lp{\cha
{\char125}\nwnewline
\nwnewline
We\ see\ that\ the\ zeros\ of\ our\ regular\ chain\ are\ split\ into\ three\nwnewline
components.\ \ This\ is\ due\ to\ the\ use\ of\ univariate\ polynomial\nwnewline
factorization.\nwnewline
\nwnewline
Each\ of\ these\ components\ consist\ of\ two\ parts.\ \ The\ first\ one\ is\ an\nwnewline
irreducible\ univariate\ polynomial\ {\char123}{\char92}bf\ p(?){\char125}\ which\ defines\
algebraic\ extension\ of\ the\ field\ of\ fractions\ of\ {\char123}{\char92}bf\ R{\char125}.
one\ consists\ of\ multivariate\ polynomials\ {\char123}{\char92}bf\ pol1(x,{\char92}{\char3
pol2(y,{\char92}{\char37}A){\char125}\ and\ {\char123}{\char92}bf\ pol3(z,{\char92}{\char37}
two\ variables:\ one\ is\ an\ indeterminate\ {\char123}{\char92}bf\ x{\char125},\ {\char123}
the\ input\ system\ {\char123}{\char92}bf\ lp{\char125}\ and\ the\ other\ is\ {\char123}{\ch
any\ root\ of\ {\char123}{\char92}bf\ p(?){\char125}.\ \ Recall\ that\ this\ {\char123}{\cha
element\ of\ the\ third\ parameter\ of\ {\char92}spadtype{\char123}ZDSOLVE{\char125}.\ \ Thu
complex\ root\ {\char123}{\char92}bf\ ?{\char125}\ of\ {\char123}{\char92}bf\ p(?){\char125}
system\ {\char123}{\char92}bf\ lp{\char125}\ by\ replacing\ {\char123}{\char92}bf\ {\char92}
{\char123}{\char92}bf\ pol1(x,{\char92}{\char37}A){\char125},\ {\char123}{\char92}bf\ pol2(y
the\ polynomials\ {\char123}{\char92}bf\ pol1(x,{\char92}{\char37}A){\char125},\ {\char123}{
have\ degree\ one\ w.r.t.\ {\char123}{\char92}bf\ x{\char125},\ {\char123}{\char92}bf\ y{\ch
is\ always\ the\ case\ for\ all\ univariate\ representations.\ \ Hence\ the\nwnewline
operation\ {\char123}{\char92}bf\ univariateSolve{\char125}\ replaces\ a\ system\ of\ multiv
polynomials\ by\ a\ list\ of\ univariate\ polynomials,\ what\ justifies\ its\nwnewline
name.\ \ Another\ example\ of\ univariate\ representations\ illustrates\ the\nwnewline
{\char92}spadtype{\char123}LexTriangularPackage{\char125}\ package\ constructor.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
```

```
We\ now\ compute\ the\ solutions\ with\ real\ coordinates:\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}lr\ :=\ realSolve(lp){\char36}pack\ {\char92}free{\char123}lp{\char125}\ {\c
{\char125}\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ number\ of\ real\ solutions\ for\ the\ input\ system\ is:\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}{\char92}{\char35}\ lr\ {\char92}free{\char123}lr{\char125}{\char125}\nwnewl
{\char125}\nwnewline
\nwnewline
Each\ of\ these\ real\ solutions\ is\ given\ by\ a\ list\ of\ elements\ in\nwnewline
{\char92}spadtype{\char123}RealClosure(R){\char125}.\ \ In\ these\ 8\ lists,\ the\ first\ element\ is\ a
value\ of\ {\char123}{\char92}bf\ z{\char125},\ the\ second\ of\ {\char123}{\char92}bf\ y{\char125}\ and
is\ logical\ since\ by\ setting\ the\ list\ of\ variables\ of\ the\ package\ to\nwnewline
{\char123}{\char92}bf\ [x,y,z,t]{\char125}\ we\ mean\ that\ the\ elimination\ ordering\ on\ the\ variabl
is\ {\char123}{\char92}bf\ t\ <\ z\ <\ y\ <\ x\ {\char125}.\ \ Note\ that\ each\ system\ treated\ by\ th
{\char92}spadtype{\char123}ZDSOLVE{\char125}\ package\ constructor\ needs\ only\ to\ be\nwnewline
zero-dimensional\ w.r.t.\ the\ variables\ involved\ in\ the\ system\ it-self\nwnewline
and\ not\ necessarily\ w.r.t.\ all\ the\ variables\ used\ to\ define\ the\nwnewline
package.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
We\ can\ approximate\ these\ real\ numbers\ as\ follows.\ \nwnewline
This\ computation\ takes\ between\ 30\ sec.\ and\ 5\ min,\ depending\ on\ your\ \nwnewline
machine.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}[[approximate(r,1/1000000)\ for\ r\ in\ point]\ for\ point\ in\ lr]\nwnewlin
{\char92}free{\char123}lr{\char125}{\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
We\ can\ also\ concentrate\ on\ the\ solutions\ with\ real\ (strictly)\ \nwnewline
positive\ coordinates:\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}lpr\ :=\ positiveSolve(lp){\char36}pack\ {\char92}free{\char123}lp{\char125}
{\char125}\nwnewline
\nwnewline
Thus\ we\ have\ checked\ that\ the\ input\ system\ has\ no\ solution\ with\ \nwnewline
strictly\ positive\ coordinates.\nwnewline
\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
Let\ us\ define\ another\ polynomial\ system\ ({\char123}{\char92}em\ L-3{\char125}).\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}f0\ :=\ x**3\ +\ y\ +\ z\ +\ t-\ 1\ {\char92}bound{\char123}f0{\char125}{\ch

3.109 zlindep.ht

3.109.1 IntegerLinearDependence

— zlindep.ht —

```
\begin{page}{IntegerLinearDependenceXmpPage}{IntegerLinearDependence}
\beginscroll

The elements \texht{$v_1, \dots,v_n$}{\spad{v1,...,vn}}
of a module \spad{M} over a ring \spad{R} are
said to be {\it linearly dependent over \spad{R}} if there exist
\texht{$c_1,\dots,c_n$}{\spad{c1, ..., cn}} in \spad{R},
not all \smath{0},
such that
\texht{$c_1 v_1 + \dots c_n v_n = 0$}{\spad{c1*v1 + ... + cn*vn = 0}}.
If such \texht{$c_i$}{\spad{ci}}'s exist,
they form what is called a {\it linear dependence
relation over \spad{R}} for the \texht{$v_i$}{\spad{vi}}'s.

The package \spadtype{IntegerLinearDependence} provides functions
for testing whether some elements of a module over the integers are
linearly dependent over the integers, and to find the linear
dependence relations, if any.
%
\xtc{
Consider the domain of two by two square matrices with integer entries.
}{
\spadpaste{M := SQMATRIX(2,INT) \bound{M}}
}
%
%
\xtc{
Now create three such matrices.
}{
\spadpaste{m1: M := squareMatrix matrix {\tt{}1,\ 2],\ [0,\ -1}
\free{M}\bound{m1}}
}
\xtc{
}{
\spadpaste{m2: M := squareMatrix matrix {\tt{}2,\ 3],\ [1,\ -2}
\free{M}\bound{m2}}
}
\xtc{
}{
\spadpaste{m3: M := squareMatrix matrix {\tt{}3,\ 4],\ [2,\ -3}
\free{M}\bound{m3}}
}
%
%
\xtc{
This tells you whether \spad{m1}, \spad{m2} and \spad{m3} are linearly
dependent over the integers.
}{
\spadpaste{linearlyDependentOverZ? vector [m1, m2, m3] \free{m1 m2 m3}}
}
%
%
\xtc{
Since they are linearly dependent, you can ask for the dependence
relation.
}{
\spadpaste{c := linearDependenceOverZ vector [m1, m2, m3]
\free{m1 m2 m3}\bound{c}}
}
%
%
\xtc{
This means that the following linear combination should be \spad{0}.
}{
\spadpaste{c.1 * m1 + c.2 * m2 + c.3 * m3 \free{c m1 m2 m3}}
}
%
When a given set of elements are linearly dependent over \spad{R}, this
also means that at least one of them can be rewritten as a linear
combination of the others with coefficients in the quotient field of
\spad{R}.
%
\xtc{
To express a given element in terms of other elements, use the operation
\spadfunFrom{solveLinearlyOverQ}{IntegerLinearDependence}.
}{
\spadpaste{solveLinearlyOverQ(vector [m1, m3], m2) \free{m1 m2 m3}}
}

Univariate polynomial factorisation over the integers has been
enhanced by updates to the \spadtype{GaloisGroupFactorizer} type and
friends from Frederic Lehobey (Frederic.Lehobey@lifl.fr, University of
Lille I, France).

The package constructor \spadtype{PseudoRemainderSequence} provides
efficient algorithms by Lionel Ducos
(Lionel.Ducos@mathlabo.univ-poitiers.fr, University of Poitiers,
France) for computing sub-resultants.  This leads to a speed up in
many places in Axiom where sub-resultants are computed (polynomial
system solving, algebraic factorization, integration).

Based on this package, the domain constructor
\spadtype{NewSparseUnivariatePolynomial} extends the constructor
\spadtype{SparseUnivariatePolynomial}.  In a similar way, the
\spadtype{NewSparseMultivariatePolynomial} extends the constructor
\spadtype{SparseUnivariatePolynomial}; it also provides some
additional operations related to polynomial system solving by means of
triangular sets.

Several domain constructors implement regular triangular sets (or
regular chains).  Among them \spadtype{RegularTriangularSet} and
\spadtype{SquareFreeRegularTriangularSet}.  They also implement an
algorithm by Marc Moreno Maza (marc@nag.co.uk, NAG) for computing
triangular decompositions of polynomial systems.  This method is
refined in the package \spadtype{LazardSetSolvingPackage} in order to
produce decompositions by means of Lazard triangular sets.  For the
case of polynomial systems with finitely many solutions, these
decompositions can also be computed by the package
\spadtype{LexTriangularPackage}.

The domain constructor \spadtype{RealClosure} by Renaud Rioboo
(Renaud.Rioboo@lip6.fr, University of Paris 6, France) provides the
real closure of an ordered field.  The implementation is based on
interval arithmetic.  Moreover, the design of this constructor and its
related packages allows an easy use of other codings for real
algebraic numbers.

Based on triangular decompositions and the \spadtype{RealClosure}
constructor, the package \spadtype{ZeroDimensionalSolvePackage}
provides operations for computing symbolically the real or complex
```

```
roots of polynomial systems with finitely many solutions.

Polynomial arithmetic with non-commutative variables has been improved
too by a contribution of Michel Petitot (Michel.Petitot@lifl.fr,
University of Lille I, France).  The domain constructors
\spadtype{XRecursivePolynomial} and \spadtype{XDistributedPolynomial}
provide recursive and distributed representations for these
polynomials.  They are the non-commutative equivalents for the
\spadtype{SparseMultivariatePolynomial} and
\spadtype{DistributedMultivariatePoly} constructors.  The
constructor \spadtype{LiePolynomial} implement Lie polynomials in the
Lyndon basis.  The constructor \spadtype{XPBWPolynomial} manage
polynomials with non-commutative variables in the
\texht{Poincar\'e}{Poincare\space{-1}'}-Birkhoff-Witt basis from the
Lyndon basis.  This allows to compute in the Lie Group associated with
a free nilpotent Lie algebra by using the \spadtype{LieExponentials}
domain constructor.

\beginscroll

In this version of Axiom, certain Library operations have been
accelerated by converting their Lisp implementations into kernel
operations implemented directly in C. Here is a list of the
accelerated operations. The given names encode the abbreviated type
the operation comes from, the name of the operation and, in the case
of exported functions, an encoded signature and numerical index.

\begin{page}{ugIntroPage}{1. An Overview of Axiom}

\beginscroll

Welcome to the Axiom environment for interactive computation and
problem solving.  Consider this chapter a brief, whirlwind tour of the
```

```
Axiom world.  We introduce you to Axiom's graphics and the Axiom
language.  Then we give a sampling of the large variety of facilities
in the Axiom system, ranging from the various kinds of numbers, to
data types (like lists, arrays, and sets) and mathematical objects
(like matrices, integrals, and differential equations).  We conclude
with the discussion of system commands and an interactive ``undo.''

Before embarking on the tour, we need to brief those readers
working interactively with Axiom on some details.
Others can skip right immediately to
\downlink{``Typographic Conventions''}{ugIntroTypoPage} in
Section 1.2\ignore{ugIntroTypo}.

```
\begin{page}{ugIntroStartPage}{1.1. Starting Up and Winding Down}
\beginscroll
```

```
You need to know how to start the Axiom system and how to stop it.
We assume that Axiom has been correctly installed on your machine (as
described in another Axiom document).

To begin using Axiom, issue the command {\bf axiom} to the operating
system shell.  There is a brief pause, some start-up messages, and
then one or more windows appear.

If you are not running Axiom under the X Window System, there is only
one window (the console).  At the lower left of the screen there is a
prompt that looks like
\begin{verbatim}
(1) ->
\end{verbatim}

When you want to enter input to Axiom, you do so on the same line
after the prompt.  The ``1'' in ``(1)'' is the computation step number
and is incremented after you enter Axiom statements.  Note, however,
that a system command such as \spadsys{)clear all} may change the step
number in other ways.  We talk about step numbers more when we discuss
system commands and the workspace history facility.

If you are running Axiom under the X Window System, there may be two
windows: the console window (as just described) and the Hyperdoc main
menu.  Hyperdoc is a multiple-window hypertext system that lets you
view Axiom documentation and examples on-line, execute Axiom
expressions, and generate graphics.  If you are in a graphical
windowing environment, it is usually started automatically when Axiom
begins.  If it is not running, issue \spadsys{)hd} to start it.  We
discuss the basics of Hyperdoc in
\downlink{``Using Hyperdoc''}{ugHyperPage} in Chapter 3\ignore{ugHyper}.

To interrupt an Axiom computation, hold down the
\texht{\fbox{\bf Ctrl}}{{\bf Ctrl}} (control) key and press
\texht{\fbox{\bf c}}{{\bf c}}.
This  brings you back to the Axiom prompt.

\beginImportant

To exit from Axiom, move to the console window, type \spadsys{)quit}
at the input prompt and press the \texht{\fbox{\bf Enter}}
{{\bf Enter}} key.  You will probably be prompted with the following
message: \centerline{{Please enter {\bf y} or {\bf yes} if you really
want to leave the }} \centerline{{interactive environment and return
to the operating system}} You should respond {\bf yes}, for example,
to exit Axiom.
\endImportant

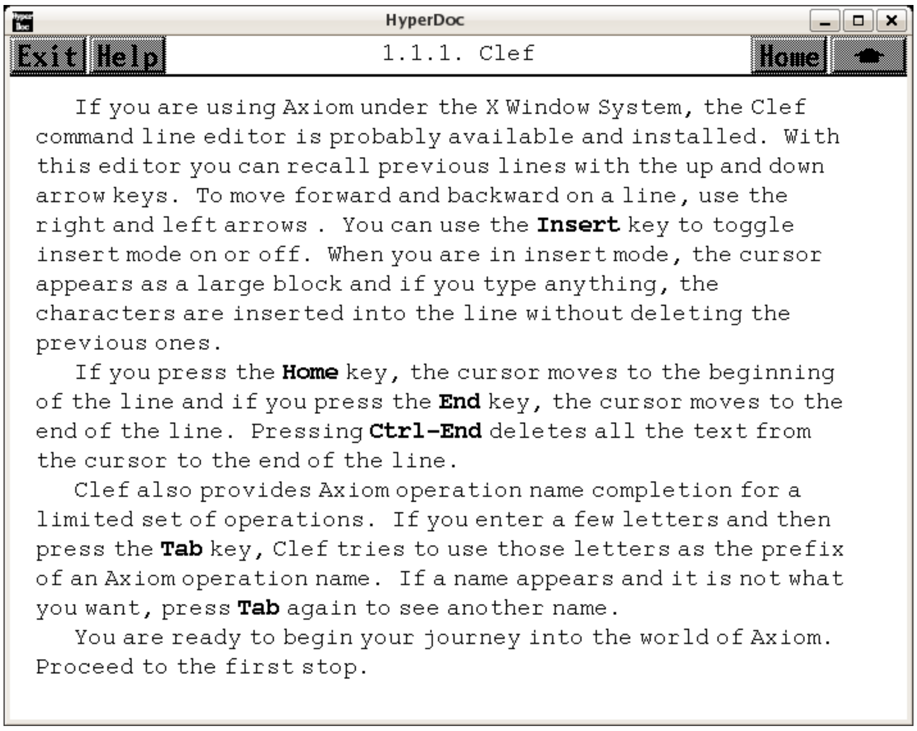
We are purposely vague in describing exactly what your screen looks
```

```
like or what messages Axiom displays.  Axiom runs on a number of
different machines, operating systems and window environments, and
these differences all affect the physical look of the system.  You can
also change the way that Axiom behaves via \spadgloss{system commands}
described later in this chapter and in
\downlink{``Axiom System Commands''}{ugSysCmdPage} in Appendix B
\ignore{ugSysCmd}.  System commands are special
commands, like \spadcmd{)set}, that begin with a closing parenthesis
and are used to change your environment.  For example, you can set a
system variable so that you are not prompted for confirmation when you
want to leave Axiom.

\beginmenu
    \menudownlink{{1.1.1. \Clef{}}}{ugAvailCLEFPage}
\endmenu
\endscroll
\autobuttons
\end{page}
```

————

6.0.10 Clef



If you are using Axiom under the X Window System, the Clef command line editor is probably available and installed. With this editor you can recall previous lines with the up and down arrow keys. To move forward and backward on a line, use the right and left arrows . You can use the **Insert** key to toggle insert mode on or off. When you are in insert mode, the cursor appears as a large block and if you type anything, the characters are inserted into the line without deleting the previous ones.

If you press the **Home** key, the cursor moves to the beginning of the line and if you press the **End** key, the cursor moves to the end of the line. Pressing **Ctrl-End** deletes all the text from the cursor to the end of the line.

Clef also provides Axiom operation name completion for a limited set of operations. If you enter a few letters and then press the **Tab** key, Clef tries to use those letters as the prefix of an Axiom operation name. If a name appears and it is not what you want, press **Tab** again to see another name.

You are ready to begin your journey into the world of Axiom. Proceed to the first stop.

⇐ "Computation of Galois Groups" (ugProblemGaloisPage) 9.0.122 on page 2274

— **ug01.ht** —

```
\begin{page}{ugAvailCLEFPage}{1.1.1. \Clef{}}
\beginscroll
%

If you are using Axiom under the X Window System, the \Clef{} command
line editor is probably available and installed.  With this editor you
can recall previous lines with the up and down arrow keys\texht{
(\fbox{$\uparrow$} and \fbox{$\downarrow$})}{}.  To move forward and
backward on a line, use the right and left arrows
\texht{(\fbox{$\rightarrow$} and \fbox{$\leftarrow$})}{}.  You can use the
\texht{\fbox{\bf Insert}}{{\bf Insert}} key to toggle insert mode on
or off.  When you are in insert mode, the cursor appears as a large
block and if you type anything, the characters are inserted into the
line without deleting the previous ones.

If you press the \texht{\fbox{\bf Home}}{{\bf Home}} key, the cursor
moves to the beginning of the line and if you press the
\texht{\fbox{\bf End}}{{\bf End}} key, the cursor moves to the end of
the line.  Pressing
```

```
\texht{\fbox{\bf Ctrl}--\fbox{\bf End}}{{\bf Ctrl-End}}
deletes all the text from the cursor to the end of the line.

\Clef{} also provides Axiom operation name completion for a limited
set of operations.  If you enter a few letters and then press the
\texht{\fbox{\bf Tab}}{{\bf Tab}} key, \Clef{} tries to use those
letters as the prefix of an Axiom operation name.  If a name appears
and it is not what you want, press \texht{\fbox{\bf Tab}}{{\bf Tab}}
again to see another name.

You are ready to begin your journey into the world of Axiom.
Proceed to the first stop.

\autobuttons
\end{page}
```

———-

6.0.11 Typographic Conventions

— ug01.ht —

```
\begin{page}{ugIntroTypoPage}{1.2. Typographic Conventions}
\beginscroll

In this book we have followed these typographical conventions:
\indent{4}
\beginitems
%
\item[-] Categories, domains and packages are displayed in
\texht{a sans-serif typeface:}{this font:}
\axiomType{Ring}, \axiomType{Integer},
\axiomType{DiophantineSolutionPackage}.
%
\item[-] Prefix operators, infix operators, and
punctuation symbols in the Axiom
language are displayed in the text like this:
\axiomOp{+}, \axiomSyntax{\$}, \axiomSyntax{+->}.
%
\item[-] Axiom expressions or expression fragments are displayed in
\texht{a mon\-o\-space typeface:}{this font:}
\axiom{inc(x) == x + 1}.
%
\item[-] For clarity of presentation, \TeX{} is often
used to format expressions\texht{: $g(x)=x^2+1.$}{.}
%
```

```
\item[-] Function names and Hyperdoc button names
are displayed in the text in
\texht{a bold typeface:}{this font:}
\axiomFun{factor}, \axiomFun{integrate},  {\bf Lighting}.
%
\item[-] Italics are used for emphasis and for words defined in the
glossary: \spadgloss{category}.
\enditems
\indent{0}

This book contains over 2500 examples of Axiom input and output.
All examples were run though Axiom and their output was
created in \texht{\TeX{}}{TeX} form for this book by the Axiom
\axiomType{TexFormat} package.
We have deleted system messages from the example output if those
messages are not important for the discussions in which the examples
appear.

\endscroll

6.0.13 Arithmetic Expressions

— ug01.ht —

```
\begin{page}{ugIntroArithmeticPage}{1.3.1. Arithmetic Expressions}
\beginscroll

For arithmetic expressions, use the \spadop{+} and \spadop{-}
\spadglossSee{operators}{operator} as in mathematics.  Use \spadop{*}
for multiplication, and \spadop{**} for exponentiation.  To create a
fraction, use \spadop{/}.  When an expression contains several
operators, those of highest \spadgloss{precedence} are evaluated
first.  For arithmetic operators, \spadop{**} has highest precedence,
\spadop{*} and \spadop{/} have the next highest precedence, and
\spadop{+} and \spadop{-} have the lowest precedence.

\xtc{
Axiom puts implicit parentheses around operations of higher
precedence, and groups those of equal precedence from left to right.
}{
\spadpaste{1 + 2 - 3 / 4 * 3 ** 2 - 1}
}
\xtc{
The above expression is equivalent to this.
}{
```

```
\spadpaste{((1 + 2) - ((3 / 4) * (3 ** 2))) - 1}
}
\xtc{
If an expression contains subexpressions enclosed in parentheses,
the parenthesized subexpressions are evaluated first (from left to
right, from inside out).
}{
\spadpaste{1 + 2 - 3/ (4 * 3 ** (2 - 1))}
}

6.0.15 Some Types

⇒ “notitle” (ugTypesPage) **??** on page **??**
— **ug01.ht** —

```
\begin{page}{ugIntroTypesPage}{1.3.3. Some Types}
\beginscroll

Everything in Axiom has a type.
The type determines what operations you can perform on an object and
how the object can be used.
An entire chapter of this book (
\downlink{``Using Types and Modes''}{ugTypesPage}
in Chapter 2\ignore{ugTypes}) is dedicated to
the interactive use of types.
Several of the final chapters discuss how types are built and how
they are organized in the Axiom library.
```

```
\xtc{
Positive integers are given type \spadtype{PositiveInteger}.
}{
\spadpaste{8}
}
\xtc{
Negative ones are given type \spadtype{Integer}.
This fine distinction is helpful to the
Axiom interpreter.
}{
\spadpaste{-8}

6.0.16 Symbols, Variables, Assignments, and Declarations

⇒ "notitle" (ugLangAssignPage) 8.0.50 on page 1720

— **ug01.ht** —

```
\begin{page}{ugIntroAssignPage}
{1.3.4. Symbols, Variables, Assignments, and Declarations}
\beginscroll

A \spadgloss{symbol} is a literal used for the input of things like
the ``variables'' in polynomials and power series.

\labelSpace{2pc}
\xtc{
We use the three symbols \axiom{x}, \axiom{y}, and \axiom{z} in
entering this polynomial.
}{
\spadpaste{(x - y*z)**2}
}

A symbol has a name beginning with an uppercase or lowercase
alphabetic character, \axiomSyntax{\%}, or \axiomSyntax{!}.
Successive characters (if any) can be any of the above, digits, or
\axiomSyntax{?}.  Case is distinguished: the symbol \axiom{points} is
different from the symbol \axiom{Points}.

A symbol can also be used in Axiom as a \spadgloss{variable}.  A
variable refers to a value.  To \spadglossSee{assign}{assignment} a
value to a variable, the operator \axiomSyntax{:=} is
used.\footnote{Axiom actually has two forms of assignment: {\it
immediate} assignment, as discussed here, and {\it delayed
assignment}. See \downlink{``Immediate and Delayed Assignments''}
{ugLangAssignPage} in Section 5.1\ignore{ugLangAssign} for details.}
A variable initially has no restrictions on the kinds of values to
which it can refer.

\xtc{
This assignment gives the value \axiom{4} (an integer) to
a variable named \axiom{x}.
}{
\spadpaste{x := 4}
}
\xtc{
This gives the value \axiom{z + 3/5} (a polynomial)  to \axiom{x}.
}{
\spadpaste{x := z + 3/5}
}
\xtc{
To restrict the types of objects that can be assigned to a variable,
use a \spadgloss{declaration}
}{
\spadpaste{y : Integer \bound{y}}
}
\xtc{
After a variable is declared to be of some type, only values
of that type can be assigned to that variable.
}{
\spadpaste{y := 89\bound{y1}\free{y}}
}
\xtc{
The declaration for \axiom{y} forces values assigned to \axiom{y} to
be converted to integer values.
}{
\spadpaste{y := sin \%pi}
}
\xtc{
If no such conversion is possible,
Axiom refuses to assign a value to \axiom{y}.
}{
\spadpaste{y := 2/3}
}
\xtc{
A type declaration can also be given together with an assignment.
The declaration can assist Axiom in choosing the correct
operations to apply.
}{
\spadpaste{f : Float := 2/3}
}

Any number of expressions can be given on input line.
Just separate them by semicolons.
Only the result of evaluating the last expression is displayed.

\xtc{
These two expressions have the same effect as
the previous single expression.
}{
\spadpaste{f : Float; f := 2/3 \bound{fff}}
}

The type of a symbol is either \axiomType{Symbol}
or \axiomType{Variable({\it name})} where {\it name} is the name
of the symbol.

\xtc{
By default, the interpreter
gives this symbol the type \axiomType{Variable(q)}.
}{
\spadpaste{q}
```

```
}
\xtc{
When multiple symbols are involved, \axiomType{Symbol} is used.
}{
\spadpaste{[q, r]}
}

\xtc{
What happens when you try to use a symbol that is the name of a variable?
}{
\spadpaste{f \free{fff}}
}
\xtc{
Use a single quote (\axiomSyntax{'}) before
the name to get the symbol.
}{
\spadpaste{'f}
}

Quoting a name creates a symbol by
preventing evaluation of the name as a variable.
Experience will teach you when you are most likely going to need to use
a quote.
We try to point out the location of such trouble spots.

6.0.17 Conversion

⇒ "notitle" (ugTypesConvertPage) **??** on page **??**
— **ug01.ht** —

```
\begin{page}{ugIntroConversionPage}{1.3.5. Conversion}
\beginscroll

Objects of one type can usually be ‘‘converted’’ to objects of several
other types.  To \spadglossSee{convert}{conversion} an object to a new
type, use the \axiomSyntax{::} infix operator.\footnote{Conversion is
discussed in detail in
\downlink{‘‘Conversion’’}{ugTypesConvertPage} in Section
2.7\ignore{ugTypesConvert}.}  For example, to
display an object, it is necessary to convert the object to type
\spadtype{OutputForm}.

\xtc{
This produces a polynomial with rational number coefficients.
}{
\spadpaste{p := r**2 + 2/3 \bound{p}}
}
\xtc{
Create a quotient of polynomials with integer coefficients
by using \axiomSyntax{::}.
}{
\spadpaste{p :: Fraction Polynomial Integer \free{p}}
}

Some conversions can be performed automatically when
Axiom tries to evaluate your input.
Others conversions must be explicitly requested.

6.0.18 Calling Functions

— ug01.ht —

```
\begin{page}{ugIntroCallFunPage}{1.3.6. Calling Functions}
\beginscroll

As we saw earlier, when you want to add or subtract two values,
you place the arithmetic operator \spadop{+}
or \spadop{-} between the two
\spadglossSee{arguments}{argument} denoting the values.
To use most other Axiom operations, however, you use another syntax:
write the name
of the operation first, then an open parenthesis, then each of the
arguments separated by commas, and, finally, a closing parenthesis.
If the operation takes only one argument and the argument is a number
or a symbol, you can omit the parentheses.

\xtc{
This calls the operation \axiomFun{factor} with the single
integer argument \axiom{120}.
}{
\spadpaste{factor(120)}
}
\xtc{
This is a call to \axiomFun{divide} with the two integer arguments
\axiom{125} and \axiom{7}.
}{
\spadpaste{divide(125,7)}
}
\xtc{
This calls \axiomFun{quatern} with four floating-point arguments.
}{
\spadpaste{quatern(3.4,5.6,2.9,0.1)}
}
\xtc{
This is the same as \axiom{factorial(10)}.
}{
\spadpaste{factorial 10}
}

An operations that returns a \spadtype{Boolean} value (that is,
\spad{true} or \spad{false}) frequently has a name suffixed with
a question mark (``?'').  For example, the \spadfun{even?}
operation returns \spad{true} if its integer argument is an even
number, \spad{false} otherwise.

An operation that can be destructive on one or more arguments
usually has a name ending in a exclamation point (``!'').
This actually means that it is {\it allowed} to update its
arguments but it is not {\it required} to do so. For example,
the underlying representation of a collection type may not allow
the very last element to removed and so an empty object may be
returned instead. Therefore, it is important that you use the
object returned by the operation and not rely on a physical
change having occurred within the object. Usually, destructive
operations are provided for efficiency reasons.

— **ug01.ht** —

```
\begin{page}{ugIntroLongPage}{1.3.8. Long Lines}
\beginscroll

When you enter Axiom expressions from your keyboard, there
will be times when they are too long to fit on one line.
Axiom does not care how long your lines are, so you can let
them continue from the right margin to the left side of the
next line.

Alternatively, you may want to enter several shorter lines and
have Axiom glue them together.
To get this glue, put an underscore (\_) at the end of
each line you wish to continue.
\begin{verbatim}
2_
+_
3
\end{verbatim}
is the same as if you had entered
\begin{verbatim}
2+3
\end{verbatim}

If you are putting your Axiom statements in an input file
(see \downlink{``Input Files''}{ugInOutInPage}
in Section 4.1\ignore{ugInOutIn}),
you can use indentation to indicate the structure of your program.
(see \downlink{``Blocks''}{ugLangBlocksPage}
in Section 5.2\ignore{ugLangBlocks}).

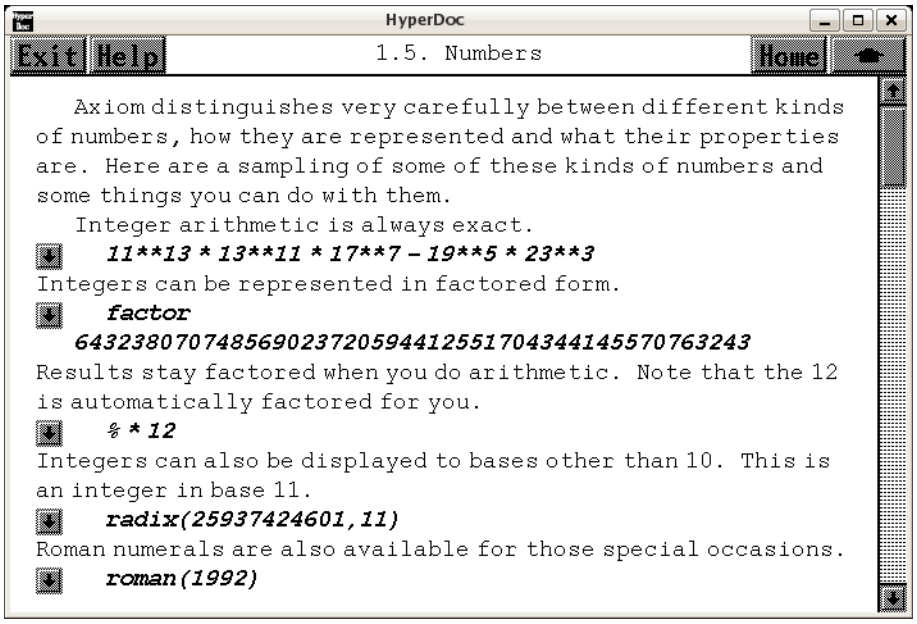
6.0.23 Numbers



Axiom distinguishes very carefully between different kinds of numbers, how they are represented and what their properties are. Here are a sampling of some of these kinds of numbers and some things you can do with them.

Integer arithmetic is always exact.

```
11**13 * 13**11 * 17**7 - 19**5 * 23**3
```

Integers can be represented in factored form.

```
factor 643238070748569023720594412551704344145570763243
```

Results stay factored when you do arithmetic. Note that the 12 is automatically factored for you.

```
% * 12
```

Integers can also be displayed to bases other than 10. This is an integer in base 11.

```
radix(25937424601,11)
```

Roman numerals are also available for those special occasions.

```
roman(1992)
```

map \axiomFun{factor} onto the numerator and denominator.
}{
\spadpaste{map(factor,r) \free{r}}
}
\xtc{
Type \spadtype{SingleInteger} refers to machine word-length
integers.
In English, this expression means ``\axiom{11} as a small
integer''.
}{
\spadpaste{11@SingleInteger}
}
\xtc{
Machine double-precision floating-point numbers are also
available for numeric and graphical
applications.
}{
\spadpaste{123.21@DoubleFloat}
```

```
}

The normal floating-point type in Axiom, \spadtype{Float},
is a software implementation of floating-point numbers in which
the exponent and the mantissa may have any number of
digits.\footnote{See
\downlink{`Float'}{FloatXmpPage}\ignore{Float} and
\downlink{`DoubleFloat'}{DoubleFloatXmpPage}\ignore{DoubleFloat} for
additional information on floating-point types.}
The types \spadtype{Complex(Float)} and
\spadtype{Complex(DoubleFloat)} are the corresponding software
implementations of complex floating-point numbers.

\xtc{
This is a floating-point approximation to about twenty digits.
The \axiomSyntax{::}
is used here to change from one kind of object
(here, a rational number) to another (a floating-point number).
}{
\spadpaste{r :: Float \free{r}}
}
\xtc{
Use \spadfunFrom{digits}{Float} to change the number of digits in
the representation.
This operation returns the previous value so you can reset it
later.
}{
\spadpaste{digits(22) \bound{fewerdigits}}
}
\xtc{
To \axiom{22} digits of precision, the number
\texht{$e^{\pi {\sqrt {163.0}}}$}{\axiom{exp(\%pi * sqrt 163.0)}}
appears to be an integer.
}{
\spadpaste{exp(\%pi * sqrt 163.0) \free{fewerdigits}}
}
\xtc{
Increase the precision to forty digits and try again.
}{
\spadpaste{digits(40);  exp(\%pi * sqrt 163.0) \free{moredigits}}
}
\xtc{
Here are complex numbers with rational numbers as real and
imaginary parts.
}{
\spadpaste{(2/3 + \%i)**3 \bound{gaussint}}
}
\xtc{
The standard operations on complex numbers are available.
}{
```

```
\spadpaste{conjugate \% \free{gaussint}}
}
\xtc{
You can factor complex integers.
}{
\spadpaste{factor(89 - 23 * \%i)}
}
\xtc{
Complex numbers with floating point parts are also available.
}{
\spadpaste{exp(\%pi/4.0 * \%i)}
}
\xtc{
Every rational number has an exact representation as a
repeating decimal expansion
(see \downlink{`DecimalExpansion'}{DecimalExpansionXmpPage}
\ignore{DecimalExpansion}).
}{
\spadpaste{decimal(1/352)}
}
\xtc{
A rational number can also be expressed as a continued fraction (see
\downlink{`ContinuedFraction'}{ContinuedFractionXmpPage}
\ignore{ContinuedFraction}).
}{
\spadpaste{continuedFraction(6543/210)}
}
\xtc{
Also, partial fractions can be used and can be displayed in a
compact \ldots
}{
\spadpaste{partialFraction(1,factorial(10)) \bound{partfrac}}
}
\xtc{
or expanded format (see
\downlink{`PartialFraction'}{PartialFractionXmpPage}
\ignore{PartialFraction}).
}{
\spadpaste{padicFraction(\%) \free{partfrac}}
}
\xtc{
Like integers, bases (radices) other than ten can be used for rational
numbers (see
\downlink{`RadixExpansion'}{RadixExpansionXmpPage}
\ignore{RadixExpansion}).
Here we use base eight.
}{
\spadpaste{radix(4/7, 8)\bound{rad}}
}
\xtc{
```

```
Of course, there are complex versions of these as well.
Axiom decides to make the result a complex rational number.
}{
\spadpaste{\% + 2/3*\%i\free{rad}}
}
\xtc{
You can also use Axiom to manipulate fractional powers.
}{
\spadpaste{(5 + sqrt 63 + sqrt 847)**(1/3)}
}
\xtc{
You can also compute with integers modulo a prime.
}{
\spadpaste{x : PrimeField 7 := 5 \bound{x}}
}
\xtc{
Arithmetic is then done modulo \mathOrSpad{7}.
}{
\spadpaste{x**3 \free{x}}
}
\xtc{
Since \mathOrSpad{7} is prime, you can invert nonzero values.
}{
\spadpaste{1/x \free{x}}
}
\xtc{
You can also compute modulo an integer that is not a prime.
}{
\spadpaste{y : IntegerMod 6 := 5 \bound{y}}
}
\xtc{
All of the usual arithmetic operations are available.
}{
\spadpaste{y**3 \free{y}}
}
\xtc{
Inversion is not available if the modulus is not a prime
number.
Modular arithmetic and prime fields are discussed in
\downlink{``Modular Arithmetic and Prime Fields''}
{ugxProblemFinitePrimePage}
in Section 8.11.1\ignore{ugxProblemFinitePrime}.
}{
\spadpaste{1/y \free{y}}
}
\xtc{
This defines \axiom{a} to be an algebraic number, that is,
a root of a polynomial equation.
}{
\spadpaste{a := rootOf(a**5 + a**3 + a**2 + 3,a) \bound{a}}
```

```
}
\xtc{
Computations with \axiom{a} are reduced according
to the polynomial equation.
}{
\spadpaste{(a + 1)**10\free{a}}
}
\xtc{
Define \axiom{b} to be an algebraic number involving \axiom{a}.
}{
\spadpaste{b := rootOf(b**4 + a,b) \bound{b}\free{a}}
}
\xtc{
Do some arithmetic.
}{
\spadpaste{2/(b - 1) \free{b}\bound{check}}
}
\xtc{
To expand and simplify this, call \axiomFun{ratDenom}
to rationalize the denominator.
}{
\spadpaste{ratDenom(\%) \free{check}\bound{check1}}
}
\xtc{
If we do this, we should get \axiom{b}.
}{
\spadpaste{2/\%+1 \free{check1}\bound{check2}}
}
\xtc{
But we need to rationalize the denominator again.
}{
\spadpaste{ratDenom(\%) \free{check2}}
}
\xtc{
Types \spadtype{Quaternion} and \spadtype{Octonion} are also available.
Multiplication of quaternions is non-commutative, as expected.
}{

```
\begin{page}{ugIntroCollectPage}{1.6. Data Structures}
\beginscroll
%

Axiom has a large variety of data structures available.
Many data structures are particularly useful for interactive
computation and others are useful for building applications.
The data structures of Axiom are organized into
\spadglossSee{category hierarchies}{hierarchy} as shown on
the inside back cover.

A \spadgloss{list} is the most commonly used data structure in
Axiom for holding objects all of the same
```

```
type.\footnote{Lists are discussed in
\downlink{`List'}{ListXmpPage}\ignore{List} and in
\downlink{``Creating Lists and Streams with Iterators''}
{ugLangItsPage} in Section 5.5\ignore{ugLangIts}.}
The name {\it list} is short for ``linked-list of nodes.'' Each
node consists of a value (\spadfunFrom{first}{List}) and a link
(\spadfunFrom{rest}{List}) that
\spadglossSee{points}{pointer} to the next node, or to a
distinguished value denoting the empty list.
To get to, say, the third element, Axiom starts at the front
of the list, then traverses across two links to the third node.

\xtc{
Write a list of elements using
square brackets with commas separating the elements.
}{
\spadpaste{u := [1,-7,11] \bound{u}}
}
\xtc{
This is the value at the third node.
Alternatively, you can say \axiom{u.3}.
}{
\spadpaste{first rest rest u\free{u}}
}

Many operations are defined on lists, such as:
\axiomFun{empty?}, to test that a list has no elements;
\axiomFun{cons}\axiom{(x,l)}, to create a new list with
\axiomFun{first} element \axiom{x} and \axiomFun{rest} \axiom{l};
\axiomFun{reverse}, to create a new list with elements in reverse
order; and \axiomFun{sort}, to arrange elements in order.

An important point about lists is that they are ``mutable'': their
constituent elements and links can be changed ``in place.''
To do this, use any of the operations whose names end with the
character \axiomSyntax{!}.

\xtc{
The operation \spadfunFromX{concat}{List}\axiom{(u,v)}
replaces the last link of the list
\axiom{u} to point to some other list \axiom{v}.
Since \axiom{u} refers to the original list,
this change is seen by \axiom{u}.
}{
\spadpaste{concat!(u,[9,1,3,-4]); u\free{u}\bound{u1}}
}
\xtc{
A {\it cyclic list} is a list with a ``cycle'':
a link pointing back to an earlier node of the list.
To create a cycle, first get a node somewhere down
```

```
the list.
}{
\spadpaste{lastnode := rest(u,3)\free{u1}\bound{u2}}
}
\xtc{
Use \spadfunFromX{setrest}{List} to
change the link emanating from that node to point back to an
earlier part of the list.
}{
\spadpaste{setrest!(lastnode,rest(u,2)); u\free{u2}}
}

A \spadgloss{stream}
is a structure that (potentially) has an infinite number of
distinct elements.\footnote{Streams are discussed in
\downlink{`Stream'}{StreamXmpPage}\ignore{Stream} and in
\downlink{``Creating Lists and Streams with Iterators''}
{ugLangItsPage} in Section 5.5\ignore{ugLangIts}.}
Think of a stream as an ``infinite list'' where elements are
computed successively.

\xtc{
Create an infinite stream of factored integers.
Only a certain number of initial elements are computed
and displayed.
}{
\spadpaste{[factor(i) for i in 2.. by 2] \bound{stream1}}
}
\xtc{
Axiom represents streams by a collection of already-computed
elements together with a function to compute the next element
``on demand.''
Asking for the \eth{\axiom{n}} element causes elements \axiom{1} through
\axiom{n} to be evaluated.
}{
\spadpaste{\%.36 \free{stream1}}
}

Streams can also be finite or cyclic.
They are implemented by a linked list structure similar to lists
and have many of the same operations.
For example, \axiomFun{first} and \axiomFun{rest} are used to access
elements and successive nodes of a stream.
%%> reverse and sort do not exist for streams
%%Don't try to reverse or sort a stream: the
%%operation will generally run forever!

A \spadgloss{one-dimensional array} is another data structure used
to hold objects of the same type.\footnote{See
\downlink{`OneDimensionalArray'}{OneDimensionalArrayXmpPage}
```

```
\ignore{OneDimensionalArray} for
details.}
Unlike lists, one-dimensional arrays are inflexible---they are
implemented using a fixed block of storage.
Their advantage is that they give quick and equal access time to
any element.

\xtc{
A simple way to create a one-dimensional array is to apply the
operation \axiomFun{oneDimensionalArray} to a list of elements.
}{
\spadpaste{a := oneDimensionalArray [1, -7, 3, 3/2]\bound{a}}
}
\xtc{
One-dimensional arrays are also mutable:
you can change their constituent elements ``in place.''
}{
\spadpaste{a.3 := 11; a\bound{a1}\free{a}}
}
\xtc{
However, one-dimensional arrays are not flexible structures.
You cannot destructively \spadfunX{concat} them together.
}{
\spadpaste{concat!(a,oneDimensionalArray [1,-2])\free{a1}}
}

Examples of datatypes similar to \spadtype{OneDimensionalArray}
are: \spadtype{Vector} (vectors are mathematical structures
implemented by one-dimensional arrays), \spadtype{String} (arrays
of ``characters,'' represented by byte vectors), and
\spadtype{Bits} (represented by ``bit vectors'').

\xtc{
A vector of 32 bits,
each representing the \spadtype{Boolean} value \axiom{true}.
}{
\spadpaste{bits(32,true)}
}

A \spadgloss{flexible array} is a cross between a list
and a one-dimensional array.\footnote{See
\downlink{`FlexibleArray'}{FlexibleArrayXmpPage}\ignore{FlexibleArray} for
details.}
Like a one-dimensional array, a flexible array occupies a fixed
block of storage.
Its block of storage, however, has room to expand!
When it gets full, it grows (a new, larger block of storage is
allocated); when it has too much room, it contracts.

\xtc{
```

```
Create a flexible array of three elements.
}{
\spadpaste{f := flexibleArray [2, 7, -5]\bound{f}}
}
\xtc{
Insert some elements between the second and third elements.
}{
\spadpaste{insert!(flexibleArray [11, -3],f,2)\free{f}}
}

Flexible arrays are used to implement ``heaps.'' A
\spadgloss{heap} is an example of a data structure called a
\spadgloss{priority queue}, where elements are ordered with
respect to one another.\footnote{See
\downlink{`Heap'}{HeapXmpPage}\ignore{Heap} for more details.
Heaps are also examples of data structures called
\spadglossSee{bags}{bag}.
Other bag data structures are \spadtype{Stack}, \spadtype{Queue},
and \spadtype{Dequeue}.}
A heap is organized
so as to optimize insertion and extraction of maximum elements.
The \spadfunX{extract} operation
returns the maximum element of the heap, after destructively
removing that element and
reorganizing the heap
so that the next maximum element is ready to be delivered.

\xtc{
An easy way to create a heap is to apply the
operation \spadfun{heap} to a list of values.
}{
\spadpaste{h := heap [-4,7,11,3,4,-7]\bound{h}}
}
\xtc{
This loop extracts elements one-at-a-time from \spad{h}
until the heap is exhausted, returning the elements
as a list in the order they were extracted.
}{
\spadpaste{[extract!(h) while not empty?(h)]\free{h}}
}

A \spadgloss{binary tree} is a ``tree'' with at most two branches per
node: it is either empty, or else is a node consisting of a value, and
a left and right subtree (again, binary trees).\footnote{Example of
binary tree types are \spadtype{BinarySearchTree} (see
\downlink{`BinarySearchTree'}{BinarySearchTreeXmpPage}
\ignore{BinarySearchTree}, \spadtype{PendantTree},
\spadtype{TournamentTree}, and \spadtype{BalancedBinaryTree} (see
\downlink{`BalancedBinaryTree'}{BalancedBinaryTreeXmpPage}
\ignore{BalancedBinaryTree}).}
```

```
\xtc{
A {\it binary search tree} is a binary tree such that,
for each node, the value of the node is
greater than all values (if any) in the left subtree,
and less than or equal all values (if any) in the right subtree.
}{
\spadpaste{binarySearchTree [5,3,2,9,4,7,11]}
}

\xtc{
A {\it balanced binary tree} is useful for doing modular computations.
Given a list \axiom{lm} of moduli,
\axiomFun{modTree}\axiom{(a,lm)} produces a balanced binary
tree with the values \texht{$a \bmod m$}{a {\tt mod} m}
at its leaves.
}{
\spadpaste{modTree(8,[2,3,5,7])}
}

A \spadgloss{set} is a collection of elements where duplication
and order is irrelevant.\footnote{See
\downlink{`Set'}{SetXmpPage}\ignore{Set} for more
details.}
Sets are always finite and have no corresponding
structure like streams for infinite collections.

\xtc{
%Create sets using braces (\axiomSyntax{\{} and \axiomSyntax{\}})
%rather than brackets.
}{
\spadpaste{fs := set [1/3,4/5,-1/3,4/5] \bound{fs}}
}

A \spadgloss{multiset}
is a set that keeps track of the number
of duplicate values.\footnote{See
\downlink{`MultiSet'}{MultiSetXmpPage}\ignore{MultiSet} for details.}
\xtc{
For all the primes \axiom{p} between 2 and 1000, find the
distribution of \texht{$p \bmod 5$}{p mod 5}.
}{
\spadpaste{multiset [x rem 5 for x in primes(2,1000)]}
}

A \spadgloss{table}
is conceptually a set of ``key--value'' pairs and
is a generalization of a multiset.\footnote{For examples of tables, see
\spadtype{AssociationList} (
\downlink{`AssociationList'}{AssociationListXmpPage}
\ignore{AssociationList}),
\spadtype{HashTable},
\spadtype{KeyedAccessFile} (
\downlink{‘KeyedAccessFile’}{KeyedAccessFileXmpPage}
\ignore{KeyedAccessFile}),
\spadtype{Library} (\downlink{‘Library’}{LibraryXmpPage}
\ignore{Library}),
\spadtype{SparseTable} (
\downlink{‘SparseTable’}{SparseTableXmpPage}\ignore{SparseTable}),
\spadtype{StringTable} (
\downlink{‘StringTable’}{StringTableXmpPage}\ignore{StringTable}),
and \spadtype{Table} (\downlink{‘Table’}{TableXmpPage}\ignore{Table}).}
The domain \spadtype{Table(Key, Entry)} provides a general-purpose
type for tables with {\it values} of type \axiom{Entry} indexed
by {\it keys} of type \axiom{Key}.

\xtc{
Compute the above distribution of primes using tables.
First, let \axiom{t} denote an empty table of keys and values,
each of type \spadtype{Integer}.
}{
\spadpaste{t : Table(Integer,Integer) := empty()\bound{t}}
}

We define a function \userfun{howMany} to return the number
of values of a given modulus \axiom{k} seen so far.
It calls \axiomFun{search}\axiom{(k,t)} which returns the number of
values stored under the key \axiom{k} in table \axiom{t}, or
\axiom{"failed"} if no such value is yet stored in \axiom{t} under
\axiom{k}.

\xtc{
In English, this says ‘‘Define \axiom{howMany(k)} as follows.
First, let \smath{n} be the value of \axiomFun{search}\smath{(k,t)}.
Then, if \smath{n} has the value \smath{"failed"}, return the value
\smath{1}; otherwise return \smath{n + 1}.’’
}{
\spadpaste{howMany(k) == (n:=search(k,t); n case "failed" => 1; n+1)
\bound{how}}
}
\xtc{
Run through the primes to create the table, then print the table.
The expression \axiom{t.m := howMany(m)} updates the value in table \axiom{t}
stored under key \axiom{m}.
}{
\spadpaste{for p in primes(2,1000) repeat (m:= p rem 5; t.m:= howMany(m));
t\free{how t}}
}

A {\it record}
```

```
is an example of an inhomogeneous collection
of objects.\footnote{See
\downlink{‘‘Records’’}{ugTypesRecordsPage}
in Section 2.4\ignore{ugTypesRecords} for details.}
A record consists of a set of named {\it selectors} that
can be used to access its components.

\xtc{
Declare that \axiom{daniel} can only be
assigned a record with two prescribed fields.
}{
\spadpaste{daniel : Record(age : Integer, salary : Float) \bound{danieldec}}
}
\xtc{
Give \axiom{daniel} a value, using square brackets to enclose the values of
the fields.
}{
\spadpaste{daniel := [28, 32005.12] \free{danieldec}\bound{daniel}}
}
\xtc{
Give \axiom{daniel} a raise.
}{
\spadpaste{daniel.salary := 35000; daniel \free{daniel}}
}

A {\it union}
is a data structure used when objects
have multiple types.\footnote{See
\downlink{‘‘Unions’’}{ugTypesUnionsPage}
in Section 2.5\ignore{ugTypesUnions} for details.}

\xtc{
Let \axiom{dog} be either an integer or a string value.
}{
\spadpaste{dog: Union(licenseNumber: Integer, name: String)\bound{xint}}
}
\xtc{
Give \axiom{dog} a name.
}{
\spadpaste{dog := "Whisper"\free{xint}}
}

All told, there are over forty different data structures in
Axiom.
Using the domain constructors described in
\downlink{‘‘Domains’’}{ugDomainsPage}
in Chapter 13\ignore{ugDomains}, you
can add your own data structure or extend an existing one.
Choosing the right data structure for your application may be the key
to obtaining good performance.

\begin{page}{ugIntroTwoDimPage}{1.7. Expanding to Higher Dimensions}
\beginscroll
%

To get higher dimensional aggregates, you can create one-dimensional
aggregates with elements that are themselves aggregates, for example,
lists of lists, one-dimensional arrays of lists of multisets, and so
on.  For applications requiring two-dimensional homogeneous
aggregates, you will likely find {\it two-dimensional arrays} and {\it
matrices} most useful.

The entries in \spadtype{TwoDimensionalArray} and
\spadtype{Matrix} objects
are all the same type, except that those for
\spadtype{Matrix} must belong to a \spadtype{Ring}.
You create and access elements in roughly the same way.
Since matrices have an understood algebraic structure, certain algebraic
operations are available for matrices but not for arrays.
Because of this, we limit our discussion here to
\spadtype{Matrix}, that can be regarded as an extension of
\spadtype{TwoDimensionalArray}.\footnote{See
\downlink{`TwoDimensionalArray'}{TwoDimensionalArrayXmpPage}
\ignore{TwoDimensionalArray} for more information about arrays.
For more information about Axiom's linear algebra
facilities, see \downlink{`Matrix'}{MatrixXmpPage}\ignore{Matrix},

— **ug01.ht** —

```
\begin{page}{ugIntroYouPage}{1.8. Writing Your Own Functions}
\beginscroll
%
```

```
Axiom provides you with a very large library of predefined operations
and objects to compute with.  You can use the Axiom library of
constructors to create new objects dynamically of quite arbitrary
complexity.  For example, you can make lists of matrices of fractions
of polynomials with complex floating point numbers as coefficients.
Moreover, the library provides a wealth of operations that allow you
to create and manipulate these objects.

For many applications, you need to interact with the interpreter and
write some Axiom programs to tackle your application.  Axiom allows
you to write functions interactively, thereby effectively extending
the system library.  Here we give a few simple examples, leaving the
details to \downlink{``User-Defined Functions, Macros and Rules''}
{ugUserPage} in Chapter 6\ignore{ugUser}.

We begin by looking at several ways that you can define the
``factorial'' function in Axiom.  The first way is to give a
piece-wise definition of the function.  This method is best for a
general recurrence relation since the pieces are gathered together and
compiled into an efficient iterative function.  Furthermore, enough
previously computed values are automatically saved so that a
subsequent call to the function can pick up from where it left off.

\xtc{
Define the value of \userfun{fact} at \axiom{0}.
}{
\spadpaste{fact(0) == 1 \bound{fact}}
}
\xtc{
Define the value of \axiom{fact(n)} for general \axiom{n}.
}{
\spadpaste{fact(n) == n*fact(n-1)\bound{facta}\free{fact}}
}
\xtc{
Ask for the value at \axiom{50}.
The resulting function created by Axiom
computes the value by iteration.
}{
\spadpaste{fact(50) \free{facta}}
}
\xtc{
A second definition uses an \axiom{if-then-else} and recursion.
}{
\spadpaste{fac(n) == if n < 3 then n else n * fac(n - 1) \bound{fac}}
}
\xtc{
This function is less efficient than the previous version since
each iteration involves a recursive function call.
}{
```

```
\spadpaste{fac(50) \free{fac}}
}
\xtc{
A third version directly uses iteration.
}{
\spadpaste{fa(n) == (a := 1; for i in 2..n repeat a := a*i; a) \bound{fa}}
}
\xtc{
This is the least space-consumptive version.
}{
\spadpaste{fa(50) \free{fa}}
}
\xtc{
A final version appears to construct a large list and then reduces over
it with multiplication.
}{
\spadpaste{f(n) == reduce(*,[i for i in 2..n]) \bound{f}}
}
\xtc{
In fact, the resulting computation is optimized into an efficient
iteration loop equivalent to that of the third version.
}{
\spadpaste{f(50) \free{f}}
}
\xtc{
The library version uses an algorithm that is different from the four
above because it highly optimizes the recurrence relation definition of
\axiomFun{factorial}.
}{
\spadpaste{factorial(50)}
}

You are not limited to one-line functions in Axiom.
If you place your function definitions in {\bf .input} files
(see \downlink{``Input Files''}{ugInOutInPage}
in Section 4.1\ignore{ugInOutIn}), you can have
multi-line functions that use indentation for grouping.

Given \axiom{n} elements, \axiomFun{diagonalMatrix} creates an
\axiom{n} by \axiom{n} matrix with those elements down the diagonal.
This function uses a permutation matrix
that interchanges the \axiom{i}th and \axiom{j}th rows of a matrix
by which it is right-multiplied.

\xtc{
This function definition shows a style of definition that can be used
in {\bf .input} files.
Indentation is used to create \spadglossSee{blocks}{block}\texht{\/}{}:
sequences of expressions that are evaluated in sequence except as
modified by control statements such as \axiom{if-then-else} and \axiom{return}.
```

```
}{
\begin{spadsrc}[\bound{permMat}]
permMat(n, i, j) ==
  m := diagonalMatrix
    [(if i = k or j = k then 0 else 1)
      for k in 1..n]
  m(i,j) := 1
  m(j,i) := 1
  m
\end{spadsrc}
}
\xtc{
This creates a four by four matrix that interchanges the second and third
rows.
}{
\spadpaste{p := permMat(4,2,3) \free{permMat}\bound{p}}
}
\xtc{
Create an example matrix to permute.

\nwnewline
Polynomials\ are\ the\ commonly\ used\ algebraic\ types\ in\ symbolic\nwnewline
computation.\nwnewline
Interactive\ users\ of\ Axiom\ generally\ only\ see\ one\ type\nwnewline
of\ polynomial:\ {\char92}spadtype{\char123}Polynomial(R){\char125}.\nwnewline
This\ type\ represents\ polynomials\ in\ any\ number\ of\ unspecified\nwnewline
variables\ over\ a\ particular\ coefficient\ domain\ {\char92}axiom{\char123}R{\char125}.\nw
This\ type\ represents\ its\ coefficients\nwnewline
{\char92}spadglossSee{\char123}sparsely{\char125}{\char123}sparse{\char125}:\ only\ terms\ w
coefficients\ are\ represented.\nwnewline
\nwnewline
In\ building\ applications,\ many\ other\ kinds\ of\ polynomial\nwnewline
representations\ are\ useful.\nwnewline
Polynomials\ may\ have\ one\ variable\ or\ multiple\ variables,\ the\nwnewline
variables\ can\ be\ named\ or\ unnamed,\ the\ coefficients\ can\ be\ stored\nwnewline
sparsely\ or\ densely.\nwnewline
So-called\ ‘‘distributed\ multivariate\ polynomials’’\ store\nwnewline
polynomials\ as\ coefficients\ paired\ with\ vectors\ of\ exponents.\nwnewline
This\ type\ is\ particularly\ efficient\ for\ use\ in\ algorithms\ for\nwnewline
solving\ systems\ of\ non-linear\ polynomial\ equations.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ polynomial\ constructor\ most\ familiar\ to\ the\ interactive\ user\nwnewline
is\ {\char92}spadtype{\char123}Polynomial{\char125}.\nwnewline
{\char125}{\char123}\nwnewline

{\char92}begin{\char123}page{\char125}{\char123}ugIntroIntegratePage{\char125}{\char123}1.13.\ Integrati
{\char92}beginscroll\nwnewline
{\char37}\nwnewline
\nwnewline
Axiom\ has\ extensive\ library\ facilities\ for\ integration.\nwnewline
\nwnewline
The\ first\ example\ is\ the\ integration\ of\ a\ fraction\ with\ denominator\nwnewline
that\ factors\ into\ a\ quadratic\ and\ a\ quartic\ irreducible\ polynomial.\nwnewline
The\ usual\ partial\ fraction\ approach\ used\ by\ most\ other\ computer\nwnewline
algebra\ systems\ either\ fails\ or\ introduces\ expensive\ unneeded\nwnewline
algebraic\ numbers.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
We\ use\ a\ factorization-free\ algorithm.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}integrate((x**2+2*x+1)/((x+1)**6+1),x){\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
When\ real\ parameters\ are\ present,\ the\ form\ of\ the\ integral\ can\ depend\ on\nwnewline
the\ signs\ of\ some\ expressions.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
Rather\ than\ query\ the\ user\ or\ make\ sign\ assumptions,\ Axiom\ returns\nwnewline
all\ possible\ answers.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}integrate(1/(x**2\ +\ a),x){\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
The\ {\char92}axiomFun{\char123}integrate{\char125}\ operation\ generally\ assumes\ that\ all\nwnewline
parameters\ are\ real.\nwnewline
The\ only\ exception\ is\ when\ the\ integrand\ has\ complex\ valued\nwnewline
quantities.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
If\ the\ parameter\ is\ complex\ instead\ of\ real,\ then\ the\ notion\ of\ sign\nwnewline
is\ undefined\ and\ there\ is\ a\ unique\ answer.\ \ You\ can\ request\ this\nwnewline
answer\ by\ ``prepending''\ the\ word\ ``complex''\ to\ the\ command\ name:\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}complexIntegrate(1/(x**2\ +\ a),x){\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
The\ following\ two\ examples\ illustrate\ the\ limitations\ of\ table-based\nwnewline
approaches.\ \ The\ two\ integrands\ are\ very\ similar,\ but\ the\ answer\ to\nwnewline
one\ of\ them\ requires\ the\ addition\ of\ two\ new\ algebraic\ numbers.\nwnewline
```

```
\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ one\ is\ the\ easy\ one.\nwnewline
The\ next\ one\ looks\ very\ similar\nwnewline
but\ the\ answer\ is\ much\ more\ complicated.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}integrate(x**3\ /\ (a+b*x)**(1/3),x){\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Only\ an\ algorithmic\ approach\nwnewline
is\ guaranteed\ to\ find\ what\ new\ constants\ must\ be\ added\ in\ order\ to\nwnewline
find\ a\ solution.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}integrate(1\ /\ (x**3\ *\ (a+b*x)**(1/3)),x){\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
Some\ computer\ algebra\ systems\ use\ heuristics\ or\ table-driven\nwnewline
approaches\ to\ integration.\ \ When\ these\ systems\ cannot\ determine\ the\nwnewline
answer\ to\ an\ integration\ problem,\ they\ reply\ ``I\ don't\ know.''\ Axiom\nwnewline
uses\ an\ algorithm\ for\ integration.\ \ that\ conclusively\ proves\ that\ an\nwnewline
integral\ cannot\ be\ expressed\ in\ terms\ of\ elementary\ functions.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
When\ Axiom\ returns\ an\ integral\ sign,\ it\ has\ proved\nwnewline
that\ no\ answer\ exists\ as\ an\ elementary\ function.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}integrate(log(1\ +\ sqrt(a*x\ +\ b))\ /\ x,x){\char125}\nwnewlin
{\char125}\nwnewline
Axiom\ can\ handle\ complicated\ mixed\ functions\ much\ beyond\ what\ you\nwnewline
can\ find\ in\ tables.\nwnewline
{\char92}xtc{\char123}\nwnewline
Whenever\ possible,\ Axiom\ tries\ to\ express\ the\ answer\ using\ the\ functions\nwnewline
present\ in\ the\ integrand.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}integrate((sinh(1+sqrt(x+b))+2*sqrt(x+b))\ /\ \nwnewline
(sqrt(x+b)\ *\ (x\ +\ cosh(1+sqrt(x\ +\ b)))),\ x){\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
A\ strong\ structure-checking\ algorithm\ in\ Axiom\ finds\ hidden\ algebraic\nwnewline
relationships\ between\ functions.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}integrate(tan(atan(x)/3),x){\char125}\nwnewline
{\char125}\nwnewline
{\char92}noindent\nwnewline
{\char37}{\char37}-->\ Bob--->\ please\ make\ these\ formulas\ in\ this\ section\ smaller.\nw
The\ discovery\ of\ this\ algebraic\ relationship\ is\ necessary\ for\ correct\nwnewline
integration\ of\ this\ function.\nwnewline
Here\ are\ the\ details:\nwnewline
{\char92}indent{\char123}4{\char125}\nwnewline
{\char92}beginitems\nwnewline
```

```
{\char92}item[1.\ ]\ \nwnewline

6.0.27 Solution of Equations

— ug01.ht —

```
\begin{page}{ugIntroSolutionPage}{1.15. Solution of Equations}
\beginscroll
%

Axiom also has state-of-the-art algorithms for the solution
of systems of polynomial equations.
When the number of equations and unknowns is the same, and you
have no symbolic coefficients, you can use \spadfun{solve} for
real roots and \spadfun{complexSolve} for complex roots.
In each case, you tell Axiom how accurate you want your
result to be.
All operations in the \spadfun{solve} family return answers in
the form of a list of solution sets, where each solution set is a
list of equations.
```

```
\xtc{
A system of two equations involving a symbolic
parameter \axiom{t}.
}{
\spadpaste{S(t) == [x**2-2*y**2 - t,x*y-y-5*x + 5]\bound{S1}}
}
\xtc{
Find the real roots of \spad{S(19)} with
rational arithmetic, correct to within \smath{1/10^{20}}.
}{
\spadpaste{solve(S(19),1/10**20)\free{S1}}
}
\xtc{
Find the complex roots of \spad{S(19)} with floating
point coefficients to \spad{20} digits accuracy in the mantissa.
}{
\spadpaste{complexSolve(S(19),10.e-20)\free{S1}}
}
\xtc{
If a system of equations has symbolic coefficients and you want
a solution in radicals, try \spadfun{radicalSolve}.
}{
\spadpaste{radicalSolve(S(a),[x,y])\free{S1}}
}
For systems of equations with symbolic coefficients, you can apply
\spadfun{solve}, listing the variables that you want Axiom to solve
for.  For polynomial equations, a solution cannot usually be expressed
solely in terms of the other variables.  Instead, the solution is
presented as a ``triangular'' system of equations, where each
polynomial has coefficients involving only the succeeding
variables. This is analogous to converting a linear system of
equations to ``triangular form''.
\xtc{
A system of three equations in five variables.
}{
\spadpaste{eqns := [x**2 - y + z,x**2*z + x**4 - b*y, y**2 *z - a - b*x]
\bound{e}}
}
\xtc{
Solve the system for unknowns \smath{[x,y,z]},
reducing the solution to triangular form.
}{
\spadpaste{solve(eqns,[x,y,z])\free{e}}
}

{\char37}\nwnewline
\nwnewline
We\ conclude\ our\ tour\ of\ Axiom\ with\ a\ brief\ discussion\ of\nwnewline
{\char92}spadgloss{\char123}system\ commands{\char125}.\ \ System\ commands\ are\ special\ statements\nw
that\ start\ with\ a\ closing\ parenthesis\ ({\char92}axiomSyntax{\char123}){\char125}).\ They\ are\ use
to\ control\ or\ display\ your\ Axiom\ environment,\ start\ the\ Hyperdoc\nwnewline
system,\ issue\ operating\ system\ commands\ and\ leave\ Axiom.\ \ For\ example,\nwnewline
{\char92}spadsys{\char123})system{\char125}\ is\ used\ to\ issue\ commands\ to\ the\ operating\ system\n
```

```
from\ Axiom.\ \ Here\ is\ a\ brief\ description\ of\ some\ of\ these\ commands.\nwnewline
For\ more\ information\ on\ specific\ commands,\ see\nwnewline
{\char92}downlink{\char123}``Axiom\ System\ Commands''{\char125}{\char123}ugSysCmdPage{\char
{\char92}ignore{\char123}ugSysCmd{\char125}.\nwnewline
\nwnewline
Perhaps\ the\ most\ important\ user\ command\ is\ the\ {\char92}spadsys{\char123})clear\ all
command\ that\ initializes\ your\ environment.\ \ Every\ section\ and\nwnewline
subsection\ in\ this\ book\ has\ an\ invisible\ {\char92}spadsys{\char123})clear\ all{\char12
read\ prior\ to\ the\ examples\ given\ in\ the\ section.\ \ {\char92}spadsys{\char123})clear\
gives\ you\ a\ fresh,\ empty\ environment\ with\ no\ user\ variables\ defined\nwnewline
and\ the\ step\ number\ reset\ to\ {\char92}axiom{\char123}1{\char125}.\ \ The\ {\char92}spad
can\ also\ be\ used\ to\ selectively\ clear\ values\ and\ properties\ of\ system\nwnewline
variables.\nwnewline
\nwnewline
Another\ useful\ system\ command\ is\ {\char92}spadsys{\char123})read{\char125}.\ \ A\ prefer
develop\ an\ application\ in\ Axiom\ is\ to\ put\ your\ interactive\ commands\nwnewline
into\ a\ file,\ say\ {\char123}{\char92}bf\ my.input{\char125}\ file.\ \ To\ get\ Axiom\ to\
you\ use\ the\ system\ command\ {\char92}spadsys{\char123})read\ my.input{\char125}.\ \ If\ y
make\ changes\ to\ your\ approach\ or\ definitions,\ go\ into\ your\ favorite\nwnewline
editor,\ change\ {\char123}{\char92}bf\ my.input{\char125},\ then\ {\char92}spadsys{\char123}
\nwnewline
Other\ system\ commands\ include:\ {\char92}spadsys{\char123})history{\char125},\ to\ display
previous\ input\ and/or\ output\ lines;\ {\char92}spadsys{\char123})display{\char125},\ to\ d
properties\ and\ values\ of\ workspace\ variables;\ and\ {\char92}spadsys{\char123})what{\cha
\nwnewline
{\char92}xtc{\char123}\nwnewline
Issue\ {\char92}spadsys{\char123})what{\char125}\ to\ get\ a\ list\ of\ Axiom\ objects\ that\
contain\ a\ given\ substring\ in\ their\ name.\nwnewline
{\char125}{\char123}\nwnewline

{\char37}{\char92}head{\char123}subsection{\char125}{\char123}Undo{\char125}{\char123}ugIntro
\nwnewline
A\ useful\ system\ command\ is\ {\char92}spadcmd{\char123})undo{\char125}.\nwnewline
Sometimes\ while\ computing\ interactively\ with\ Axiom,\ you\ make\nwnewline
a\ mistake\ and\ enter\ an\ incorrect\ definition\ or\ assignment.\nwnewline
Or\ perhaps\ you\nwnewline
need\ to\ try\ one\ of\ several\ alternative\ approaches,\ one\ after\nwnewline
another,\ to\ find\ the\ best\ way\ to\ approach\ an\ application.\nwnewline
For\ this,\ you\ will\ find\ the\ {\char92}spadgloss{\char123}undo{\char125}\ facility\ of\nw
Axiom\ helpful.\nwnewline
\nwnewline
System\ command\ {\char92}spadsys{\char123})undo\ n{\char125}\ means\ ``undo\ back\ to\ step\
{\char92}axiom{\char123}n{\char125}'';\ it\ restores\ the\ values\ of\ user\ variables\ to\ t
existed\ immediately\ after\ input\ expression\ {\char92}axiom{\char123}n{\char125}\ was\ eva
Similarly,\ {\char92}spadsys{\char123})undo\ -n{\char125}\ undoes\ changes\ caused\ by\ the\
{\char92}axiom{\char123}n{\char125}\ input\ expressions.\ \ Once\ you\ have\ done\ an\ {\char
you\ can\ continue\ on\ from\ there,\ or\ make\ a\ change\ and\ {\char123}{\char92}bf\ redo{\
your\ input\ expressions\ from\ the\ point\ of\ the\ {\char92}spadsys{\char123})undo{\char125
```

```
The\ {\char92}spadsys{\char123})undo{\char125}\ is\ completely\ general:\ it\ changes\ the\ environment\
like\ any\ user\ expression.\ \ Thus\ you\ can\ {\char92}spadsys{\char123})undo{\char125}\ any\ previous
undo.\nwnewline
\nwnewline
Here\ is\ a\ sample\ dialogue\ between\ user\ and\ Axiom.\nwnewline
{\char92}xtc{\char123}\nwnewline
``Let\ me\ define\nwnewline
two\ mutually\ dependent\ functions\ {\char92}axiom{\char123}f{\char125}\ and\ {\char92}axiom{\char123}g
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}f(0)\ ==\ 1;\ g(0)\ ==\ 1{\char92}bound{\char123}u1{\char125}{\char125}\nwne
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
``Here\ is\ the\ general\ term\ for\ {\char92}axiom{\char123}f{\char125}.''\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}f(n)\ ==\ e/2*f(n-1)\ -\ x*g(n-1){\char92}bound{\char123}u2{\char125}{\char9
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
``And\ here\ is\ the\ general\ term\ for\ {\char92}axiom{\char123}g{\char125}.''\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}g(n)\ ==\ -x*f(n-1)\ +\ d/3*g(n-1){\char92}bound{\char123}u3{\char125}{\char
{\char125}\nwnewline

{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}f(3){\char92}bound{\char123}u4{\char125}{\char92}free{\char123}u3{\char125}{
{\char125}\nwnewline
{\char92}noOutputXtc{\char123}\nwnewline
``Hmm,\ I\ think\ I\ want\ to\ define\ {\char92}axiom{\char123}f{\char125}\ differently.\nwnewline
Undo\ to\ the\ environment\ right\ after\ I\ defined\ {\char92}axiom{\char123}f{\char125}.''\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123})undo\ 2{\char92}bound{\char123}u5{\char125}{\char92}free{\char123}u4{\char1
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
``Here\ is\ how\ I\ think\ I\ want\ {\char92}axiom{\char123}f{\char125}\ to\ be\ defined\ instead.''\nwn
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}f(n)\ ==\ d/3*f(n-1)\ -\ x*g(n-1){\char92}bound{\char123}u6{\char125}{\char9
{\char125}\nwnewline
{\char92}noOutputXtc{\char123}\nwnewline
Redo\ the\ computation\ from\ expression\ {\char92}axiom{\char123}3{\char125}\ forward.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123})undo\ )redo{\char92}bound{\char123}u7{\char125}{\char92}free{\char123}u6{\c
{\char125}\nwnewline
{\char92}noOutputXtc{\char123}\nwnewline
``I\ want\ my\ old\ definition\ of\nwnewline
{\char92}axiom{\char123}f{\char125}\ after\ all.\ Undo\ the\ undo\ and\ restore\nwnewline
the\ environment\ to\ that\ immediately\ after\ {\char92}axiom{\char123}(4){\char125}.''\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123})undo\ 4{\char92}bound{\char123}u8{\char125}{\char92}free{\char123}u7{\char1
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
```

```
‘‘Check\ that\ the\ value\ of\ {\char92}axiom{\char123}f(3){\char125}\ is\ restored.’’\nwnewl
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}f(3){\char92}bound{\char123}u9{\char125}{\char92}free{\char123}u8
{\char125}\nwnewline
\nwnewline
After\ you\ have\ gone\ off\ on\ several\ tangents,\ then\ backtracked\ to\nwnewline
previous\ points\ in\ your\ conversation\ using\ {\char92}spadsys{\char123})undo{\char125},\
want\ to\ save\ all\ the\ ‘‘correct’’\ input\ commands\ you\ issued,\nwnewline
disregarding\ those\ undone.\ \ The\ system\ command\ {\char92}spadsys{\char123})history\nwne
)write\ mynew.input{\char125}\ writes\ a\ clean\ straight-line\ program\ onto\ the\ file\nwne
{\char123}{\char92}bf\ mynew.input{\char125}\ on\ your\ disk.\nwnewline
\nwnewline
This\ concludes\ your\ tour\ of\ Axiom.\nwnewline
To\ disembark,\ issue\ the\ system\ command\ {\char92}spadsys{\char123})quit{\char125}\ to\ l
and\ return\ to\ the\ operating\ system.\nwnewline

{\char92}begin{\char123}chunk{\char125}{\char123}ug02.ht{\char125}\nwnewline
{\char92}begin{\char123}page{\char125}{\char123}ugTypesBasicPage{\char125}{\char123}2.1.\ The
{\char92}beginscroll\nwnewline
\nwnewline
The\ Axiom\ world\ deals\ with\ many\ kinds\ of\ objects.\nwnewline
There\ are\ mathematical\ objects\ such\ as\ numbers\ and\ polynomials,\nwnewline
data\ structure\ objects\ such\ as\ lists\ and\ arrays,\ and\ graphics\nwnewline
objects\ such\ as\ points\ and\ graphic\ images.\nwnewline
Functions\ are\ objects\ too.\nwnewline
\nwnewline
Axiom\ organizes\ objects\ using\ the\ notion\ of\ {\char92}spadglossSee{\char123}domain\ of\
computation{\char125}{\char123}domain{\char125},\ or\ simply\ {\char92}spadgloss{\char123}dom
denotes\ a\ class\ of\ objects.\ \ The\ class\ of\ objects\ it\ denotes\ is\nwnewline
usually\ given\ by\ the\ name\ of\ the\ domain:\ {\char92}axiomType{\char123}Integer{\char125
integers,\ {\char92}axiomType{\char123}Float{\char125}\ for\ floating-point\ numbers,\ and\ s
The\ convention\ is\ that\ the\ first\ letter\ of\ a\ domain\ name\ is\nwnewline
capitalized.\ \ Similarly,\ the\ domain\ {\char92}axiomType{\char123}Polynomial(Integer){\cha
denotes\ ‘‘polynomials\ with\ integer\ coefficients.’’\ \ Also,\nwnewline
{\char92}axiomType{\char123}Matrix(Float){\char125}\ denotes\ ‘‘matrices\ with\ floating-poi
entries.’’\nwnewline
\nwnewline
Every\ basic\ Axiom\ object\ belongs\ to\ a\ unique\ domain.\ \ The\ integer\nwnewline
{\char92}axiom{\char123}3{\char125}\ belongs\ to\ the\ domain\ {\char92}axiomType{\char123}I
```

```
{\char92}axiom{\char123}x\ +\ 3{\char125}\ belongs\ to\ the\ domain\ {\char92}axiomType{\char123}Polynom
The\ domain\ of\ an\ object\ is\ also\ called\ its\ {\char92}spadgloss{\char123}type{\char125}.\ \ Thus\
speak\ of\ ``the\ type\ {\char92}axiomType{\char123}Integer{\char125}''\ and\ ``the\ type\nwnewline
{\char92}axiomType{\char123}Polynomial(Integer){\char125}.''\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
After\ an\ Axiom\ computation,\ the\ type\ is\ displayed\ toward\ the\nwnewline
right-hand\ side\ of\ the\ page\ (or\ screen).\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}-3{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Here\ we\ create\ a\ rational\ number\ but\ it\ looks\ like\ the\ last\ result.\nwnewline
The\ type\ however\ tells\ you\ it\ is\ different.\nwnewline
You\ cannot\ identify\ the\ type\ of\ an\ object\ by\ how\ Axiom\nwnewline
displays\ the\ object.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}-3/1{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
When\ a\ computation\ produces\ a\ result\ of\ a\ simpler\ type,\ Axiom\ leaves\nwnewline
the\ type\ unsimplified.\nwnewline
Thus\ no\ information\ is\ lost.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}x\ +\ 3\ -\ x\ {\char92}bound{\char123}three{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ seldom\ matters\ since\ Axiom\ retracts\ the\ answer\ to\ the\nwnewline
simpler\ type\ if\ it\ is\ necessary.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}factorial({\char92}{\char37})\ {\char92}free{\char123}three{\char125}{\char1
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
When\ you\ issue\ a\ positive\ number,\ the\ type\ {\char92}axiomType{\char123}PositiveInteger{\char125}
is\ printed.\ \ Surely,\ {\char92}axiom{\char123}3{\char125}\ also\ has\ type\ {\char92}axiomType{\char1
curious\ reader\ may\ now\ have\ two\ questions.\ \ First,\ is\ the\ type\ of\ an\nwnewline
object\ not\ unique?\ \ Second,\ how\ is\ {\char92}axiomType{\char123}PositiveInteger{\char125}\ related
to\ {\char92}axiomType{\char123}Integer{\char125}?\ \ Read\ on!\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}3{\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
Any\ domain\ can\ be\ refined\ to\ a\ {\char92}spadgloss{\char123}subdomain{\char125}\ by\ a\ membership
{\char92}spadgloss{\char123}predicate{\char125}.{\char92}footnote{\char123}A\ predicate\ is\ a\ function
applied\ to\ an\ object\ of\ the\ domain,\ returns\ either\ {\char92}axiom{\char123}true{\char125}\ or\n
{\char92}axiom{\char123}false{\char125}.{\char125}\ \ For\ example,\ the\ domain\ {\char92}axiomType{\ch
refined\ to\ the\ subdomain\ {\char92}axiomType{\char123}PositiveInteger{\char125},\ the\ set\ of\nwnewl
integers\ {\char92}axiom{\char123}x{\char125}\ such\ that\ {\char92}axiom{\char123}x\ >\ 0{\char125},\ b
predicate\ {\char92}axiom{\char123}x\ +->\ x\ >\ 0{\char125}.\ \ Similarly,\ Axiom\ can\ define\ subdoma
such\ as\ ``the\ subdomain\ of\ diagonal\ matrices,''\ ``the\ subdomain\ of\nwnewline
```

```
lists\ of\ length\ two,''\ ``the\ subdomain\ of\ monic\ irreducible\nwnewline
polynomials\ in\ {\char92}axiom{\char123}x{\char125},''\ and\ so\ on.\ \ Trivially,\ any\ do
subdomain\ of\ itself.\nwnewline
\nwnewline
While\ an\ object\ belongs\ to\ a\ unique\ domain,\ it\ can\ belong\ to\ any\nwnewline
number\ of\ subdomains.\ \ Any\ subdomain\ of\ the\ domain\ of\ an\ object\ can\ be\nwnewlin
used\ as\ the\ {\char123}{\char92}it\ type{\char125}\ of\ that\ object.\ \ The\ type\ of\ {\
indeed\ both\ {\char92}axiomType{\char123}Integer{\char125}\ and\ {\char92}axiomType{\char12
well\ as\ any\ other\ subdomain\ of\ integer\ whose\ predicate\ is\ satisfied,\nwnewline
such\ as\ ``the\ prime\ integers,''\ ``the\ odd\ positive\ integers\ between\ 3\nwnewline
and\ 17,''\ and\ so\ on.\nwnewline

\nwnewline
The\ most\ basic\ operation\ involving\ domains\ is\ that\ of\ building\ a\ new\nwnewline
domain\ from\ a\ given\ one.\ \ To\ create\ the\ domain\ of\ ``polynomials\ over\nwnewline
the\ integers,''\ Axiom\ applies\ the\ function\ {\char92}axiomType{\char123}Polynomial{\char
the\ domain\ {\char92}axiomType{\char123}Integer{\char125}.\ \ A\ function\ like\nwnewline
{\char92}axiomType{\char123}Polynomial{\char125}\ is\ called\ a\ {\char92}spadgloss{\char123}
more\ simply,\ a\ {\char92}spadgloss{\char123}constructor{\char125}.\ \ A\ domain\ construct
function\ that\ creates\ a\ domain.\ \ An\ argument\ to\ a\ domain\ constructor\nwnewline
can\ be\ another\ domain\ or,\ in\ general,\ an\ arbitrary\ kind\ of\ object.\nwnewline
{\char92}axiomType{\char123}Polynomial{\char125}\ takes\ a\ single\ domain\ argument\ while\n
{\char92}axiomType{\char123}SquareMatrix{\char125}\ takes\ a\ positive\ integer\ as\ an\ argu
give\ its\ dimension\ and\ a\ domain\ argument\ to\ give\ the\ type\ of\ its\nwnewline
components.\nwnewline
\nwnewline
What\ kinds\ of\ domains\ can\ you\ use\ as\ the\ argument\ to\nwnewline
{\char92}axiomType{\char123}Polynomial{\char125}\ or\ {\char92}axiomType{\char123}SquareMatri
{\char92}axiomType{\char123}List{\char125}?\ \ Well,\ the\ first\ two\ are\ mathematical\ in\
You\ want\ to\ be\ able\ to\ perform\ algebraic\ operations\ like\ {\char92}axiomOp{\char123}
and\ {\char92}axiomOp{\char123}*{\char125}\ on\ polynomials\ and\ square\ matrices,\ and\ ope
such\ as\ {\char92}axiomFun{\char123}determinant{\char125}\ on\ square\ matrices.\ \ So\ you'
```

```
allow\ polynomials\ of\ integers\ {\char123}{\char92}it\ and{\char125}\ polynomials\ of\ square\ matrice
with\ complex\ number\ coefficients\ and,\ in\ general,\ anything\ that\nwnewline
‘‘makes\ sense.’’\ At\ the\ same\ time,\ you\ don’t\ want\ Axiom\ to\ be\ able\ to\nwnewline
build\ nonsense\ domains\ such\ as\ ‘‘polynomials\ of\ strings!’’\nwnewline
\nwnewline
In\ contrast\ to\ algebraic\ structures,\ data\ structures\ can\ hold\ any\ kind\nwnewline
of\ object.\ \ Operations\ on\ lists\ such\ as\ {\char92}axiomFunFrom{\char123}insert{\char125}{\char123
{\char92}axiomFunFrom{\char123}delete{\char125}{\char123}List{\char125},\ and\ {\char92}axiomFunFrom{\ch
manipulate\ the\ list\ itself\ without\ changing\ or\ operating\ on\ its\nwnewline
elements.\ \ Thus\ you\ can\ build\ {\char92}axiomType{\char123}List{\char125}\ over\ almost\ any\nwnewl
datatype,\ including\ itself.\nwnewline
{\char92}xtc{\char123}\nwnewline
Create\ a\ complicated\ algebraic\ domain.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}\nwnewline
List\ (List\ (Matrix\ (Polynomial\ (Complex\ (Fraction\ (Integer))))){\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Try\ to\ create\ a\ meaningless\ domain.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}Polynomial(String){\char125}\nwnewline
{\char125}\nwnewline
Evidently\ from\ our\ last\ example,\ Axiom\ has\ some\ mechanism\nwnewline
that\ tells\ what\ a\ constructor\ can\ use\ as\ an\ argument.\nwnewline
This\ brings\ us\ to\ the\ notion\ of\ {\char92}spadgloss{\char123}category{\char125}.\nwnewline
As\ domains\ are\ objects,\ they\ too\ have\ a\ domain.\nwnewline
The\ domain\ of\ a\ domain\ is\ a\ category.\nwnewline
A\ category\ is\ simply\ a\ type\ whose\ members\ are\ domains.\nwnewline
\nwnewline
A\ common\ algebraic\ category\ is\ {\char92}axiomType{\char123}Ring{\char125},\ the\ class\ of\ all\nwn
domains\ that\ are\ ‘‘rings.’’\ \ A\ ring\ is\ an\ algebraic\ structure\ with\nwnewline
constants\ {\char92}axiom{\char123}0{\char125}\ and\ {\char92}axiom{\char123}1{\char125}\ and\ operation
{\char92}axiomOpFrom{\char123}+{\char125}{\char123}Ring{\char125},\ {\char92}axiomOpFrom{\char123}-{\cha
{\char92}axiomOpFrom{\char123}*{\char125}{\char123}Ring{\char125}.\ \ These\ operations\ are\ assumed\ ‘
respect\ to\ the\ domain,\ meaning\ that\ they\ take\ two\ objects\ of\ the\nwnewline
domain\ and\ produce\ a\ result\ object\ also\ in\ the\ domain.\ \ The\ operations\nwnewline
are\ understood\ to\ satisfy\ certain\ ‘‘axioms,’’\ certain\ mathematical\nwnewline
principles\ providing\ the\ algebraic\ foundation\ for\ rings.\ \ For\ example,\nwnewline
the\ {\char123}{\char92}it\ additive\ inverse\ axiom{\char125}\ for\ rings\ states:\ {\char92}centerline
element\ {\char92}axiom{\char123}x{\char125}\ has\ an\ additive\ inverse\ {\char92}axiom{\char123}y{\cha
{\char92}centerline{\char123}{\char123}that\ {\char92}axiom{\char123}x\ +\ y\ =\ 0{\char125}.{\char125}{
domain\ that\ is\ a\ ring\ is\ the\ integers.\ \ Keep\ them\ in\ mind\ whenever\ we\nwnewline
mention\ {\char92}axiomType{\char123}Ring{\char125}.\nwnewline
\nwnewline
Many\ algebraic\ domain\ constructors\ such\ as\ {\char92}axiomType{\char123}Complex{\char125},\nwnewlin
{\char92}axiomType{\char123}Polynomial{\char125},\ {\char92}axiomType{\char123}Fraction{\char125},\ take
and\ return\ rings\ as\ values.\ \ You\ can\ use\ the\ infix\ operator\nwnewline
‘‘{\char92}axiom{\char123}has{\char125}’’\ {\char92}spadkey{\char123}has{\char125}\ to\ ask\ a\ domain\
particular\ category.\nwnewline
\nwnewline
```

```
{\char92}xtc{\char123}\nwnewline
All\ numerical\ types\ are\ rings.\ \ Domain\ constructor\nwnewline
{\char92}axiomType{\char123}Polynomial{\char125}\ builds\ ‘‘the\ ring\ of\ polynomials\ over\
ring.’’\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}Polynomial(Integer)\ has\ Ring{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Constructor\ {\char92}axiomType{\char123}List{\char125}\ never\ produces\ a\ ring.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}List(Integer)\ has\ Ring{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ constructor\ {\char92}axiomType{\char123}Matrix(R){\char125}\ builds\ ‘‘the\ domain\ of\
matrices\ over\ the\ ring\ {\char92}axiom{\char123}R{\char125}.’’\ This\ domain\ is\ never\ a
the\ operations\ {\char92}axiomSyntax{\char123}+{\char125},\ {\char92}axiomSyntax{\char123}-
on\ matrices\ of\ arbitrary\ shapes\ are\ undefined.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}Matrix(Integer)\ has\ Ring{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Thus\ you\ can\ never\ build\ polynomials\ over\ matrices.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}Polynomial(Matrix(Integer)){\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Use\ {\char92}axiomType{\char123}SquareMatrix(n,R){\char125}\ instead.\nwnewline
For\ any\ positive\ integer\ {\char92}axiom{\char123}n{\char125},\ it\ builds\ ‘‘the\ ring\ o
{\char92}axiom{\char123}n{\char125}\ matrices\ over\ {\char92}axiom{\char123}R{\char125}.’’\n
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}Polynomial(SquareMatrix(7,Complex(Integer))){\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
Another\ common\ category\ is\ {\char92}axiomType{\char123}Field{\char125},\ the\ class\ of\
A\ field\ is\ a\ ring\ with\ additional\ operations.\ \ For\ example,\ a\ field\nwnewline
has\ commutative\ multiplication\ and\ a\ closed\ operation\nwnewline
{\char92}axiomOpFrom{\char123}/{\char125}{\char123}Field{\char125}\ for\ the\ division\ of\ t
{\char92}axiomType{\char123}Integer{\char125}\ is\ not\ a\ field\ since,\ for\ example,\ {\ch
does\ not\ have\ an\ integer\ result.\ \ The\ prototypical\ example\ of\ a\ field\nwnewline
is\ the\ rational\ numbers,\ that\ is,\ the\ domain\nwnewline
{\char92}axiomType{\char123}Fraction(Integer){\char125}.\ \ In\ general,\ the\ constructor\nw
{\char92}axiomType{\char123}Fraction{\char125}\ takes\ a\ ring\ as\ an\ argument\ and\ return
field.{\char92}footnote{\char123}Actually,\ the\ argument\ domain\ must\ have\ some\nwnewline
additional\ properties\ so\ as\ to\ belong\ to\ category\nwnewline
{\char92}axiomType{\char123}IntegralDomain{\char125}.{\char125}\ \ Other\ domain\ constructor
{\char92}axiomType{\char123}Complex{\char125},\ build\ fields\ only\ if\ their\ argument\ dom
field.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ complex\ integers\ (often\ called\ the\ ‘‘Gaussian\ integers’’)\ do\ not\ \nwnewline
```

```
form\ a\ field.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}Complex(Integer)\ has\ Field{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
But\ fractions\ of\ complex\ integers\ do.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}Fraction(Complex(Integer))\ has\ Field{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ algebraically\ equivalent\ domain\ of\ complex\ rational\ numbers\ is\ a\nwnewline
field\ since\ domain\ constructor\ {\char92}axiomType{\char123}Complex{\char125}\ produces\ a\ field\nwn
whenever\ its\ argument\ is\ a\ field.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}Complex(Fraction(Integer))\ has\ Field{\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
The\ most\ basic\ category\ is\ {\char92}axiomType{\char123}Type{\char125}.\ \ It\ denotes\ the\ class\
all\ domains\ and\ subdomains.{\char92}footnote{\char123}{\char92}axiomType{\char123}Type{\char125}\ doe
the\ class\ of\ all\ types.\ \ The\ type\ of\ all\ categories\ is\nwnewline
{\char92}axiomType{\char123}Category{\char125}.\ \ The\ type\ of\ {\char92}axiomType{\char123}Type{\char
undefined.{\char125}\ \ Domain\ constructor\ {\char92}axiomType{\char123}List{\char125}\ is\ able\ to\ b
``lists\ of\ elements\ from\ domain\ {\char92}axiom{\char123}D{\char125}''\ for\ arbitrary\ {\char92}axi
simply\ by\ requiring\ that\ {\char92}axiom{\char123}D{\char125}\ belong\ to\ category\nwnewline
{\char92}axiomType{\char123}Type{\char125}.\nwnewline
\nwnewline
Now,\ you\ may\ ask,\ what\ exactly\ is\ a\ category?\nwnewline
Like\ domains,\ categories\ can\ be\ defined\ in\ the\ Axiom\ language.\nwnewline
A\ category\ is\ defined\ by\ three\ components:\nwnewline
{\char37}\nwnewline
{\char92}indent{\char123}4{\char125}\nwnewline
{\char92}beginitems\nwnewline
{\char92}item[1.\ ]\ a\ name\ (for\ example,\ {\char92}axiomType{\char123}Ring{\char125}),\nwnewline
used\ to\ refer\ to\ the\ class\ of\ domains\ that\ the\ category\ represents;\nwnewline
{\char92}item[2.\ ]\ a\ set\ of\ operations,\ used\ to\ refer\ to\ the\ operations\ that\nwnewline
the\ domains\ of\ this\ class\ support\nwnewline
(for\ example,\ {\char92}axiomOp{\char123}+{\char125},\ {\char92}axiomOp{\char123}-{\char125},\ and\ {\c
{\char92}item[3.\ ]\ an\ optional\ list\ of\ other\ categories\ that\ this\ category\ extends.\nwnewline
{\char92}enditems\nwnewline
{\char92}indent{\char123}0{\char125}\nwnewline
{\char37}\nwnewline
\nwnewline
This\ last\ component\ is\ a\ new\ idea.\ \ And\ it\ is\ key\ to\ the\ design\ of\nwnewline
Axiom!\ \ Because\ categories\ can\ extend\ one\ another,\ they\ form\nwnewline
hierarchies.\ \ {\char92}texht{\char123}Detailed\ charts\ showing\ the\ category\ hierarchies\nwnewline
in\ Axiom\ are\ displayed\ in\ the\ endpages\ of\ this\ book.\ \ There\ you\ see\nwnewline
that\ all\ categories\ are\ extensions\ of\ {\char92}axiomType{\char123}Type{\char125}\ and\ that\nwnewl
{\char92}axiomType{\char123}Field{\char125}\ is\ an\ extension\ of\ {\char92}axiomType{\char123}Ring{\ch
\nwnewline
The\ operations\ supported\ by\ the\ domains\ of\ a\ category\ are\ called\ the\nwnewline
```

```
{\char92}spadglossSee{\char123}exports{\char125}{\char123}export{\char125}\ of\ that\ catego
operations\ made\ available\ for\ system-wide\ use.\ \ The\ exports\ of\ a\nwnewline
domain\ of\ a\ given\ category\ are\ not\ only\ the\ ones\ explicitly\ mentioned\nwnewline
by\ the\ category.\ \ Since\ a\ category\ extends\ other\ categories,\ the\nwnewline
operations\ of\ these\ other\ categories---and\ all\ categories\ these\ other\nwnewline
categories\ extend---are\ also\ exported\ by\ the\ domains.\nwnewline
\nwnewline
For\ example,\ polynomial\ domains\ belong\ to\nwnewline
{\char92}axiomType{\char123}PolynomialCategory{\char125}.\ \ This\ category\ explicitly\ men
some\ twenty-nine\ operations\ on\ polynomials,\ but\ it\ extends\ eleven\nwnewline
other\ categories\ (including\ {\char92}axiomType{\char123}Ring{\char125}).\ \ As\ a\ result
current\ system\ has\ over\ one\ hundred\ operations\ on\ polynomials.\nwnewline
\nwnewline
If\ a\ domain\ belongs\ to\ a\ category\ that\ extends,\ say,\ {\char92}axiomType{\char123}R
it\ is\ convenient\ to\ say\ that\ the\ domain\ exports\ {\char92}axiomType{\char123}Ring{\c
name\ of\ the\ category\ thus\ provides\ a\ convenient\ shorthand\ for\ the\ list\nwnewline
of\ operations\ exported\ by\ the\ category.\ \ Rather\ than\ listing\nwnewline
operations\ such\ as\ {\char92}axiomOpFrom{\char123}+{\char125}{\char123}Ring{\char125}\ and
{\char92}axiomType{\char123}Ring{\char125}\ each\ time\ they\ are\ needed,\ the\ definition\
simply\ asserts\ that\ it\ exports\ category\ {\char92}axiomType{\char123}Ring{\char125}.\nw
\nwnewline
The\ category\ name,\ however,\ is\ more\ than\ a\ shorthand.\nwnewline
The\ name\ {\char92}axiomType{\char123}Ring{\char125},\ in\ fact,\ implies\ that\ the\ opera
rings\ are\ required\ to\ satisfy\ a\ set\ of\ ``axioms''\ associated\ with\ the\ name\nwnew
{\char92}axiomType{\char123}Ring{\char125}.{\char92}footnote{\char123}This\ subtle\nwnewline
but\ important\ feature\ distinguishes\ Axiom\ from\nwnewline
other\ abstract\ datatype\ designs.{\char125}\nwnewline
\nwnewline
Why\ is\ it\ not\ correct\ to\ assume\ that\ some\ type\ is\ a\ ring\ if\ it\ exports\nwnewl
all\ of\ the\ operations\ of\ {\char92}axiomType{\char123}Ring{\char125}?\ \ Here\ is\ why.\
languages\ such\ as\ {\char123}{\char92}bf\ APL{\char125}\ denote\ the\ {\char92}axiomType{\
{\char92}axiom{\char123}true{\char125}\ and\ {\char92}axiom{\char123}false{\char125}\ by\ th
respectively,\ then\ use\ {\char92}axiomOp{\char123}+{\char125}\ and\ {\char92}axiomOp{\char
logical\ operators\ {\char92}axiomFun{\char123}or{\char125}\ and\ {\char92}axiomFun{\char123
definitions\ {\char92}axiomType{\char123}Boolean{\char125}\ is\ not\ a\ ring\ since\ the\ ad
inverse\ axiom\ is\ violated.{\char92}footnote{\char123}There\ is\ no\ inverse\ element\nwne
{\char92}axiom{\char123}a{\char125}\ such\ that\ {\char92}axiom{\char123}1\ +\ a\ =\ 0{\char
{\char92}axiom{\char123}true\ or\ a\ =\ false{\char125}.{\char125}\ \ This\ alternative\ def
{\char92}axiomType{\char123}Boolean{\char125}\ can\ be\ easily\ and\ correctly\ implemented\
since\ {\char92}axiomType{\char123}Boolean{\char125}\ simply\ does\ not\ assert\ that\ it\ i
category\ {\char92}axiomType{\char123}Ring{\char125}.\ \ This\ prevents\ the\ system\ from\
meaningless\ domains\ such\ as\ {\char92}axiomType{\char123}Polynomial(Boolean){\char125}\ a
wrongfully\ applying\ algorithms\ that\ presume\ that\ the\ ring\ axioms\ hold.\nwnewline
\nwnewline
\nwnewline
Enough\ on\ categories.\ To\ learn\ more\ about\ them,\ see\nwnewline
{\char92}downlink{\char123}``Categories''{\char125}{\char123}ugCategoriesPage{\char125}\ \nw
in\ Chapter\ 12{\char92}ignore{\char123}ugCategories{\char125}.\nwnewline
We\ now\ return\ to\ our\ discussion\ of\ domains.\nwnewline
\nwnewline
```

```
Domains\ {\char92}spadgloss{\char123}export{\char125}\ a\ set\ of\ operations\ to\ make\ them\ available
for\ system-wide\ use.\ \ {\char92}axiomType{\char123}Integer{\char125},\ for\ example,\ exports\ the\nw
operations\ {\char92}axiomOpFrom{\char123}+{\char125}{\char123}Integer{\char125}\ and\ {\char92}axiomOpF
by\ the\ {\char92}spadglossSee{\char123}signatures{\char125}{\char123}signature{\char125}\ {\char92}axio
{\char92}spadsig{\char123}(Integer,Integer){\char125}{\char123}Integer{\char125}\ and\ {\char92}axiomOpF
{\char92}spadsig{\char123}(Integer,Integer){\char125}{\char123}Boolean{\char125},\ respectively.\ \ Each
operations\ takes\ two\ {\char92}axiomType{\char123}Integer{\char125}\ arguments.\ \ The\nwnewline
{\char92}axiomOpFrom{\char123}+{\char125}{\char123}Integer{\char125}\ operation\ also\ returns\ an\ {\ch
but\ {\char92}axiomOpFrom{\char123}={\char125}{\char123}Integer{\char125}\ returns\ a\ {\char92}axiomTyp
{\char92}axiom{\char123}true{\char125}\ or\ {\char92}axiom{\char123}false{\char125}.\ \ The\ operations\
usually\ manipulate\ objects\ of\ the\ domain---but\ not\ always.\nwnewline
\nwnewline
The\ operations\ of\ a\ domain\ may\ actually\ take\ as\ arguments,\ and\ return\nwnewline
as\ values,\ objects\ from\ any\ domain.\ \ For\ example,\ {\char92}axiomType{\char123}Fraction\nwnewlin
(Integer){\char125}\ exports\ the\ operations\ {\char92}axiomOpFrom{\char123}/{\char125}{\char123}Fracti
{\char92}spadsig{\char123}(Integer,Integer){\char125}{\char123}Fraction(Integer){\char125}\ and\nwnewlin
{\char92}axiomFunFrom{\char123}characteristic{\char125}{\char123}Fraction{\char125}:\nwnewline
{\char92}spadsig{\char123}{\char125}{\char123}NonNegativeInteger{\char125}.\nwnewline
\nwnewline
Suppose\ all\ operations\ of\ a\ domain\ take\ as\ arguments\ and\ return\ as\nwnewline
values,\ only\ objects\ from\ {\char123}{\char92}it\ other{\char125}\ domains.\ \ This\ kind\ of\ domain
what\ Axiom\ calls\ a\ {\char92}spadgloss{\char123}package{\char125}.\nwnewline
\nwnewline
A\ package\ does\ not\ designate\ a\ class\ of\ objects\ at\ all.\ \ Rather,\ a\nwnewline
package\ is\ just\ a\ collection\ of\ operations.\ \ Actually\ the\ bulk\ of\ the\nwnewline
Axiom\ library\ of\ algorithms\ consists\ of\ packages.\ \ The\ facilities\ for\nwnewline
factorization;\ integration;\ solution\ of\ linear,\ polynomial,\ and\nwnewline
differential\ equations;\ computation\ of\ limits;\ and\ so\ on,\ are\ all\nwnewline
defined\ in\ packages.\ \ Domains\ needed\ by\ algorithms\ can\ be\ passed\ to\ a\nwnewline
package\ as\ arguments\ or\ used\ by\ name\ if\ they\ are\ not\ ‘‘variable.’’\nwnewline
Packages\ are\ useful\ for\ defining\ operations\ that\ convert\ objects\ of\nwnewline
one\ type\ to\ another,\ particularly\ when\ these\ types\ have\ different\nwnewline
parameterizations.\ \ As\ an\ example,\ the\ package\nwnewline
{\char92}axiomType{\char123}PolynomialFunction2(R,S){\char125}\ defines\ operations\ that\ convert\nwnew
polynomials\ over\ a\ domain\ {\char92}axiom{\char123}R{\char125}\ to\ polynomials\ over\ {\char92}axiom
convert\ an\ object\ from\ {\char92}axiomType{\char123}Polynomial(Integer){\char125}\ to\nwnewline
{\char92}axiomType{\char123}Polynomial(Float){\char125},\ Axiom\ builds\ the\ package\nwnewline
{\char92}axiomType{\char123}PolynomialFunctions2(Integer,Float){\char125}\ in\ order\ to\ create\ the\nw
required\ conversion\ function.\ \ (This\ happens\ ‘‘behind\ the\ scenes’’\ for\nwnewline
you:\ see\ {\char92}downlink{\char123}‘‘Conversion’’{\char125}{\char123}ugTypesConvertPage{\char125}\ in
Section\ 2.7{\char92}ignore{\char123}ugTypesConvert{\char125}\ for\ details\ on\nwnewline
how\ to\ convert\ objects.)\nwnewline
\nwnewline
Axiom\ categories,\ domains\ and\ packages\ and\ all\ their\ contained\nwnewline
functions\ are\ written\ in\ the\ Axiom\ programming\ language\ and\ have\nwnewline
been\ compiled\ into\ machine\ code.\nwnewline
This\ is\ what\ comprises\ the\ Axiom\ {\char92}spadgloss{\char123}library{\char125}.\nwnewline
In\ the\ rest\ of\ this\ book\ we\ show\ you\ how\ to\ use\ these\ domains\ and\nwnewline
their\ functions\ and\ how\ to\ write\ your\ own\ functions.\nwnewline
\nwnewline

{\char92}beginscroll\nwnewline
\nwnewline
A\ constructor\ with\ one\ argument\ can\ frequently\ be\ written\ with\ no\nwnewline
parentheses.\ \ Types\ nest\ from\ right\ to\ left\ so\ that\ {\char92}axiomType{\char123}Complex\nwnewl
Fraction\ Polynomial\ Integer{\char125}\ is\ the\ same\ as\ {\char92}axiomType{\char123}Complex\nwnewlin
(Fraction\ (Polynomial\ (Integer))){\char125}.\ \ You\ need\ to\ use\ parentheses\ to\nwnewline
force\ the\ application\ of\ a\ constructor\ to\ the\ correct\ argument,\ but\nwnewline
you\ need\ not\ use\ any\ more\ than\ is\ necessary\ to\ remove\ ambiguities.\nwnewline
\nwnewline
Here\ are\ some\ guidelines\ for\ using\ parentheses\ (they\ are\ possibly\nwnewline
slightly\ more\ restrictive\ than\ they\ need\ to\ be).\nwnewline
{\char92}xtc{\char123}\nwnewline
If\ the\ argument\ is\ an\ expression\ like\ {\char92}axiom{\char123}2\ +\ 3{\char125}\nwnewline
then\ you\ must\ enclose\ the\ argument\ in\ parentheses.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}e\ :\ PrimeField(2\ +\ 3){\char125}\nwnewline
```

```
{\char125}\nwnewline
{\char37}\nwnewline
{\char92}xtc{\char123}\nwnewline
If\ the\ type\ is\ to\ be\ used\ with\ package\ calling\nwnewline
then\ you\ must\ enclose\ the\ argument\ in\ parentheses.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}content(2){\char92}{\char36}Polynomial(Integer){\char125}\nwnewli
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Alternatively,\ you\ can\ write\ the\ type\ without\ parentheses\nwnewline
then\ enclose\ the\ whole\ type\ expression\ with\ parentheses.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}content(2){\char92}{\char36}(Polynomial\ Complex\ Fraction\ Integ
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
If\ you\ supply\ computation\ target\ type\ information\nwnewline
({\char92}downlink{\char123}‘‘Package\ Calling\ and\ Target\ Types’’{\char125}{\char123}ugTyp
in\ Section\ 2.9{\char92}ignore{\char123}ugTypesPkgCall{\char125})\nwnewline
then\ you\ should\ enclose\ the\ argument\ in\ parentheses.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}(2/3)@Fraction(Polynomial(Integer)){\char125}\nwnewline
{\char125}\nwnewline
{\char37}\nwnewline
{\char92}xtc{\char123}\nwnewline
If\ the\ type\ itself\ has\ parentheses\ around\ it\ and\ we\ are\nwnewline
not\ in\ the\ case\ of\ the\ first\ example\ above,\nwnewline
then\ the\ parentheses\ can\ usually\ be\ omitted.\nwnewline
{\char125}{\char123}\nwnewline

———

6.0.28 Records

— ug02.ht —

```
\begin{page}{ugTypesRecordsPage}{2.4. Records}
\beginscroll
%
A \pspadtype{Record} is an object composed of one or more other objects,
each of which is referenced
with
a \spadgloss{selector}.
Components can all belong to the same type or each can have a different
type.

\beginImportant
The syntax for writing a \pspadtype{Record} type is \centerline{{{\tt
Record(\subscriptIt{selector}{1}:\subscriptIt{type}{1},
\subscriptIt{selector}{2}:\subscriptIt{type}{2}, \ldots,
\subscriptIt{selector}{N}:\subscriptIt{type}{N})}}} You must be
careful if a selector has the same name as a variable in the
workspace.  If this occurs, precede the selector name by a single
quote.
\endImportant

Record components are implicitly ordered.  All the components of a
record can be set at once by assigning the record a bracketed
\spadgloss{tuple} of values of the proper length (for example,
\axiom{r : Record(a: Integer, b: String) := [1, "two"]}).  To access a
component of a record \axiom{r}, write the name \axiom{r}, followed by
a period, followed by a selector.
```

```
%
\xtc{
The object returned by this computation is a record with two components: a
\axiom{quotient} part and a \axiom{remainder} part.
}{
\spadpaste{u := divide(5,2) \bound{u}}
}
%
\xtc{
This is the quotient part.
}{
\spadpaste{u.quotient \free{u}}
}
\xtc{
This is the remainder part.
}{
\spadpaste{u.remainder \free{u}}
}
%
\xtc{
You can use selector expressions on the left-hand side of an assignment
to change destructively the components of a record.
}{
\spadpaste{u.quotient := 8978 \free{u}\bound{u1}}
}
\xtc{
The selected component \axiom{quotient} has the value \axiom{8978},
which is what is returned by the assignment.
Check that the value of \axiom{u} was modified.
}{
\spadpaste{u \free{u}\free{u1}}
}
\xtc{
Selectors are evaluated.
Thus you can use variables that evaluate to selectors instead of the
selectors themselves.
}{
\spadpaste{s := 'quotient \bound{s}}
}
\xtc{
Be careful!
A selector could have the same name as a variable in the workspace.
If this occurs, precede the selector name by a single quote, as in
\axiom{u.'quotient}.
}{
\spadpaste{divide(5,2).s \free{s}}
}
\xtc{
Here we declare that the value of \axiom{bd}
```

```
has two components: a string,
to be accessed via \axiom{name}, and an integer,
to be accessed via \axiom{birthdayMonth}.
}{
\spadpaste{bd : Record(name : String, birthdayMonth : Integer)
\bound{bddec}}
}
\xtc{
You must initially set the value of the entire \pspadtype{Record}
at once.
}{
\spadpaste{bd := ["Judith", 3] \free{bddec}\bound{bd}}
}
\xtc{
Once set, you can change any of the individual components.
}{
\spadpaste{bd.name := "Katie" \free{bd}}
}
\xtc{
Records may be nested and the selector names can be shared at
different levels.
}{
\spadpaste{r : Record(a : Record(b: Integer, c: Integer), b: Integer)
\bound{rdec}}
}
\xtc{
The record \axiom{r} has a \axiom{b} selector at two different levels.
Here is an initial value for \axiom{r}.
}{

{\char92}beginscroll\nwnewline
\nwnewline
Like\ records\ (\ {\char92}downlink{\char123}‘‘Records’’{\char125}{\char123}ugTypesRecordsPag
2.4{\char92}ignore{\char123}ugTypesRecords{\char125}),\ you\ can\ write\ {\char92}pspadtype{\
with\ selectors.\nwnewline
\nwnewline
{\char92}beginImportant\nwnewline
The\ syntax\ for\ writing\ a\ {\char92}pspadtype{\char123}Union{\char125}\ type\ with\ select
{\char92}centerline{\char123}{\char123}{\char123}{\char92}tt\nwnewline
Union({\char92}subscriptIt{\char123}selector{\char125}{\char123}1{\char125}:{\char92}subscrip
{\char92}subscriptIt{\char123}selector{\char125}{\char123}2{\char125}:{\char92}subscriptIt{\c
{\char92}subscriptIt{\char123}selector{\char125}{\char123}N{\char125}:{\char92}subscriptIt{\c
careful\ if\ a\ selector\ has\ the\ same\ name\ as\ a\ variable\ in\ the\nwnewline
workspace.\ \ If\ this\ occurs,\ precede\ the\ selector\ name\ by\ a\ single\nwnewline
quote.\ \ It\ is\ an\ error\ to\ use\ a\ selector\ that\ does\ not\ correspond\ to\nwnewline
the\ branch\ of\ the\ {\char92}pspadtype{\char123}Union{\char125}\ in\ which\ the\ element\ a
lies.\nwnewline
{\char92}endImportant\nwnewline
\nwnewline
Be\ sure\ to\ understand\ the\ difference\ between\ records\ and\ unions\ with\nwnewline
selectors.\ \ Records\ can\ have\ more\ than\ one\ component\ and\ the\ selectors\nwnewline
are\ used\ to\ refer\ to\ the\ components.\ \ Unions\ always\ have\ one\ component\nwnewline
but\ the\ type\ of\ that\ one\ component\ can\ vary.\ \ An\ object\ of\ type\nwnewline
{\char92}pspadtype{\char123}Record(a:\ Integer,\ b:\ Float,\ c:\ String){\char125}\ contains\
integer\ {\char123}{\char92}it\ and{\char125}\ a\ float\ {\char123}{\char92}it\ and{\char125}
{\char92}pspadtype{\char123}Union(a:\ Integer,\ b:\ Float,\ c:\ String){\char125}\ contains\
{\char123}{\char92}it\ or{\char125}\ a\ float\ {\char123}{\char92}it\ or{\char125}\ a\ string
\nwnewline
Here\ is\ a\ version\ of\ the\ {\char92}userfun{\char123}sayBranch{\char125}\ function\ (cf.\
{\char92}downlink{\char123}‘‘Unions\ Without\ Selectors’’{\char125}{\char123}ugTypesUnionsWOS
in\ Section\ 2.5.1{\char92}ignore{\char123}ugTypesUnionsWOSel{\char125})\ \nwnewline
that\ works\ with\ a\ union\ with\ selectors.\nwnewline
It\ displays\ a\ message\ stating\ in\ which\ branch\ of\ the\ {\char92}pspadtype{\char123}Un
object\ lies.\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline

{\char92}spadpaste{\char123}\nwnewline
m\ :=\ matrix\ [[x-3/4*{\char92}{\char37}i,z*y**2+1/2],[3/7*{\char92}{\char37}i*y**4\ -\ x,12-{\char92}{
\bound{m}\free{mdec}}
}
\xtc{
We first want to interchange the \axiomType{Complex} and
\axiomType{Fraction} layers.
We do the conversion by doing the interchange in the type expression.
}{
\spadpaste{m1 := m :: SquareMatrix(2,POLY FRAC COMPLEX INT)
\free{m}\bound{m1}}
}
\xtc{
Interchange the \axiomType{Polynomial} and the
\axiomType{Fraction} levels.
}{
\spadpaste{m2 := m1 :: SquareMatrix(2,FRAC POLY COMPLEX INT)
\free{m1}\bound{m2}}
}
\xtc{
Interchange the \axiomType{Polynomial} and the
\axiomType{Complex} levels.
}{
\spadpaste{m3 := m2 :: SquareMatrix(2,FRAC COMPLEX POLY INT)
\free{m2}\bound{m3}}
}

All the entries have changed types, although in comparing the
last two results only the entry in the lower left corner looks different.
We did all the intermediate steps to show you what Axiom can do.

\xtc{
In fact, we could have combined all these into one conversion.
}{
\spadpaste{m :: SquareMatrix(2,FRAC COMPLEX POLY INT) \free{m}}
}

There are times when Axiom is not be able to do the conversion
in one step.
You may need to break up the transformation into several conversions
in order to get an object of the desired type.

We cannot move either \axiomType{Fraction} or \axiomType{Complex}
above (or to the left of, depending on how you look at it)
```

```
\axiomType{SquareMatrix} because each of these levels requires that its
argument type have commutative multiplication, whereas
\axiomType{SquareMatrix} does not.\footnote{\axiomType{Fraction} requires
that its argument belong to the category \axiomType{IntegralDomain} and
\axiomType{Complex} requires that its argument belong to
\axiomType{CommutativeRing}. See
\downlink{``The Basic Idea''}{ugTypesBasicPage}
in Section 2.1\ignore{ugTypesBasic}
for a brief discussion of categories.}
The \axiomType{Integer} level did not move anywhere
because it does not allow any arguments.
We also did not move the \axiomType{SquareMatrix} part anywhere, but
we could have.
\xtc{
Recall that \axiom{m} looks like this.
}{
\spadpaste{m \free{m}}
}
\xtc{
If we want a polynomial with matrix coefficients rather than a matrix
with polynomial entries, we can just do the conversion.
}{
\spadpaste{m :: POLY SquareMatrix(2,COMPLEX FRAC INT) \free{m}}
}
\xtc{
We have not yet used modes for any conversions.
Modes are a great shorthand for indicating the type of the
object you want.
Instead of using the long type expression in the
last example, we could have simply said this.
}{
\spadpaste{m :: POLY ? \free{m}}
}
\xtc{
We can also indicate more structure if we want the entries
of the matrices to be fractions.
}{
\spadpaste{m :: POLY SquareMatrix(2,FRAC ?) \free{m}}
}

6.0.29 Subdomains Again

— ug02.ht —

```
\begin{page}{ugTypesSubdomainsPage}{2.8. Subdomains Again}
\beginscroll

A \spadgloss{subdomain} \axiom{S} of a domain \axiom{D} is a domain
consisting of
\indent{4}
\beginitems
\item[1. ] those elements of \axiom{D} that satisfy some
\spadgloss{predicate} (that is, a test that returns \axiom{true} or
\axiom{false}) and
\item[2. ] a subset of the operations of \axiom{D}.
\enditems
\indent{0}
Every domain is a subdomain of itself, trivially satisfying the
membership test: \axiom{true}.

Currently, there are only two system-defined subdomains in Axiom that
receive substantial use.  \axiomType{PositiveInteger} and
\axiomType{NonNegativeInteger} are subdomains of \axiomType{Integer}.
An element \axiom{x} of \axiomType{NonNegativeInteger} is an integer
that is greater than or equal to zero, that is, satisfies \axiom{x >=
0.}  An element \axiom{x} of \axiomType{PositiveInteger} is a
nonnegative integer that is, in fact, greater than zero, that is,
satisfies \axiom{x > 0.}  Not all operations from \axiomType{Integer}
are available for these subdomains.  For example, negation and
subtraction are not provided since the subdomains are not closed under
those operations.  When you use an integer in an expression, Axiom
assigns to it the type that is the most specific subdomain whose
predicate is satisfied.
\xtc{
This is a positive integer.
```

```
}{
\spadpaste{5}
}
\xtc{
This is a nonnegative integer.
}{
\spadpaste{0}
}
\xtc{
This is neither of the above.
}{
\spadpaste{-5}
}
\xtc{
Furthermore, unless you are assigning an integer to a declared variable
or using a conversion, any integer result has as type the most
specific subdomain.
}{
\spadpaste{(-2) - (-3)}
}
\xtc{
}{
\spadpaste{0 :: Integer}
}
\xtc{
}{
\spadpaste{x : NonNegativeInteger := 5}
}

When necessary, Axiom converts an integer object into one belonging to
a less specific subdomain.  For example, in \axiom{3-2}, the arguments
to \axiomOpFrom{-}{Integer} are both elements of
\axiomType{PositiveInteger}, but this type does not provide a
subtraction operation.  Neither does \axiomType{NonNegativeInteger},
so \axiom{3} and \axiom{2} are viewed as elements of
\axiomType{Integer}, where their difference can be calculated.  The
result is \axiom{1}, which Axiom then automatically assigns the type
\axiomType{PositiveInteger}.

\xtc{
Certain operations are very sensitive to the subdomains to which their
arguments belong.
This is an element of \axiomType{PositiveInteger}.
}{
\spadpaste{2 ** 2}
}
\xtc{
This is an element of \axiomType{Fraction Integer}.
}{
\spadpaste{2 ** (-2)}
```

```
}
\xtc{
It makes sense then that this
is a list of elements of \axiomType{PositiveInteger}.
}{
\spadpaste{[10**i for i in 2..5]}
}
What should the type of \axiom{[10**(i-1) for i in 2..5]} be?
On one hand, \axiom{i-1} is always an integer greater than zero
as \axiom{i} ranges from \axiom{2} to \axiom{5} and so \axiom{10**i}
is also always a positive integer.
On the other, \axiom{i-1} is a very simple function of \axiom{i}.
Axiom does not try to analyze every such function over the
index's range of values to determine whether it is always positive
or nowhere negative.
For an arbitrary Axiom function, this analysis is not possible.

\xtc{
So, to be consistent no such analysis is done and we get this.
}{
\spadpaste{[10**(i-1) for i in 2..5]}
}
\xtc{
To get a list of elements of \axiomType{PositiveInteger} instead, you
have two choices.
You can use a conversion.
}{
\spadpaste{[10**((i-1) :: PI) for i in 2..5]}
}
\xtc{
Or you can use \axiom{pretend}.
\spadkey{pretend}
}{
\spadpaste{[10**((i-1) pretend PI) for i in 2..5]}
}

The operation \axiom{pretend} is used to defeat the Axiom
type system.
The expression \axiom{object pretend D} means ``make a new object
(without copying) of type \axiom{D} from \axiom{object}.''
If \axiom{object} were an integer and you told Axiom
to pretend it was a list, you would probably see a message about a
fatal error being caught and memory possibly being damaged.
Lists do not have the same internal representation as integers!

You use \axiom{pretend} at your peril.

\xtc{
Use \axiom{pretend} with great care!
Axiom trusts you that the value is of the specified type.
```

```
}{
\spadpaste{(2/3) pretend Complex Integer}
}

6.0.30 Package Calling and Target Types

⇒ "notitle" (ugTypesDeclarePage) ?? on page ??
⇒ "notitle" (ugUserUsePage) ?? on page ??
— **ug02.ht** —

```
\begin{page}{ugTypesPkgCallPage}{2.9. Package Calling and Target Types}
\beginscroll

Axiom works hard to figure out what you mean by an
expression without your having to qualify it with type
information.
Nevertheless, there are times when you need to help it along by
providing hints (or even orders!) to get Axiom to do what
you want.

We saw in \downlink{``Declarations''}{ugTypesDeclarePage}
in Section 2.3\ignore{ugTypesDeclare} that
declarations using types
and modes control the type of the results produced.
For example, we can either produce a complex object with
polynomial real and imaginary parts or a polynomial with complex
integer coefficients, depending on the declaration.

\spadglossSee{Package calling}{package call} is how you tell
Axiom to use a particular function from a particular part of
```

```
the library.

\xtc{
Use the \axiomOpFrom{/}{Fraction} from \axiomType{Fraction Integer}
to create a fraction of two integers.
}{
\spadpaste{2/3}
}
\xtc{
If we wanted a floating point number, we can say ``use the
\axiomOpFrom{/}{Float} in \axiomType{Float}.''
}{
\spadpaste{(2/3)\$Float}
}
\xtc{
Perhaps we actually wanted a fraction of complex integers.
}{
\spadpaste{(2/3)\$Fraction(Complex Integer)}
}

In each case, Axiom used the indicated operations, sometimes
first needing to convert the two integers into objects of an
appropriate type.
In these examples, \axiomOpFrom{/}{Fraction} is written as an
infix operator.

\beginImportant
To use package calling with an infix operator, use the
following syntax:
\centerline{{{\tt ( \subscriptIt{arg}{1} {\it op}
\subscriptIt{arg}{1} )\${\it type} }}}
\endImportant

We used, for example, \axiom{(2/3)\$Float}.  The expression \axiom{2 +
3 + 4} is equivalent to \axiom{(2+3) + 4.}  Therefore in the
expression \axiom{(2 + 3 + 4)\$Float} the second \axiomOp{+} comes
from the \axiomType{Float} domain.  Can you guess whether the first
\axiomOp{+} comes from \axiomType{Integer} or
\axiomType{Float}?\footnote{\axiomType{Float}, because the package
call causes Axiom to convert \axiom{(2 + 3)} and \axiom{4} to type
\axiomType{Float}.  Before the sum is converted, it is given a target
type (see below) of \axiomType{Float} by Axiom and then evaluated.
The target type causes the \axiomOp{+} from \axiomType{Float} to be
used.}

\beginImportant
For an operator written before its arguments, you must use
parentheses around the arguments (even if there is only one),
and follow the closing parenthesis by a \axiomSyntax{\$}
and then the type.
```

```
\centerline{{{\tt {\it fun} ( \subscriptIt{arg}{1},
\subscriptIt{arg}{1}, \ldots, \subscriptIt{arg}{N} )\${\it type}}}}
\endImportant

For example, to call the ‘‘minimum’’ function from \axiomType{DoubleFloat}
on two integers, you could write \axiom{min(4,89)\$DoubleFloat}.
Another use of package calling is to tell Axiom to use a library
function rather than a function you defined.
We discuss this in
\downlink{‘‘How Axiom Determines What Function to Use’’}{ugUserUsePage}
in Section 6.9\ignore{ugUserUse}.

Sometimes rather than specifying where an operation comes from, you just
want to say what type the result should be.
We say that you provide
a
\spadglossSee{target type}{target} for the expression.
Instead of using a \axiomSyntax{\$}, use a \axiomSyntax{@} to specify
the requested target type.
Otherwise, the syntax is the same.
Note that giving a target type is not the same as explicitly doing a
conversion.
The first says ‘‘try to pick operations so that the result has
such-and-such a type.’’
The second says ‘‘compute the result and then convert to an object of
such-and-such a type.’’

\xtc{
Sometimes it makes sense, as in this expression,
to say ‘‘choose the operations in this expression so that
the final result is a \axiomType{Float}.’’
}{
\spadpaste{(2/3)@Float}
}

Here we used \axiomSyntax{@} to say that the target type of the
left-hand side was \axiomType{Float}.
In this simple case, there was no real difference
between using \axiomSyntax{\$} and \axiomSyntax{@}.
You can see the difference if you try the following.
\xtc{
This says to try to choose \axiomOp{+} so that the result is
a string.
Axiom cannot do this.
}{
\spadpaste{(2 + 3)@String}
}
\xtc{
This says to get the \axiomOp{+} from \axiomType{String} and apply
it to the two integers.
Axiom also cannot do this because there is no \axiomOp{+}
exported by \axiomType{String}.
}{
\spadpaste{(2 + 3)\$String}
}
(By the way, the operation \axiomFunFrom{concat}{String} or juxtaposition
is used to concatenate two strings.)

When we have more than one operation in an expression, the
difference is even more evident.
The following two expressions show that Axiom uses the
target type to create different objects.
The \axiomOp{+}, \axiomOp{*} and \axiomOp{**} operations are all
chosen so that an object of the correct final type is created.

\xtc{
This says that the operations should be chosen so
that the result is a \axiomType{Complex} object.
}{
\spadpaste{((x + y * \%i)**2)@(Complex Polynomial Integer)}
}
\xtc{
This says that the operations should be chosen so
that the result is a \axiomType{Polynomial} object.
}{
\spadpaste{((x + y * \%i)**2)@(Polynomial Complex Integer)}
}
\xtc{
What do you think might happen if we left off all
target type and package call information in this last example?
}{
\spadpaste{(x + y * \%i)**2 \bound{prevC}}
}
\xtc{
We can convert it to \axiomType{Complex} as an afterthought.
But this is more work than just saying making what we want in the first
place.
}{
\spadpaste{\% :: Complex ? \free{prevC}}
}

Finally, another use of package calling is to qualify fully an
operation that is passed as an argument to a function.

\xtc{
Start with a small matrix of integers.
}{
\spadpaste{h := matrix {\tt{}8,6],[-4,9} \bound{h}}
}
%
```

```
\xtc{
We want to produce a new matrix that has for entries the multiplicative
inverses of the entries of \axiom{h}.
One way to do this is by calling
\axiomFunFrom{map}{MatrixCategoryFunctions2} with the
\axiomFunFrom{inv}{Fraction} function from \axiomType{Fraction (Integer)}.
}{
\spadpaste{map(inv\$Fraction(Integer),h) \free{h}}
}
\xtc{
We could have been a bit less verbose and used abbreviations.
}{
\spadpaste{map(inv\$FRAC(INT),h) \free{h}\bound{h1}}
}
%
\xtc{
As it turns out, Axiom is smart enough to know what we mean
anyway.
We can just say this.
}{
\spadpaste{map(inv,h) \free{h}}
}

6.0.31 Resolving Types

— ug02.ht —

```
\begin{page}{ugTypesResolvePage}{2.10. Resolving Types}
\beginscroll

In this section we briefly describe an internal process by which
Axiom determines a type to which two objects of possibly
different types can be converted.
We do this to give you further insight into how Axiom takes
your input, analyzes it, and produces a result.

What happens when you enter \axiom{x + 1} to Axiom?
Let's look at what you get from the two terms of this expression.

\xtc{
This is a symbolic object whose type indicates the name.
}{
\spadpaste{x}
}
\xtc{
This is a positive integer.
}{
\spadpaste{1}
}

There are no operations in \axiomType{PositiveInteger} that add
positive integers to objects of type \axiomType{Variable(x)} nor
are there any in \axiomType{Variable(x)}.
Before it can add the two parts, Axiom must come up with
a common type to which both \axiom{x} and \axiom{1} can be
converted.
We say that Axiom must {\it resolve} the two types
into a common type.
In this example, the common type is \axiomType{Polynomial(Integer)}.

\xtc{
Once this is determined, both parts are converted into polynomials,
and the addition operation from \axiomType{Polynomial(Integer)} is used
to get the answer.
}{
\spadpaste{x + 1}
}
\xtc{
Axiom can always resolve two types: if nothing resembling
the original types can be found, then \axiomType{Any} is be used.
This is fine and useful in some cases.
}{
\spadpaste{["string",3.14159]}
}
\xtc{
In other cases objects of type \axiomType{Any} can't be used
by the operations you specified.
}{
\spadpaste{"string" + 3.14159}
}
Although this example was contrived, your expressions may need
to be qualified slightly to help Axiom resolve the
types involved.
You may need to declare a few variables, do some package calling,
provide some target type information or do some explicit
conversions.

We suggest that you just enter the expression you want evaluated and
see what Axiom does.
We think you will be impressed with its ability to ``do what I
mean.''
If Axiom is still being obtuse, give it some hints.
As you work with Axiom, you will learn where it needs a
```

```
little help to analyze quickly and perform your computations.

— **ug02.ht** —

```
\begin{page}{ugTypesExposePage}{2.11. Exposing Domains and Packages}
\beginscroll
```

```
In this section we discuss how Axiom makes some operations
available to you while hiding others that are meant to be used by
developers or only in rare cases.
If you are a new user of Axiom, it is likely that everything
you need is available by default and you may want
to skip over this section on first reading.

Every
domain and package in the Axiom library
is
either
\spadglossSee{exposed}{expose} (meaning that you can use its
operations without doing
anything special) or it is {\it hidden} (meaning you have to either
package call
(see \downlink{``Package Calling and Target Types''}{ugTypesPkgCallPage}
in Section 2.9\ignore{ugTypesPkgCall})
the operations it contains or explicitly expose it to use the
operations).
The initial exposure status for a constructor is set in the
file {\bf exposed.lsp} (see the {\it Installer's Note}
for Axiom
if you need to know the location of this file).
Constructors are collected together in
{\it exposure groups}.
Categories are all in the exposure group ``categories'' and the
bulk of the basic set of packages and domains that are exposed
are in the exposure group ``basic.''
Here is an abbreviated sample of the file (without the Lisp parentheses):
\begin{verbatim}
basic
        AlgebraicNumber                          AN
        AlgebraGivenByStructuralConstants        ALGSC
        Any                                      ANY
        AnyFunctions1                            ANY1
        BinaryExpansion                          BINARY
        Boolean                                  BOOLEAN
        CardinalNumber                           CARD
        CartesianTensor                          CARTEN
        Character                                CHAR
        CharacterClass                           CCLASS
        CliffordAlgebra                          CLIF
        Color                                    COLOR
        Complex                                  COMPLEX
        ContinuedFraction                        CONTFRAC
        DecimalExpansion                         DECIMAL
        ...
\end{verbatim}
\begin{verbatim}
categories
```

```
        AbelianGroup                            ABELGRP
        AbelianMonoid                           ABELMON
        AbelianMonoidRing                       AMR
        AbelianSemiGroup                        ABELSG
        Aggregate                               AGG
        Algebra                                 ALGEBRA
        AlgebraicallyClosedField                ACF
        AlgebraicallyClosedFunctionSpace        ACFS
        ArcHyperbolicFunctionCategory           AHYP
        ...
\end{verbatim}
For each constructor in a group, the full name and the abbreviation
is given.
There are other groups in {\bf exposed.lsp} but initially only the
constructors in exposure groups ``basic'' ``categories'' ``naglink''
and ``anna'' are exposed.

As an interactive user of Axiom, you do not need to modify this file.
Instead, use \spadcmd{)set expose} to expose, hide or query the
exposure status of an individual constructor or exposure group.  The
reason for having exposure groups is to be able to expose or hide
multiple constructors with a single command.  For example, you might
group together into exposure group ``quantum'' a number of domains and
packages useful for quantum mechanical computations.  These probably
should not be available to every user, but you want an easy way to
make the whole collection visible to Axiom when it is looking for
operations to apply.

If you wanted to hide all the basic constructors available by default,
you would issue \spadcmd{)set expose drop group basic}.  If, however,
you discover that you have hidden all the basic constructors, you
should issue \spadcmd{)set expose add group basic} to restore your
default environment.

It is more likely that you would want to expose or hide individual
constructors.  In
\downlink{``A Famous Triangle''}{ugUserTrianglePage} in Section
6.19\ignore{ugUserTriangle} we use several operations
from \axiomType{OutputForm}, a domain usually hidden.  To avoid
package calling every operation from \axiomType{OutputForm}, we expose
the domain and let Axiom conclude that those operations should be
used.  Use \spadcmd{)set expose add constructor} and \spadcmd{)set
expose drop constructor} to expose and hide a constructor,
respectively.  You should use the constructor name, not the
abbreviation.  The \spadcmd{)set expose} command guides you through
these options.

If you expose a previously hidden constructor, Axiom exhibits new
behavior (that was your intention) though you might not expect the
results that you get.  \axiomType{OutputForm} is, in fact, one of the
```

```
worst offenders in this regard.  This domain is meant to be used by
other domains for creating a structure that Axiom knows how to
display.  It has functions like \axiomOpFrom{+}{OutputForm} that form
output representations rather than do mathematical calculations.
Because of the order in which Axiom looks at constructors when it is
deciding what operation to apply, \axiomType{OutputForm} might be used
instead of what you expect.  \xtc{ This is a polynomial.  }{
\spadpaste{x + x} } \xtc{ Expose \axiomType{OutputForm}.  }{
\spadpaste{)set expose add constructor OutputForm
\bound{setexposeadd}} } \xtc{ This is what we get when
\axiomType{OutputForm} is automatically available.  }{ \spadpaste{x +
x \free{setexposeadd}} } \xtc{ Hide \axiomType{OutputForm} so we don't
run into problems with any later examples!  }{ \spadpaste{)set expose
drop constructor OutputForm \bound{setexposedrop}} }

Finally, exposure is done on a frame-by-frame basis.  A
\spadgloss{frame} (see
\downlink{``)frame''}{ugSysCmdframePage} in Section B.11
\ignore{ugSysCmdframe}) is one of possibly several
logical Axiom workspaces within a physical one, each having its own
environment (for example, variables and function definitions).  If you
have several Axiom workspace windows on your screen, they are all
different frames, automatically created for you by Hyperdoc.  Frames
can be manually created, made active and destroyed by the
\spadcmd{)frame} system command.  They do not share exposure
information, so you need to use \spadcmd{)set expose} in each one to
add or drop constructors from view.

6.0.33 Commands for Snooping

⇒ "notitle" (ugBrowsePage) 11.0.146 on page 2429

⇒ "notitle" (ComplexXmpPage) 3.16.1 on page 240
⇒ "notitle" (ugUserDeclarePage) **??** on page **??**

— **ug02.ht** —

```
\begin{page}{ugAvailSnoopPage}{2.12. Commands for Snooping}
\beginscroll

To conclude this chapter, we introduce you to some system commands
that you can use for getting more information about domains,
packages, categories, and operations.
The most powerful Axiom facility for getting information about
constructors and operations is the \Browse{} component of Hyperdoc.
This is discussed in \downlink{``Browse''}{ugBrowsePage}
in Chapter 14\ignore{ugBrowse}.

Use the \spadsys{)what} system command to see lists of system objects
whose name contain a particular substring (uppercase or lowercase is
not significant).

\xtc{
Issue this to see a list of all operations with
``{\tt complex}'' in their names.
}{
\spadpaste{)what operation complex}
}
\xtc{
If you want to see all domains with ``{\tt matrix}'' in their names, issue
this.
}{
\spadpaste{)what domain matrix}
}
\xtc{
Similarly, if you wish to see all packages whose names contain
``{\tt gauss}'', enter this.
}{
\spadpaste{)what package gauss}
}
\xtc{
This command shows all
the operations that \axiomType{Any} provides.
Wherever \axiomSyntax{\$} appears, it means ``\axiomType{Any}''.
}{
\spadpaste{)show Any}
}
\xtc{
This displays all operations with the name \axiomFun{complex}.
}{
\spadpaste{)display operation complex}
}
Let's analyze this output.
```

```
\xtc{
First we find out what some of the abbreviations mean.
}{
\spadpaste{)abbreviation query COMPCAT}
}
\xtc{
}{
\spadpaste{)abbreviation query COMRING}
}

So if \axiom{D1} is a commutative ring (such as the integers or
floats) and \axiom{D} belongs to \axiomType{ComplexCategory
D1}, then there is an operation called \axiomFun{complex} that
takes two elements of \axiom{D1} and creates an element of
\axiom{D}.
The primary example of a constructor implementing domains
belonging to \axiomType{ComplexCategory} is \axiomType{Complex}.
See \downlink{`Complex'}{ComplexXmpPage}\ignore{Complex}
for more information on that and see
\downlink{``Declaring the Type of Functions''}{ugUserDeclarePage} in
Section 6.4\ignore{ugUserDeclare}
for more information on function types.

\begin{page}{ugHyperPage}{3. Using Hyperdoc}
\beginscroll

Hyperdoc is the gateway to Axiom.
It's both an on-line tutorial and an on-line reference manual.
It also enables you to use Axiom simply by using the mouse and
filling in templates.
Hyperdoc is available to you if you are running Axiom under the
X Window System.

Pages usually have active areas, marked in
\texht{{\bf this font} (bold face).}{\downlink{this font.}{YouTriedIt}}
As you move the mouse pointer to an active area, the pointer changes from
a filled dot to an open circle.
```

```
The active areas are usually linked to other pages.
When you click on an active area, you move to the linked page.
\texht{}{Try clicking \downlink{here}{YouTriedIt} now.}

We suggest that you learn more about other features of
Hyperdoc by clicking on an active area in the menu below.

\beginmenu
    \menudownlink{{3.1. Headings}}{ugHyperHeadingsPage}
    \menudownlink{{3.2. Key Definitions}}{ugHyperKeysPage}
    \menudownlink{{3.3. Scroll Bars}}{ugHyperScrollPage}
    \menudownlink{{3.4. Input Areas}}{ugHyperInputPage}

7.0.35 Headings

— ug03.ht —

```
\begin{page}{ugHyperHeadingsPage}{3.1. Headings}
\beginscroll
%
Most pages have a standard set of buttons at the top of the page.
This is what they mean:

\indent{0}
\beginitems
\item[\StdHelpButton{}] Click on this to get help.
The button only appears if there is specific help for the page you are
viewing.
You can get {\it general} help for Hyperdoc by clicking the help
button on the home page.

\item[\UpButton{}] Click here to go back one page.
By clicking on this button repeatedly, you can go back several pages and
then take off in a new direction.

\item[\ReturnButton{}] Go back to the home page, that is,
the page on which you started.
Use Hyperdoc to explore, to make forays into new topics.
Don't worry about how to get back.
Hyperdoc remembers where you came from.
Just click on this button to return.

\item[\StdExitButton{}] From the root window (the one that is
displayed when you start the system) this button leaves the Hyperdoc
program, and it must be restarted if you want to use it again.  From
any other Hyperdoc window, it just makes that one window go away.  You
{\it must} use this button to get rid of a window.  If you use the
window manager ``Close'' button, then all of Hyperdoc goes away.

7.0.37 Scroll Bars

⇒ “notitle” (ugHyperInputPage) 7.0.38 on page 1687

— **ug03.ht** —

```
\begin{page}{ugHyperScrollPage}{3.3. Scroll Bars}
\beginscroll

Whenever there is too much text to fit on a page, a {\it scroll
bar} automatically appears along the right side.

With a scroll bar, your page becomes an aperture, that is, a
window into a larger amount of text than can be displayed at one
time.
The scroll bar lets you move up and down in the text to see
different parts.
It also shows where the aperture is relative to the whole text.
The aperture is indicated by a strip on the scroll bar.

Move the cursor with the mouse to the ‘‘down-arrow’’ at the bottom
of the scroll bar and click.
See that the aperture moves down one line.
Do it several times.
Each time you click, the aperture moves down one line.
Move the mouse to the ‘‘up-arrow’’ at the top of the scroll bar and
click.
The aperture moves up one line each time you click.
```

```
Next move the mouse to any position along the middle of the scroll bar
and click.  Hyperdoc attempts to move the top of the aperture to this
point in the text.

You cannot make the aperture go off the bottom edge.  When the
aperture is about half the size of text, the lowest you can move the
aperture is halfway down.

To move up or down one screen at a time, use the
\texht{\fbox{\bf PageUp}}{{\bf PageUp}} and
\texht{\fbox{\bf PageDown}}{{\bf PageDown}} keys on your keyboard.
They move the visible part of the region up and down one page each
time you press them.

If the Hyperdoc page does not contain an input area
(see \downlink{``Input Areas''}{ugHyperInputPage}
in Section 3.4\ignore{ugHyperInput}),
you can also use the
\texht{\fbox{\bf Home}}{{\bf Home}} and
\texht{\fbox{$\uparrow$}}{up} and
\texht{\fbox{$\downarrow$}}{down} arrow keys to navigate.
When you press the \texht{\fbox{\bf Home}}{{\bf Home}} key,
the screen is positioned at the very top of the page.
Use the \texht{\fbox{$\uparrow$}}{up} and
\texht{\fbox{$\downarrow$}}{down} arrow keys to move the screen up
and down one line at a time, respectively.

\endscroll
\autobuttons
\end{page}
```

———-

7.0.38 Input Areas

— ug03.ht —

```
\begin{page}{ugHyperInputPage}{3.4. Input Areas}
\beginscroll
%
Input areas are boxes where you can put data.
Here is one:
\centerline{\inputstring{one}{40}{some text}}
\newline
As you can see, the input area has some initial text {\it some text}
followed by an underscore cursor (the character {\it _}).
```

```
To enter characters, first
move your mouse cursor to somewhere within the Hyperdoc page.
Characters that you type are inserted in front of the underscore.
This means that when you type characters at your keyboard, they
go into this first input area.

The input area grows to accommodate as many characters as you type.
Use the \texht{\fbox{\bf Backspace}}{{\bf Backspace}}
key to erase characters to the left.
To modify what you type, use the right-arrow \texht{\fbox{$\rightarrow$}}{}
and left-arrow keys \texht{\fbox{$\leftarrow$}}{} and the
keys \texht{\fbox{\bf Insert}}{{\bf Insert}},
\texht{\fbox{\bf Delete}}{{\bf Delete}},
\texht{\fbox{\bf Home}}{{\bf Home}} and
\texht{\fbox{\bf End}}{{\bf End}}.
These keys are found immediately on the right of the standard IBM keyboard.

If you press the
\texht{\fbox{\bf Home}}{{\bf Home}}
key, the cursor moves to the beginning of the line and if you press the
\texht{\fbox{\bf End}}{{\bf End}}
key, the cursor moves to the end of the line.
Pressing
\texht{\fbox{\bf Ctrl}--\fbox{\bf End}}{{\bf Ctrl-End}}
deletes all the text from the cursor to the end of the line.

A page may have more than one input area.
Only one input area has an underscore cursor.
When you first see apage, the top-most input area contains the
cursor.
To type information into another input area,
use the \texht{\fbox{\bf Enter}}{{\bf Enter}} or
\texht{\fbox{\bf Tab}}{{\bf Tab}} key to move
from one input area to another.
To move in the reverse order, use
\texht{\fbox{\bf Shift}--\fbox{\bf Tab}}{{\bf Shift-Tab}}.

You can also move from one input area to another using your mouse.
Notice that each input area is active. Click on one of the areas.
As you can see, the underscore cursor moves to that window.

\endscroll

\end{page}
```

7.0.39 Radio Buttons and Toggles

— ug03.ht —

```
\begin{page}{ugHyperButtonsPage}{3.5. Radio Buttons and Toggles}
\beginscroll
%
Some pages have {\it radio buttons} and {\it toggles}.
Radio buttons are a group of buttons like those on car radios: you can
select only one at a time.
\radioboxes{sample}{\htbmfile{pick}}{\htbmfile{unpick}}
Here are three radio buttons:
\centerline{
{\em\radiobox[1]{rone}{sample}\space{}\ First one}\space{3}
{\em\radiobox[0]{rtwo}{sample}\space{}\ Second one}\space{3}
{\em\radiobox[0]{rthree}{sample}\space{}\ Third one}
}
\newline
Once you have selected a button, it appears to be inverted and
contains a checkmark.
To change the selection, move the cursor with the mouse to a
different radio button and click.
\texht{}{Try it now.}

A toggle is an independent button that displays some on/off
state.
When ``on'', the button appears to be inverted and
contains a checkmark.
When ``off'', the button is raised.
%
Unlike radio buttons, you can set a group of them any way you like.
Here are three:
\centerline{
{\em\inputbox[1]{one}{\htbmfile{pick}}{\htbmfile{unpick}}\space{}
\ First one}
\space{3}
{\em\inputbox[0]{two}{\htbmfile{pick}}{\htbmfile{unpick}}\space{}
\ Second one}
\space{3}
{\em\inputbox[1]{three}{\htbmfile{pick}}{\htbmfile{unpick}}\space{}
\ Third one}
}
\newline
To change toggle the selection, move the cursor with the mouse
to the button and click.

\endscroll
\autobuttons
\end{page}

7.0.40 Search Strings

⇒ "notitle" (ugLogicalSearchesPage) 7.0.41 on page 1691

— **ug03.ht** —

```
\begin{page}{ugHyperSearchPage}{3.6. Search Strings}
\beginscroll
%
A {\it search string} is used for searching some database.
To learn about search strings, we suggest that
you bring up the Hyperdoc glossary.
To do this from the top-level page of Hyperdoc:
\indent{4}
\beginitems
\item[1. ] Click on \windowlink{Reference}{TopReferencePage},
bringing up the Axiom Reference page.
\item[2. ] Click on \windowlink{Glossary}{GlossaryPage},
bringing up the glossary.
\texht{}{(You can also just click on the word ``Glossary'' in the
last sentence.)}
\enditems
\indent{0}
Once you get the window containing the glossary, move it so that
it and this window are both visible.

The glossary has an input area at its bottom.
We review the various kinds of search strings
you can enter to search the glossary.

The simplest search string is a word, for example, {\tt operation}.
A word only matches an entry having exactly that spelling.
Enter the word {\tt operation} into the input area above then click on
{\bf Search}.
As you can see, {\tt operation} matches only one entry, namely with {\tt
operation} itself.

Normally matching is insensitive to whether the alphabetic characters
of your search string are in uppercase or lowercase.  Thus {\tt
operation} and {\tt OperAtion} both have the same effect.  %If you
prefer that matching be case-sensitive, issue the command
%\spadsys{set HHyperName mixedCase} command to the interpreter.

You will very often want to use the wildcard \spadSyntax{*} in your
search string so as to match multiple entries in the list.  The search
```

```
key \spadSyntax{*} matches every entry in the list.  You can also use
\spadSyntax{*} anywhere within a search string to match an arbitrary
substring.  Try {\tt cat*} for example: enter {\tt cat*} into the
input area and click on {\bf Search}.  This matches several entries.

You use any number of wildcards in a search string as long as they are
not adjacent.  Try search strings such as {\tt *dom*}.  As you see,
this search string matches {\tt domain}, {\tt domain constructor},
{\tt subdomain}, and so on.

\beginmenu
    \menudownlink{{3.6.1. Logical Searches}}{ugLogicalSearchesPage}
\endmenu
\endscroll
\autobuttons
\end{page}
```

———

7.0.41 Logical Searches

— ug03.ht —

```
\begin{page}{ugLogicalSearchesPage}{3.6.1. Logical Searches}
\beginscroll

For more complicated searches, you can use
\spadSyntax{and}, \spadSyntax{or}, and \spadSyntax{not}
with basic search strings;
write logical expressions using these three operators just as
in the Axiom language.
For example, {\tt domain or package}  matches the two
entries {\tt domain} and {\tt package}.
Similarly, {\tt dom* and *con*} matches {\tt domain constructor}
and others.
Also {\tt not *a*} matches every entry that does not contain
the letter {\tt a} somewhere.

Use parentheses for grouping.
For example, {\tt dom* and (not *con*)}
matches {\tt domain} but not {\tt domain constructor}.

There is no limit to how complex your logical expression can be.
For example,
\centerline{{{\tt a* or b* or c* or d* or e* and (not *a*)}}}
is a valid expression.
```

```
\endscroll
\autobuttons
\end{page}
```

———-

7.0.42 Example Pages

— ug03.ht —

```
\begin{page}{ugHyperExamplePage}{3.7. Example Pages}
\beginscroll
%
Many pages have Axiom example commands.
%
Here are two:
\spadpaste{a:= x**2 + 1 \bound{a}}
\spadpaste{(a - 2)**2 \free{a}}
%
Each command has an active ‘‘button’’ along the left margin.
When you click on this button, the output for the command is
‘‘pasted-in.’’
Click again on the button and you see that the pasted-in output
disappears.

Maybe you would like to run an example?
To do so, just click on any part of its text!
When you do, the example line is copied into a new interactive
Axiom buffer for this Hyperdoc page.

Sometimes one example line cannot be run before you run an earlier one.
Don’t worry---Hyperdoc automatically runs all the necessary
lines in the right order!
For instance, the second example line above refers to \spad{a} which is
assigned in the first example line.
What happens if you first click on the second example line?
Axiom first issues the first line (to assign \spad{a}), then the
second (to do the computation using \spad{a}).

The new interactive Axiom buffer disappears when you leave
Hyperdoc.
If you want to get rid of it beforehand,
use the {\bf Cancel} button of the X Window manager
or issue the Axiom system command \spadsys{)close.}

\begin{page}{ugInOutPage}{4. Input Files and Output Styles}
\beginscroll

In this chapter we discuss how to collect Axiom statements
and commands into files and then read the contents into the
workspace.
We also show how to display the results of your computations in
several different styles including \texht{\TeX}{TeX}, FORTRAN and
monospace two-dimensional format.\footnote{\texht{\TeX}{TeX} is a
trademark of the American Mathematical Society.}

The printed version of this book uses the Axiom
\texht{\TeX}{TeX} output formatter.
When we demonstrate a particular output style, we will need to
turn \texht{\TeX}{TeX} formatting off and the output style on so
that the correct output is shown in the text.

8.0.45 Input Files

⇒ “notitle” (ugLangBlocksPage) 8.0.51 on page 1728

— **ug04.ht** —

```
\begin{page}{ugInOutInPage}{4.1. Input Files}
\beginscroll
%
In this section we explain what an {\it input file} is and
why you would want to know about it.
We discuss where Axiom looks for input files and how you can
direct it to look elsewhere.
We also show how to read the contents of an input file into the
\spadgloss{workspace} and how to use the \spadgloss{history}
facility to generate an input file from the statements you have
entered directly into the workspace.

An {\it input} file contains Axiom expressions and system
commands.
Anything that you can enter directly to Axiom can be put
into an input file.
This is how you save input functions and expressions that you wish
to read into Axiom more than one time.

To read an input file into Axiom, use the \spadcmd{)read}
system command.
For example, you can read a file in a particular directory by issuing
\begin{verbatim}
```

```
)read /spad/src/input/matrix.input
\end{verbatim}
The ``{\bf .input}'' is optional; this also works:
\begin{verbatim}
)read /spad/src/input/matrix
\end{verbatim}
What happens if you just enter
\spadcmd{)read matrix.input} or even \spadcmd{)read matrix}?
Axiom looks in your current working directory for input files
that are not qualified by a directory name.
Typically, this directory is the directory from which you invoked
Axiom.
To change the current working directory, use the \spadcmd{)cd} system
command. The command \spadsys{)cd} by itself shows the current
working
directory.
To change it to
the \spadsys{src/input} subdirectory for user ``babar'',
issue
\begin{verbatim}
)cd /u/babar/src/input
\end{verbatim}
Axiom looks first in this directory for an input file.
If it is not found, it looks in the system's directories, assuming
you meant some input file that was provided with Axiom.

\beginImportant
If you have the Axiom history facility turned on (which it is
by default), you can save all the lines you have entered into the
workspace by entering
\begin{verbatim}
)history )write
\end{verbatim}

Axiom tells you what input file to edit to see your
statements.
The file is in your home directory or in the directory you
specified with \spadsys{)cd}.
\endImportant

In \downlink{``Blocks''}{ugLangBlocksPage} in Section 5.2
\ignore{ugLangBlocks}
we discuss using indentation in input files to group statements
into {\it blocks.}

\endscroll
\autobuttons
\end{page}
```

———-

8.0.46 The .axiom.input File

— ug04.ht —

```
\begin{page}{ugInOutSpadprofPage}{4.2. The .axiom.input File}
\beginscroll

When Axiom starts up, it tries to read the input file
{\bf .axiom.input} from your home
directory.
It there is no {\bf axiom.input} in your home directory, it reads the copy
located in its own {\bf src/input} directory.
The file usually contains
system commands to personalize your Axiom environment.
In the remainder of this section we mention a few things
that users frequently place in their
{\bf axiom.input} files.

In order to have FORTRAN output always produced from your
computations, place the system command
\spadcmd{)set output fortran on}
in {\bf axiom.input}.
If you do not want to be prompted for confirmation when you issue
the \spadcmd{)quit} system command, place
\spadcmd{)set quit unprotected}
in {\bf axiom.input}.
If you then decide that you do want to be prompted, issue
\spadcmd{)set quit protected}.
This is the default setting
so that new users do not leave Axiom
inadvertently.\footnote{The
system command \spadsys{)pquit} always prompts you for
confirmation.}

To see the other system variables you can set, issue \spadsys{)set}
or use the Hyperdoc {\bf Settings} facility to view and change
Axiom system variables.

\endscroll
\autobuttons
\end{page}
```

———-

8.0.47 Common Features of Using Output Formats

— ug04.ht —

```
\begin{page}{ugInOutOutPage}{4.3. Common Features of Using Output Formats}
\beginscroll

In this section we discuss how to start and stop the display
of the different output formats and how to send the output to the
screen or to a file.
To fix ideas, we use FORTRAN output format for most of the
examples.

You can use the \spadcmd{)set output}
system
command to
toggle or redirect the different kinds of output.
The name of the kind of output follows ‘‘output’’ in the command.
The names are

\indent{0}
\beginitems
\item[fortran]  for FORTRAN output.
\item[algebra]  for monospace two-dimensional mathematical output.
\item[tex]      for \texht{\TeX}{TeX} output.
\item[html]     for HTML output.
\item[mathml]   for MathML output.
\item[script]   for IBM Script Formula Format output.
\enditems
\indent{0}

For example, issue \spadsys{)set output fortran on} to turn on
FORTRAN format and
issue \spadsys{)set output fortran off} to turn it off.
By default, {\tt algebra} is {\tt on} and all others are {\tt off}.
When output is started, it is sent to the screen.
To send the output to a file, give the file name without
directory or extension.
Axiom appends a file extension depending on the kind of
output being produced.
\xtc{
Issue this to redirect FORTRAN output to, for example, the file
{\bf linalg.sfort}.
}{
\spadpaste{)set output fortran linalg}
}
\noOutputXtc{
You must {\it also} turn on the creation of FORTRAN output.
The above just says where it goes if it is created.
```

```
}{
\spadpaste{)set output fortran on}
}
In what directory is this output placed?
It goes into the directory from which you started Axiom,
or if you have used the \spadsys{)cd} system command, the one
that you specified with \spadsys{)cd}.
You should use \spadcmd{)cd} before you send the output to the file.

\noOutputXtc{
You can always direct output back to the screen by issuing this.
}{
\spadpaste{)set output fortran console}
}
\noOutputXtc{
Let's make sure FORTRAN formatting is off so that nothing we
do from now on produces FORTRAN output.
}{
\spadpaste{)set output fortran off}
}
\noOutputXtc{
We also delete the demonstrated output file we created.
}{
\spadpaste{)system rm linalg.sfort}
}

You can abbreviate the words ``\spad{on},'' ``\spad{off}'' and
``\spad{console}'' to the minimal number
of characters needed to distinguish them.
Because of this, you cannot send output to files called
{\bf on.sfort, off.sfort, of.sfort,
console.sfort, consol.sfort} and so on.

The width of the output on the page is set by
\spadcmd{)set output length}
for all formats except FORTRAN.
Use \spadcmd{)set fortran fortlength} to
change the FORTRAN line length from its default value of \spad{72}.

8.0.48 Monospace 2D Mathematical Format

— ug04.ht —

```
\begin{page}{ugInOutAlgebraPage}
{4.4. Monospace 2D Mathematical Format}
\beginscroll

This is the default output format for Axiom.
It is usually on when you start the system.

\texht{\vskip 4pc}{}
\noOutputXtc{
If it is not, issue this.
}{
\spadpaste{)set output algebra on \bound{algon}}
}
\noOutputXtc{
Since the printed version of this book
(as opposed to the Hyperdoc version)
shows output produced by the
\texht{\TeX}{TeX}{} output formatter,
let us temporarily turn off
\texht{\TeX}{TeX}{} output.
}{
\spadpaste{)set output tex off \bound{texoff}}
}
\xtc{
Here is an example of what it looks like.
}{
\spadpaste{matrix {\tt{}i*x**i\ +\ j*{\char92}{\char37}i*y**j\ for\ i\ in\ 1..2]\ for\ j\ in
{\char92}free{\char123}algon\ texoff{\char125}{\char125}\nwnewline
```

```

{\char92}end{\char123}chunk{\char125}\nwnewline
{\char92}pagetitle{\char123}ugInOutFortranPage{\char125}{\char123}ug04.ht{\char125}{\char123}FORTRAN\ Fo
{\char92}begin{\char123}chunk{\char125}{\char123}ug04.ht{\char125}\nwnewline
{\char92}begin{\char123}page{\char125}{\char123}ugInOutFortranPage{\char125}{\char123}4.7.\ FORTRAN\ For
{\char92}beginscroll\nwnewline
\nwnewline
In\ addition\ to\ turning\ FORTRAN\ output\ on\ and\ off\ and\ stating\ where\ the\nwnewline
output\ should\ be\ placed,\ there\ are\ many\ options\ that\ control\ the\nwnewline
appearance\ of\ the\ generated\ code.\ \ In\ this\ section\ we\ describe\ some\ of\nwnewline
the\ basic\ options.\ \ Issue\ {\char92}spadcmd{\char123})set\ fortran{\char125}\ to\ see\ a\ full\ list
with\ their\ current\ settings.\nwnewline
```

```
\nwnewline
The\ output\ FORTRAN\ expression\ usually\ begins\ in\ column\ 7.\ \ If\ the\nwnewline
expression\ needs\ more\ than\ one\ line,\ the\ ampersand\ character\nwnewline
{\char92}spadSyntax{\char123}{\char92}{\char38}{\char125}\ is\ used\ in\ column\ 6.\ \ Since\
have\ restrictions\ on\ the\ number\ of\ lines\ per\ statement,\ Axiom\ breaks\nwnewline
long\ expressions\ into\ segments\ with\ a\ maximum\ of\ 1320\ characters\ (20\nwnewline
lines\ of\ 66\ characters)\ per\ segment.\ \ If\ you\ want\ to\ change\ this,\ say,\nwnewline
to\ 660\ characters,\ issue\ the\ system\ command\ {\char92}spadcmd{\char123})set\ fortran\nw
explength\ 660{\char125}.\ \ You\ can\ turn\ off\ the\ line\ breaking\ by\ issuing\nwnewline
{\char92}spadcmd{\char123})set\ fortran\ segment\ off{\char125}.\ \ Various\ code\ optimizati
are\ available.\ \ {\char37}\ {\char92}noOutputXtc{\char123}\ FORTRAN\ output\ is\ produced\
issue\ this.\ \ {\char125}{\char123}\ {\char92}spadpaste{\char123})set\ output\ fortran\ on\
{\char92}noOutputXtc{\char123}\ For\ the\ initial\ examples,\ we\ set\ the\ optimization\ lev
to\ 0,\ which\ is\ the\ lowest\ level.\ \ {\char125}{\char123}\ {\char92}spadpaste{\char123}
0\ {\char92}bound{\char123}opt0{\char125}{\char92}free{\char123}forton{\char125}{\char125}\
columns\ 7\ through\ 72,\ although\ fewer\ columns\ are\ used\ in\ the\ following\nwnewline
examples\ so\ that\ the\ output\ fits\ nicely\ on\ the\ page.\ \ {\char125}{\char123}\nwnewli
{\char92}spadpaste{\char123})set\ fortran\ fortlength\ 60{\char125}\ {\char125}\ {\char92}xtc
goes\ to\ the\ screen\ and\ is\ displayed\ before\ the\ standard\ Axiom\nwnewline
two-dimensional\ output.\ \ In\ this\ example,\ an\ assignment\ to\ the\nwnewline
variable\ {\char92}spad{\char123}R1{\char125}\ was\ generated\ because\ this\ is\ the\ result
{\char125}{\char123}\ {\char92}spadpaste{\char123}(x+y)**3\ {\char92}free{\char123}opt0{\char
\nwnewline
{\char92}xtc{\char123}\ Here\ is\ an\ example\ that\ illustrates\ the\ line\ breaking.\ \ {\c
{\char123}\ {\char92}spadpaste{\char123}(x+y+z)**3\ {\char92}free{\char123}opt0{\char125}{\ch
{\char125}\nwnewline
\nwnewline
Note\ in\ the\ above\ examples\ that\ integers\ are\ generally\ converted\ to\nwnewline
floating\ point\ numbers,\ except\ in\ exponents.\nwnewline
This\ is\ the\ default\ behavior\ but\ can\ be\ turned\ off\ by\ issuing\nwnewline
{\char92}spadcmd{\char123})set\ fortran\ ints2floats\ off{\char125}.\nwnewline
The\ rules\ governing\ when\ the\ conversion\ is\ done\ are:\nwnewline
{\char92}indent{\char123}4{\char125}\nwnewline
{\char92}beginitems\nwnewline
{\char92}item[1.\ ]\ If\ an\ integer\ is\ an\ exponent,\ convert\ it\ to\ a\ floating\ point\
number\ if\ it\ is\ greater\ than\ 32767\ in\ absolute\ value,\ otherwise\ leave\ it\nwnewlin
as\ an\ integer.\nwnewline
{\char92}item[2.\ ]\ Convert\ all\ other\ integers\ in\ an\ expression\ to\ floating\nwnewlin
point\ numbers.\nwnewline
{\char92}enditems\nwnewline
{\char92}indent{\char123}0{\char125}\nwnewline
These\ rules\ only\ govern\ integers\ in\ expressions.\nwnewline
Numbers\ generated\ by\ Axiom\ for\ {\char92}spad{\char123}DIMENSION{\char125}\ statements\ a
integers.\nwnewline
\nwnewline
To\ set\ the\ type\ of\ generated\ FORTRAN\ data,\nwnewline
use\ one\ of\ the\ following:\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
)set\ fortran\ defaulttype\ REAL\nwnewline
)set\ fortran\ defaulttype\ INTEGER\nwnewline
```

```
)set\ fortran\ defaulttype\ COMPLEX\nwnewline
)set\ fortran\ defaulttype\ LOGICAL\nwnewline
)set\ fortran\ defaulttype\ CHARACTER\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
When\ temporaries\ are\ created,\ they\ are\ given\ a\ default\ type\ of\nwnewline
{\char123}{\char92}tt\ REAL.{\char125}\nwnewline
Also,\ the\ {\char123}{\char92}tt\ REAL{\char125}\ versions\ of\ functions\ are\ used\ by\ default.\nwne

\begin{page}{ugLangPage}{5. Introduction to the Axiom Interactive Language}
\beginscroll

In this chapter we look at some of the basic components of the
Axiom language that you can use interactively.
We show how to create a \spadgloss{block} of expressions,
how to form loops and list iterations, how to modify the sequential
evaluation of a block and how to use {\tt if-then-else} to
evaluate parts of your program conditionally.
We suggest you first read the boxed material in each section and then
proceed to a more thorough reading of the chapter.

8.0.50 Immediate and Delayed Assignments

⇒ "notitle" (ugUserDelayPage) ?? on page ??

— **ug05.ht** —

```
\begin{page}{ugLangAssignPage}{5.1. Immediate and Delayed Assignments}
\beginscroll

A \spadgloss{variable} in Axiom refers to a value.
A variable has a name beginning with an uppercase or lowercase alphabetic
character, \axiomSyntax{\%}, or \axiomSyntax{!}.
Successive characters (if any) can be any of the above, digits, or
\axiomSyntax{?}.
Case is distinguished.
The following are all examples of valid, distinct variable names:
\begin{verbatim}
a            tooBig?    a1B2c3%!?
```

```
A             %j         numberOfPoints
beta6         %J         numberofpoints
\end{verbatim}

The \axiomSyntax{:=} operator is the immediate \spadgloss{assignment}
operator.
Use it to associate a value with a variable.

\beginImportant
The syntax for immediate assignment for a single variable is
\centerline{{{\it variable} \axiom{:=} {\it expression}}}
The value returned by an immediate assignment is the value of
{\it expression}.
\endImportant

\xtc{
The right-hand side of the expression is evaluated,
yielding \axiom{1}.  This value is then assigned to \axiom{a}.
}{
\spadpaste{a := 1 \bound{a}}
}
\xtc{
The right-hand side of the expression is evaluated,
yielding \axiom{1}.  This value is then assigned to \axiom{b}.
Thus \axiom{a} and \axiom{b} both have the value \axiom{1} after
the sequence of assignments.
}{
\spadpaste{b := a \free{a}\bound{b}}
}
\xtc{
What is the value of \axiom{b} if \axiom{a} is
assigned the value \axiom{2}?
}{
\spadpaste{a := 2 \bound{a2}}
}
\xtc{
As you see, the value of \axiom{b} is left unchanged.
}{
\spadpaste{b \free{b}}
}
This is what we mean when we say this kind of assignment is
{\it immediate};
\axiom{b} has no dependency on \axiom{a} after the initial assignment.
This is the usual notion of assignment found in programming
languages such as C,
PASCAL
and FORTRAN.

Axiom provides delayed assignment with \axiomSyntax{==}.
This implements a
```

```
delayed evaluation of the right-hand side and dependency
checking.

\beginImportant
The syntax for delayed assignment is
\centerline{{{\it variable} \axiom{==} {\it expression}}}
The value returned by a delayed assignment is \void{}.
\endImportant

\xtc{
Using \axiom{a} and \axiom{b} as above, these are the corresponding
delayed assignments.
}{
\spadpaste{a == 1 \bound{ad}}
}
\xtc{
}{
\spadpaste{b == a \free{ad}\bound{bd}}
}
\xtc{
The right-hand side of each delayed assignment
is left unevaluated until the
variables on the left-hand sides are evaluated.
Therefore this evaluation and \ldots
}{
\spadpaste{a \free{ad}}
}
\xtc{
this evaluation seem the same as before.
}{
\spadpaste{b \free{bd}}
}
\xtc{
If we change \axiom{a} to \axiom{2}
}{
\spadpaste{a == 2 \bound{ad2}}
}
\xtc{
then
\axiom{a} evaluates to \axiom{2}, as expected, but
}{
\spadpaste{a \free{ad2}}
}
\xtc{
the value of \axiom{b} reflects the change to \axiom{a}.
}{
\spadpaste{b \free{bd ad2}}
}

It is possible to set several variables at the same time
```

```
by using
a \spadgloss{tuple} of variables and a tuple of expressions.\footnote{A
\spadgloss{tuple} is a collection of things separated by commas, often
surrounded by parentheses.}

\beginImportant
The syntax for multiple immediate assignments is
\centerline{{{\tt ( \subscriptIt{var}{1}, \subscriptIt{var}{2},
\ldots, \subscriptIt{var}{N} ) := ( \subscriptIt{expr}{1},
\subscriptIt{expr}{2}, \ldots, \subscriptIt{expr}{N} ) }}}
The value returned by an immediate assignment is the value of
\subscriptIt{expr}{N}.
\endImportant

\xtc{
This sets \axiom{x} to \axiom{1} and \axiom{y} to \axiom{2}.
}{
\spadpaste{(x,y) := (1,2) \bound{x}\bound{y}}
}
Multiple immediate assigments are parallel in the sense that the
expressions on the right are all evaluated before any assignments
on the left are made.
However, the order of evaluation of these expressions is undefined.
\xtc{
You can use multiple immediate assignment to swap the
values held by variables.
}{
\spadpaste{(x,y) := (y,x) \free{x y}\bound{swap}}
}
\xtc{
\axiom{x} has the previous value of \axiom{y}.
}{
\spadpaste{x \free{swap}}
}
\xtc{
\axiom{y} has the previous value of \axiom{x}.
}{
\spadpaste{y \free{swap}}
}

There is no syntactic form for multiple delayed assignments.
See the discussion in
\downlink{``Delayed Assignments vs. Functions with No Arguments''}
{ugUserDelayPage}
in Section 6.8\ignore{ugUserDelay}
about how Axiom differentiates between delayed assignments and
user functions of no arguments.

8.0.51 Blocks

⇒ “notitle” (ugLangIfPage) 8.0.52 on page 1737

— **ug05.ht** —

```
\begin{page}{ugLangBlocksPage}{5.2. Blocks}
```

```
\beginscroll

%%
%% We should handle tabs in pile correctly but so far we do not.
%%

A \spadgloss{block} is a sequence of expressions evaluated
in the order that they appear, except as modified by control expressions
such as \axiom{break},
\spadkey{break}
\axiom{return},
\spadkey{return}
\axiom{iterate} and
\spadkey{iterate}
\axiom{if-then-else} constructions.
The value of a block is the value of the expression last evaluated
in the block.

To leave a block early, use \axiomSyntax{=>}.
For example, \axiom{i < 0 => x}.
The expression before the \axiomSyntax{=>} must evaluate to
\axiom{true} or \axiom{false}.
The expression following the \axiomSyntax{=>} is the return value
for the block.

A block can be constructed in two ways:
\indent{4}
\beginitems
\item[1. ] the expressions can be separated by semicolons
and the resulting expression surrounded by parentheses, and
\item[2. ] the expressions can be written on succeeding lines with
each line indented the same number of spaces (which must be greater
than zero).
A block entered in this form is
called a \spadgloss{pile}.
\enditems
\indent{0}
Only the first form is available if you are entering expressions
directly to Axiom.
Both forms are available in {\bf .input} files.

\beginImportant
The syntax for a simple block of expressions entered interactively is
\centerline{{{\tt ( \subscriptIt{expression}{1};
\subscriptIt{expression}{2}; \ldots; \subscriptIt{expression}{N} )}}}
The value returned by a block is the value of an
\axiomSyntax{=>} expression, or \subscriptIt{expression}{N}
if no \axiomSyntax{=>} is encountered.
\endImportant
```

```
In {\bf .input} files, blocks can also be written using
\spadglossSee{piles}{pile}.
The examples throughout this book are assumed to come from
{\bf .input} files.

\xtc{
In this example, we assign a rational number to \axiom{a} using a block
consisting of three expressions.
This block is written as a pile.
Each expression in the pile has the same indentation, in this case two
spaces to the right of the first line.
}{
\begin{spadsrc}
a :=
  i := gcd(234,672)
  i := 3*i**5 - i + 1
  1 / i
\end{spadsrc}
}
\xtc{
Here is the same block written on one line.
This is how you are required to enter it at the input prompt.
}{
\spadpaste{a := (i := gcd(234,672); i := 3*i**5 - i + 1; 1 / i)}
}
\xtc{
Blocks can be used to put several expressions on one line.
The value returned is that of the last expression.
}{
\spadpaste{(a := 1; b := 2; c := 3; [a,b,c]) \bound{a b c}}
}

Axiom gives you two ways of writing a block and the
preferred way in an {\bf .input} file is to use a pile.
Roughly speaking, a pile is
a block whose constituent expressions are indented the same amount.
You begin a pile by starting a new line for the first expression,
indenting it to the right of the previous line.
You then enter the second expression on a new line, vertically aligning
it with the first line. And so on.
If you need to enter an inner pile, further indent its lines to the right
of the outer pile.
Axiom knows where a pile ends.
It ends when a subsequent line is indented to the left of the pile or
the end of the file.

\xtc{
Blocks can be used to perform several steps before an assignment
(immediate or delayed) is made.
}{
```

```
\begin{spadsrc}[\free{a b}]
d :=
   c := a**2 + b**2
   sqrt(c * 1.3)
\end{spadsrc}
}
\xtc{
Blocks can be used in the arguments to functions.
(Here \axiom{h} is assigned \axiom{2.1 + 3.5}.)
}{
\begin{spadsrc}[\bound{h}]
h := 2.1 +
   1.0
   3.5
\end{spadsrc}
}
\xtc{
Here the second argument to \axiomFun{eval} is \axiom{x = z}, where
the value of \axiom{z} is computed in the first line of the block
starting on the second line.
}{

8.0.52 if-then-else

⇒ "notitle" (ugTypesResolvePage) 6.0.31 on page 1670
⇒ "notitle" (ugTypesPkgCallPage) 6.0.30 on page 1661

— **ug05.ht** —

```
\begin{page}{ugLangIfPage}{5.3. if-then-else}
\beginscroll

Like many other programming languages, Axiom uses the three
keywords \spadkey{if} \axiom{if, then} \spadkey{then} and \axiom{else}
\spadkey{else} to form
conditional expressions.
The \axiom{else} part of the conditional is optional.
The expression between the \axiom{if} and \axiom{then} keywords
is a
\spadgloss{predicate}: an expression that evaluates to or is
convertible to either {\tt true} or {\tt false}, that is,
a \axiomType{Boolean}.
```

```
\beginImportant The syntax for conditional expressions is
\centerline{{{\tt if {\it predicate} then \subscriptIt{expression}{1}
else \subscriptIt{expression}{2}}}} where the \axiom{else}
\subscriptIt{\it expression}{2} part is optional.  The value returned
from a conditional expression is \subscriptIt{\it expression}{1} if
the predicate evaluates to \axiom{true} and \subscriptIt{\it
expression}{2} otherwise.  If no \axiom{else} clause is given, the
value is always \void{}.  \endImportant

An \axiom{if-then-else} expression always returns a value.
If the
\axiom{else} clause is missing then the entire expression returns
\void{}.
If both clauses are present, the type of the value returned by \axiom{if}
is obtained by resolving the types of the values of the two clauses.
See \downlink{``Resolving Types''}{ugTypesResolvePage}
in Section 2.10\ignore{ugTypesResolve}
for more information.

The predicate must evaluate to, or be convertible to, an object of type
\axiomType{Boolean}: {\tt true} or {\tt false}.
By default, the equal sign \spadopFrom{=}{Equation} creates
an equation.
\xtc{
This is an equation.
In particular, it is an object of type
\axiomType{Equation Polynomial Integer}.
}{
\spadpaste{x + 1 = y}
}
However, for predicates in \axiom{if} expressions, Axiom
places a default target type of \axiomType{Boolean} on the
predicate and equality testing is performed.
Thus you need not qualify the \axiomSyntax{=} in any way.
In other contexts you may need to tell Axiom that you want
to test for equality rather than create an equation.
In those cases, use \axiomSyntax{@} and a target type of
\axiomType{Boolean}.
See \downlink{``Package Calling and Target Types''}
{ugTypesPkgCallPage} in Section 2.9
\ignore{ugTypesPkgCall} for more information.

The compound symbol meaning ``not equal'' in Axiom is
``\texht{$\sim =$}{\axiom{~=}}''.
This can be used directly without a package call or a target
specification. The expression
\axiom{a} \texht{$\sim =$}{\axiom{~=}} \axiom{b} is directly
translated into \axiom{not (a = b)}.

Many other functions have return values of type \axiomType{Boolean}.
```

```
These include \axiom{<}, \axiom{<=}, \axiom{>},
\axiom{>=}, \texht{$\sim =$}{\axiom{~=}} and \axiom{member?}.
By convention, operations with names ending in \axiomSyntax{?}
return \axiomType{Boolean} values.

The usual rules for piles are suspended for conditional expressions.
In {\bf .input} files, the \axiom{then} and
\axiom{else} keywords can begin in the same column as the corresponding
\axiom{if} but may also appear to the right.
Each of the following styles of writing \axiom{if-then-else}
expressions is acceptable:
\begin{verbatim}
if i>0 then output("positive") else output("nonpositive")

if i > 0 then output("positive")
  else output("nonpositive")

if i > 0 then output("positive")
else output("nonpositive")

if i > 0
then output("positive")
else output("nonpositive")

if i > 0
  then output("positive")
  else output("nonpositive")
\end{verbatim}

A block can follow the \axiom{then} or \axiom{else} keywords.
In the following two assignments to \axiom{a},
the \axiom{then} and \axiom{else}
clauses each are followed by two-line piles.
The value returned in each is the value of the second line.

\begin{verbatim}
a :=
  if i > 0 then
    j := sin(i * pi())
    exp(j + 1/j)
  else
    j := cos(i * 0.5 * pi())
    log(abs(j)**5 + 1)

a :=
  if i > 0
    then
      j := sin(i * pi())
      exp(j + 1/j)
    else
```

```
      j := cos(i * 0.5 * pi())
      log(abs(j)**5 + 1)
\end{verbatim}
These are both equivalent to the following:
\begin{verbatim}
a :=
  if i > 0 then (j := sin(i * pi()); exp(j + 1/j))
  else (j := cos(i * 0.5 * pi()); log(abs(j)**5 + 1))
\end{verbatim}

\begin{page}{ugLangLoopsPage}{5.4. Loops}
\beginscroll

A \spadgloss{loop} is an expression that contains another expression,
called the {\it loop body}, which is to be evaluated zero or more
times.
All loops contain the \axiom{repeat} keyword and return \void{}.
Loops can contain inner loops to any depth.

\beginImportant
The most basic loop is of the form
\centerline{{\axiom{repeat} {\it loopBody}}}
Unless {\it loopBody} contains a \axiom{break} or \axiom{return}
expression, the loop repeats forever.
The value returned by the loop is \void{}.
\endImportant

8.0.54 Compiling vs. Interpreting Loops

⇒ "notitle" (ugUserCompIntPage) ?? on page ??
— **ug05.ht** —

```
\begin{page}{ugLangLoopsCompIntPage}
{5.4.1. Compiling vs. Interpreting Loops}
\beginscroll

Axiom tries to determine completely the type of every
object in a loop and then to translate the loop body to LISP or even to
machine code.
This translation is called \spadglossSee{compilation}{compiler}.

If Axiom decides that it cannot compile the loop, it issues a
message stating the problem and then the following message:
%
\centerline{
{{\bf We will attempt to step through and interpret the code.}}}
%
It is still possible that Axiom can evaluate the loop but in
\spadgloss{interpret-code mode}.
See \downlink{``Compiling vs. Interpreting''}{ugUserCompIntPage}
in Section 6.10\ignore{ugUserCompInt} where
this is discussed in terms
of compiling versus interpreting functions.

\endscroll
\autobuttons
\end{page}
```

————

8.0.55 return in Loops

⇒ "notitle" (ugUserBlocksPage) ?? on page ??
— **ug05.ht** —

```
\begin{page}{ugLangLoopsReturnPage}{5.4.2. return in Loops}
\beginscroll

A \axiom{return} expression is used to exit a function with
a particular value.
In particular, if a \axiom{return} is in a loop within the
\spadkey{return}
```

```
function, the loop is terminated whenever the \axiom{return}
is evaluated.
%> This is a bug! The compiler should never accept allow
%> Void to be the return type of a function when it has to use
%> resolve to determine it.
\xtc{
Suppose we start with this.
}{
\begin{spadsrc}[\bound{f}]
f() ==
  i := 1
  repeat
    if factorial(i) > 1000 then return i
    i := i + 1
\end{spadsrc}
}
\xtc{
When \axiom{factorial(i)} is big enough, control passes from
inside the loop all the way outside the function, returning the
value of \axiom{i} (or so we think).
}{
\spadpaste{f() \free{f}}
}

What went wrong?
Isn't it obvious that this function should return an integer?
Well, Axiom makes no attempt to analyze the structure of a
loop to determine if it always returns a value because, in
general, this is impossible.
So Axiom has this simple rule: the type of the function is
determined by the type of its body, in this case a block.
The normal value of a block is the value of its last expression,
in this case, a loop.
And the value of every loop is \void{}!
So the return type of \userfun{f} is \axiomType{Void}.

There are two ways to fix this.
The best way is for you to tell Axiom what the return type
of \axiom{f} is.
You do this by giving \axiom{f} a declaration \axiom{f: () ->
Integer} prior to calling for its value.
This tells Axiom: ``trust me---an integer is returned.''
We'll explain more about this in the next chapter.
Another clumsy way is to add a dummy expression as follows.

\xtc{
Since we want an integer, let's stick in a dummy final expression that is
an integer and will never be evaluated.
}{
\begin{spadsrc}[\bound{f1}]
f() ==
  i := 1
  repeat
    if factorial(i) > 1000 then return i
    i := i + 1
  0
\end{spadsrc}
}
\xtc{
When we try \userfun{f} again we get what we wanted.
See
\downlink{``Functions Defined with Blocks''}{ugUserBlocksPage}
in Section 6.15\ignore{ugUserBlocks}
for more information.
}{
\spadpaste{f() \free{f1}}
}

\endscroll
\autobuttons
\end{page}

8.0.56 break in Loops

⇒ "notitle" (ugLangLoopsReturnPage) 8.0.55 on page 1742

— **ug05.ht** —

```
\begin{page}{ugLangLoopsBreakPage}{5.4.3. break in Loops}
\beginscroll

The \axiom{break} keyword is often more useful
\spadkey{break}
in terminating
a loop.
%>  and more in keeping with the ideas of structured programming.
A \axiom{break} causes control to transfer to the expression
immediately following the loop.
As loops always return \void{},
you cannot return a value with \axiom{break}.
That is, \axiom{break} takes no argument.

\xtc{
This example is a modification of the last example in
\texht{the previous section}{
\downlink{``return in Loops''}{ugLangLoopsReturnPage}
in Section 5.4.2\ignore{ugLangLoopsReturn}}.
Instead of using \axiom{return}, we'll use \axiom{break}.
}{
\begin{spadsrc}[\bound{f1}]
f() ==
  i := 1
  repeat
    if factorial(i) > 1000 then break
    i := i + 1
  i
\end{spadsrc}
}
\xtc{
The loop terminates when \axiom{factorial(i)} gets big enough,
the last line of the function evaluates to the corresponding ``good''
value of \axiom{i}, and the function terminates, returning that value.
}{
```

```
\spadpaste{f() \free{f1}}
}
\xtc{
You can only use \axiom{break} to terminate the evaluation of one loop.
Let's consider a loop within a loop, that is, a loop with a nested loop.
First, we initialize two counter variables.
}{
\spadpaste{(i,j) := (1, 1) \bound{i}\bound{j}}
}
\xtc{
Nested loops must have multiple \axiom{break}
expressions at the appropriate nesting level.
How would you rewrite this so \axiom{(i + j) > 10} is only evaluated once?
}{
\begin{spadsrc}[\free{i j}]
repeat
  repeat
    if (i + j) > 10 then break
    j := j + 1
  if (i + j) > 10 then break
  i := i + 1
\end{spadsrc}
}

8.0.57 break vs. => in Loop Bodies

— ug05.ht —

```
\begin{page}{ugLangLoopsBreakVsPage}
{5.4.4. break vs. {\tt =>} in Loop Bodies}
\beginscroll

Compare the following two loops:

\begin{verbatim}
i := 1                            i := 1
repeat                            repeat
  i := i + 1                        i := i + 1
  i > 3 => i                        if i > 3 then break
  output(i)                         output(i)
\end{verbatim}

In the example on the left, the values
\mathOrSpad{2} and \mathOrSpad{3} for \axiom{i} are displayed
but then the \axiomSyntax{=>} does not allow control to reach the call to
\axiomFunFrom{output}{OutputForm} again.
The loop will not terminate
until you run out of space or interrupt the execution.
The variable \axiom{i} will continue to be incremented because
the \axiomSyntax{=>} only means to leave the {\it block,} not the loop.

In the example on the right,
upon reaching \mathOrSpad{4}, the \axiom{break} will be
executed, and both the block and the loop will terminate.
This is one of the reasons why both \axiomSyntax{=>} and \axiom{break} are
```

```
provided.
Using a \axiom{while} clause (see below) with the \axiomSyntax{=>}
\spadkey{while}
lets you simulate the action of \axiom{break}.

\endscroll
\autobuttons
\end{page}
```

———-

8.0.58 More Examples of break

⇒ "notitle" (ugLangLoopsForInPage) 8.0.61 on page 1766

— **ug05.ht** —

```
\begin{page}{ugLangLoopsBreakMorePage}{5.4.5. More Examples of break}
\beginscroll

Here we give four examples of \axiom{repeat} loops that
terminate when a value exceeds a given bound.

\texht{\vskip 1pc}{}
\xtc{
First, initialize \axiom{i} as the loop counter.
}{
\spadpaste{i := 0 \bound{i}}
}
\xtc{
Here is the first loop.
When the square of \axiom{i} exceeds \axiom{100}, the loop terminates.
}{
\begin{spadsrc}[\free{i}\bound{i1}]
repeat
  i := i + 1
  if i**2 > 100 then break
\end{spadsrc}
}
\xtc{
Upon completion, \axiom{i} should have the value \axiom{11}.
}{
\spadpaste{i \free{i1}}
}
%
%
\xtc{
Do the same thing except use \axiomSyntax{=>} instead
```

```
an \axiom{if-then} expression.
}{
\spadpaste{i := 0 \bound{i2}}
}
\xtc{
}{
\begin{spadsrc}[\free{i2}\bound{i3}]
repeat
  i := i + 1
  i**2 > 100 => break
\end{spadsrc}
}
\xtc{
}{
\spadpaste{i \free{i3}}
}
%
%
\xtc{
As a third example, we use a simple loop to compute \axiom{n!}.
}{
\spadpaste{(n, i, f) := (100, 1, 1) \bound{n}\bound{i4}\bound{f}}
}
\xtc{
Use \axiom{i} as the iteration variable and \axiom{f}
to compute the factorial.
}{
\begin{spadsrc}[\bound{f1}\bound{i5}\free{f i4 n}]
repeat
  if i > n then break
  f := f * i
  i := i + 1
\end{spadsrc}
}
\xtc{
Look at the value of \axiom{f}.
}{
\spadpaste{f \free{f1}}
}
%
%
\xtc{
Finally, we show an example of nested loops.
First define a four by four matrix.
}{
\spadpaste{m :=
matrix {\tt{}21,37,53,14],\ [8,-24,22,-16],\ [2,10,15,14],\ \nwnewline
[26,33,55,-13} \bound{m2}}
}
\xtc{
```

```
Next, set row counter \axiom{r} and column counter \axiom{c} to
\mathOrSpad{1}.
Note: if we were writing a function, these would all be local
variables rather than global workspace variables.
}{
\spadpaste{(r, c) := (1, 1) \bound{r}\bound{c}}
}
\xtc{
Also, let \axiom{lastrow} and
\axiom{lastcol} be the final row and column index.
}{
\spadpaste{(lastrow, lastcol) := (nrows(m), ncols(m))
\bound{lastrow}\bound{lastcol}\free{m2}}
}
%
\xtc{
Scan the rows looking for the first negative element.
We remark that you can reformulate this example in a better, more
concise form by using a \axiom{for} clause with \axiom{repeat}.
See
\downlink{``for Loops''}{ugLangLoopsForInPage}
in Section 5.4.8\ignore{ugLangLoopsForIn}
for more information.
}{
\begin{spadsrc}[\free{m2 r c lastrow lastcol}]
repeat
  if r > lastrow then break
  c := 1
  repeat
    if c > lastcol then break
    if elt(m,r,c) < 0 then
      output [r, c, elt(m,r,c)]
      r := lastrow
      break     -- don't look any further
    c := c + 1
  r := r + 1
\end{spadsrc}
}

———-

8.0.60 while Loops

— ug05.ht —

```
\begin{page}{ugLangLoopsWhilePage}{5.4.7. while Loops}
\beginscroll

The \axiom{repeat} in a loop can be modified by adding one or
more \axiom{while} clauses.
\spadkey{while}
Each clause contains a \spadgloss{predicate}
immediately following the \axiom{while} keyword.
The predicate is tested {\it before}
the evaluation of the body of the loop.
The loop body is evaluated whenever the predicates in a \axiom{while}
clause are all \axiom{true}.
```

```
\beginImportant
The syntax for a simple loop using \axiom{while} is
\centerline{{\axiom{while} {\it predicate} \axiom{repeat} {\it loopBody}}}
The {\it predicate} is evaluated before {\it loopBody} is evaluated.
A \axiom{while} loop terminates immediately when {\it predicate}
evaluates to \axiom{false} or when a \axiom{break} or \axiom{return}
expression is evaluated in {\it loopBody}.
The value returned by the loop is \void{}.
\endImportant

\xtc{
Here is a simple example of using \axiom{while} in a loop.
We first initialize the counter.
}{
\spadpaste{i := 1 \bound{i}}
}
\xtc{
The steps involved in computing this example are
(1) set \axiom{i} to \axiom{1}, (2) test the condition \axiom{i < 1} and
determine that it is not true, and (3) do not evaluate the
loop body and therefore do not display \axiom{"hello"}.
}{
\begin{spadsrc}[\free{i}]
while i < 1 repeat
  output "hello"
  i := i + 1
\end{spadsrc}
}
\xtc{
If you have multiple predicates to be tested use the
logical \axiom{and} operation to separate them.
Axiom evaluates these predicates from left to right.
}{
\spadpaste{(x, y) := (1, 1) \bound{x}\bound{y}}
}
\xtc{
}{
\begin{spadsrc}[\free{x y}]
while x < 4 and y < 10 repeat
  output [x,y]
  x := x + 1
  y := y + 2
\end{spadsrc}
}
\xtc{
A \axiom{break} expression can be included in a loop body to terminate
a loop even if the predicate in any \axiom{while} clauses are not
\axiom{false}.
}{
\spadpaste{(x, y) := (1, 1) \bound{x1}\bound{y1}}
}
\xtc{
This loop has multiple \axiom{while} clauses and the loop terminates
before any one of their conditions evaluates to \axiom{false}.
}{
\begin{spadsrc}[\free{x1 y1}]
while x < 4 while y < 10 repeat
  if x + y > 7 then break
  output [x,y]
  x := x + 1
  y := y + 2
\end{spadsrc}
}
\xtc{
Here's a different version of the nested loops that looked
for the first negative element in a matrix.
}{
\spadpaste{m := matrix {\tt{}21,37,53,14],\ [8,-24,22,-16],\ [2,10,15,14],\ \nwnewline
[26,33,55,-13} \bound{m2}}
}
\xtc{
Initialized the row index to \axiom{1} and
get the number of rows and columns.
If we were writing a function, these would all be
local variables.
}{
\spadpaste{r := 1 \bound{r}}
}
\xtc{
}{
\spadpaste{(lastrow, lastcol) := (nrows(m), ncols(m))
\bound{lastrow}\bound{lastcol}\free{m2}}
}
%
\xtc{
Scan the rows looking for the first negative element.
}{
\begin{spadsrc}[\free{m2 r lastrow lastcol}]
while r <= lastrow repeat
  c := 1  -- index of first column
  while c <= lastcol repeat
    if elt(m,r,c) < 0 then
      output [r, c, elt(m,r,c)]
      r := lastrow
      break     -- don't look any further
    c := c + 1
  r := r + 1
\end{spadsrc}
}
```

```

8.0.61 for Loops

— ug05.ht —

```
\begin{page}{ugLangLoopsForInPage}{5.4.8. for Loops}
\beginscroll

Axiom provides the \axiom{for}
\spadkey{for}
and \axiom{in}
\spadkey{in}
keywords in \axiom{repeat} loops,
allowing you to iterate across all
elements of a list, or to have a variable take on integral values
from a lower bound to an upper bound.
We shall refer to these modifying clauses of \axiom{repeat} loops as
\axiom{for} clauses.
These clauses can be present in addition to \axiom{while} clauses.
As with all other types of \axiom{repeat} loops, \axiom{break} can
\spadkey{break}
be used to prematurely terminate the evaluation of the loop.

\beginImportant
The syntax for a simple loop using \axiom{for} is
\centerline{{\axiom{for} {\it iterator} \axiom{repeat} {\it loopBody}}}
The {\it iterator} has several forms.
Each form has an end test which is evaluated
before {\it loopBody} is evaluated.
A \axiom{for} loop terminates immediately when the end test
succeeds (evaluates to \axiom{true}) or when a \axiom{break} or
\axiom{return} expression is evaluated in {\it loopBody}.
```

```
The value returned by the loop is \void{}.
\endImportant

\endscroll
\autobuttons
\end{page}

8.0.62 for i in n..m repeat

⇒ "notitle" (SegmentXmpPage) **??** on page **??**

— **ug05.ht** —

```
\begin{page}{ugLangLoopsForInNMPage}{5.4.9. for i in n..m repeat}
\beginscroll

If \axiom{for}
\spadkey{for}
is followed by a variable name, the \axiom{in}
\spadkey{in}
keyword and then an integer segment of the form \axiom{n..m},
the end test for this loop is the predicate \axiom{i > m}.
The body of the loop is evaluated \axiom{m-n+1} times if this
number is greater than 0.
If this number is less than or equal to 0, the loop body is not evaluated
at all.

The variable \axiom{i} has the value
\axiom{n, n+1, ..., m} for successive iterations
of the loop body.
The loop variable is a \spadgloss{local variable}
within the loop body: its value is not available outside the loop body
and its value and type within the loop body completely mask any outer
definition of a variable with the same name.

%
\xtc{
This loop prints the values of
\texht{${10}^3$, ${11}^3$, and $12^3$}{\axiom{10**3, 11**3, and 12**3}}:

8.0.63 for i in n..m by s repeat

— **ug05.ht** —

```
\begin{page}{ugLangLoopsForInNMSPage}{5.4.10. for i in n..m by s repeat}
\beginscroll

By default, the difference between values taken on by a variable in loops
such as \axiom{for i in n..m repeat ...} is \mathOrSpad{1}.
It is possible to supply another, possibly negative, step value by using
the \axiom{by}
\spadkey{by}
keyword along with \axiom{for} and \axiom{in}.
Like the upper and lower bounds, the step value following the
\axiom{by} keyword must be an integer.
Note that the loop
\axiom{for i in 1..2 by 0 repeat output(i)}
will not terminate by itself, as the step value does not change the index
from its initial value of \mathOrSpad{1}.

\xtc{
This expression displays the odd integers between two bounds.
}{

8.0.65 for x in l repeat

— ug05.ht —

```
\begin{page}{ugLangLoopsForInXLPage}{5.4.12. for x in l repeat}
\beginscroll

Another variant of the \axiom{for} loop has the form:
\centerline{{{\it \axiom{for} x \axiom{in} list \axiom{repeat} loopBody}}}
This form is used when you want to iterate directly over the
elements of a list.
In this form of the \axiom{for} loop, the variable
\axiom{x} takes on the value of each successive element in \axiom{l}.
The end test is most simply stated in English: ``are there no more
```

```
\axiom{x} in \axiom{l}?''

\xtc{
If \axiom{l} is this list,
}{
\spadpaste{l := [0,-5,3] \bound{l}}
}
\xtc{
display all elements of \axiom{l}, one per line.
}{
\spadpaste{for x in l repeat output(x) \free{l}}
}

Since the list constructing expression \axiom{expand [n..m]} creates the
list \axiom{[n, n+1, ..., m]}\footnote{This list is empty if \axiom{n >
m}.}, you might be tempted to think that the loops
\begin{verbatim}
for i in n..m repeat output(i)
\end{verbatim}
and
\begin{verbatim}
for x in expand [n..m] repeat output(x)
\end{verbatim}
are equivalent.
The second form first creates the list
\axiom{expand [n..m]} (no matter how large it might be) and
then does the iteration.
The first form potentially runs in much less space, as the index variable
\axiom{i} is simply incremented once per loop and the list is not actually
created.
Using the first form is much more efficient.
%
\xtc{
Of course, sometimes you really want to iterate across a specific list.
This displays each of the factors of \axiom{2400000}.

8.0.66 “Such that” Predicates

— ug05.ht —

```
\begin{page}{ugLangLoopsForInPredPage}{5.4.13. ‘‘Such that’’ Predicates}
\beginscroll

A \axiom{for} loop can be followed by a \axiomSyntax{|} and then a
predicate.
The predicate qualifies the use of the values from the iterator following
the \axiom{for}.
Think of the vertical bar
\axiomSyntax{|} as the phrase ‘‘such that.’’
\xtc{
This loop expression
prints out the integers \axiom{n} in the given segment
such that \axiom{n} is odd.
}{
\spadpaste{for n in 0..4 | odd? n repeat output n}
}

\beginImportant
A \axiom{for} loop can also be written
\centerline{{\axiom{for} {\it iterator} \axiom{|} {\it predicate}
\axiom{repeat} {\it loopBody}}}
which is equivalent to:
\centerline{{\axiom{for} {\it iterator} \axiom{repeat if}}}
\centerline{{{\it predicate} \axiom{then} {\it loopBody} \axiom{else}
\axiom{iterate}}}
\endImportant

The predicate need not refer only to the variable in the \axiom{for} clause:
any variable in an outer scope can be part of the predicate.
\xtc{
In this example, the predicate on the inner \axiom{for} loop uses
\axiom{i} from the outer loop and the \axiom{j} from the \axiom{for}
clause that it directly modifies.
}{
\begin{spadsrc}
for i in 1..50 repeat

```

8.0.67 Parallel Iteration

⇒ “notitle” (ugLangLoopsForInPredPage) 8.0.66 on page 1776
— **ug05.ht** —

```
\begin{page}{ugLangLoopsParPage}{5.4.14. Parallel Iteration}
\beginscroll

The last example of
\texht{the previous section}{
\downlink{‘‘Such that Predicates’’}{ugLangLoopsForInPredPage}
in Section 5.4.13\ignore{ugLangLoopsForInPred}}
gives an example of
\spadgloss{nested iteration}: a loop is contained
in another loop.
Sometimes you want to iterate across two lists in parallel, or perhaps
you want to traverse a list while incrementing a variable.

\beginImportant
The general syntax of a repeat loop is
\centerline{{{\tt \subscriptIt{iterator}{1} \subscriptIt{iterator}{2}
\ldots \subscriptIt{iterator}{N} repeat {\it loopBody}}}}
where each {\it iterator} is either a \axiom{for} or a \axiom{while} clause.
The loop terminates immediately when the end test of any {\it iterator}
succeeds or when a \axiom{break} or \axiom{return} expression is evaluated
in {\it loopBody}.
The value returned by the loop is \void{}.
\endImportant

\xtc{
Here we write a loop to iterate across
two lists, computing the sum of the pairwise product
of elements. Here is the first list.
}{
\spadpaste{l := [1,3,5,7] \bound{l}}
}
\xtc{
And the second.
}{
\spadpaste{m := [100,200] \bound{m}}
}
\xtc{
The initial value of the sum counter.
}{
\spadpaste{sum := 0 \bound{sum}}
}
\xtc{
The last two elements of \axiom{l} are not used in the calculation
because \axiom{m} has two fewer elements than \axiom{l}.
}{
\begin{spadsrc}[\bound{doit}\free{sum l m}]
for x in l for y in m repeat
    sum := sum + x*y
\end{spadsrc}
}
\xtc{
Display the ‘‘dot product.’’
}{
\spadpaste{sum \free{doit}}
}

\xtc{
Next, we write a loop to compute the sum of the products of the loop
elements with
their positions in the loop.
}{
\spadpaste{l := [2,3,5,7,11,13,17,19,23,29,31,37] \bound{l1}}
}
\xtc{
The initial sum.
}{
\spadpaste{sum := 0 \bound{sum1}}
}
\xtc{
Here looping stops when the list \axiom{l} is exhausted, even though
the \axiom{for i in 0..} specifies no terminating condition.
}{
\spadpaste{
for i in 0.. for x in l repeat sum := i * x \bound{doit1}\free{sum1 l1}}
}
\xtc{
Display this weighted sum.
}{
\spadpaste{sum \free{doit1}}
}

When \axiomSyntax{|} is used to qualify any of the \axiom{for} clauses in a
parallel iteration, the variables in the predicates can be from an outer
scope or from a \axiom{for} clause in or to the left of a modified clause.

This is correct:
\begin{verbatim}
for i in 1..10 repeat
  for j in 200..300 | odd? (i+j) repeat
    output [i,j]
\end{verbatim}
This is not correct since the variable \axiom{j} has not been
defined outside the inner loop.
\begin{verbatim}
```

```
for i in 1..10 | odd? (i+j) repeat  -- wrong, j not defined
  for j in 200..300 repeat
    output [i,j]
\end{verbatim}

%>\head{subsection}{Mixing Loop Modifiers}{ugLangLoopsMix}

\xtc{
This example shows that it is possible to mix several of the
forms of \axiom{repeat} modifying clauses on a loop.
}{
\begin{spadsrc}
for i in 1..10
    for j in 151..160 | odd? j
      while i + j < 160 repeat
        output [i,j]
\end{spadsrc}
}
%
Here are useful rules for composing loop expressions:
\indent{4}
\beginitems
\item[1. ] \axiom{while} predicates can only refer to variables that
are global (or in an outer scope)
or that are defined in \axiom{for} clauses to the left of the
predicate.
\item[2. ] A ``such that'' predicate (something following \axiomSyntax{|})
must directly follow a \axiom{for} clause and can only refer to
variables that are global (or in an outer scope)
or defined in the modified \axiom{for} clause
or any \axiom{for} clause to the left.

\begin{page}{ugLangItsPage}{5.5. Creating Lists and Streams with Iterators}
\beginscroll

All of what we did for loops in
\downlink{``Loops''}{ugLangLoopsPage}
in Section 5.4\ignore{ugLangLoops}
can be transformed into expressions that create lists
and streams.
The \axiom{repeat,} \axiom{break} or \axiom{iterate} words are not used but
all the other ideas carry over.
Before we give you the general rule, here are some examples which
give you the idea.

\xtc{
This creates a simple list of the integers from \axiom{1} to \axiom{10}.
}{
\spadpaste{list := [i for i in 1..10] \bound{list}}
}
\xtc{
Create a stream of the integers greater than or equal to \axiom{1}.
}{
\spadpaste{stream := [i for i in 1..] \bound{stream}}
}
\xtc{
This is a list of the prime integers between \axiom{1} and \axiom{10},
inclusive.
}{
\spadpaste{[i for i in 1..10 | prime? i]}
}
\xtc{
This is a stream of the prime integers greater than or equal to \axiom{1}.
}{
\spadpaste{[i for i in 1..   | prime? i]}
}
\xtc{
This is a list of the integers between \axiom{1} and \axiom{10},
inclusive, whose squares are less than \axiom{700}.
}{
\spadpaste{[i for i in 1..10 while i*i < 700]}
}
\xtc{
This is a stream of the integers greater than or equal to \axiom{1}
whose squares are less than \axiom{700}.
}{
\spadpaste{[i for i in 1..   while i*i < 700]}
}

Got the idea?
Here is the general rule.

\beginImportant
The general syntax of a collection is
\centerline{{{\tt [ {\it collectExpression} \subscriptIt{iterator}{1}
\subscriptIt{iterator}{2}  \ldots  \subscriptIt{iterator}{N} ]}}}
where each \subscriptIt{iterator}{i} is either a \axiom{for} or a
\axiom{while} clause.
The loop terminates immediately when the end test of any
\subscriptIt{iterator}{i} succeeds or when a \axiom{return} expression is
evaluated in {\it collectExpression}.
The value returned by the collection is either a list or a stream of
elements, one for each iteration of the {\it collectExpression}.
\endImportant

Be careful when you use \axiom{while}
to create a stream.
By default, Axiom tries to compute and display the first ten elements
of a stream.
If the \axiom{while} condition is not satisfied quickly, Axiom
can spend a long (possibly infinite) time trying to compute
the elements.
Use \spadcmd{)set streams calculate} to change the default
to something else.
This also affects the number of terms computed and displayed for power
series.
For the purposes of this book, we have used this system
command to display fewer than ten terms.
\xtc{
Use nested iterators to create lists of
```

```
lists which can then be given as an argument to \axiomFun{matrix}.
}{
\spadpaste{matrix {\tt{}x**i+j\ for\ i\ in\ 1..3]\ for\ j\ in\ 10..12]{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
You\ can\ also\ create\ lists\ of\ streams,\ streams\ of\ lists\ and\nwnewline
streams\ of\ streams.\nwnewline
Here\ is\ a\ stream\ of\ streams.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}[[i/j\ for\ i\ in\ j+1..]\ for\ j\ in\ 1..]{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
You\ can\ use\ parallel\ iteration\ across\ lists\ and\ streams\ to\ create\nwnewline
new\ lists.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}[i/j\ for\ i\ in\ 3..\ by\ 10\ for\ j\ in\ 2..]{\char125}\nwnewli
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Iteration\ stops\ if\ the\ end\ of\ a\ list\ or\ stream\ is\ reached.\nwnewline
{\char125}{\char123}\nwnewline

{\char92}beginscroll\nwnewline
\nwnewline
We\ conclude\ this\ chapter\ with\ an\ example\ of\ the\ creation\ and\nwnewline
manipulation\ of\ infinite\ streams\ of\ prime\ integers.\ \ This\ might\ be\nwnewline
useful\ for\ experiments\ with\ numbers\ or\ other\ applications\ where\ you\nwnewline
are\ using\ sequences\ of\ primes\ over\ and\ over\ again.\ \ As\ for\ all\nwnewline
streams,\ the\ stream\ of\ primes\ is\ only\ computed\ as\ far\ out\ as\ you\ need.\nwnewline
Once\ computed,\ however,\ all\ the\ primes\ up\ to\ that\ point\ are\ saved\ for\nwnewline
future\ reference.\nwnewline
\nwnewline
Two\ useful\ operations\ provided\ by\ the\ Axiom\ library\ are\nwnewline
{\char92}axiomFunFrom{\char123}prime?{\char125}{\char123}IntegerPrimesPackage{\char125}\ and\nwnewline
{\char92}axiomFunFrom{\char123}nextPrime{\char125}{\char123}IntegerPrimesPackage{\char125}.\nwnewline
A\ straight-forward\ way\ to\ create\ a\ stream\ of\nwnewline
prime\ numbers\ is\ to\ start\ with\ the\ stream\ of\ positive\ integers\ \nwnewline
{\char92}axiom{\char123}[2,..]{\char125}\ and\ filter\ out\ those\ that\ are\ prime.\nwnewline
{\char92}xtc{\char123}\nwnewline
Create\ a\ stream\ of\ primes.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}primes\ :\ Stream\ Integer\ :=\ [i\ for\ i\ in\ 2..\ |\ prime?\ i]{\char125}
{\char125}\nwnewline
A\ more\ elegant\ way,\ however,\ is\ to\ use\ the\ {\char92}axiomFunFrom{\char123}generate{\char125}{\c
operation\ from\ {\char92}axiomType{\char123}Stream{\char125}.\nwnewline
Given\ an\ initial\ value\ {\char92}axiom{\char123}a{\char125}\ and\ a\ function\ {\char92}axiom{\char12
{\char92}axiomFunFrom{\char123}generate{\char125}{\char123}Stream{\char125}\nwnewline
constructs\ the\ stream\ {\char92}axiom{\char123}[a,\ f(a),\ f(f(a)),\ ...]{\char125}.\nwnewline
This\ function\ gives\ you\ the\ quickest\ method\ of\ getting\ the\ stream\ of\ primes.\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ is\ how\ you\ use\nwnewline
{\char92}axiomFunFrom{\char123}generate{\char125}{\char123}Stream{\char125}\ to\nwnewline
generate\ an\ infinite\ stream\ of\ primes.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}primes\ :=\ generate(nextPrime,2){\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Once\ the\ stream\ is\ generated,\ you\ might\ only\ be\ interested\ in\nwnewline
primes\ starting\ at\ a\ particular\ value.\nwnewline
```

```
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}smallPrimes\ :=\ [p\ for\ p\ in\ primes\ |\ p\ >\ 1000]\ \nwnewli
{\char92}bound{\char123}smallPrimes{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Here\ are\ the\ first\ 11\ primes\ greater\ than\ 1000.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}[p\ for\ p\ in\ smallPrimes\ for\ i\ in\ 1..11]\ {\char92}free{\c
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Here\ is\ a\ stream\ of\ primes\ between\ 1000\ and\ 1200.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}[p\ for\ p\ in\ smallPrimes\ while\ p\ <\ 1200]\ {\char92}free{\c
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
To\ get\ these\ expanded\ into\ a\ finite\ stream,\nwnewline
you\ call\ {\char92}axiomFunFrom{\char123}complete{\char125}{\char123}Stream{\char125}\ on\ t
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}complete\ {\char92}{\char37}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Twin\ primes\ are\ consecutive\ odd\ number\ pairs\ which\ are\ prime.\nwnewline
Here\ is\ the\ stream\ of\ twin\ primes.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}twinPrimes\ :=\ [[p,p+2]\ for\ p\ in\ primes\ |\ prime?(p\ +\ 2)]
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Since\ we\ already\ have\ the\ primes\ computed\ we\ can\nwnewline
avoid\ the\ call\ to\ {\char92}axiomFunFrom{\char123}prime?{\char125}{\char123}IntegerPrimesP
by\ using\ a\ double\ iteration.\nwnewline
This\ time\ we'll\ just\ generate\ a\ stream\ of\ the\ first\ of\ the\ twin\ primes.\nwnewlin
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}\nwnewline
firstOfTwins:=\ [p\ for\ p\ in\ primes\ for\ q\ in\ rest\ primes\ |\ q=p+2]{\char125}\nwnewli
{\char125}\nwnewline
\nwnewline
Let's\ try\ to\ compute\ the\ infinite\ stream\ of\ triplet\ primes,\nwnewline
the\ set\ of\ primes\ {\char92}axiom{\char123}p{\char125}\ such\ that\ {\char92}axiom{\char12
are\ primes.\ For\ example,\ {\char92}axiom{\char123}[3,5,7]{\char125}\ is\ a\ triple\ prime
We\ could\ do\ this\ by\ a\ triple\ {\char92}axiom{\char123}for{\char125}\ iteration.\nwnewli
A\ more\ economical\ way\ is\ to\ use\ {\char92}userfun{\char123}firstOfTwins{\char125}.\nwne
This\ time\ however,\ put\ a\ semicolon\ at\ the\ end\ of\ the\ line.\nwnewline
\nwnewline
{\char92}xtc{\char123}Create\ the\ stream\ of\ firstTriplets.\nwnewline
Put\ a\ semicolon\ at\ the\ end\ so\ that\ no\nwnewline
elements\ are\ computed.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}firstTriplets\ :=\ \nwnewline
[p\ for\ p\ in\ firstOfTwins\ for\ q\ in\ rest\ firstOfTwins\ |\ q\ =\ p+2];{\char125}\nwnewl
{\char125}\nwnewline
```

```
\nwnewline
What\ happened?\ \ As\ you\ know,\ by\ default\ Axiom\ displays\ the\ first\ ten\nwnewline
elements\ of\ a\ stream\ when\ you\ first\ display\ it.\ \ And,\ therefore,\ it\nwnewline
needs\ to\ compute\ them!\ \ If\ you\ want\ {\char123}{\char92}it\ no{\char125}\ elements\ computed,\ ju
terminate\ the\ expression\ by\ a\ semicolon\ ({\char92}axiomSyntax{\char123};{\char125}).{\char92}footn
Why\ does\ this\ happen?\ The\ semi-colon\ prevents\ the\ display\ of\ the\nwnewline
result\ of\ evaluating\ the\ expression.\ \ Since\ no\ stream\ elements\ are\nwnewline
needed\ for\ display\ (or\ anything\ else,\ so\ far),\ none\ are\ computed.\nwnewline
{\char125}\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
Compute\ the\ first\ triplet\ prime.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}firstTriplets.1{\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
If\ you\ want\ to\ compute\ another,\ just\ ask\ for\ it.\nwnewline
But\ wait\ a\ second!\nwnewline
Given\ three\ consecutive\ odd\ integers,\ one\ of\ them\ must\ be\ divisible\nwnewline
by\ 3.\ Thus\ there\ is\ only\ one\ triplet\ prime.\nwnewline
But\ suppose\ that\ you\ did\ not\ know\ this\ and\ wanted\ to\ know\ what\ was\ the\nwnewline
tenth\ triplet\ prime.\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
firstTriples.10\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
To\ compute\ the\ tenth\ triplet\ prime,\ Axiom\ first\ must\ compute\ the\ second,\nwnewline
the\ third,\ and\ so\ on.\nwnewline
But\ since\ there\ isn't\ even\ a\ second\ triplet\ prime,\ Axiom\ will\nwnewline
compute\ forever.\nwnewline
Nonetheless,\ this\ effort\ can\ produce\ a\ useful\ result.\nwnewline
After\ waiting\ a\ bit,\ hit\nwnewline
{\char92}texht{\char123}{\char92}fbox{\char123}{\char92}bf\ Ctrl{\char125}--{\char92}fbox{\char123}{\cha
The\ system\ responds\ as\ follows.\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
\ \ \ >>\ System\ error:\nwnewline
\ \ \ Console\ interrupt.\nwnewline
\ \ \ You\ are\ being\ returned\ to\ the\ top\ level\ of\nwnewline
\ \ \ the\ interpreter.\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
Let's\ say\ that\ you\ want\ to\ know\ how\ many\ primes\ have\ been\ computed.\nwnewline
Issue\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
numberOfComputedEntries\ primes\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
and,\ for\ this\ discussion,\ let's\ say\ that\ the\ result\ is\ {\char92}axiom{\char123}2045.{\char125}
{\char92}xtc{\char123}\nwnewline
How\ big\ is\ the\ {\char92}eth{\char123}{\char92}axiom{\char123}2045{\char125}{\char125}\ prime?\nwnewl
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}primes.2045{\char125}\nwnewline
{\char125}\nwnewline
```

```
\nwnewline
What\ you\ have\ learned\ is\ that\ there\ are\ no\ triplet\ primes\ between\ 5\nwnewline
and\ 17837.\ \ Although\ this\ result\ is\ well\ known\ (some\ might\ even\ say\nwnewline
trivial),\ there\ are\ many\ experiments\ you\ could\ make\ where\ the\ result\nwnewline
is\ not\ known.\ \ What\ you\ see\ here\ is\ a\ paradigm\ for\ testing\ of\nwnewline
hypotheses.\ \ Here\ our\ hypothesis\ could\ have\ been:\ ‘‘there\ is\ more\ than\nwnewline
one\ triplet\ prime.’’\ \ We\ have\ tested\ this\ hypothesis\ for\ 17837\ cases.\nwnewline
With\ streams,\ you\ can\ let\ your\ machine\ run,\ interrupt\ it\ to\ see\ how\nwnewline
far\ it\ has\ progressed,\ then\ start\ it\ up\ and\ let\ it\ continue\ from\ where\nwnewline
it\ left\ off.\nwnewline

A\ function\ is\ a\ program\ to\ perform\ some\nwnewline
computation.\nwnewline
Most\ functions\ have\ names\ so\ that\ it\ is\ easy\ to\ refer\ to\ them.\nwnewline
A\ simple\ example\ of\ a\ function\ is\ one\ named\nwnewline
{\char92}axiomFunFrom{\char123}abs{\char125}{\char123}Integer{\char125}\ which\nwnewline
computes\ the\ absolute\ value\ of\ an\ integer.\nwnewline
{\char37}\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ is\ a\ use\ of\ the\ ‘‘absolute\ value’’\ library\ function\ for\ integers.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}abs(-8){\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ is\ an\ unnamed\ function\ that\ does\ the\ same\ thing,\ using\ the\nwnewline
‘‘maps-to’’\ syntax\ {\char92}axiomSyntax{\char123}+->{\char125}\ that\ we\ discuss\ in\nwnewline
{\char92}downlink{\char123}‘‘Anonymous\ Functions’’{\char125}{\char123}ugUserAnonPage{\char125}\ \nwnewl
in\ Section\ 6.17{\char92}ignore{\char123}ugUserAnon{\char125}.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}(x\ +->\ if\ x\ <\ 0\ then\ -x\ else\ x)(-8){\char125}\nwnewline
{\char125}\nwnewline
{\char37}\nwnewline
Functions\ can\ be\ used\ alone\ or\ serve\ as\ the\ building\ blocks\ for\ larger\nwnewline
```

```
programs.\nwnewline
Usually\ they\ return\ a\ value\ that\ you\ might\ want\ to\ use\ in\ the\ next\ stage\nwnewl
of\ a\ computation,\ but\ not\ always\ (for\ example,\ see\nwnewline
{\char92}downlink{\char123}`Exit'{\char125}{\char123}ExitXmpPage{\char125}{\char92}ignore{\ch
{\char92}downlink{\char123}`Void'{\char125}{\char123}VoidXmpPage{\char125}{\char92}ignore{\ch
They\ may\ also\ read\ data\ from\ your\ keyboard,\ move\ information\ from\ one\nwnewline
place\ to\ another,\ or\ format\ and\ display\ results\ on\ your\ screen.\nwnewline
\nwnewline
In\ Axiom,\ as\ in\ mathematics,\ functions\ are\ usually\nwnewline
{\char92}spadglossSee{\char123}parameterized{\char125}{\char123}parameterized\ form{\char125
call{\char125}\ (some\ people\ say\ {\char92}spadgloss{\char123}apply{\char125}\ or\nwnewline
{\char92}spadglossSee{\char123}invoke{\char125}{\char123}invocation{\char125})\ a\ function,\
parameters\ (variables).\ \ Such\ a\ value\ is\ called\ an\nwnewline
{\char92}spadgloss{\char123}argument{\char125}\ of\ the\ function.\ \ Axiom\ uses\ the\ argu
the\ computation.\ \ In\ this\ way\ you\ get\ different\ results\ depending\ on\nwnewline
what\ you\ ``feed''\ the\ function.\nwnewline
\nwnewline
Functions\ can\ have\ local\ variables\ or\ refer\ to\ global\ variables\ in\ the\nwnewline
workspace.\nwnewline
Axiom\ can\ often\ {\char92}spadglossSee{\char123}compile{\char125}{\char123}compiler{\char12
they\ execute\ very\ efficiently.\nwnewline
Functions\ can\ be\ passed\ as\ arguments\ to\ other\ functions.\nwnewline
\nwnewline
Macros\ are\ textual\ substitutions.\ \ They\ are\ used\ to\ clarify\ the\nwnewline
meaning\ of\ constants\ or\ expressions\ and\ to\ be\ templates\ for\ frequently\nwnewline
used\ expressions.\ \ Macros\ can\ be\ parameterized\ but\ they\ are\ not\nwnewline
objects\ that\ can\ be\ passed\ as\ arguments\ to\ functions.\ \ In\ effect,\nwnewline
macros\ are\ extensions\ to\ the\ Axiom\ expression\ parser.\nwnewline

{\char92}beginscroll\nwnewline
\nwnewline
Each\ name\ in\ your\ workspace\ can\ refer\ to\ a\ single\ object.\nwnewline
This\ may\ be\ any\ kind\ of\ object\ including\ a\ function.\nwnewline
You\ can\ use\ interactively\ any\ function\ from\ the\ library\ or\ any\ that\ you\nwnewline
define\ in\ the\ workspace.\nwnewline
In\ the\ library\ the\ same\ name\ can\ have\ very\ many\ functions,\ but\ you\nwnewline
can\ have\ only\ one\ function\ with\ a\ given\ name,\ although\ it\ can\ have\ any\nwnewline
number\ of\ arguments\ that\ you\ choose.\nwnewline
\nwnewline
If\ you\ define\ a\ function\ in\ the\ workspace\ that\ has\ the\ same\ name\ and\ number\nwnewline
of\ arguments\ as\ one\ in\ the\ library,\ then\ your\ definition\ takes\ precedence.\nwnewline
In\ fact,\ to\ get\ the\ library\ function\ you\ must\nwnewline
{\char92}spadglossSee{\char123}package-call{\char125}{\char123}package\ call{\char125}\ it\ (see\ \nwnew
{\char92}downlink{\char123}‘‘Package\ Calling\ and\ Target\ Types’’{\char125}{\char123}ugTypesPkgCallPag
in\ Section\ 2.9{\char92}ignore{\char123}ugTypesPkgCall{\char125}).\nwnewline
\nwnewline
To\ use\ a\ function\ in\ Axiom,\ you\ apply\ it\ to\ its\ arguments.\nwnewline
Most\ functions\ are\ applied\ by\ entering\ the\ name\ of\ the\ function\ followed\ by\nwnewline
its\ argument\ or\ arguments.\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline

{\char92}xtc{\char123}\nwnewline
Some\ functions\ like\ \nwnewline
{\char92}axiomOp{\char123}+{\char125}\ have\ {\char123}{\char92}it\ infix{\char125}\ {\char92}spadgloss{
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}3\ +\ 4{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ function\ {\char92}axiomOp{\char123}+{\char125}\ has\ two\ arguments.\nwnewline
When\ you\ give\ it\ more\ than\ two\ arguments,\nwnewline
```

```
Axiom\ groups\ the\ arguments\ to\ the\ left.\nwnewline
This\ expression\ is\ equivalent\ to\ {\char92}axiom{\char123}(1\ +\ 2)\ +\ 7{\char125}.\nwne
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}1\ +\ 2\ +\ 7{\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
All\ operations,\ including\ infix\ operators,\ can\ be\ written\ in\ prefix\ form,\nwnewline
that\ is,\ with\ the\ operation\ name\ followed\ by\ the\ arguments\nwnewline
in\ parentheses.\nwnewline
For\ example,\ {\char92}axiom{\char123}2\ +\ 3{\char125}\ can\ alternatively\ be\ written\ as
But\ {\char92}axiom{\char123}+(2,3,4){\char125}\ is\ an\ error\ since\ {\char92}axiomOp{\char
takes\ only\ two\ arguments.\nwnewline
\nwnewline
Prefix\ operations\ are\ generally\ applied\ before\ the\ infix\ operation.\nwnewline
Thus\ {\char92}axiom{\char123}factorial\ 3\ +\ 1{\char125}\ means\ {\char92}axiom{\char123}fa
{\char92}axiom{\char123}7{\char125},\ and\nwnewline
{\char92}axiom{\char123}-\ 2\ +\ 5{\char125}\ means\ {\char92}axiom{\char123}(-2)\ +\ 5{\char
An\ example\ of\ a\ prefix\ operator\ is\ prefix\ {\char92}axiomOp{\char123}-{\char125}.\nwne
For\ example,\ {\char92}axiom{\char123}-\ 2\ +\ 5{\char125}\ converts\ to\ {\char92}axiom{\ch
the\ value\ {\char92}axiom{\char123}3{\char125}.\nwnewline
Any\ prefix\ function\ taking\ two\ arguments\ can\ be\ written\ in\nwnewline
an\ infix\ manner\ by\ putting\ an\nwnewline
ampersand\ ({\char92}axiomSyntax{\char123}{\char92}{\char38}{\char125})\ before\ the\ name.\n
Thus\ {\char92}axiom{\char123}D(2*x,x){\char125}\ can\ be\ written\ as\nwnewline
{\char92}axiom{\char123}2*x\ {\char92}{\char38}D\ x{\char125}\ returning\ {\char92}axiom{\cha
\nwnewline
Every\ function\ in\ Axiom\ is\ identified\ by\nwnewline
a\ {\char92}spadgloss{\char123}name{\char125}\ and\ {\char92}spadgloss{\char123}type{\char12
an\ ``anonymous\ function''\nwnewline
discussed\ in\nwnewline
{\char92}downlink{\char123}``Anonymous\ Functions''{\char125}{\char123}ugUserAnonPage{\char12
in\ Section\ 6.17{\char92}ignore{\char123}ugUserAnon{\char125}.{\char125}\nwnewline
The\ type\ of\ a\ function\ is\ always\ a\ mapping\ of\ the\ form\nwnewline
{\char92}spadsig{\char123}Source{\char125}{\char123}Target{\char125}\nwnewline
where\ {\char92}axiom{\char123}Source{\char125}\ and\ {\char92}axiom{\char123}Target{\char12
To\ enter\ a\ type\ from\ the\ keyboard,\ enter\ the\ arrow\ by\ using\nwnewline
a\ hyphen\ {\char92}axiomSyntax{\char123}-{\char125}\ followed\ by\ a\ greater-than\ sign\nwn
{\char92}axiomSyntax{\char123}>{\char125},\ e.g.\ {\char123}{\char92}tt\ Integer\ ->\ Intege
\nwnewline
Let's\ go\ back\ to\ {\char92}axiomOp{\char123}+{\char125}.\nwnewline
There\ are\ many\ {\char92}axiomOp{\char123}+{\char125}\ functions\ in\ the\nwnewline
Axiom\ library:\ one\ for\ integers,\ one\ for\ floats,\ another\ for\nwnewline
rational\ numbers,\ and\ so\ on.\nwnewline
These\ {\char92}axiomOp{\char123}+{\char125}\ functions\ have\ different\ types\ and\ thus\ a
different\ functions.\nwnewline
You've\ seen\ examples\ of\ this\ {\char92}spadgloss{\char123}overloading{\char125}\nwnewline
before---using\ the\ same\ name\ for\ different\ functions.\nwnewline
Overloading\ is\ the\ rule\ rather\ than\ the\ exception.\nwnewline
You\ can\ add\ two\ integers,\ two\ polynomials,\ two\ matrices\ or\nwnewline
two\ power\ series.\nwnewline
```

```
These\ are\ all\ done\ with\ the\ same\ function\ name\nwnewline
but\ with\ different\ functions.\nwnewline

\nwnewline
In\ {\char92}downlink{\char123}‘‘Declarations’’{\char125}{\char123}ugTypesDeclarePage{\char12
in\ Section\ 2.3{\char92}ignore{\char123}ugTypesDeclare{\char125}\ we\ \nwnewline
discussed\ how\ to\ declare\ a\ variable\nwnewline
to\ restrict\ the\ kind\ of\ values\ that\ can\ be\ assigned\ to\ it.\nwnewline
In\ this\ section\ we\ show\ how\ to\ declare\ a\ variable\ that\ refers\ to\nwnewline
function\ objects.\nwnewline
\nwnewline
{\char92}beginImportant\nwnewline
A\ function\ is\ an\ object\ of\ type\nwnewline
{\char92}centerline{\char123}{\char123}{\char92}spadsig{\char123}Source{\char125}{\char123}Ty
where\ {\char92}axiom{\char123}Source{\char125}\ and\ {\char92}axiom{\char123}Target{\char125
A\ common\ type\ for\ {\char92}axiom{\char123}Source{\char125}\ is\nwnewline
{\char92}axiomType{\char123}Tuple{\char125}({\char92}subscriptIt{\char123}T{\char125}{\char12
usually\ written\nwnewline
({\char92}subscriptIt{\char123}T{\char125}{\char123}1{\char125},\ {\char92}ldots,\ {\char92}s
to\ indicate\ a\ function\ of\ {\char92}axiom{\char123}n{\char125}\ arguments.\nwnewline
{\char92}endImportant\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
If\ {\char92}axiom{\char123}g{\char125}\ takes\ an\ {\char92}axiomType{\char123}Integer{\char
another\ {\char92}axiomType{\char123}Integer{\char125},\ and\ returns\ a\nwnewline
{\char92}axiomType{\char123}String{\char125},\ the\ declaration\ is\ written\ this\ way.\nwne
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}g:\ (Integer,Float,Integer)\ ->\ String{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ types\ need\ not\ be\ written\ fully;\ using\ abbreviations,\ the\ above\nwnewline
declaration\ is:\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}g:\ (INT,FLOAT,INT)\ ->\ STRING{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
It\ is\ possible\ for\ a\ function\ to\ take\ no\ arguments.\nwnewline
If\ {\char92}axiom{\char123}\ h{\char125}\ takes\ no\ arguments\nwnewline
but\ returns\ a\ {\char92}axiomType{\char123}Polynomial{\char125}\ {\char92}axiomType{\char12
of\ the\ following\ declarations\ is\ acceptable.\nwnewline
{\char125}{\char123}\nwnewline
```

```
{\char92}spadpaste{\char123}h:\ ()\ ->\ POLY\ INT{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}h:\ ()\ ->\ Polynomial\ INT{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}h:\ ()\ ->\ POLY\ Integer{\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
\nwnewline
{\char92}beginImportant\nwnewline
Functions\ can\ also\ be\ declared\ when\ they\ are\ being\ defined.\nwnewline
The\ syntax\ for\ combined\ declaration/definition\ is:\nwnewline
{\char92}centerline{\char123}{\char123}{\char92}frenchspacing{\char123}{\char92}tt\ {\char123}{\char92}i
{\char92}subscriptIt{\char123}parm{\char125}{\char123}1{\char125}:\ {\char92}subscriptIt{\char123}parmTy
{\char92}subscriptIt{\char123}parm{\char125}{\char123}N{\char125}:\ {\char92}subscriptIt{\char123}parmTy
{\char123}{\char92}it\ functionReturnType{\char125}{\char125}{\char125}{\char125}\nwnewline
{\char92}endImportant\nwnewline
\nwnewline
The\ following\ definition\ fragments\ show\ how\ this\ can\ be\ done\ for\nwnewline
the\ functions\ {\char92}axiom{\char123}g{\char125}\ and\ {\char92}axiom{\char123}h{\char125}\ above.\nw
{\char92}begin{\char123}verbatim{\char125}\nwnewline
g(arg1:\ INT,\ arg2:\ FLOAT,\ arg3:\ INT):\ STRING\ ==\ ...\nwnewline
\nwnewline
h():\ POLY\ INT\ ==\ ...\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
\nwnewline
A\ current\ restriction\ on\ function\ declarations\ is\ that\ they\ must\nwnewline
involve\ fully\ specified\ types\ (that\ is,\ cannot\ include\ modes\ involving\nwnewline
explicit\ or\ implicit\ {\char92}axiomSyntax{\char123}?{\char125}).\nwnewline
For\ more\ information\ on\ declaring\ things\ in\ general,\ see\nwnewline
{\char92}downlink{\char123}``Declarations''{\char125}{\char123}ugTypesDeclarePage{\char125}\ \nwnewline
in\ Section\ 2.3{\char92}ignore{\char123}ugTypesDeclare{\char125}.\nwnewline

{\char92}begin{\char123}page{\char125}{\char123}ugUserDecOpersPage{\char125}{\char123}6.7.\ Functions\ v
{\char92}beginscroll\nwnewline
\nwnewline
A\ function\ is\ an\ object\ that\ you\ can\ create,\ manipulate,\ pass\ to,\nwnewline
and\ return\ from\ functions\ (for\ some\ interesting\ examples\ of\nwnewline
library\ functions\ that\ manipulate\ functions,\ see\nwnewline
{\char92}downlink{\char123}‘MappingPackage1’{\char125}{\char123}MappingPackageOneXmpPage{\char125}\nwnew
{\char92}ignore{\char123}MappingPackage1{\char125}).\nwnewline
```

```
Yet,\ we\ often\ seem\ to\ use\ the\ term\ {\char92}spadgloss{\char123}operation{\char125}\ a
function\ interchangeably\ in\ Axiom.\nwnewline
What\ is\ the\ distinction?\nwnewline
\nwnewline
First\ consider\ values\ and\ types\ associated\ with\ some\ variable\nwnewline
{\char92}axiom{\char123}n{\char125}\ in\ your\ workspace.\ \ You\ can\ make\ the\ declaratio
Integer{\char125},\ then\ assign\ {\char92}axiom{\char123}n{\char125}\ an\ integer\ value.\ \
the\ integer\ {\char92}axiom{\char123}n{\char125}.\ \ However,\ note\ that\ the\ integer\ is\
{\char92}axiom{\char123}n{\char125}\ itself,\ but\ the\ value\ that\ you\ assign\ to\ {\char9
\nwnewline
Similarly,\ you\ can\ declare\ a\ variable\ {\char92}axiom{\char123}f{\char125}\ in\ your\ wo
have\ type\ {\char92}spadsig{\char123}Integer{\char125}{\char123}Integer{\char125},\ then\ as
definition\ or\ an\ assignment\ of\ an\ anonymous\ function.\ \ You\ then\ speak\nwnewline
of\ the\ function\ {\char92}axiom{\char123}f{\char125}.\ \ However,\ the\ function\ is\ not\
but\ the\ value\ that\ you\ assign\ to\ {\char92}axiom{\char123}f{\char125}.\nwnewline
\nwnewline
A\ function\ is\ a\ value,\ in\ fact,\ some\ machine\ code\ for\ doing\ something.\nwnewline
Doing\ what?\ \ Well,\ performing\ some\ {\char92}spadgloss{\char123}operation{\char125}.\ \
an\ operation\ consists\ of\ the\ constituent\ parts\ of\ {\char92}axiom{\char123}f{\char125
workspace,\ excluding\ the\ value;\ thus\ an\ operation\ has\ a\ name\ and\ a\nwnewline
type.\ \ An\ operation\ is\ what\ domains\ and\ packages\ export.\ \ Thus\nwnewline
{\char92}axiomType{\char123}Ring{\char125}\ exports\ one\ operation\ {\char92}axiomOp{\char1
exports\ this\ operation.\ \ Also,\ the\ author\ of\ every\ ring\ in\ the\ system\nwnewline
is\ obliged\ under\ contract\ (see\nwnewline
{\char92}downlink{\char123}``Abstract\ Datatypes''{\char125}{\char123}ugPackagesAbstractPage
Section\ 11.3{\char92}ignore{\char123}ugPackagesAbstract{\char125})\ to\nwnewline
provide\ an\ implementation\ for\ this\ operation.\nwnewline
\nwnewline
This\ chapter\ is\ all\ about\ functions---how\ you\ create\ them\nwnewline
interactively\ and\ how\ you\ apply\ them\ to\ meet\ your\ needs.\ \ In\nwnewline
{\char92}downlink{\char123}``Packages''{\char125}{\char123}ugPackagesPage{\char125}\ in\ Cha
11{\char92}ignore{\char123}ugPackages{\char125}\ you\ will\ learn\ how\ to\ create\ them\nwn
for\ the\ Axiom\ library.\ \ Then\ in\nwnewline
{\char92}downlink{\char123}``Categories''{\char125}{\char123}ugCategoriesPage{\char125}\ in\
12{\char92}ignore{\char123}ugCategories{\char125},\ you\ will\ learn\ about\nwnewline
categories\ and\ exported\ operations.\nwnewline

{\char123}6.9.\ How\ Axiom\ Determines\ What\ Function\ to\ Use{\char125}\nwnewline
{\char92}beginscroll\nwnewline
\nwnewline
What\ happens\ if\ you\ define\ a\ function\ that\ has\ the\ same\ name\ as\ a\nwnewline
library\ function?\ \ Well,\ if\ your\ function\ has\ the\ same\ name\ and\ number\nwnewline
of\ arguments\ (we\ sometimes\ say\ {\char92}spadgloss{\char123}arity{\char125})\ as\ another\ function\
in\ the\ library,\ then\ your\ function\ covers\ up\ the\ library\ function.\ \ If\nwnewline
you\ want\ then\ to\ call\ the\ library\ function,\ you\ will\ have\ to\nwnewline
package-call\ it.\ \ Axiom\ can\ use\ both\ the\ functions\ you\ write\ and\ those\nwnewline
that\ come\ from\ the\ library.\ \ Let's\ do\ a\ simple\ example\ to\ illustrate\nwnewline
this.\nwnewline
{\char92}xtc{\char123}\nwnewline
Suppose\ you\ (wrongly!)\ define\ {\char92}userfun{\char123}sin{\char125}\ in\ this\ way.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}sin\ x\ ==\ 1.0\ {\char92}bound{\char123}sin{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ value\ {\char92}axiom{\char123}1.0{\char125}\ is\ returned\ for\ any\ argument.\nwnewline
```

```
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}sin\ 4.3\ {\char92}free{\char123}sin{\char125}{\char125}\nwnewli
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
If\ you\ want\ the\ library\ operation,\ we\ have\ to\ package-call\ it\nwnewline
(see\ {\char92}downlink{\char123}‘‘Package\ Calling\ and\ Target\ Types’’{\char125}{\char123
in\ Section\ 2.9{\char92}ignore{\char123}ugTypesPkgCall{\char125}\nwnewline
for\ more\ information).\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}sin(4.3){\char92}{\char36}Float{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}sin(34.6){\char92}{\char36}Float{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Even\ worse,\ say\ we\ accidentally\ used\ the\ same\ name\ as\ a\ library\nwnewline
function\ in\ the\ function.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}sin\ x\ ==\ sin\ x\ {\char92}bound{\char123}sin1{\char125}{\char
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Then\ Axiom\ definitely\ does\ not\ understand\ us.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}sin\ 4.3\ {\char92}free{\char123}sin1{\char125}{\char125}\nwnewl
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Again,\ we\ could\ package-call\ the\ inside\ function.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}sin\ x\ ==\ sin(x){\char92}{\char36}Float\ {\char92}bound{\char1
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}sin\ 4.3\ {\char92}free{\char123}sin2{\char125}{\char125}\nwnewl
{\char125}\nwnewline
Of\ course,\ you\ are\ unlikely\ to\ make\ such\ obvious\ errors.\nwnewline
It\ is\ more\ probable\ that\ you\ would\ write\ a\ function\ and\ in\ the\ body\ use\ a\nwn
function\ that\ you\ think\ is\ a\ library\ function.\nwnewline
If\ you\ had\ also\ written\ a\ function\ by\ that\ same\ name,\ the\ library\ function\nwne
would\ be\ invisible.\nwnewline
\nwnewline
How\ does\ Axiom\ determine\ what\ library\ function\ to\ call?\nwnewline
It\ very\ much\ depends\ on\ the\ particular\ example,\ but\ the\ simple\ case\ of\nwnewline
creating\ the\ polynomial\nwnewline
{\char92}axiom{\char123}x\ +\ 2/3{\char125}\ will\ give\ you\ an\ idea.\nwnewline
{\char92}indent{\char123}4{\char125}\nwnewline

{\char92}beginscroll\nwnewline
\nwnewline
When\ possible,\ Axiom\ completely\ determines\ the\ type\ of\ every\ object\ in\nwnewline
a\ function,\ then\ translates\ the\ function\ definition\ to\ {\char92}Lisp{\char123}{\char1
machine\ code\ (see\ next\ section).\ \ This\ translation,\ called\nwnewline
{\char92}spadglossSee{\char123}compilation{\char125}{\char123}compiler{\char125},\ happens\ t
the\ function\ and\ results\ in\ a\ computational\ delay.\ \ Subsequent\nwnewline
function\ calls\ with\ the\ same\ argument\ types\ use\ the\ compiled\ version\nwnewline
of\ the\ code\ without\ delay.\nwnewline
\nwnewline
If\ Axiom\ cannot\ determine\ the\ type\ of\ everything,\ the\ function\ may\nwnewline
still\ be\ executed\ but\ in\ {\char92}spadglossSee{\char123}interpret-code\nwnewline
mode{\char125}{\char123}interpreter{\char125}\ :\ each\ statement\ in\ the\ function\ is\ ana
executed\ as\ the\ control\ flow\ indicates.\ \ This\ process\ is\ slower\ than\nwnewline
executing\ a\ compiled\ function,\ but\ it\ allows\ the\ execution\ of\ code\nwnewline
that\ may\ involve\ objects\ whose\ types\ change.\nwnewline
\nwnewline
{\char92}beginImportant\nwnewline
If\ Axiom\ decides\ that\ it\ cannot\ compile\ the\ code,\ it\nwnewline
issues\ a\ message\ stating\ the\ problem\ and\ then\ the\ following\nwnewline
message:\nwnewline
{\char37}\nwnewline
{\char92}centerline{\char123}\nwnewline
{\char123}{\char123}{\char92}bf\ We\ will\ attempt\ to\ step\ through\ and\ interpret\ the\ c
{\char37}\nwnewline
This\ is\ not\ a\ time\ to\ panic.\nwnewline
Rather,\ it\ just\ means\ that\ what\ you\ gave\ to\ Axiom\nwnewline
is\ somehow\ ambiguous:\ either\ it\ is\ not\ specific\ enough\ to\ be\ analyzed\nwnewline
completely,\ or\ it\ is\ beyond\ Axiom's\ present\ interactive\nwnewline
compilation\ abilities.\nwnewline
{\char92}endImportant\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ function\ runs\ in\ interpret-code\ mode,\ but\ it\ does\ not\ compile.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}begin{\char123}spadsrc{\char125}[{\char92}bound{\char123}varPolys{\char125}]\nwnewli
varPolys(vars)\ ==\nwnewline
\ \ for\ var\ in\ vars\ repeat\nwnewline
\ \ \ \ output(1\ ::\ UnivariatePolynomial(var,Integer))\nwnewline
{\char92}end{\char123}spadsrc{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
For\ {\char92}axiom{\char123}vars{\char125}\ equal\ to\ {\char92}axiom{\char123}['x,\ 'y,\ 'z
{\char92}axiom{\char123}1{\char125}\ three\ times.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}varPolys\ ['x,'y,'z]\ {\char92}free{\char123}varPolys{\char125}{\char125}\nw
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ type\ of\ the\ argument\ to\ {\char92}axiomFun{\char123}output{\char125}\ changes\ in\ each\ iterat
so\ Axiom\ cannot\ compile\ the\ function.\nwnewline
In\ this\ case,\ even\ the\ inner\ loop\ by\ itself\ would\ have\ a\ problem:\nwnewline
{\char125}{\char123}\nwnewline
{\char92}begin{\char123}spadsrc{\char125}\nwnewline
for\ var\ in\ ['x,'y,'z]\ repeat\nwnewline
\ \ output(1\ ::\ UnivariatePolynomial(var,Integer))\nwnewline
{\char92}end{\char123}spadsrc{\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
Sometimes\ you\ can\ help\ a\ function\ to\ compile\ by\ using\ an\ extra\nwnewline
conversion\ or\ by\ using\ {\char92}axiom{\char123}pretend{\char125}.\ \ {\char92}spadkey{\char123}prete
{\char92}downlink{\char123}``Subdomains\ Again''{\char125}{\char123}ugTypesSubdomainsPage{\char125}\ in\
Section\ 2.8{\char92}ignore{\char123}ugTypesSubdomains{\char125}\ for\nwnewline
details.\nwnewline
\nwnewline
When\ a\ function\ is\ compilable,\ you\ have\ the\ choice\ of\ whether\ it\ is\nwnewline
compiled\ to\ {\char92}Lisp{\char123}{\char125}\ and\ then\ interpreted\ by\ the\ {\char92}Lisp{\char123
then\ further\ compiled\ from\ {\char92}Lisp{\char123}{\char125}\ to\ machine\ code.\ \ The\ option\ is\
controlled\ via\ {\char92}spadcmd{\char123})set\ functions\ compile{\char125}.\ \ Issue\ {\char92}spadcm
functions\ compile\ on{\char125}\ to\ compile\ all\ the\ way\ to\ machine\ code.\ \ With\nwnewline
the\ default\ setting\ {\char92}spadcmd{\char123})set\ functions\ compile\ off{\char125},\ Axiom\ has\nw
its\ {\char92}Lisp{\char123}{\char125}\ code\ interpreted\ because\ the\ overhead\ of\ further\nwnewline
compilation\ is\ larger\ than\ the\ run-time\ of\ most\ of\ the\ functions\ our\nwnewline
users\ have\ defined.\ \ You\ may\ find\ that\ selectively\ turning\ this\ option\nwnewline
on\ and\ off\ will\ give\ you\ the\ best\ performance\ in\ your\ particular\nwnewline
application.\ \ For\ example,\ if\ you\ are\ writing\ functions\ for\ graphics\nwnewline
applications\ where\ hundreds\ of\ points\ are\ being\ computed,\ it\ is\ almost\nwnewline
certainly\ true\ that\ you\ will\ get\ the\ best\ performance\ by\ issuing\nwnewline
{\char92}spadcmd{\char123})set\ functions\ compile\ on{\char125}.\nwnewline

{\char92}beginscroll\nwnewline
\nwnewline
There\ are\ many\ other\ ways\ to\ define\ a\ factorial\ function\ for\ nonnegative\nwnewline
integers.\nwnewline
You\ might\nwnewline
say\nwnewline
factorial\ of\ {\char92}axiom{\char123}0{\char125}\ is\ {\char92}axiom{\char123}1,{\char125}\ otherwise\
{\char92}axiom{\char123}n{\char125}\ times\ factorial\ of\ {\char92}axiom{\char123}n-1{\char125}.\nwnewl
Here\ is\ one\ way\ to\ do\ this\ in\ Axiom.\nwnewline
{\char37}\nwnewline
{\char92}xtc{\char123}\nwnewline
Here\ is\ the\ value\ for\ {\char92}axiom{\char123}n\ =\ 0{\char125}.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}fact(0)\ ==\ 1\ {\char92}bound{\char123}fact0{\char125}{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Here\ is\ the\ value\ for\ {\char92}axiom{\char123}n\ >\ 0{\char125}.\nwnewline
The\ vertical\ bar\ {\char92}axiomSyntax{\char123}|{\char125}\ means\nwnewline
``such\ that''.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}fact(n\ |\ n\ >\ 0)\ ==\ n\ *\ fact(n\ -\ 1)\ {\char92}free{\char123}fact0{\
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
What\ is\ the\ value\ for\ {\char92}axiom{\char123}n\ =\ 3{\char125}?\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}fact(3)\ {\char92}free{\char123}factn{\char125}{\char125}\nwnewli
{\char125}\nwnewline

```

```
{\char92}beginscroll\nwnewline
\nwnewline
We\ have\ already\ seen\ some\ examples\ of\nwnewline
predicates\nwnewline
({\char92}downlink{\char123}``A\ Basic\ Example''{\char125}{\char123}ugUserPieceBasicPage{\char125}\ \nw
in\ Section\ 6.11.1{\char92}ignore{\char123}ugUserPieceBasic{\char125}).\nwnewline
Predicates\ are\ {\char92}axiomType{\char123}Boolean{\char125}-valued\ expressions\ and\ Axiom\ uses\ th
for\ filtering\ collections\nwnewline
(see\ {\char92}downlink{\char123}``Creating\ Lists\ and\ Streams\ with\ Iterators''{\char125}\nwnewline
{\char123}ugLangItsPage{\char125}\ in\ Section\ 5.5{\char92}ignore{\char123}ugLangIts{\char125})\nwnewli
and\ for\ placing\ constraints\ on\ function\ arguments.\nwnewline
In\ this\ section\ we\ discuss\ their\ latter\ usage.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ simplest\ use\ of\ a\ predicate\ is\ one\ you\ don't\ see\ at\ all.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}opposite\ 'right\ ==\ 'left{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Here\ is\ a\ longer\ way\ to\ give\ the\ ``opposite\ definition.''\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}opposite\ (x\ |\ x\ =\ 'left)\ ==\ 'right{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Try\ it\ out.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}for\ x\ in\ ['right,'left,'inbetween]\ repeat\ output\ opposite\ x{\char125}
{\char125}\nwnewline
\nwnewline
Explicit\ predicates\ tell\ Axiom\ that\ the\ given\ function\ definition\nwnewline
piece\ is\ to\ be\ applied\ if\ the\ predicate\ evaluates\ to\ {\char123}{\char92}tt\ true{\char125}\ fo
the\ arguments\ to\ the\ function.\ \ You\ can\ use\ such\ ``constant''\nwnewline
arguments\ for\ integers,\ strings,\ and\ quoted\ symbols.\ \ The\nwnewline
{\char92}axiomType{\char123}Boolean{\char125}\ values\ {\char92}axiom{\char123}true{\char125}\ and\ {\ch
used\ if\ qualified\ with\ ``{\char92}spad{\char123}@{\char125}''\ or\ ``{\char92}spad{\char123}{\char92
{\char92}axiomType{\char123}Boolean{\char125}.\ \ The\ following\ are\ all\ valid\ function\ definition\
fragments\ using\ constant\ arguments.\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
a(1)\ ==\ ...\nwnewline
b("unramified")\ ==\ ...\nwnewline
c('untested)\ ==\ ...\nwnewline
d(true@Boolean)\ ==\ ...\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
\nwnewline
If\ a\ function\ has\ more\ than\ one\ argument,\ each\ argument\ can\ have\ its\nwnewline
own\ predicate.\ \ However,\ if\ a\ predicate\ involves\ two\ or\ more\nwnewline
arguments,\ it\ must\ be\ given\ {\char123}{\char92}it\ after{\char125}\ all\ the\ arguments\ mentioned\
the\ predicate\ have\ been\ given.\ \ You\ are\ always\ safe\ to\ give\ a\ single\nwnewline
predicate\ at\ the\ end\ of\ the\ argument\ list.\nwnewline
{\char92}xtc{\char123}\nwnewline
```

```
A\ function\ involving\ predicates\ on\ two\ arguments.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}inFirstHalfQuadrant(x\ |\ x\ >\ 0,y\ |\ y\ <\ x)\ ==\ true{\char
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ is\ incorrect\ as\ it\ gives\ a\ predicate\ on\ {\char92}axiom{\char123}y{\char125}\nw
before\ the\ argument\ {\char92}axiom{\char123}y{\char125}\ is\ given.\nwnewline
{\char125}{\char123}\nwnewline

{\char92}beginscroll\nwnewline
\nwnewline
One\ of\ the\ most\ useful\ classes\ of\ function\ are\ those\ defined\ via\ a\nwnewline
‘‘recurrence\ relation.’’\nwnewline
A\ {\char123}{\char92}it\ recurrence\ relation{\char125}\ makes\ each\ successive\nwnewline
value\ depend\ on\ some\ or\ all\ of\ the\ previous\ values.\nwnewline
A\ simple\ example\ is\ the\ ordinary\ ‘‘factorial’’\ function:\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
fact(0)\ ==\ 1\nwnewline
fact(n\ |\ n\ >\ 0)\ ==\ n\ *\ fact(n-1)\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
\nwnewline
The\ value\ of\ {\char92}axiom{\char123}fact(10){\char125}\ depends\ on\ the\ value\ of\ {\c
{\char92}axiom{\char123}fact(9){\char125}\ on\ {\char92}axiom{\char123}fact(8){\char125},\ a
only\ one\ previous\ value,\ it\ is\ usually\ called\ a\ {\char123}{\char92}it\ first\ order
recurrence\ relation.{\char125}\ \ You\ can\ easily\ imagine\ a\ function\ based\ on\ two,\n
three\ or\ more\ previous\ values.\ \ The\ Fibonacci\ numbers\ are\ probably\ the\nwnewline
most\ famous\ function\ defined\ by\ a\ second\ order\ recurrence\ relation.\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ library\ function\ {\char92}axiomFun{\char123}fibonacci{\char125}\ computes\ Fibonacci\
It\ is\ obviously\ optimized\ for\ speed.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}[fibonacci(i)\ for\ i\ in\ 0..]{\char125}\nwnewline
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Define\ the\nwnewline
Fibonacci\ numbers\ ourselves\ using\ a\ piece-wise\ definition.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}fib(1)\ ==\ 1\ {\char92}bound{\char123}fib0{\char125}{\char125}\
{\char125}\nwnewline
```

```
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}fib(2)\ ==\ 1\ {\char92}bound{\char123}fib1{\char125}{\char92}free{\char123}
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}fib(n)\ ==\ fib(n-1)\ +\ fib(n-2)\ {\char92}bound{\char123}fibn{\char125}{\c
{\char125}\nwnewline
\nwnewline
As\ defined,\ this\ recurrence\ relation\ is\ obviously\ doubly-recursive.\nwnewline
To\ compute\ {\char92}axiom{\char123}fib(10){\char125},\ we\ need\ to\ compute\ {\char92}axiom{\char123}
{\char92}axiom{\char123}fib(8){\char125}.\ \ And\ to\ {\char92}axiom{\char123}fib(9){\char125},\ we\ nee
{\char92}axiom{\char123}fib(8){\char125}\ and\ {\char92}axiom{\char123}fib(7){\char125}.\ \ And\ so\ on.
compute\ {\char92}axiom{\char123}fib(10){\char125}\ we\ need\ to\ compute\ {\char92}axiom{\char123}fib(9
{\char92}axiom{\char123}fib(8){\char125}\ twice,\ {\char92}axiom{\char123}fib(7){\char125}\ three\ times
number\ of\ function\ calls\ needed\ to\ compute\ {\char123}{\char92}it\ any{\char125}\ second\ order\nw
recurrence\ relation\ in\ the\ obvious\ way\ is\ exactly\ {\char92}axiom{\char123}fib(n){\char125}.\nwne
These\ numbers\ grow!\ \ For\ example,\ if\ Axiom\ actually\ did\ this,\ then\nwnewline
{\char92}axiom{\char123}fib(500){\char125}\ requires\ more\ than\nwnewline
{\char92}texht{\char123}{\char36}10{\char94}{\char123}104{\char125}{\char36}{\char125}{\char123}{\char92
this,\ our\ definition\ of\ {\char92}userfun{\char123}fib{\char125}\ obviously\ could\ not\ be\ used\ to
calculate\ the\ five-hundredth\ Fibonacci\ number.\nwnewline
{\char92}xtc{\char123}\nwnewline
Let's\ try\ it\ anyway.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}fib(500)\ {\char92}free{\char123}fibn{\char125}{\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
Since\ this\ takes\ a\ short\ time\ to\ compute,\ it\ obviously\ didn't\ do\ as\nwnewline
many\ as\ {\char92}texht{\char123}{\char36}10{\char94}{\char123}104{\char125}{\char36}{\char125}{\char12
Axiom\ transforms\ any\ recurrence\ relation\ it\ recognizes\ into\ an\nwnewline
iteration.\ \ Iterations\ are\ efficient.\ \ To\ compute\ the\ value\ of\ the\nwnewline
{\char92}eth{\char123}{\char92}axiom{\char123}n{\char125}{\char125}\ term\ of\ a\ recurrence\ relation\
requires\ only\ {\char92}axiom{\char123}n{\char125}\ function\ calls.{\char92}footnote{\char123}If\ you\
speed\ of\ our\ {\char92}userfun{\char123}fib{\char125}\ function\ to\ the\ library\ function,\ our\nwne
version\ is\ still\ slower.\ \ This\ is\ because\ the\ library\nwnewline
{\char92}axiomFunFrom{\char123}fibonacci{\char125}{\char123}IntegerNumberTheoryFunctions{\char125}\ uses
``powering\ algorithm''\ with\ a\ computing\ time\ proportional\ to\nwnewline
{\char92}texht{\char123}{\char36}{\char92}log{\char94}3(n){\char36}{\char125}{\char123}{\char92}axiom{\c
{\char92}axiom{\char123}fibonacci(n).{\char125}{\char125}\nwnewline
\nwnewline
To\ turn\ off\ this\ special\ recurrence\ relation\ compilation,\ issue\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
)set\ functions\ recurrence\ off\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
To\ turn\ it\ back\ on,\ substitute\ ``{\char123}{\char92}tt\ on{\char125}''\ for\ ``{\char123}{\char92}
\nwnewline
The\ transformations\ that\ Axiom\ uses\ for\ {\char92}userfun{\char123}fib{\char125}\ caches\ the\nwnew
last\ two\ values.{\char92}footnote{\char123}For\ a\ more\ general\ {\char92}eth{\char123}{\char92}axiom
relation,\ Axiom\ caches\ the\ last\ {\char92}axiom{\char123}k{\char125}\ values.{\char125}\nwnewline
```

```
If,\ after\ computing\ a\ value\ for\ {\char92}userfun{\char123}fib{\char125},\ you\ ask\nwne
for\ some\ larger\ value,\ Axiom\ picks\ up\ the\ cached\ values\nwnewline
and\ continues\ computing\ from\ there.\nwnewline
See\ {\char92}downlink{\char123}‘‘Free\ and\ Local\ Variables’’{\char125}{\char123}ugUserFre
in\ Section\ 6.16{\char92}ignore{\char123}ugUserFreeLocal{\char125}\nwnewline
for\ an\ example\ of\ a\ function\ definition\ that\ has\ this\ same\ behavior.\nwnewline
Also\ see\ {\char92}downlink{\char123}‘‘Caching\ Previously\ Computed\ Results’’{\char125}\n

{\char92}begin{\char123}page{\char125}{\char123}ugUserMakePage{\char125}{\char123}6.14.\ Making\ Functio
{\char92}beginscroll\nwnewline
\nwnewline
There\ are\ many\ times\ when\ you\ compute\ a\ complicated\ expression\nwnewline
and\ then\ wish\ to\ use\ that\ expression\ as\ the\ body\ of\ a\ function.\nwnewline
Axiom\ provides\ an\ operation\ called\ {\char92}axiomFun{\char123}function{\char125}\ to\ do\nwnewline
this.\nwnewline
It\ creates\ a\ function\ object\ and\ places\ it\ into\ the\ workspace.\nwnewline
There\ are\ several\ versions,\ depending\ on\ how\ many\ arguments\ the\ function\nwnewline
has.\nwnewline
The\ first\ argument\ to\ {\char92}axiomFun{\char123}function{\char125}\ is\ always\ the\ expression\ to
converted\ into\ the\ function\ body,\ and\ the\ second\ is\ always\ the\ name\ to\ be\nwnewline
used\ for\ the\ function.\nwnewline
For\ more\ information,\ see\ {\char92}downlink{\char123}‘MakeFunction’{\char125}{\char123}MakeFunctionX
{\char92}ignore{\char123}MakeFunction{\char125}.\nwnewline
```

```
\nwnewline
{\char92}xtc{\char123}\nwnewline
Start\ with\ a\ simple\ example\ of\ a\ polynomial\ in\ three\ variables.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}p\ :=\ -x\ +\ y**2\ -\ z**3\ {\char92}bound{\char123}p{\char125}
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
To\ make\ this\ into\ a\ function\ of\ no\ arguments\ that\nwnewline
simply\ returns\ the\ polynomial,\ use\ the\ two\ argument\ form\ of\nwnewline
{\char92}axiomFun{\char123}function{\char125}.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}function(p,'f0)\ {\char92}free{\char123}p{\char125}{\char92}boun
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
To\ avoid\ possible\ conflicts\ (see\ below),\ it\ is\ a\ good\ idea\ to\nwnewline
quote\ always\ this\ second\ argument.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}f0\ {\char92}free{\char123}f0{\char125}{\char125}\nwnewline
{\char125}\nwnewline

This\ definition\ is\ both\ recursive\ and\ iterative,\ and\ is\ tricky!\nwnewline
Unless\ you\ are\ {\char123}{\char92}it\ really{\char125}\ curious\ about\ this\ definition,\nwnewline
we\ suggest\ you\ skip\ immediately\ to\ the\ next\ section.\nwnewline
\nwnewline
Here\ are\ the\ key\ points\ in\ the\ definition.\ \ First\ notice\ that\ if\ you\nwnewline
are\ sorting\ a\ list\ with\ less\ than\ two\ elements,\ there\ is\ nothing\ to\nwnewline
do:\ just\ return\ the\ list.\ \ This\ definition\ returns\ immediately\ if\nwnewline
there\ are\ zero\ elements,\ and\ skips\ the\ entire\ {\char92}axiom{\char123}while{\char125}\ loop\ if\
there\ is\ just\ one\ element.\nwnewline
\nwnewline
The\ second\ point\ to\ realize\ is\ that\ on\ each\ outer\ iteration,\ the\nwnewline
bubble\ sort\ ensures\ that\ the\ minimum\ element\ is\ propagated\ leftmost.\nwnewline
Each\ iteration\ of\ the\ {\char92}axiom{\char123}while{\char125}\ loop\ calls\ {\char92}userfun{\char12
recursively\ to\ sort\ all\ but\ the\ first\ element.\ \ When\ finished,\ the\nwnewline
minimum\ element\ is\ either\ in\ the\ first\ or\ second\ position.\ \ The\nwnewline
conditional\ expression\ ensures\ that\ it\ comes\ first.\ \ If\ it\ is\ in\ the\nwnewline
second,\ then\ a\ swap\ occurs.\ \ In\ any\ case,\ the\ {\char92}axiomFun{\char123}rest{\char125}\ of\ t
original\ list\ must\ be\ updated\ to\ hold\ the\ result\ of\ the\ recursive\nwnewline
call.\nwnewline

{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
How\ about\ this\ one?\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}[a,\ b]\ {\char92}free{\char123}hhh{\char125}{\char125}\nwnewline
{\char125}\nwnewline
\nwnewline
What\ happened?\ \ In\ the\ first\ line\ of\ the\ function\ body\ for\ {\char92}axiom{\char123}h{\char12
{\char92}axiom{\char123}a{\char125}\ is\ referenced\ on\ the\ right-hand\ side\ of\ the\ assignment.\nwn
Thus\ {\char92}axiom{\char123}a{\char125}\ is\ a\ free\ variable.\ \ The\ variable\ {\char92}axiom{\char
referenced\ in\ that\ line,\ but\ it\ is\ assigned\ a\ value.\ \ Thus\ {\char92}axiom{\char123}b{\char12
is\ a\ local\ variable\ and\ is\ given\ the\ value\ {\char92}axiom{\char123}a\ +\ 1\ =\ 2{\char125}.\ \ \
second\ line,\ the\ free\ variable\ {\char92}axiom{\char123}a{\char125}\ is\ assigned\ the\ value\nwnewl
{\char92}axiom{\char123}b\ +\ a{\char125}which\ equals\ {\char92}axiom{\char123}2\ +\ 1\ =\ 3.{\char125}
returned\ by\ the\ function.\ \ Since\ {\char92}axiom{\char123}a{\char125}\ was\ free\ in\ {\char92}user
the\ global\ variable\ {\char92}axiom{\char123}a{\char125}\ has\ value\ {\char92}axiom{\char123}3.{\char
was\ local\ in\ {\char92}userfun{\char123}h{\char125},\ the\ global\ variable\ {\char92}axiom{\char123}b
unchanged---it\ still\ has\ the\ value\ {\char92}axiom{\char123}1.{\char125}\nwnewline
\nwnewline
It\ is\ good\ programming\ practice\ always\ to\ declare\ global\ variables.\nwnewline
However,\ by\ far\ the\ most\ common\ situation\ is\ to\ have\ local\ variables\nwnewline
in\ your\ functions.\ \ No\ declaration\ is\ needed\ for\ this\ situation,\ but\nwnewline
be\ sure\ to\ initialize\ their\ values.\nwnewline
\nwnewline
Be\ careful\ if\ you\ use\ free\ variables\ and\ you\ cache\ the\ value\ of\nwnewline
your\ function\ (see\ {\char92}downlink{\char123}‘‘Caching\ Previously\ Computed\ Results’’{\char125}\nw
{\char123}ugUserCachePage{\char125}\ in\ Section\ 6.12{\char92}ignore{\char123}ugUserCache{\char125}).\n
Caching\ {\char123}{\char92}it\ only{\char125}\ checks\ if\ the\ values\ of\ the\ function\ arguments\nw
are\ the\ same\ as\ in\ a\ function\ call\ previously\ seen.\nwnewline
It\ does\ not\ check\ if\ any\ of\ the\ free\ variables\ on\ which\ the\nwnewline
function\ depends\ have\ changed\ between\ function\ calls.\nwnewline

{\char92}begin{\char123}page{\char125}{\char123}ugUserAnonDeclarePage{\char125}{\char123}6.17.2.\ Declar
{\char92}beginscroll\nwnewline
\nwnewline
If\ you\ declare\ any\ of\ the\ arguments\ you\ must\ declare\ all\ of\ them.\nwnewline
Thus,\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
(x:\ INT,y):\ FRAC\ INT\ +->\ (x\ +\ 2*y)/(y\ -\ 1)\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
is\ not\ legal.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ is\ an\ example\ of\ a\ fully\ declared\ anonymous\nwnewline
function.\nwnewline
The\ output\ shown\ just\ indicates\ that\ the\ object\ you\ created\ is\ a\nwnewline
particular\ kind\ of\ map,\ that\ is,\ function.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}(x:\ INT,y:\ INT):\ FRAC\ INT\ +->\ (x\ +\ 2*y)/(y\ -\ 1){\char125}\nwnewlin
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
Axiom\ allows\ you\ to\ declare\ the\ arguments\ and\ not\ declare\nwnewline
the\ return\ type.\nwnewline
```

```
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}(x:\ INT,y:\ INT)\ +->\ (x\ +\ 2*y)/(y\ -\ 1){\char125}\nwnewline
{\char125}\nwnewline
The\ return\ type\ is\ computed\ from\ the\ types\ of\ the\ arguments\ and\ the\nwnewline
body\ of\ the\ function.\nwnewline
You\ cannot\ declare\ the\ return\ type\ if\ you\ do\ not\ declare\ the\ arguments.\nwnewline
Therefore,\nwnewline
{\char92}begin{\char123}verbatim{\char125}\nwnewline
(x,y):\ FRAC\ INT\ +->\ (x\ +\ 2*y)/(y\ -\ 1)\nwnewline
{\char92}end{\char123}verbatim{\char125}\nwnewline
is\ not\ legal.\nwnewline
\nwnewline
{\char92}xtc{\char123}\nwnewline
This\ and\ the\ next\ expression\ are\ equivalent.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}h(x:\ INT,y:\ INT):\ FRAC\ INT\ ==\ (x\ +\ 2*y)/(y\ -\ 1){\char1
{\char125}\nwnewline
{\char92}xtc{\char123}\nwnewline
The\ one\ you\ use\ is\ a\ matter\ of\ taste.\nwnewline
{\char125}{\char123}\nwnewline
{\char92}spadpaste{\char123}h\ ==\ (x:\ INT,y:\ INT):\ FRAC\ INT\ +->\ (x\ +\ 2*y)/(y\ -\ 1)
{\char125}\nwnewline
\nwnewline
When\ should\ you\ declare\ an\ anonymous\ function?\nwnewline
{\char92}indent{\char123}4{\char125}\nwnewline
{\char92}beginitems\nwnewline
{\char92}item[1.\ ]\ If\ you\ use\ an\ anonymous\ function\ and\ Axiom\ can't\ figure\nwnewli
out\ what\ you\ are\ trying\ to\ do,\ declare\ the\ function.\nwnewline
{\char92}item[2.\ ]\ If\ the\ function\ has\ nontrivial\ argument\ types\ or\ a\nwnewline
nontrivial\ return\ type\ that\nwnewline
Axiom\ may\ be\ able\ to\ determine\ eventually,\ but\ you\ are\ not\nwnewline
willing\ to\ wait\ that\ long,\ declare\ the\ function.\nwnewline
{\char92}item[3.\ ]\ If\ the\ function\ will\ only\ be\ used\ for\ arguments\ of\ specific\nw
types\ and\ it\ is\ not\ too\ much\ trouble\ to\ declare\ the\ function,\ do\ so.\nwnewline
{\char92}item[4.\ ]\ If\ you\ are\ using\ the\ anonymous\ function\ as\ an\ argument\ to\nwne
another\ function\ (such\ as\ {\char92}axiomFun{\char123}map{\char125}\ or\ {\char92}axiomFu
consider\ declaring\ the\ function.\nwnewline
{\char92}item[5.\ ]\ If\ you\ define\ an\ anonymous\ function\ inside\ a\ named\ function,\n
you\ {\char123}{\char92}it\ must{\char125}\ declare\ the\ anonymous\ function.\nwnewline
